ST. JAMES'S PALACE

For millions of people, Jerusalem is a place of the mind and, even more, the spirit. It is a focus of their hopes and their prayers. It is enshrined in the beliefs of Islam, Christianity and Judaism as a holy city, beloved of God. As such it has a permanent place of honour in our scriptures. And Jerusalem has, of course, quite another dimension in the politics of the modern Middle East, a dimension inevitably linked to its holiness, being bound up with modern images of the nation state - of what it means to be an Israeli, a Palestinian.

Alongside, underpinning Jerusalem as a spiritual and political idea, there is the city of stone, wood and mortar which is celebrated in this book; the Old City clustered within the circuit of walls erected by the Ottoman Sultan, Sulaiman the Magnificent, in the 16th century. This is the living, breathing entity in which Muslim, Christian and Jew have long gone about their daily business and which incorporates the fabric and thus the tangible memory of the Jerusalem of Solomon, of Jesus and of Saladin.

The modern world has learned to its cost how fragile the vestiges of the past can be. None more so, perhaps, than the fabric of pre-modern towns. In every continent such towns have fallen victim to the pressures of economic growth, population pressure, unrestricted building activity and urbanisation. Such towns have become an endangered species. To conserve that heritage world-wide is an urgent priority. Jerusalem is just such a town; indeed, it is one of the best preserved examples to survive from the pre-modern Middle East.

Most of what visitors see as they walk around the Old City is the architectural setting created by Muslims for themselves over the past five centuries, largely under the Ottomans. That setting is all of a piece, its parts are interdependent. And the whole is much more than the sum of those parts; it is precisely that combination of street and houses, bakeries and baths, mosques and mausolea, that fashions an organic whole. The hand-cut stonework, graciously weathered by age, which is the hallmark of the Old City, is a striking visual metaphor of that unity.

The Trustees of Altajir World of Islam Trust
have the pleasure and privilege to acknowledge the role
played by other friends of Jerusalem. With great generosity,
they together funded the work of academic research and
preparation which comprises the contents of this major
publication in all its splendour and variety. These are:

PUBLISHER'S PREFACE

It seemed natural to all of us who had joined together to research and publish *Mamluk Jerusalem*¹ that we should continue our initiative by focusing attention upon another equally significant phase of Jerusalem's turbulent history: the Ottoman period.

However, unlike the Mamluks, the Ottomans have left an extensive treasury of archival material, which is augmented by the records and writings of travellers, consular officials and academic institutions of the Western powers over the last two centuries. These latter institutions, from which the British School of Archaeology in Jerusalem developed, were designed as vehicles for biblical and archaeological studies and research.

It was therefore appropriate that the BSAJ should gather together a team of experts, who would combine to present not only the structure and fabric of the city, but also to comment upon those who lived and moved and had their being in Jerusalem during this period.

Generous tributes are made elsewhere in this book to the individuals and organisations whose financial support made possible this publication and thus ensured that all concerned were able to play their respective roles to the full. In this regard we are also grateful to the Administration of Aqaf and Islamic Affairs, Jerusalem, under the direction of Mr Adnan al-Husaini, for their

fraternal support and co-operation throughout the years of the project's gestation.

Under the benign and exacting editorship of Dr Sylvia Auld and Professor Robert Hillenbrand, this extensive and detailed work presents a wide-ranging study of many facets of the Ottoman City. A wealth of socio-historical research is combined with an important architectural survey deriving from Dr Yusuf Natsheh's doctoral thesis, also sponsored by the Trust.

We also gratefully acknowledge the work and dedication of Leonard Harrow and his colleagues, Alan Ball and Dennis Bracey, who have borne the burden of the design, preparation, production and marketing of the Trusts' publications since 1978.

Finally it is our privilege to pay tribute to the imagination and consistent generosity of His Excellency Mohamed Mahdi Altajir, whose critical assistance and support has enabled our work to develop and thrive over the years.

It is our hope that this unique volume will serve as a standard work on the four hundred years of this period of Jerusalem's historic heritage.

Alistair Charteris Duncan,
Director, Altajir World of Islam Trust

PREFACE I

The British School of Archaeology in Jerusalem

From its establishment more than three-quarters of a century ago, the British School of Archaeology in Jerusalem has devoted special effort and attention to the study—both above and below ground—of the city whose name it bears. Since the end of the Second World War, the School has undertaken three major projects in Jerusalem. Below ground, the late Dame Kathleen Kenyon conducted an important series of excavations—both within and outside the Old City—between 1961 and 1967.

The political situation after 1967 did not permit Dame Kathleen to continue her planned excavation programme, and under her guidance, the School turned its attention to historical Jerusalem above ground. Up till that time, the medieval Islamic architecture of the Old City was almost unstudied. It was decided to undertake a detailed architectural survey of the buildings and structures of the Mamluk period, and to complement this with an historical study of the buildings and the people connected with them, using not only published material, but also the archives of the Ottoman court, and documents held in the Haram al-Sharif by the Administration of Auqaf and Islamic Affairs. Twenty years after the conception of this monumental project, the generosity of Their Majesties, the late King Hussein and Queen Noor al-Hussein, and other benefactors, enabled The World of Islam Festival Trust to publish *Mamluk Jerusalem* on behalf of the School. The principal author of the volume was Michael Burgoyne, and Donald Richards provided additional historical material.

The School had long envisaged following this project with a comparable study of the Ottoman period. The World of Islam Festival Trust shared this objective, and undertook to provide funding from its own resources and

from other sympathetic supporters. By December 1991 this funding was in place, and work could commence. The British Academy provided additional financial support through its annual grant.

The School appointed Robert Hillenbrand as Managing Editor of the volume, and Sylvia Auld as Associate Editor and Project Manager, to work in close collaboration with the Administration of Auqaf and Islamic Affairs, Jerusalem, and to recruit an international group of specialist contributors. The Administration demonstrated its commitment to the success of the project by granting Yusuf Natsheh unpaid leave from his day-to-day responsibilities as Director of the Department of Islamic Archaeology. This enabled him not only to work on the physical structure of the buildings, but also to undertake detailed research into the extensive archives of the period held in the Haram al-Sharif. In order to extend the scope of his research, he enrolled as a mature Ph.D. student at the School of Oriental and African Studies at the University of London, under the supervision of Geoffrey King. The World of Islam Festival Trust extended its support for the project still further by covering all Yusuf Natsheh's expenses while he studied in London, and by contributing to the support of his family in Jerusalem. His revelatory research has earned him his doctorate, and provides the largest individual contribution to this volume.

Many people contributed to the successful completion of this project. Their names are recorded elsewhere in this volume, and I express here the warm thanks of the School to them all, individually and collectively. As with *Mamluk Jerusalem*, the Administration of Auqaf and Islamic Affairs, Jerusalem, and its staff were

Ottoman Jerusalem

indispensable and greatly valued partners. The Managing Editor and the Associate Editor deserve the utmost praise for their commitment and their unremitting efforts which have brought this volume to print. Richard Harper, the Director of the School from 1984, drew on his fund of local knowledge and expertise to ensure that work in the field went as smoothly as possible. But I must above all record the School's profound gratitude and appreciation to the Trustees and the Director of the World of Islam Festival Trust and the Altajir World of Islam Trust, under whose imprint—and at whose expense—the book is published; and also to the other donors who responded so generously to our appeal at the outset. Without their magnificent financial and moral support, the School would not have been in a position to commission the necessary research, and this volume could never have appeared.

Earlier this year, as a result of a detailed review by the British Academy of its support for the British Schools and Institutes overseas, the School merged with the British Institute at Amman for Archaeology and History. The new body, the Council for British Research in the Levant, is

now responsible for promoting British research in the area. Meanwhile, the Library of the School continues, independently financed, with the hostel in the building at Shaikh Jarrah. It is particularly fitting that the subject of the final research volume to be published by the School, as it has been, is the City with which it has been so closely identified since its foundation; and that this volume is the fruit—once again—of the long tradition of close co-operation between the School and the Administration of Auqaf and Islamic Affairs, Jerusalem. The Old City contains many buildings and structures of other periods which merit similar detailed examination. The School has bequeathed to the Council for British Research in the Levant a wealth of knowledge and expertise on which to base further studies of the unique city that is Jerusalem.

P G de Courcy-Ireland
Chairman, The British School of Archaeology
in Jerusalem, 1990-1999
London, October 1999

PREFACE II

The Administration of Auqaf and Islamic Affairs, Jerusalem

In the Name of God, the Merciful, the Compassionate

'Glory be to Him, who bore His Servant by night from the Sacred Mosque to Al-Aqsa Mosque, the precincts of which We have blessed.'

From the point where the Messenger of Allah—may God bless him and grant him salvation—departed on Al-'Isra, from the First of the Two Qiblas and the Third of the Sacred Shrines, from the Blessed Al-Aqsa Mosque, it is my pleasure to commend to all who are interested in the Arab Islamic heritage of Sacred Jerusalem this volume of research into a multitude of aspects of the history and archaeology of the city of Jerusalem in the Ottoman period.

This book is the fruit of many years of collaboration between the Administration of Auqaf and Islamic Affairs, Jerusalem, the British School of Archaeology in Jerusalem, and the World of Islam Festival Trust and Altajir World of Islam Trust. The Administration of Auqaf and Islamic Affairs, Jerusalem, and the British School of Archaeology in Jerusalem began working together in the immediate aftermath of the events of 1967, to overcome the obstacles to an architectural survey of Mamluk buildings. Their collaboration bore fruit in the publication of a valuable volume on Mamluk Jerusalem, and was subsequently extended to bring to fulfilment this companion volume for which it falls to me to write a preface.

Everyone is conscious that this book appears at a time when the Old City of Jerusalem is facing a bleak situation, being subject to blatant and concentrated attacks to change by force and effectively attempts to obliterate its

Arab and Islamic characteristics, and indeed its cultural identity. This book, with the documents it contains, is the best possible demonstration of the Arab and Islamic nature of the city of Jerusalem; it illustrates and authenticates the contribution made by Arabs and Muslims to the city's architectural texture and cultural development.

A group of specialists and scholars from a number of countries was brought together to undertake research into and study of this period in the history of the city of Jerusalem. Their researches reflect the variety of their specialisations, interests and views. Their views do not necessarily represent those of the Administration of Auqaf and Islamic Affairs, Jerusalem, but are rather the personal scholarly opinions of the authors, which are open to scholarly and academic evaluation and criticism, in accordance with recognised scholarly practice.

The choice of contributors was a matter for the Managing Editor of the volume. However, the Administration of Auqaf and Islamic Affairs, Jerusalem, was particularly keen that the largest possible number of Arab and Palestinian specialists be given the opportunity to participate in this project. Although the preparation of the book has taken eight years, some of the researchers and specialists who were invited to contribute were unable to undertake their research because of their involvement in other commitments and projects.

I value highly the participation of many distinguished scholars, and should like to mention particularly the young Palestinians who participated in writing a part of their history, amongst whom are Yusuf Natsheh and Khadr Salameh from the Administration of Auqaf and Islamic Affairs, Jerusalem.

I am very hopeful that this book will win the attention it merits and appreciation of the effort devoted to it. I hope too that this work will be a stimulus in the future for similar studies on the Noble City of Jerusalem, recognising that there are many aspects which have not been covered by this book, and which can be the basis for constructive future collaboration. I am also prompted to hope that we shall one day be able to offer this volume to Arab readers in a full or partial translation into their mother tongue.

I should like to thank all those who kindly contributed to the studies and research, and devoted their valuable time and effort to producing this research. I should especially like to thank Professor Robert Hillenbrand, the Managing Editor; Dr Sylvia Auld, the Associate Editor; and Dr Yusuf Natsheh, Head of the

Department of Islamic Archaeology, all of whom demonstrated great enthusiasm for and understanding of the project. The Departments of Islamic Auqaf and Islamic Affairs and Islamic Archaeology supported it to the utmost of their capabilities. I express my gratitude and appreciation to Mr Alistair Duncan, Director of the World of Islam Festival Trust and of Altajir World of Islam Trust, and co-ordinator of the project, and to all those who so generously provided the funds required to produce this book. Finally I thank the Ministry of Auqaf, Islamic Affairs and Shrines, and the Council of Auqaf, Islamic Affairs and Shrines, for their approval of and support for this project.

Muhandis Adnan al-Husaini
Director

EDITORS' ACKNOWLEDGEMENTS

Without Alistair Duncan, the Director of Altajir World of Islam Trust, this work would never have been undertaken, and it is thanks to his unwavering interest and commitment that it has been brought to term. A huge debt of gratitude is owed to him and his Trustees by all lovers of Jerusalem. The project was first mooted in a walk around al-Haram al-Sharif in Jerusalem, shortly after the publication of *Mamluk Jerusalem*, when Michael Hannam (who was then Chairman of the BSAJ), Graeme Auld (then Honorary Secretary), and Michael Burgoyne went to visit Yusuf Natsheh. They discussed the possibility of a sister volume to *Mamluk Jerusalem* which concentrated on the Ottoman city. It was Alistair Duncan who then turned the dream into reality by finding the sponsors, headed by His Excellency Mohamed Mahdi Altajir, to all of whom our thanks are most cordially extended.

Equally, we must thank Adnan al-Husaini, the Director of the Administration of Auqaf and Islamic Affairs, Jerusalem, and Yusuf Natsheh, Director of the Department of Islamic Archaeology. Yusuf Natsheh, who has also been funded throughout the long gestation of the project by the World of Islam Festival Trust, completed his doctorate on the subject of the architecture of Ottoman Jerusalem and is publishing the results of that doctoral research, with additional material, within these pages. Without the active support of the Administration of Auqaf and Islamic Affairs, Jerusalem, access to the buildings for the survey would have been impossible, and, in addition, it is on the basis of original work by the Department of Islamic Archaeology that much of the material for this book has been produced. Moreover, the Administration of Auqaf and Islamic Affairs, Jerusalem, granted Yusuf Natsheh

unpaid leave to allow him to pursue his researches.

Next, our thanks go to Richard Harper and Paddy de Courcy-Ireland, the last Director and Chairman of the British School of Archaeology in Jerusalem respectively, for their support and encouragement during the long years of preparation, survey and fieldwork. Keith Whitelam, Nick Wyatt and John Woodhead also played a major supportive role in their respective capacities of Honorary Secretary and Assistant Director to the BSAJ, which has now merged with the British Institute at Amman for Archaeology and History to form the new Council for British Research in the Levant; and it is under the aegis of this new body that the project has reached completion. Our thanks go also to Louise Maguire and Jo Clarke, who in their day were both Secretaries of the BSAJ, for their help with administration. Jo Clarke is now CBRL Director in Jerusalem and has continued to be of help in her new role.

Our special thanks wing their way to our families—especially Carole Hillenbrand for her wise counsel on many questions about the finer points of translation—and the many friends and colleagues who have encouraged us over the sometimes difficult moments in the production of such a large work. These include Michael Burgoyne, who has an encyclopaedic knowledge of the buildings of Jerusalem, Joe Rock for his marvellous photographs, David Myres for the period he spent in Jerusalem working on the catalogue of buildings, Susan Roaf and her student team of surveyors from Oxford Brookes University, Oxford (so generously funded by special grants from The British Academy and WIFT), the student survey team from the BSAJ who worked one summer exclusively on al-‘Imara al-‘Amira, Yolande Hodson for her help with maps, and the staff of

the PEF for their good-tempered response to many queries. In particular both Hamish and Caroline Auld have helped with the preparation of drawings. But most of all we would like to say an extra special thank-you to Leonard Harrow, who with patience, good humour and expertise has nursed an unwieldy bulk of paper into the coherent book it is now.

In Jerusalem our thanks go to Issam Awad (Chief Architect of al-Aqsa Restoration Committee), Khadr Salameh (Librarian and Director of al-Aqsa Mosque Library and Museum), Marwan Abu Khalaf (Institute of Islamic Archaeology, Al-Quds University), and George

Hintlian (Armenian Patriarchate).

But we owe a very special debt of gratitude to our many authors. Their very varied expertise has put flesh on the bones of the architectural survey and has made these buildings live again in a human context. It is their work that will give this volume enduring value and will at last put Ottoman Jerusalem on the map.

*Sylvia Auld
Robert Hillenbrand
Edinburgh, 2000*

EDITORS' NOTE ON TRANSLITERATION AND TRANSLATION

In view of the length and costs of this book, which includes the work of many authors working in many disciplines, languages and backgrounds, a decision was made to dispense with any single system of transliteration for the Arabic, Persian and Turkish names and terms used in the main body of the text. The editors were presented with a great variety of spellings of proper names, terms, etc., to say nothing of the different—and mutually incompatible—systems of transliteration. Such spellings can anyway be disputed; spellings out of non-roman scripts are often compromises and no transliteration system is ever completely adequate. It has been decided, therefore, to keep the spellings of proper nouns, foreign terms, etc., as simple as possible and to avoid the use of complex transliteration systems. In such matters the comments of T E Lawrence in the Preface to his *Seven Pillars of Wisdom* are worth bearing in mind:

Arabic names won't go into English, exactly, for their consonants are not the same as ours, and their vowels, like ours, vary from district to district. There are some 'scientific systems' of transliteration, helpful to people who know

enough Arabic not to need helping, but a wash-out for the world. I spell my names anyhow, to show what rot the systems are.

Specific dates are given in the Islamic calendar first, with the Christian equivalent following after an oblique stroke; approximate dates and centuries are given in the Christian calendar only. Throughout the book the words Ibn and b. are used interchangeably.

Dr Yusuf Natsheh is responsible for the translation of Arabic in his catalogue of buildings. We would also like to thank Dr Christine Woodhead for her valuable help with the translation of difficult Turkish passages, and Dr Ulrike al-Khamis for her help with the translation from German of the technical section on the preparation of oil in Dalman, *Arbeit und Sitte in Palästina*, Leipzig and Hildesheim, 1927-41.

Throughout the book, Istanbul has been used as the name for the city of Constantinople for the sake of convenience and the term 'Qoja' has been used for the great architect, Sinan, for this is how the title has continued to appear in popular literature, almost as part of the name, since at least the 19th century.

CONTRIBUTORS

The chapters contained in this volume have been written by the following scholars who have wide and varied academic associations, mainly with the institutions listed below.

Marwan Abu Khalaf	Al-Quds University, Jerusalem
Mohammad ‘Ali ‘Alami	Historian, Jerusalem
James W Allan	Ashmolean Museum, Oxford
Kamal al-‘Asali	Former Director of the University of Jordan Library
Mahmud Atallah	Director, Manuscripts and Archives, Al-Najah University, Nablus

Introduction

STRUCTURE, STYLE AND CONTEXT IN THE MONUMENTS OF OTTOMAN JERUSALEM

Robert Hillenbrand

1. The historical setting

In 1453 Mehmed the Conqueror had fulfilled the long-term Ottoman ambition to capture Constantinople and to take over the territories of Byzantium. But his successors, not content with this, had sought to extend Ottoman power to the south, which resulted in their conquest of the Levant and Egypt, and—almost simultaneously—to the east. They had thus become embroiled in long-running, inconclusive and costly hostilities with Iran. Sulaiman the Magnificent had then embarked on a series of campaigns in eastern and south-eastern Europe. Thus by 1536, when—some twenty years after their conquest of Jerusalem—the Ottoman authorities began their first projects of serious architectural patronage in the city, their empire was firmly committed to a war on two fronts, both of them far from the Levant. The intensification of Ottoman interest in the European and Iranian theatres of war could not fail to give Sulaiman, as the Ottoman sultan, a perspective on Jerusalem which differed radically from that of his Mamluk predecessors—although, like them, he saw himself as the leader of the Sunni Muslim world, which gave an extra edge to his conflict with Shi'ite Iran. For the Mamluks, Jerusalem was centrally placed in an empire which stretched the full length of the Levantine seaboard and also encompassed Egypt and Western Arabia. Moreover, it was they who had definitively liberated the Holy Land from Frankish hands and who had thus set the seal on a campaign of *jihad* inaugurated in the early 12th century and fostered by such legendary Ayyubid and Mamluk rulers as Zengi, Nur al-Din, Saladin and Baibars. Just as the Crusaders had

celebrated their capture of Jerusalem with a building boom there, so too did the Mamluks inaugurate a comparable boom when they took over control of the city. They had fought hard for Jerusalem and it had a special place in their affections. In the 16th century there was no reason for the Ottomans to share this view. Nevertheless, like the Mamluks they maintained the useful fiction of allegiance to a puppet caliph, and as self-styled rulers of the orthodox Muslim world they took over the guardianship of the Holy Places, which naturally included Jerusalem as the site of the First Qibla. But they did so from a very different geopolitical stance. Their pressing interests lay to the north-west and to the east, not in the Levant. For them, Syria, Palestine, Egypt and Arabia were provinces of a much larger empire whose centre of gravity lay in Anatolia and the Balkans. These provinces were a source of revenue, manpower and raw materials; otherwise they were of secondary interest. They were governed by appointees from Istanbul, where the metropolitan court and administration were Turkish in speech and largely Persian in culture. The relatively modest scale of Ottoman architectural patronage in Jerusalem makes sense only in the context of this seismic shift in geopolitical realities. Stripped of its special status under the Mamluks, reduced to the role of a minor provincial town, ruled by Muslims who—however sympathetic they were to Arab culture—nevertheless owed their first loyalty to the Turkish sultan in distant Istanbul, Jerusalem under the Ottomans had definitively relinquished its position at centre stage. The architecture built there by the Ottoman authorities inevitably betrays this dramatic change in its role. It is this context that best

explains the unprecedented emphasis on repair work rather than spectacular brand-new buildings in the Ottoman contribution to the architecture of the city.

2. The differences between Ottoman and Mamluk Jerusalem

The differences between Mamluk and Ottoman architecture in Jerusalem reflect this sea-change in the role of the city. From a religious point of view, very little had changed, at least outwardly; the Ottomans, as noted above, took over from the Mamluks the self-styled office of Guardian of the Holy Places, and like them embellished Mecca, Madina and Jerusalem. But the nature of their patronage in Jerusalem was very different, as will be discussed in Section 6 below. Its most spectacular expression was two-fold. One element was the refurbishment of the Dome of the Rock, which appears quite simply to have been unnecessary since there is no evidence that the Umayyad external mosaics which rendered the building unique had suffered serious damage over the centuries. Thus the Ottomans seem to have destroyed something exceptional in order to replace it by something commonplace—for by the mid-16th century the major imperial Ottoman religious buildings were frequently clad in lavish tilework. The work of Sulaiman the Magnificent could therefore be seen as an attempt to stake a claim to this especially holy site, and to ottomanise its appearance in an unmistakable way—for glazed tilework could not fail to have been recognised at the time as a foreign kind of decoration in the local context. Significantly, the interior, which naturally lacked the exceptional visibility, and therefore the propaganda potential, of the exterior, was left virtually untouched. The second element of Ottoman patronage was the walls, including the Citadel (probably 938/1531-2). Here, too, the political statement is unmistakable (see Section 3 below). The third most holy city of Islam, which had remained without continuous walls, and therefore obviously vulnerable, since Ayyubid times, was now fully protected—this was the long arm of the Ottoman sultan in action. As in the case of the Dome of the Rock, the visual impact was what mattered. Hence, perhaps, the warlike battlements, more for show than use. Much of the new walling was too low and too frail to offer serious protection against a determined enemy or artillery bombardment. Happily the city was not called upon to endure such tests.

These, then, were the two most public expressions of Ottoman patronage, and there can be little doubt that they had an incomparably greater impact on the local population, and on visitors and pilgrims—always an important category in Jerusalem—than any two Mamluk foundations in the city. But, with the single exception of the Khassaki Sultan complex, the rest of the Ottoman

buildings reveal a very modest financial commitment to the city's architecture on the part of the Ottoman regime and its functionaries. Their rule lasted almost twice as long as that of the Mamluks, and yet it produced only a fraction of the Mamluk output in terms of quality and scale of buildings. True, there are plenty of them; but as a group they are undistinguished. What is the explanation?

The basic factor seems to be geopolitical. For the Mamluks, ensconced in Egypt with important provincial capitals in Damascus and Aleppo, Jerusalem was relatively close to the centres of power. It straddled the route to Syria. It therefore had strategic as well as religious importance and was an integral part of a relatively small and self-contained state. With the Ottoman conquest, all this changed. As already explained, the new masters of Jerusalem had much wider horizons than the Mamluks had possessed. They had interests in the Balkans, Anatolia, Iran, Iraq and along the North African coast. The significance of Jerusalem could only dwindle in this vast perspective. Above all, the Ottoman capital was in Istanbul, not Cairo, and in an age of slow, laborious communications this effectively rendered Jerusalem out of sight, out of mind. Moreover, the principal theatres of war in Ottoman times were the Balkans, Iran, the Mediterranean—Palestine fomented a minor rebellion on occasion, but nothing to justify the intervention of the imperial army in force. After a brief spate of Ottoman interest in the city in the generation after the conquest in 1517—a period which saw most of the significant Ottoman contributions to the city's architectural heritage—Jerusalem sank to the status of a minor provincial town. It lost touch with the great world. An economy long boosted by the intense building activity of the Mamluk period gradually stagnated. The city turned inwards, resting on its past glories while its current affairs gradually became the preserve of a few leading local Arab families who dominated the religious establishment and the administration of the *waqfs* of its many pious foundations.

Even in the Levant itself, Jerusalem under the Ottomans was significantly downgraded *vis-à-vis* its role a century earlier. Under the Mamluks, Damascus and Aleppo were indeed more important politically, yet Jerusalem rivalled them in its architectural heritage because of the special religious significance which it held to that dynasty. Under the Ottomans Damascus and Aleppo, in accordance with their much larger populations and their greater political and economic importance, were both graced with many major buildings. This was not true of Jerusalem. And thus a paradox emerges: the Ottomans disposed of much larger cash revenues than did the Mamluks, and—as already noted—ruled Jerusalem for considerably longer, and yet they built far less; and what they did build was on a much smaller scale. This can only mean that they gave Jerusalem a lower priority than did the Mamluks. Yet the city was by no means neglected; and it is

one of the ironies of its history that under the early Ottomans its population tripled, a process perhaps due in part to Sultan Sulaiman's repair in 1532 of the aqueduct originally built by the Amir Tankiz, who was viceroy of Syria between 1312 and 1340. The restoration of the aqueduct was completed in 1541-42; it conducted water from the Pools of Solomon to nine public fountains in Jerusalem, to others on the Haram and to certain *hammams* in the city. His reconstruction and enlargement of the bazaar area revitalised the urban economy. But it also had wider horizons—thus the new spice bazaar was part of the Ottoman response to the challenge which Portuguese activities in the Indian Ocean presented to the lucrative spice trade, traditionally a Mamluk monopoly. Above all, Sulaiman's rebuilding of the walls resulted in a complete circuit of fortifications and thereby set Jerusalem apart from most other Palestinian towns, which would have created a welcome sense of security and thus an added incentive to settle there.

Unlike today, when much of the Mamluk heritage has vanished altogether and most of what remains is dilapidated or diminished by later constructions, in 1517 and the following few decades it must have been largely intact, for the most part of recent origin and of a splendour that was very plainly hard to beat. These buildings, and sometimes the structures surrounding them too, were still well protected by functioning *waqfs* which prevented unauthorised re-use or adaptation. All this may well have made the Ottomans disinclined to enter into retrospective competition with the Mamluk achievement; but it may also have suggested to them that the city simply did not need an architectural transformation. The afterglow of Mamluk patronage must have lingered for generations. Its implicit challenge helps to explain why the best Ottoman architecture in Jerusalem is concentrated into the 16th century—though it is only fair to note that in the Ottoman capital, Istanbul, this was also the period which saw the apogee of Ottoman architecture. The fact that Jerusalem was still a relatively new Ottoman possession may also have played its part as an incentive for architectural activity.

On the whole the Mamluk *amirs* had concentrated their building activity on the immediate surroundings of the Haram, and this area gradually filled up with public monuments in the course of the Mamluk centuries. Thus by 1517 there was virtually no room left for further significant construction in this part of the city—quite apart from the fact that it effectively bore the stamp of Mamluk ownership. There was only one place left for the new dynasty—the interior of the Haram—and, for all the difficulties that this site presented, the Ottomans were so to speak in honour bound to use it. But the ineluctable need to respect the Dome of the Rock and the Aqsa mosque and not to intrude on their physical space in any way seriously inhibited prospective Ottoman patrons. One cannot help

being struck by how low the Ottoman buildings on the Haram are in comparison with the Mamluk façades which border it; they are dwarfed in comparison. Yet as the new masters of Jerusalem the new rulers had to assert their power in some tangible, visible, architectural way. That political imperative—so often a factor in glamorous public architecture—excluded foundations in the outskirts of the city, where they would have been effectively out of sight, and pointed, so far as religious architecture was concerned, to the hitherto unexploited Haram. In the field of secular architecture, on the other hand, there was one obvious task to be undertaken, and it was one which the Mamluks had sedulously ignored: the rebuilding of the walls.

3. The walls

Beyond question, the most striking testimony of Ottoman architectural patronage in Jerusalem is the circuit of walls repaired and in part erected by Sulaiman the Magnificent between 1537 and 1541, as its eleven inscriptions record. The supervisor of the entire enterprise was Muhammad Çelebi al-Naqqash. Several introductory remarks may be in order. First, this was a rare accolade for the Holy City, since its walls had been in an increasingly ruinous condition ever since their deliberate breach by the Ayyubid princes, al-Mu'azzam 'Isa and al-Malik al-Kamil, in 1219 and 1227 to prevent their use by the Christian enemy. Second, fully walled cities—as distinct from fortified citadels dominating unwalled cities—were a rarity in the Near East. Third, these walls largely followed the line of earlier walls erected when the city was more densely populated, and thus the Ottoman walls defined the area of Jerusalem generously, leaving plenty of room for renewed population growth and thus expressing faith in the future of the city. And for the first time in centuries they gave Jerusalem a physical unity—the necessary prelude to a more intangible sense of community and morale. Fourth, there is a more than local context here, for at almost the same time the selfsame Sultan Sulaiman was constructing a major wall around Madina, the second holiest city in Islam; and of course, his capital, the former Constantinople, was itself surrounded by late Roman and Byzantine walls which were one of the wonders of the medieval world. That fact, and the perennial association of those walls with great empires of antiquity, might well have motivated Sulaiman to emulate that achievement elsewhere, and to present himself as a latter-day Caesar. Lastly, it would be mistaken to attribute this costly project entirely to the pious motives of the sultan. Other factors, both local and international, were at work.

The local factors were not confined to the city. Jerusalem, in common with Hebron and other Palestinian towns, had long suffered from the raids which marauding

Bedouin tribes regularly conducted against travellers on the open road and even against the inhabitants of the outskirts of the larger towns. Thus a chronic insecurity afflicted the surrounding countryside for much of the Ottoman period. Hence there is a darker side to the building of these walls. Put briefly, the building of the walls absolved the Ottoman authorities of the need to police the environs of Jerusalem effectively, and indeed could be interpreted as an acknowledgement that the writ of the government did not run in these areas. This was not a new situation; early in the 16th century, at the end of the Mamluk period, no one could perform the *hajj* from Jerusalem for an entire decade because the Bedouin had rendered the roads so unsafe. Bedouin lawlessness in fact persisted for centuries and the protection of travellers, for example on the main Ramla-Jerusalem road, necessitated the provision of a heavy guard or the payment of protection money. As late as the early 18th century the then governor of Jerusalem, Mustafa Agha, negotiated an agreement with the inhabitants of a trio of villages to the north of Jerusalem that they would not molest travellers bound for the city.

The story does not end here: there is an international dimension too. After the defining and traumatic experience of the Crusades, it is no wonder that in Muslim eyes the Christian pilgrims who continued to visit Jerusalem should represent the shadow of a possible threat against the city, all the more so as the Europeans had never abjured the resumption of hostilities. In the 1530s, rumours were circulating of a new crusade under the leadership of the Holy Roman Emperor Charles V, stung by the recent Ottoman campaigns in Austria. In the aftermath of the fall of Rhodes, the last Christian outpost in the Levant, in 1520, such rumours could not be ignored, and indeed Charles did mount an expedition against Algiers in 1538. Its failure may explain why work on the walls of Jerusalem was abruptly terminated, leaving the interiors of about half the towers unfinished. Nevertheless, the scale and nature of Ottoman work on the towers can be gauged by the Stork, Gaza and Sulphur Towers, and by Goliath's Castle. Some of this work was executed on earlier foundations. The unfinished state of the work—for while the circuit of the walls is complete, neither the height nor the treatment of the ramparts themselves is consistent—is perhaps not all that serious a deficiency, since the role of these walls was at least as much symbolic as military. They represented a *prise de possession* and a deterrent to any Christian designs on the city. It is certain that they would not long have resisted a determined attack by an enemy force equipped with up-to-date artillery: at some points, admittedly, the walls are almost three metres thick at the base, with a glacis in some places, but they are on the whole less than 1.5 metres thick at the level of loopholes and less than half that thickness at the height of the ramparts. This reduction is sometimes managed by a succession of

retreating jogs. Thus the upper sections of the wall, festooned as they are with bosses, parapets and merlons, are largely for show—hence, for example, the sudden outcrop of decorative forms in the battlements of the Damascus Gate—though they would assuredly have foiled any attacks by raiding Bedouin. Numerous staircases give access to the upper part of the walls. The variations in height—from 5 to 15 metres approximately, that is 17 to 50 feet—tell the same story of protection against casual raids rather than a professional army with state-of-the-art cannons. There was no attempt to rebuild the walls from scratch; earlier sections of finished wall, from Herodian times onwards, were incorporated without change wherever possible. This explains the extremely varied stonework, which ranges from the cyclopean blocks of the ancient foundations to the small, neat and relatively uniform squares which characterise Ottoman work. The earlier wall-lines were used wherever this was practicable, as were the existing ditches.

Some basic facts will clarify the size and ambition of the whole enterprise. If all the angles, re-entrants, towers and gates are included in the calculation, they extend a total of 4.325km (2.7 miles). For some reason Mount Zion was excluded, despite its strategic importance, and the Citadel, itself of Mamluk origin, which Sulaiman had fortified and garrisoned as early as 1531, had its own system of defences, though in places these blend with the outer city walls. Like many a medieval monarch before him, then, Sulaiman's first concern was to establish a strong military presence in the city. The military aspect of the walls, at least so far as their overall visual impact is concerned, is driven home by no less than 34 towers, which vary in their height, design and angle of fire. These are supplemented by 344 loopholes or embrasures intended for gunfire, and by seventeen machicolations, some of them clearly intended in a decorative spirit to judge by the *muqarnas* decoration at their base. There are seven open gates, all but one of them inscribed with the date of their construction. In some cases earlier Mamluk elements are incorporated in secondary use, perhaps for talismanic purposes, as in the lions—the heraldic symbol of Sultan Baibars, the scourge of the Crusaders—which flank St Stephen's Gate, otherwise known as the Lion Gate. Four older gates—the Golden, Single, Double and Triple Gates—lend still further monumentality to the ensemble, though the latter three gates, being located under the south wall of the Aqsa mosque, are not strictly part of the city walls. Access to the two main thoroughfares which bisect Jerusalem is through the four major gates: Jaffa, St Stephen's, Damascus and Zion (or Sion), but Herod's Gate and the Dung Gate, to the north and south respectively, handled the overflow of traffic and offered supplementary entrances to other parts of the city.

Building on this scale taxed local resources in both

cash and craftsmen well beyond their natural limits. Thus over the 5-year campaign (1536-41) enforced contributions from the whole of Palestine, and even some of Syria, supplemented the expenditure incurred from central government funds. The *sijills* of the Shari'a court for the year 945/1538 give details of this. Similarly, craftsmen were imported from as far afield as Cairo and Aleppo. For reasons of security, work began on the north side, which was the most vulnerable, and ended on the west side. The urgency with which the project was driven forward helps to explain not only the short cuts outlined above but also the frequent use of spolia. That same desire to save time and expense explains why some of the roundels and circular medallions which ornament the walls at irregular intervals (for instance in the area of the Damascus Gate) turn out on close inspection to be the re-carved ends of cylindrical columns inserted into the walls as strengthening devices. Most of the carved roundels, however, were cut from square blocks specifically for use on the walls. Numerous inscribed plaques document the progress of construction; the bare facts and dates are interspersed with verses of thanksgiving. The walls of course have their later history, notably the alterations to the New and Dung Gates, to the glacis and to the moat of the citadel in the course of the 18th and 19th centuries; but their form today is sufficiently close to the way that Sulaiman's engineers left them.

4. The role of Jerusalem in the Ottoman Levantine context

While there is no question that in matters of religious significance Jerusalem was unchallenged by any other city in the Levant, and was outranked only by Mecca and Madina in the Islamic world at large, its political and economic role was quite another matter. Egypt, in Ottoman as in medieval times, was the major force in the south-east Mediterranean, and was thus in many ways a law to itself. Comparisons with the major cities of the Levant in Ottoman times, namely Aleppo and Damascus, are therefore more to the point. Jerusalem shared with these cities the formula traditionally followed in Arab cities, whereby public buildings were concentrated in a city centre criss-crossed by major arteries, with the private residential zone further out and linked by smaller, irregular streets, alleys and *culs-de-sac*. But the main fact to bear in mind is that, by the standards of the major Levantine cities, Jerusalem for most of the Ottoman period was tiny, both in its physical scale *intra muros* and in terms of its population. In about 1525 Damascus, even after the destruction inflicted on it by Timur a little over a century earlier, had, according to the Ottoman registers, a population of approximately 57,000. In that same year, those registers show that Jerusalem had a population of some 4,000

inhabitants; this tripled during the reign of Sulaiman the Magnificent, but incompetent government and a resultant decline in revenues—for the city was essentially a tax farm administered by Ottoman officials in Egypt, Sidon or Damascus for their own benefit—steadily impoverished most of the inhabitants. This very small population suggests that, while there might well have been pockets of dense habitation in the area around the Haram, Ottoman Jerusalem as a whole cannot have been heavily built up. Supporting evidence for this assertion comes from the *waqf* of the Qadiriyya *zawiya*, which mentions a big square *haud* for plantation and 'a fair *hakura* (orchard) situated to the east of the *zawiya*, approached from the *zawiya* and planted with figs, almonds and grapevines.' As late as 1806 the number of inhabitants was estimated at 8,000, at a time when, according to Sauvaget, Aleppo had a population of about 250,000.

It is well to ponder these figures, and the economy which they reflect, when one tries to find an adequate context for Ottoman Jerusalem and its architecture. To put it brutally, the city was poor, and such money as it generated came mainly from non-Muslims. In the 16th century the two major sources of government revenue in the city were the toll levied on visitors to the Holy Sepulchre and the poll-tax imposed on Christians and Jews. The two-stage conversion of a local Christian church into the mosque of Nabi Da'ud, a process completed in 930/1524, illustrates another aspect of this anti-Christian policy.

The commercial activity of the local Arab population could not begin to compete with that of Damascus or Aleppo, and thus could not support the kind of building programmes undertaken in those cities. It is therefore no wonder that the patrons for the buildings of Ottoman Jerusalem belonged largely to the Turkish governing class. Moreover, the relative obscurity of Jerusalem in this period and the short tenure of office which these officials could expect in turn meant that they did not on the whole wield significant power or wealth; they were not rich *grande*es by the standards of Damascus or Aleppo, let alone Istanbul. All this helps to explain why the buildings of Ottoman Jerusalem are so modest in scale and decoration. A wider context for these buildings can be found by examining Aleppo and Damascus in Ottoman times.

Aleppo can serve as an exemplar of a great Levantine city under Ottoman rule. As the capital of a *vilayet*, it enjoyed a strategic site athwart a major trade route to the West, and this was reflected by the presence of permanent European mercantile enterprises, or factories, in the city. While European interest focussed on the international textile trade, which embraced both cheap cottons and luxury fabrics woven with gold and silver thread, Aleppo was also the major centre for regional trade,

and remained so throughout the Ottoman period. To this day its gigantic covered bazaar, a labyrinth some 7km long, largely an Ottoman creation and perhaps the most impressive in the Arab world, has not degenerated into a tourist trap but is still a living, functioning organism, an entrepôt for hundreds of commodities. Aleppo has remained a mercantile town with its face to the desert. Hence, in part, its prodigious economic vitality, especially in Ottoman times. It was helped in this commercial role not only by its favourable geographical situation, with easy access to the sea, to Anatolia and to Mesopotamia, but also by its large multi-ethnic population. Indeed, in Arab lands it was second in importance only to Cairo, as its large central zone, 10.6 hectares in extent, testified. The Ottoman period saw a 50 percent increase in this area.

The Ottoman architectural contribution to Aleppo is seen at its most characteristic in the residential quarters (*mahalla*; there were 72 in all) built of high-quality stone masonry. They include far more residences and palaces for the élite than does Jerusalem. The best houses were clustered nearer to the city centre, and were typically between 400 and 900 square metres in ground area, as compared with the 80-190 square metres of the houses built for the middle class and the *haush* system of multiple low houses clustering around a shared courtyard, or on either side of an alley, which—as at Damascus and Jerusalem—was the preferred housing for the urban poor. The standard pattern of élite housing in Aleppo is of an inward-looking structure dominated by a spacious reception room and an *iwān* overlooking a courtyard (*qa'a*) often embellished with a pool, vines and citrus trees. The decoration draws on local craft traditions which were already well established in the medieval period: inlaid marble in various colours and patterns, and woodwork both carved and painted. This domestic architecture is typified by Bait Jamlat and, in the Judaida quarter, a group of 17th-18th century residences—the Ghazali, Sadir, Ashikbash, Wakil, Balit, Dallal, Sayigh and Basil houses.

In commercial architecture, Aleppo is distinguished by a series of ambitious caravanserais. These include Khan al-Wazir, with its offices ranged around its courtyard, and its monumental portal executed in *ablaq* masonry, Khan al-Nahasin and Khan al-Kattin. Some contain mosques, and many are graced with windows whose frames display delicate carving with vegetal and geometric themes. Taken together, these caravanserais underline the scale of the city's trade in Ottoman times. But some have other dimensions too. A *waqf* of Dukagin-zade Mehmed Pasha dated 1555 mentions a great mosque, three *khans*, three *qaisariyyas* and four *suqs*, the whole covering some three hectares. Scarcely less impressive is the Khan al-Gumruk (after 1574), or 'Customs caravanserai', which had two rows of *suqs* adjoining its façade, and with its 344 shops covered an area of 8,000 square metres. But

it also lodged the banking houses of the French, English and Dutch, who, following 'capitulation' treaties with the Sublime Porte, had settled in the city from 1562, 1583 and 1613 respectively; here too resided the consuls of these three powers. The Venetians, by contrast, had their own *fondaco* in another quarter. This was the age of the Marseilles merchants and the Levant Company; by 1662 the English factory in Aleppo numbered some fifty traders, and as late as 1775, even in a period of economic decline, there were 80 European firms represented in the city, mainly clustered in the Frankish quarter. Many baths, fountains and workshops for textile manufacture also survive from this period. The domestic and commercial architecture of Ottoman Aleppo is to this day the dominant accent of its urban environment, and is only lightly leavened by buildings of a religious purpose; in that respect, the contrast with Damascus, and even more so Jerusalem, is dramatic. While these vernacular, palatial and mercantile structures are firmly within the local Syrian tradition, the higher-profile public religious architecture in Aleppo, typified by various gubernatorial mosques—the 'Adiliyya (1555), Bahramiyya (1583) and Khusraufiyya (from 1537)—sometimes looked further afield; thus the latter complex, attributed to the court architect Sinan, exhibits close links with the metropolitan architecture of Istanbul.

What of Ottoman Damascus? Like Aleppo, it was a provincial capital; participated in the European trade (for example by exporting the many kinds of damask made by the local women in their homes); had separate quarters for Jews and Christians; and expanded dramatically, especially to the south, as the Maidan suburb shows—in fact, the population doubled in the first three centuries of Ottoman rule. It was in the quarters that the life of the city was concentrated; indeed, Hanafi jurists distinguished between the public and the private zone of a city. These quarters were isolated, a fact symbolised by their being closed at night. The Muslim quarters typically had an oratory, mosque, bath and non-specialised markets, and were thus furnished with all that was needful for community life. Not surprisingly, this sense of closeness had its drawbacks; for example, conflicts with neighbouring quarters were common. Many quarters had a dynamic religious life centred on Sufi brotherhoods, probably because they were close to rural zones. In all these ways Damascus conformed to a pattern that was widespread in the contemporary Near East.

Like Aleppo, it boasted splendid palaces for local notables—for example, the Dahda palace of the 17th century, the house of Nur al-Din, now partially re-erected in the Metropolitan Museum, New York, and dated 1707, or the 'Azm palace of 1749-52, as well as smaller houses of quality like Bait Nizam and Bait Siba'i. Its favourable situation between the intensively cultivated Bik'a valley of

the Lebanon and the fertile Hauran plateau made it the natural market for central Syria, and it was also the nexus of several arterial routes and a natural entrepôt for the Mediterranean ports.

Like Jerusalem, moreover, its commerce was invigorated by pilgrim traffic—for Damascus, the last major town before the dangerous desert crossing, was a major stage in the *hajj* route. Like Jerusalem, again, it benefited from lavish imperial patronage in the 16th century—notably two *takiyas*, complexes intended *inter alia* to accommodate pilgrims on the *hajj* route. These foundations show how seriously the early Ottoman sultans took the responsibilities attendant upon their honorific title ‘Protector of the Two Holy Cities’, and thus fit neatly into the pietistic context of early Ottoman architectural patronage in Jerusalem. The *takiyas* are named Salimiyya and Sulaimaniyya after the successive sultans who paid for them; the Salimiyya (1518) was constructed over the tomb of Ibn al-‘Arabi, a noted Sufi, which brings to mind the carefully fostered Sufi connections of certain Ottoman sultans. The Sulaimaniyya (1554-5) is the work of the court architect Sinan, who also designed the ‘Imara of Sultan Sulaiman, which was intended for the distribution of food to indigent pilgrims visiting the tomb of Ibn al-‘Arabi. Completed in 1552, it is used to this day as a bakery; the parallels with the Khassaki Sultan complex in Jerusalem are instructive.

Other expressions of government patronage include several *jami*’s whose local striped masonry in limestone and basalt is only a veneer for the underlying metropolitan character revealed in such details as hemispherical domes, pencil-shaped minarets and courtyards surrounded by multiple domed bays. Many of the great religious foundations of the Ottoman period were situated outside the city walls, a marked contrast to the situation in Jerusalem and clear proof that Damascus had expanded well beyond its medieval limits. The mosque and mausoleum of Darwish Pasha (1571-5 and 1579 respectively), the Khan al-Harir (1572), also due to him, the mosque of Sinan Pasha (1586-91), the Qaimariyya mosque (1743) built by Fathi Efendi, an official of the Ottoman treasury, the Khan al-Gumruk built by Murad Pasha in 1608-9 and the palace, *madrassa* and *khan* of Asad Pasha al-‘Azm all testify to the patronage of enlightened nobles. Well over a dozen Ottoman *khans* survive; these, unlike so many of the important religious buildings, are *intra muros*. Their size and number clearly reflect the intense commercial activity of Damascus in this period. Only Aleppo, as already explained, among the other cities of the Levant can match this mercantile investment; the almost total absence of such buildings in Ottoman Jerusalem speaks for itself and goes far to explain the much more modest scale of the Ottoman architecture there. The emphasis on tilework in many of the Ottoman buildings of

Damascus again brings Jerusalem to mind; Damascus in the 16th and 17th centuries was a thriving centre for the manufacture of glazed ceramics and tiles which are a subset of Iznik wares. But Damascus signally lacked stable government. The bare facts are sufficiently telling: between 1516 and 1697 the city was governed by no less than 133 *pashas*. Few of them did the city much good, for all that the mosque and mausoleum of Darwish Pasha (16th century), and the palace and *khan* of Asad Pasha al-‘Azm helped to beautify the city. It is no accident that the greater prosperity of the city in the 18th century was co-terminous with the tenure of the governorship by members of the ‘Azm family for most of that time.

These brief sketches of Ottoman Aleppo and Damascus are enough to show that Jerusalem belongs less with them than with, say, Gaza, Hebron, Nablus and Tripoli in this period. For example, in the later 17th century Gaza, then enjoying a period of prosperity, acted as the capital of Palestine, and possessed an attractive set of buildings. As for Hebron, the religious significance conferred on the city by the tombs of the Patriarchs (e.g., Adam, Joseph, and especially Abraham), and the quantity of Muslim pilgrims visiting them—for just as in popular Islam Jerusalem developed as a substitute for Mecca as a pilgrimage destination, so did Hebron develop as a substitute for Madina—ensured that the Ottoman sultans oversaw its upkeep.

5. The role of the Haram in Ottoman times

To build on the Haram al-Sharif—as distinct from building along the outer perimeter of its two terraces—was not a straightforward proposition. It seems probable that there was something of a taboo in operation so far as building within the precinct itself was concerned; hence the very tentative use made of this prime site in post-Umayyad times and even under the Mamluks. On the other hand, the Ottomans were new to Jerusalem and had not been inured to such a taboo. Nevertheless, the striking fact is that nothing at all was built in the city in the reign of Selim the Grim (1512-20) or, more to the point, in the first fifteen years of the reign of his son and successor, Sulaiman; and when Sulaiman began to build, the Haram had only a minor role in his plans. Two *sabils* there document this stage of his patronage: Sabil Qasim Pasha (whose inscription exalts him as the Second Solomon) and Sabil Bab al-‘Atm. Sabil Qasim Pasha serves for ablutions and is referred to in the *sijills* as Hanafiyya; in other words it provided the running water which this particular *madhhab* requires for ablution. This proves, incidentally, that not all *sabils* were built only to furnish drinking water. The major new foundations of the new dynasty were the complexes of Bairam Jawish and Khassaki Sultan, both of them in the

immediate surroundings of the Haram and thus firmly in the Mamluk tradition, but both of them afflicted with a layout that at every turn betrays the acute shortage of space that cramped the architect's design. Indeed, the Khassaki Sultan complex incorporated into its design a hall which was part of the Mamluk foundation of Dar al-Sitt Tunshuq; this was transformed into stables. Clearly there was very little prospect of significant new building activity in this area, where—as noted above—space was at a premium and the detailed provisions of scores of *wagfs* further hampered the free exercise of an architect's imagination. The gap sites were getting smaller all the time. This made it all the more important to extract maximum advantage from them. Thus even a modest little building like the Khalwat al-Dajani is visible from several different angles and is at an important intersection of traffic.

Yet the decision to build within the precincts of the Haram had its own problems. The prestige of the Umayyad monuments was unmatched, for they had the whole weight of Islamic history—including salvation history—behind them. Above all, ample empty space was an essential aspect of the awe-inspiring presence exerted by the Dome of the Rock and the Aqsa Mosque. It was therefore not a serious option to build major new monuments on the Haram and thus to risk upstaging these numinous landmarks. Political considerations also had to be taken into account, for the Ottomans, foreign conquerors whose base was in distant Anatolia right outside the Arabic-speaking world, could not afford to alienate their Arab subjects by intrusive and insensitive construction projects on this immemorially hallowed site.

The upshot of all this was that the Ottomans proceeded with extreme circumspection in their development of the Haram area. *Sabils* apart, not a single Ottoman sultan, it seems, erected a brand-new structure on the Haram. Given the massive imperial building programme between *c.* 1460 and *c.* 1620, which utterly transformed the face of Istanbul and of numerous cities in Anatolia and the Balkans, this restraint in the third holiest city of the Islamic world is truly remarkable. Yet by slow degrees the Ottomans did contrive to establish their physical presence on the Haram. The key point to remember is that virtually none of the buildings which did this were imperial. The trickle of minor, modest buildings never became a flood, but by 1650 or so they permeated the entire precinct. Moreover, quite apart from their impact as individual buildings, they also worked in concert by virtue of the way they clustered together. Nor should one forget the dimension of sound—prayers could be heard through their open windows and sanctified the entire environment.

Thus the Ottoman claim to the Haram was staked very modestly and over many decades. This extreme caution brings out the extreme boldness of Sultan

Sulaiman's masterstroke, which was nothing short of a *coup de théâtre*: the glamorous refurbishment of the exterior of the Dome of the Rock. It was the perfect way of establishing in visual terms the Ottoman dominion of the city, and the fact that it had come to stay. In rather different language, it reiterated the political message of the Umayyad caliph 'Abd al-Malik nearly nine hundred years earlier; and it was aimed at the same audience: the people of Jerusalem. But precisely because Jerusalem has for millennia had such wide horizons in religio-political terms, the message of the second Solomon, broadcast from the site of the first Solomon's Temple, reverberated throughout the Islamic world—and beyond it. The constant flow of pilgrims, Muslims and non-Muslims alike, to Jerusalem would have seen to that.

Sulaiman's immediate audience, of course, was an Islamic one. He therefore had no need to claim for Islam—as had 'Abd al-Malik—a place of worship long held sacred by other faiths. But he certainly renewed that claim and thus invited comparison with his great Umayyad predecessor. He sought, moreover, to improve on that aspect of the Umayyad achievement which was most obvious to all, namely the colourful exterior mosaic of the building. Especially from a distance, glazed tilework in blue and white (the predominant tones of this composition) has much more visual impact than the more muted palette of mosaic. No evidence has been found to suggest that this mosaic had suffered serious decay. But the history of Islamic architecture is full of examples of later patrons remodelling the decoration of much earlier monuments so as to put their own personal stamp on them. This is what Sulaiman did. It seems unlikely that the good health of the building—or that of the neighbouring Dome of the Chain, which was included in this refurbishment, though a little later, in 1561-2—demanded it. Indeed, he forbore to attempt any major structural intervention. Instead, by sheathing the exterior of the Dome of the Rock in glistening tilework he upstaged his Umayyad predecessor, brought up to date one of the most seminal structures in the Islamic world and established the Ottoman presence right in the middle of the Haram. This was something that not even the Mamluks had done, despite their sustained embellishment of the Holy City over a period of almost three centuries. They certainly carried out work on the Haram, particularly on its inner façades, and even a certain amount of repair and refurbishing of the Aqsa Mosque and the Dome of the Rock, where the largest single project was Qala'un's repainting of the inner dome. But they attempted nothing so grand and of such public impact as tiling the lower exterior walls of the Dome of the Rock. It is perhaps a measure of Ottoman imperial pretensions that the project of loading this, the first great monument of Islamic architecture, with redundant ornament should ever have been conceived. It was only the Dome of the Rock that was

so singled out; no significant structural work was undertaken at the Aqsa mosque for almost six centuries after 1350, nor did it offer a comparable opportunity for redecoration. Scattered references in the *sijills* record such minor running repairs as the replacement of lead sheeting for the mosque's roof in 996/1588 or the repair of its doors. It has been suggested that the motive for the redecoration of the Dome of the Rock was a misunderstanding of the themes found in the Umayyad mosaic programme, namely that the depictions of 'cherubim' (probably Sasanian winged motifs) described by Western travellers of the late 15th and early 16th century stimulated an iconoclastic reaction. If so, it was at second hand, for Sulaiman never saw the building, and it seems odd that it took over eight centuries to materialise. It seems more likely that the intention was simply to assert the Ottoman presence in Jerusalem by redecorating the city's most celebrated monument. Sulaiman gave the building a new meaning through the choice of epigraphy: the drum bears Sura 18:1-20 and the date (in figures) 952/1545-6, while lower down the main octagon asserts that the work was carried out by 'the most able masters of their age' and is signed by one 'Abdallah al-Tabrizi, a Persian to judge by his *nisba*, and dated 959/1551-2. Nor did Sulaiman's work end there, for shortly before his death he caused the doors at the eastern and western entrances to the building to be covered with bronze plaques.

The main Ottoman contribution to Jerusalem apart from the walls, the aqueduct and the retiling of the Dome of the Rock is the transformation of the upper terrace of the Haram al-Sharif, on which the Dome of the Rock stands. It is important to note from the outset that this transformation was not part of a master plan for the Haram; it happened piecemeal over more than a century. Before 1517, the edge of the upper terrace bore only the *minbar* of Burhan al-Din, the colonnades and the Ayyubid Turbat al-Nahawiyya. Even before the arrival of the Ottomans, every post-Umayyad structure on the upper terrace was small, discreet and had lots of space around it. This illustrates a sensitive response to the problems of the site and the Ottoman buildings respected this approach. It is noticeable, for instance, that the façades of the *hujras* and similar structures on the upper terrace are uniformly single-storeyed whereas their façades on the lower terrace or esplanade are two- or even three-storeyed. This is a very significant contrast. It meant that, in a most unobtrusive way, these *khalwas* were able to serve as a bridge between the lower and the upper terrace.

Several other ways of sanctifying the Haram are worth brief mention here. The *mastaba*—a very slightly raised platform used for open-air prayer—helped assert a presence on the Haram without breaking up the familiar view. The finial of most of the cells and aedicules on the Haram is Mecca-oriented, another (if understated) way of

emphasising their religious function, while the Iwan al-Sultan Mahmud II is aligned to the Dome of the Rock. More distantly, high-rise buildings located relatively far from the Haram might nonetheless be designed to offer sight-lines to its monuments. Thus a view of the Dome of the Rock can be enjoyed from the Zawiya al-Muhammadiyya, though from its side chambers rather than the main ones.

It is worth reflecting briefly on the nature of these Ottoman structures. It is hard to interpret a single one of them as justified by an imperative religious, social or public need. In any event, their tiny size would have militated against their performing any such function. By and large, these are not buildings erected for the public good. Once again, one sees Ottoman patrons paying the price of arriving too late on a site already hallowed by Islam for almost a millennium. One suspects that some of these cells reflect a low-key competition among minor Ottoman functionaries for a place—any place—on the Haram. After all, some 60 percent of the Ottoman buildings in the city are concentrated there, and this trend accelerated markedly in the last two and a half centuries of Ottoman rule.

All this is not to deny that these cells do serve a wider purpose in the architecture of the Haram. Their location shows a consistent desire to line the perimeter of the upper terrace—the prime focus of Ottoman building activity—with minor monuments. They form a kind of *cordon sanitaire*. The Kursi Sulaiman, strategically placed at the north-east corner of the Haram, seems to express the same idea. It remains an open question whether the parcelling out of the available lots on the site was governed by any hierarchy or notion of privilege. Perhaps this might explain why the west and north sides were built up rather more heavily than the east side, which is largely empty to this day. Fifteen cells were built around the west, north and east sides of the upper terrace of the Dome of the Rock. Five of these are of a higher standard than the rest (cat. nos. 21, 22, 23, 24, 34 and also the *madrassa* of Ahmad Pasha, cat. no. 25). They are the work of one patron and one decade and probably one local architect: 'Abd al-Muhsin ibn Mahmud ibn Nammar. The family produced at least three generations of architects (see end of cat. no. 22). Certainly the lower terrace contains far fewer minor buildings than does the upper terrace, and a difference in status between the two areas seems a possible explanation.

What, then, were the options open to the Ottomans as successors to the Mamluks and guardians of Islam's third holiest city? It must be conceded that they were unpalatably limited. After all, the immediate surroundings of Haram were already crammed with impressive Mamluk monuments and there was no obvious area in the most prestigious part of the city in which an Ottoman enclave could be built from scratch. True, much of the Haram was empty; but, as already noted, that

emptiness was a necessary element of its design and function. Thus the Haram was indeed available, but only for small-scale structures; and such buildings necessarily sent out a somewhat modest message. It is scarcely surprising that the patronage which produced them was not royal.

It might be argued that, for all their modest size, these buildings could have had more impact had their decoration been more lavish. After all, there was the possibility of spectacular colour in the Ottoman as in the Mamluk architecture of Jerusalem because of the wide choice of coloured stone, for example yellow, red and pink. Such polychromy was indeed used, but only very sparingly, which again points to the modest ambitions if not also the modest means of the patrons. Moreover, the Ottoman architectural style did not favour applied ornament, in contrast to the Mamluk style which virtually depended on it. Thus there was no way that the Ottomans could have outdone Mamluk patronage by fancy decoration; they would simply have had to build on a much larger scale. Moreover, even if the money had been available to do this, it is a moot point whether the tiny population of the city could have justified such expense.

For Sulaiman, Jerusalem belonged in a much wider pietistic context. Most of the major architectural projects of his entire reign were of a religious nature, and they serve to put his works in Jerusalem into perspective. At his orders, in Baghdad the tomb of Abu Hanifa—the founder of the favoured Ottoman *madhhab*—was restored and enlarged; so was the mosque over the tomb of Jalal al-Din Rumi in Konya, an act which publicly affirmed that royal favour for Sufism which was foundational for the Ottoman state. Above all, in Mecca he restored the Ka'ba and the aqueducts and in Madina he restored the Masjid al-Nabi as well as building walls 12 metres high around the city, with a ditch in front of them. All this building work was clearly consistent with his activities in Jerusalem, and was of a piece with the Ottoman decision to arrogate to the sultan the appointment of the chief *qadi* of Mecca, formerly a privilege of the Grand Sharif of Mecca. Other sacred sites in Palestine also benefited from his patronage. Thus when, in 1552, the domes over the tombs of the patriarchs in Hebron collapsed—they had not been repaired since the time of the Burji Mamluks—orders for their repair were issued from Istanbul. Indeed, a stream of such orders for the repair of the Hebron shrine, together with provisions for creating extra *waqf* property to help with its upkeep and for looking after the stream of pilgrim traffic, and orders for skilled craftsmen to be sent there from Damascus, shows how seriously the Ottoman sultans took their obligations as guardians of the major Islamic shrines. Another example of a shrine that was extensively repaired and enlarged in the Ottoman period is the *maqam* of Nabi Musa. It is possible, incidentally, that in undertaking this impressive sequence

of pious foundations Sultan Sulaiman may have had it in mind to match the achievements of the Mamluk sultan Qa'itbai, whose memory would still have been green in the early 16th century and who, besides erecting a *sabil* in the Haram al-Sharif, built aqueducts for Jerusalem; he also erected a *madrasa* adjoining the Masjid al-Haram in Mecca and reconstructed the Masjid al-Nabi in Madina and its domed tomb. That said, Sulaiman's patronage in Jerusalem pales in comparison with his architectural enterprises in Istanbul—though in both cities there is a notably strong welfare element in his foundations.

Finally, the role of the Haram as a magnet for pilgrims needs to be taken into account. Nasir al-Din Rumi, writing in the mid-16th century, makes it clear that there is a set itinerary for the Muslim pilgrim to the holy places in Jerusalem. Perhaps the most famous guide to the Holy Places—Mecca, Madina and Jerusalem—is the *Dala'il al-Khairat* of the Berber mystic al-Jazuli (d. 869/1465), which, with much other material such as prayers for the Prophet, outlines these itineraries. Illustrated copies of this work with detailed views of the three Holy Cities became very popular in Ottoman times. Thus a list of key religious sites was easily available, and was often used by those seeking to acquire merit by such pious visitations, and by those paying for pilgrimage by proxy. The parallel with the Stations of the Cross is striking.

6. The nature of Ottoman patronage in Jerusalem

There is an obvious distinction to be made between royal and local patronage. To the first category belong the walls, the aqueducts, the re-tiling of the Dome of the Rock, the *sabils* and the Khassaki Sultan complex. With the exception of the *sabils*—which though beautiful enough in all conscience, and undeniably Islamic, are cheap—these all represent major financial investments in the city. All of them, moreover, the *sabils* included, are high-profile enterprises; they affected directly the daily life of every citizen of Jerusalem. The aqueducts and the associated *sabils* brought clean water within reach of everyone; the walls and the rebuilt Citadel assured the security of the whole population; the re-tiling of the Dome of the Rock could have been seen as a lavish gesture to honour the city's most famous and charismatic monument; and the Khassaki Sultan complex (like its eponymous counterpart in Istanbul, datable to 1536, which also fitted into a gap site and is also still functioning) was a massive welfare project targeting the poorest members of society. The sheer scale of that project is reflected in the size of the cauldrons from the kitchens, which are preserved in the Haram museum. All this is patronage on a grand scale.

How is one to interpret this continuous enterprise?

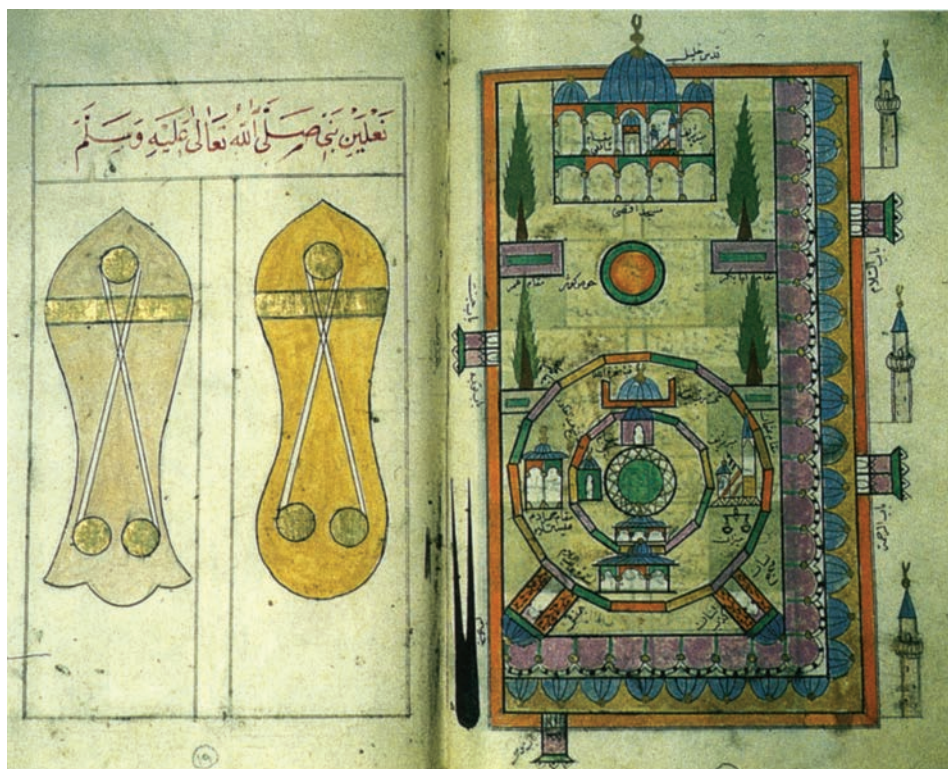

I Haram al-Sharif, Jerusalem, with the Dome of the Rock and al-Aqsa Mosque. *Hajj Vekaletnamesi*, dated 951/1544-45, in the Topkapı Sarayı Library.

III Sandal of the Prophet with a kufic inscription which reads 'jimjime al-nabi'. *Nur-i vahhaj li tahsil al-ilaj*, decorated by the copyist Mustafa Kashif (*müzehhib*) in 1253/1857, Ms. Vat. Turco 125, f. 6v.

II Haram al-Sharif, Jerusalem, with the Dome of the Rock and al-Aqsa Mosque. *Nur-i vahhaj li tahsil al-ilaj*, decorated by the copyist Mustafa Kashif (*müzehhib*) in 1253/1857, Ms. Vat. Turco 125, f. 26r.

IV Sandals of the Prophet and the Haram al-Sharif, Jerusalem. Jerusalem, National and University Library, Yah.ms.Ar. 117, f. 41r.

V Sandals of the Prophet in an architectural frame. Ceramic panel from the Darwishyya Mosque, Damascus, dated 982/1574-75.

VII Dervish scene around the Dome of the Rock. *Falnama* attributed to Aqa Mirak. Tabriz 1550, Pozzi Collection, Musée d'Art et d'Histoire, Geneva, no.1971-107/34.

VI Footprints from the sandals of the Prophet. *Falnama* attributed to Aqa Mirak. Tabriz 1550, Pozzi Collection, Musée d'Art et d'Histoire, Geneva, no.1971-107/34.

VIII Marble slab with the representation of the footprint of Jesus Christ in the Quo Vadis Chapel, Rome.

IX Solomon's Library in the form of a labyrinth. *Nur-i vahhaj li tahsil al-ilaj*, decorated by the copyist Mustafa Kashif (*müzehhib*) in 1253/1857, Ms.Vat.Turco 125, f.20r.

X *Mundus imaginalis*. Cosmic representation of the heavenly world. *Nur-i vahhaj li tahsil al-ilaj*, decorated by the copyist Mustafa Kashif (*müzehhib*) in 1253/1857, Ms.Vat.Turco 125, f.45r.

XI Double frontispiece from the Qur'an endowed in 964/1556 in the name of Bayazid, son of Sultan Sulaiman al-Qanuni. Although never in fact sultan, Bayazid is so named here.

XII Man's *qumbaz* from Jerusalem, c. 1930. White silk with red and yellow stripes, bound with ochre-coloured silk braid at the neck opening. A Turkish *entari*, although similar in construction, would not have had the tie at the front, and would most likely have had more elaborate trimming. International Folk Art Foundation Collection in the Museum of New Mexico, Accession no. FA.72-25-7.

XIV Dress from the Jerusalem region, c. 1920s or earlier. The main body of the dress is a striped silk produced in Syria, *qasabiya*. There are also three red and green taffeta skirt inserts, as well as a yoke of patterned velvet, perhaps of European origin. The dress is further decorated with an elaborately embroidered *qabba* and additional embroidery on the sleeves and skirt inserts. Both this dress and the one worn in the photograph in col. pl. XIII would have been part of a trousseau. London, Museum of Mankind, 1969 AS8 9.

XIII Woman's wedding dress, *thub abu qutba*, from Jerusalem, c. 1850. The body of the dress is made up of pieces of handwoven red and green silk, arranged to form stripes. Gold silk panels are used on the sleeves. The shape of the dress, with its long triangular sleeves, round neck opening and slit at the neck is typical of dresses of the central region of Palestine. Apart from the decorative stitching used to piece the dress, the garment is decorated with a central panel or *qabba*, sparingly embroidered with scalloped silk in red, green and yellow, and silk tassels on the neckline cord. Museum of New Mexico Collection, Accession no. 3370.

Since all of these works were carried out within the space of half a generation, their cumulative effect is hard to exaggerate. They far outshone any single Mamluk contribution to the embellishment of Jerusalem, and seem to lack that element of direct personal self-interest that marks so many medieval Islamic charitable foundations. They illustrate a type of patronage distinctively different from that of the Mamluks, for they are aimed at society at large rather than at a small segment of it—those people who would, for example, benefit from a *ribat*, *madrassa* or *khanqah*. Most Mamluk patronage was of this more specialised kind, although it did consistently lean towards private charitable institutions. Naturally there are exceptions: the work of Sultan Hasan in rebuilding the north-east part of the Aqsa and of Sultan al-Malik al-Nasir Muhammad on Suq al-Qattanin do have wider perspectives. But Ottoman patronage was different even from this. It smacks of a plan drawn up in Istanbul rather than one worked out on the spot. This patronage at arm's length, so to speak, makes it unlikely that Sulaiman was actuated by a desire to match the patronage of the Mamluks in Jerusalem, or at least to continue their work. Enough has been said to indicate that royal Ottoman patronage fostered to a degree unprecedented in Islamic Jerusalem both the practical daily welfare of its people and their lively sense of the special destiny of their city. He was its last and greatest patron and he never set foot in it. Moreover, his interest in the city spanned almost his entire reign, from the Sabil Bab al-Mahkama (Qasim Pasha) of 1527 to the refurbishment of the Dome of the Chain in 1561-2. No later Ottoman sultan achieved very much in the way of architectural patronage in Jerusalem, and this too highlights the scale of his work there. Yet, as already noted above, this undeniably impressive achievement is dwarfed by the scale of his foundations in Istanbul itself, notably the gigantic *küllîye* named after him, of which the mosque is the core, half-a-dozen other large mosques, several *madrasas* and—as at Jerusalem—the reconstruction of the water system. The fact that no major new mosque was built in Jerusalem by any Ottoman sultan, while in Istanbul a whole series of them was erected in the 16th century, speaks for itself. Nor was it a matter of new mosques being confined to Istanbul; Cairo, for example, saw several major foundations in this period, such as the mosques of Sinan Pasha (1571) and Malika Safiyya (1610), to say nothing of literally hundreds of smaller buildings, including scores of *sabil-kuttab*s. In fact, this type of monument—virtually unknown in Ottoman Jerusalem—was almost a trademark of Ottoman Cairo; fifty of the sixty-three Ottoman *sabils* in Cairo have a *kuttab* or *maktab* in the upper floor, which comprises a single chamber.

Local patronage in Jerusalem was of course a much more modest affair. Indeed, anonymous patronage was virtuous according to some religious teaching. But

whether the patrons were named or not, the critical factor was, as ever, not a sudden drop in the capacities of the craftsmen, but in the amount of cash available for building activities. After c. 1600 political and economic decline, which had set in after the death of Sulaiman the Magnificent, accelerated, and restricted still further the scope of architectural patronage. But even so, in the previous century the absence of foundations by Sinan, the Chief Architect (*mi'marbashi*) to the Ottoman court from 1538 to 1588, is marked, especially as his work is so widely found in the Ottoman provinces. In the case of non-royal foundations there is no evidence of strict control imposed from Istanbul. Most of the buildings of Ottoman Jerusalem were built by local men for local patrons. The city was given by the Ottoman authorities to its successive governors as a tax farm, and since their term of office was often no longer than two or three years, they had a strong incentive to make as much money out of the post as possible before relinquishing it. This was emphatically not a situation which encouraged such men to spend their money on public works. Similarly, in Ottoman Cairo the brief tenure of office allotted to the Turkish governors discouraged them from erecting major buildings.

In Jerusalem, the major exception to this trend favouring small structures are the foundations of Bairam Jawish. His *maktab* follows a familiar Mamluk pattern in that its prime function was not its ostensible one—i.e. a school for orphans—but to act as a burial place for Bairam Jawish himself, and the eastern chamber of the ground floor is given over to this purpose. Thus anyone entering the building could not have failed to notice the founder's tomb. But this tomb is not a self-contained structure; it is merely a cross-vaulted lower room in a much larger structure. Thus the Mamluk obsession with massive mausolea has diminished. But it remains a problem as to how children were taught in the context of this building, how big the classes were, and what age groups were catered for here. The simplicity of the facilities—essentially a succession of large halls or chambers—would lend itself to multiple uses. Perhaps this was indeed the original intention. Bairam Jawish was the administrator in charge of the neighbouring Khassaki Sultan, and thus he lived 'above the shop'. He would therefore have been well placed to oversee how his own foundation was being used.

The standard method of securing the future for a charitable foundation was, as it had been for many centuries, the pious endowment or *waqf*. Although the central government supported the Aqsa mosque and several other buildings (such as Kursi Sulaiman) by a sum (*al-surra*) sent annually to Jerusalem from Istanbul, most *waqfs*, including the best-documented ones, are those of the traditional Jerusalem families. Many others are recorded in the *sijills*, and a few specific examples will reveal something of how the system worked. Thus the *waqf*

of Bairam Jawish for his *ribat* (which functioned as a hospice for the poor) and *maktab* (here, a school for orphans) was originally registered in Gaza, even though it referred to a property in Jerusalem. Much of the *waqf* property in this case was located in Bethlehem. If Bairam Jawish's family died out, the endowment stipulated that the inspector of his *waqf* was to be the Nazir al-Haramain al-Sharifain (i.e. superintendent of Aqsa and Hebron). In this particular case, the rate of interest charged on the capital sum was 15 percent. This rate continued for another generation; the *waqf* of the *hujra* of Islam Beg, dated 1002/1593-4, was a capital sum of 500 gold *sultanis*, to be administered so as to yield a legal profit of 75 (i.e. 15 percent); the *mutawalli* was to avoid usury (*riba*). The money was to be spent on administration and on seven reciters of the Qur'an (the benefit of the readings and associated prayers was to go to the founder, his brother, the founder's family and all deceased Muslims). About a century later, Yusuf Pasha made a *waqf* of 95 *ghirsh as'adi* (gold coins) to pay for two reciters in the Dome of the Rock, oil to illuminate the cave of the Dome of the Rock and for people in charge of lighting the lamp, and for the administrator of this *waqf*; the annual amount was to be 14 and one third *ghirsh*, i.e. about 15 percent. Soon after, however, in 1665-6, *waqf* money was attracting interest at the standard rate for all transactions: an extortionate 20 percent, as the case of the Khanqah al-Maulawiyya shows. Here part of the original capital had been lost in the course of successive administrations. The running costs of this building were met in that year by the income from two houses, a single room, a stable, three chambers, a storage place, and a plot of land—all in the Maulawiyya complex or nearby. The *waqf* of the Sabil al-Khalidi is typical in the scrupulous care with which it defines the exact site of the building to be endowed; indeed, the setting for this vanished *sabil* has scarcely changed to this day from what it was in the early 18th century. Another *waqf* for the Khanqah al-Maulawiyya specifies 3kg of bread and 6kg of meat (presumably provided daily ?) and a reduction of the allowance to 1,470 *piastres* a month to feed all members of the order. The *waqf* of the North-Western Khalwa of Ahmad Pasha specifies that some of the money should be set aside for oil for the lamp (this is a common provision in the *waqfs* of Jerusalem) and for restoring the doors of the building. The *waqf* of the Qubbat al-Arwah, too—an open-plan aedicule in the middle of the largely empty upper terrace of the Haram—provides for a lamp to be lit throughout the doors of darkness, though the purpose of this provision is not specified. The *waqf* of the Khalwat Bairam Pasha mentions that *qusurmil* (building material) was provided for the monument, while that of the Zawiya al-Muhammadiyya covered such unusual annual expenses as mats for the floor of the *zawiya* and posts to support the

trellis of the grapevine over the main entrance and south wall of the *zawiya*. In other cases cash in the form of direct salaries, grants and stipends predominated. Thus the *waqf* of the *madrasa* of Ahmad Pasha states that the teacher (*mudarris*) will have a salary of 500 silver *misriyya* per year, and each of the four students a stipend of 50 silver *misriyya* per year. Teacher and students were to pray for the patron and his ancestors. The *sabil* of Mustafa Agha had a *waqf* of 40 gold coins, and the caretaker was allotted four gold coins annually, to be paid so long as this capital sum remained intact. In some cases cash and kind were combined. For instance, a *waqf* of 1038/1628-9 for the *hujra* of Muhammad Agha provided money for a Qur'an reader who every morning was to recite Sura 36 (*Ya Sin*) in the upper part of the *hujra*; the merit of the reading was for the soul of the Prophet Muhammad. For this he got 12 gold pieces a year, plus permission to live in the lower part of the building and to profit from cultivating the small garden attached to the *hujra*. Similarly, the *waqf* of the Sabil al-Shurbaji, which was based on the income from three and a half shops, paid for two people to run the *sabil*: a caretaker to keep it clean and illumine it during Ramadan and Sha'ban, and a water-carrier; while the *waqf* of the Odat Arsan Pasha stipulates that the reader had to recite the Qur'an and the normal petitions plus prayers to the Prophet and invocations to Allah.

The *waqf* of al-Zawiya al-Naqshbandiyya is one of the more interesting and informative examples and shows how a *waqf* could be rooted in the local neighbourhood and affect the local economy. It provides for only four members of the order to be housed in the building, and by the second half of the 19th century it was serving the Jerusalem poor with accommodation and food. Half of the *waqf* was for the descendants of the donor. Among the properties which were made *waqf* was a vegetable garden in the Ghawanima quarter. The income from the *waqf* was 162 *piastres* a year. The donor reserved for himself the position of caretaker (not a pension, because only 6 *piastres* a year were allocated for this post). Each Sufi was to receive 1 *piastre* per month for food and half a *piastre* for accommodation (also per month).

By contrast, the 1633 *waqfiyya* by Muhammad Pasha, the governor of Jerusalem, in favour of the Zawiya al-Qadiriyya, is an entirely cash operation: 1,000 silver *ghirsh as'adi*. The administrator of the *waqf* was enjoined to deal with this sum legally, producing 12 *ghirsh* for each ten *ghirsh*, and he was to avoid *riba*. Yet the rate of interest here is extortionate. The annual income was to be 200 *ghirsh as'adi*. The principal calls on this sum were the 11 Sufis resident in the *zawiya* (6 *ghirsh* annually each, i.e. 66 in all) and the food cooked for them every Friday night (72 *ghirsh*). How they ate the rest of the time remains unclear. The provisions of the *waqf* ensured that the 11 Sufis stayed

put, not being allowed to travel or to transfer their rights to another; and it was also mandatory for them to gather after every prayer and recite the Qur'an, for the benefit *inter alia* of the donor and his family. Thus the stipulations of the *waqf* translated into strictly enforced rules for the daily life of the beneficiaries.

As to the kind of buildings that were put up, they are for the most part small and insignificant, as if the intention were that they should blend into their surroundings and make no splash. In any case, the shortage of space meant that architects had to build upwards and not sideways, and not only had to take account of existing buildings but also to incorporate parts of them. This is especially true of the area around the *ribat* and *dar* of Bairam Jawish, which was a prime site for Ottoman building projects. Sometimes only a small detail, like a carved decorative band on that building, which betrays the remains of the original cornice, gives clues as to how the original structure looked. But small as most of these Ottoman buildings are, they are still a *prise de possession*: like the much more splendid Mamluk buildings, they assert the presence of an external authority. The difference is that the nature of these buildings suggests that the Ottomans saw themselves as guardians and even caretakers rather than as conquerors. For much the same reason, they did not lay claim to the local Mamluk buildings. If one excludes the Khassaki Sultan complex, the walls and the foundations providing Jerusalem with water, the great majority of these Ottoman structures do not serve a public or welfare purpose; again, competition with the Mamluks was just not feasible, so a different message had to be transmitted.

The effects of the developments sketched in broad outline in Section 2 above can be read in the record of Jerusalem's Ottoman architecture. It is this that explains the multitude of minor foundations, often anonymous. These were not built to perpetuate the memory of some *amir* and perhaps provide an income for his descendants. Instead they reflect the personal piety, the desire to procure religious benefit for the Muslim community at large—and, incidentally, the straitened financial circumstances—of their donors. The numerous cells and open-plan aedicules commemorating some holy event or traditional Islamic saint were too small to cost much. They were erected piecemeal, as the series of *khalwas* on the Haram esplanade shows, at the private instigation of modest patrons, for example members of the imperial militia and often local notables such as *qadis* or scholars. Occasionally a bolder or richer patron might, so to speak, think more laterally. Thus the North-Eastern Khalwa of Ahmad Pasha is the perfect match for his North-Western Khalwa; the patron had secured for himself two prize locations abutting either side of the north-eastern *mawazin* colonnade. In other words, the two foundations were conceived together, to balance each other. This is, however, an exception to the general

trend of piecemeal, small-scale patronage. Larger building campaigns of the kind financed from the imperial purse would have resulted in a less haphazard distribution of these buildings. The constant re-use of earlier material points in the same direction. And this in turn follows from the disjointed nature of Ottoman patronage. True, an individual structure can display workmanship of an impeccable quality, but such excellence reflects the personal skill of that particular craftsman. It is not the natural product of sustained investment in new building. The results of that kind of investment can be seen in Mamluk Jerusalem: it raises the overall standard, from techniques of stereotomy to varieties of vaulting, from the design of an entire façade to the execution of a capital. It can be seen in the capacity to exploit a gap site or to incorporate standing elements into a new design without strain. As the building boom which had given Mamluk Jerusalem its distinctive character petered out, so did the level of expertise decline. People must have left the construction industry for lack of work. Not surprisingly, therefore, the best of Ottoman architecture in Jerusalem is to be seen in the two generations following the Ottoman conquest, a period roughly co-terminous with the reign of Sulaiman the Magnificent, when the accumulated expertise assembled in the course of the Mamluk period could still be drawn upon and had yet to be dissipated. Typically, too, the best Ottoman work can be found in projects which involve a single master rather than an entire team. The *sabils* are a case in point. Certainly they offer challenges of design and execution. But those challenges are well within the capacity of a single master. And the skills they require are those of the mason and the sculptor, not those of the architect. With the single exception, as always, of the Khassaki Sultan complex (and perhaps that of Bairam Jawish as well), the buildings of Ottoman Jerusalem are deficient in the very lifeblood of architecture: a sense of space. This is a cruel irony when it is remembered that imperial Ottoman architects in the 16th century experimented more audaciously with spatial values than their counterparts in perhaps any earlier school of Islamic architecture. That was at least in part the result of massive investment in building campaigns, though of course it had much to do with the kind of building favoured by the sultans. Not even a distant echo of the hum of activity and eager experimentation in Istanbul can be heard in Ottoman Jerusalem. Its minarets attain barely a third of the height of those in the capital. Its monuments do not reflect the direct involvement of the top architects of Istanbul. The spatial experiment, the glamorous decoration, the precise stereotomy, the cascading curvilinear volumes of the great imperial Ottoman mosques evoked no comparable response in Jerusalem. And the provincial nature of this architecture became steadily more marked with the passing of time, and was compounded by the gradual decline in

building activity. In the course of the 18th century, for example, not a single monument of significance was erected in Jerusalem. It is perhaps no coincidence that it is from this fallow period that some of the *musallas* on the Haram—mere platforms of dressed stone, sometimes furnished with a *mihrab*—date.

Who were the major patrons, and what manner of people were they? They include Bairam Pasha, who, while governor of Egypt, donated 1,000 gold coins (*ghirsh*) to the buildings on the Haram; it was spent on porticoes for the Aqsa and near Bab al-Nazir and on Sabil Sha‘lan. He gave a further 1,000 silver coins (*qit‘a misriyya*) to the tomb of al-Nabi Da‘ud, plus textiles for it. His other major donations were for thirty-two Qur‘an readers on the Dome of the Rock platform, and for the *mu‘adhdhin* of the Haram. A later *waqf* of his indicates that he sent ready money yearly for his *khalwa*. The other major patrons were Bairam Jawish, Ahmad Pasha, Khudawirdi Abu Saifin and Muhammad Pasha. Several of them, as well as other lesser patrons, held appointments as Ottoman governors, and it may be that patronage of local building campaigns was a case of *noblesse oblige* for such men. Sulaiman Pasha, who built the Iwan al-Sultan Mahmud II, an open-plan pavilion of Turkish type, in 1233/1817-8 and also restored the Maqam al-Nabi Da‘ud for Sultan Mahmud II in the same year, was governor of Sidon and Tripoli. Ahmad Pasha, who built the North-Western Khalwa, was governor of Gaza; Yusuf Pasha, the patron of the *sabil*, *mihrab*, and *mastaba* which all bear the name Sha‘lan, was governor of Jerusalem; al-Hajj Arslan Pasha, who restored the small building now known as the Shurta al-Gharbiyya, was governor of Jerusalem, Nablus and Gaza; Muhammad Beg, who ordered the *mihrab* niche in the Qubbat wa Mihrab al-Nabi, was governor of Gaza and Jerusalem; Mustafa Agha Baraunazadeh, who ordered the domed tomb of one of the Naqshbandiyya *shaikhs*, Muhammad al-Salih al-Uzbeki, in the *zawiya* of that order, was governor of Jerusalem, as was Mustafa Agha, whose *sabil* in the Haram is the undisputed masterpiece of local 18th-century architecture. Muhammad Pasha, another governor of Jerusalem, endowed land for the Khanqah al-Maulawiyya and a plot of land on the Mount of Olives for the Sufis who came to Shaikh Muhammad al-‘Alami, and the Zawiya al-As‘adiyya, also on the Mount of Olives, in 1623. Indeed, all his patronage was for Sufi orders and in this he is unique among the great patrons of Ottoman Jerusalem. The reasons for this remain to be discovered, but may have something to do with the way that Sufis had risen to prominence in Jerusalem in the later 17th century, a time when the city had become a specially favoured place of pilgrimage. Among the other great patrons of Ottoman Jerusalem, Ahmad Pasha favoured the ‘*ulama* and Bairam Jawish the needy.

7. Architectural style in Ottoman Jerusalem

Yet this is not the whole story. As Eric Schroeder has wittily said, ‘To eschew the sacred wafer of Genius is no hardship to a man who chews the beefsteak of honest performance’. Good architecture is often a matter of good manners. And Jerusalem has long had a solid tradition in this respect. The ready availability of good building stone can be recognised at a glance in many an old street of the city. A city in which dressed stone is the standard building material will never lack stone-cutters and masons and the centuries of practical experience which they bring to their trade. Hence, at minimum, the sense of comfortable rightness, and more often the sober elegance, that characterises most Ottoman public buildings in Jerusalem. This architecture is admittedly not spectacular, but it is consistently good to look at. The architects took care that however widely rubble masonry and concealing layers of plaster were used inside a building, the best-quality stonework would be saved for the exterior.

Who were these architects? One of the major discoveries made by Dr Mahmud ‘Atallah, and confirmed by Dr Natsheh, in the *sijill* records was the existence of nothing less than a dynasty of local architects whose activity spanned five generations and almost two centuries: the Ibn Nammār family. Many of them bore the prestigious title *mi‘mar bashi*. A few of them played a major role in local financial and administrative affairs. Altogether, Dr Natsheh has unearthed the names of sixty master builders, mainly local men but also hailing from Hama, Aleppo, Cairo and Istanbul as well as such local towns as Hebron and Ramla. They included Christians in their number. It was standard practice for them to work in close concert with the *qadi* in the inspection of buildings and in carrying out the repairs that he decreed. An efficient system of checks and balances was in operation, and—to judge by the numerous cases heard before the court—it seems to have safeguarded the interests of the ordinary citizens, whatever their confessional loyalty, with conspicuous success. The picture that emerges is one of fruitful and harmonious teamwork between the law and the building trade.

(a) Building types: public architecture

The survival of almost sixty public structures of Ottoman date in Jerusalem, many of them accurately dated or datable by endowments preserved in the *sijills*, makes it possible to assess the local style in the round. Happily, too, these buildings are of the most varied type: open-plan aedicules commemorating some venerated prophet; simple local mosques; *zawiyas* serving the Sufis living in or visiting the city, sometimes so placed that buildings for separate *tariqas* adjoin each other; tiny residential open-air

madrasas, which also served to house the *shaikh* in charge; *sabils*; *mastabas*; minarets; simple domed cells; and two extensive charitable foundations fulfilling a wide range of functions.

Only a few of these building types are numerous enough to justify a general discussion. The *sabils* are an obvious case. Documentary evidence shows that they were intended as a package: Sabil Bab al-Nazir, which was made *waqf* in the name of Sultan Sulaiman five years after it was constructed, was one of nine *sabils*—which indicates that some of them have vanished in the course of the centuries. What was their purpose? Some refer in their inscriptions to the hope of the water of Paradise and compare their water to the water of Paradise. But other factors must also be considered. Several *sabils* are dated to the month of Muharram, and the semantic connection of that word with sanctity, and hence purity, is entirely appropriate to their function of aiding ritual purity. Not to be overlooked, either, are the Shi'ite pilgrims who thronged to the city; for them, there would be the added associations of the awful thirst suffered by the martyrs of Karbala. Indeed, the now vanished Sabil al-Husaini of 1724-5 refers in its surviving inscription to Husain the son of 'Ali ibn Abi Talib, and thus to the battle of Karbala. The implication is that all who drank from the *sabil* were expected to pray for al-Husain. The family name of the founder, as it happens, was al-Husaini. It may also be relevant to some of these *sabils* that—as the local people would have known—the 16 Muharram was the day that Jerusalem was selected as the *qibla*. Both Sabil Sha'lan and Sabil Bab al-'Atm have prayer facilities attached (in the former case both a *mihrab* and a *mastaba*); perhaps it was usual to pray after drinking, but in any case the *sabil* in these two cases seems to have been intended for ablution as well as consumption. The latter was surely the primary purpose of such structures; an inscription on the Sabil al-Shurbaji of 1685-6 proclaims "Abd al-Karim al-Shurbaji built the *sabil* so that thirsty people might drink.' Hence, too, their location at traffic nodes so that they could serve the largest number of people. The fact that these *sabils* are of such different sizes and designs suggests that they were the work of various craftsmen, and that there was little overall supervision. Certainly this is implied by the contrast between the most elaborate (Sabil Bab al-Silsila) and the simplest of all (Sabil Bab Sitti Maryam). Not all of the surviving *sabils* were the work of Sultan Sulaiman; Sabil Bab al-Maghariba, for example, may be one of three built, according to Evliya Çelebi, by Danyal Pasha. Like other *sabils*, it was endowed—in this case, with a brass cauldron and with money for buckets, ropes, and the daily hire of a water-carrier. The *sabil* has a strong claim to be the most typical building type of Ottoman Jerusalem, for it spans most of the Ottoman period, from Sulaiman's foundations to the *sabil* of Mustafa Agha some two centuries later. It would be

hard to choose a more fitting *envoi* for the type. It is a poised and elegant building, delicately proportioned, whose high plinth is an integral part of the design. A little gem and easily the finest building of the 18th century in Jerusalem, it fits perfectly into its context—the long arcade bordering the Haram precinct.

Still commoner are the domed squares which border the Haram or are scattered around it. The Qubbat Yusuf Agha of 1681 is typical of many of these little buildings in its extremely plain domed structure and in its isolation. Although certain formal sub-divisions for such structures do suggest themselves, these buildings follow a formula deeply rooted in Ottoman architecture from the early 14th century onwards. It was a notably flexible formula: effective on both a small and a large scale, it could accommodate adjoining structures without losing its character, and it readily lent itself to repetition. These qualities are well illustrated in the Hujrat Muhammad Amir Liwa' al-Quds, a pair of adjoining domed squares which formerly had a three-domed portico, a canonical form in Ottoman Anatolia. The Khalwat Junbalatiyya, on the other hand, formerly had a two-bayed porch (the stone here has weathered only a little, which suggests that the porch was removed only recently), while in the case of the *madrasa* of Ahmad Pasha only a platform remains. Indeed, the disappearance of the porticoes of these cells seems to be a general and as yet unexplained pattern. In a few cases, the porches have been rebuilt and the bases of their columns now serve as capitals. This cavalier attitude to re-used material, which will shortly be discussed in greater detail, is typical of the architecture of Ottoman Jerusalem.

As for their purpose, some of them probably housed the staff of the Haram, as is still the case for many of them, such as Khalwat Qitas, or Khalwat Barwiz, which is now the office of the Guards of the Noble Sanctuary, or the Qubbat Yusuf Agha, now the ticket office to the Haram. Other *khalwas* served for teaching and for Qur'an recitation. On the other hand, Evliya Çelebi writes of pilgrims being lent a cell for the duration of their visit—presumably pilgrims of a certain social standing. A rather different fate befell the Qubbat al-Khadr: in time it lost its original meaning, and was then used to store material belonging to the Aqsa mosque; other *khalwas* also served as storage space. This shifting of meaning, associations and functions from one site to another is typical of the Haram, as is the use of multiple names for the same site, which points in the same direction. The inscription of the Khalwat al-Dajani (1138/1725-6) calls it a *maqam*—'place'—as if the intention were to leave its actual function as broad as possible. Perhaps al-Dajani's primary aim was to erect a building—any building—on this coveted site. Its façades are grossly irregular, suggesting that its position, tucked into a corner of the staircase to the upper terrace, was the key factor in its design. Further information is given in the

waqf for the North-Western Khalwa of Ahmad Pasha, which stipulates that he has 'constructed and endowed cells in the mosque of Jerusalem. He has appointed to each cell a group of scholars from Jerusalem and allocated expenditure ...' He specifies the scholars, who are members of the Qadiriyya order, by name. Some of the money is for oil for the lamp and for restoring the doors.

Another common form was the open-plan octagonal (or occasionally hexagonal) aedicule, a type encountered all over the Muslim world at least from the 10th century onwards and functioning not only as a commemorative building—the category to which the many examples at Jerusalem belong—but also as a fountain (Ma'arrat al-Nu'man, Syria) or a mausoleum (Van, Turkey). The examples on the Haram are commemorative and the case of the two structures erected by Yusuf Agha in 1681—the Qubbat Yusuf (an open-plan aedicule) and the Qubbat Yusuf Agha (a closed domed square)—clearly suggest that, despite the identical terminology, different forms connoted different functions in Jerusalem at that time.

Nor should one forget structures of a more vernacular or industrial type, though these are not catalogued in this book: over a score of bakeries (here close dating is particularly difficult); *hammams*, though the few that survive are much denatured; two *khans* (one mentioned in the endowment deed of Khassaki Sultan as part of that complex, the other, Khan al-Sha'ara, in the present Jewish quarter); oil presses (though only two now survive, whereas more than a score were in operation a generation ago); and markets, notably Suq Khan al-Zait, Suq al-'Attarin, Suq al-Lahhamin, Suq al-Khuwajat, and Suq al-Husur.

(b) Building types: private architecture

At least thirty examples of the *dar* or private house for the élite survive. Some are extremely rare, like the Dar Bairam Jawish, of 953/1546, which is the only house datable to the 16th century in Jerusalem. Its north and south fronts both have an arch with a double tier of voussoirs, as does the façade of the *ribat* of Bairam Jawish. The lack of comparable structures makes it difficult to assess the originality of this feature. More generally, there are no known extant Mamluk precedents for this *dar*; the most appropriate parallel is the *dar* of Sitt Tunshuq, which is a palace rather than the private house of a notable. Another exception is the Dar al-'Izz of 1790-1, perhaps built as a private commercial guesthouse; this is a rare example of a dated secular private building in Ottoman Jerusalem, notable for the presence of a courtyard and garden on the first floor.

Since élite Ottoman housing does not figure largely in the book, it may be useful to give here a generic description of the type. A courtyard at ground floor level

surrounded by utility rooms is reached by a single external entrance. The principal rooms are at first floor level and are reached by a staircase which gives onto a balcony overlooking the courtyard. These are the rooms which contain ornament: external carved window frames, carved and painted plaster, and domes on octagons, so low that they are often only just visible from the street. Some of these houses are up to three storeys high, and narrow single or paired rectangular windows and suspended buttresses (that is, buttresses built into the wall but standing proud of it) enliven their outer walls. Although they are scattered all over the Muslim quarter, clusters of two or more of them are to be found in 'Aqabat al-Shaikh Rihan, Tariq Bab al-Silsila, Tariq al-Hakkari, 'Aqabat al-Khalidiyya, 'Aqabat al-Maulawiyya and especially 'Aqabat al-Saraya. Nor should one forget more humble types of dwelling, notably the *haush*. Many of these units still survive in Jerusalem; they house as many as six families apiece. They represent a remarkably economical exploitation of the very limited space for building available in the Old City, for they are fitted into the irregular spaces left over between larger structures, and are capable of expansion not only laterally but also vertically for several low storeys. Haush al-Hilu, for example, is entered by a low vaulted passage from 'Aqabat al-Saraya; this leads into the first courtyard. Off this courtyard are passages which lead to further dwellings which seem eventually to back on to Khassaki Sultan and Haush Shawish. Thus every crevice of space is utilised.

(c) The nature of the cityscape

Nonetheless, for all this variety of public, industrial, commercial, vernacular and private buildings, there are some telling absences which are enough in themselves to define Jerusalem as an economic and architectural backwater. The lack of major Ottoman mosques, palaces, and caravanserais clinches this unflattering description. The picture is very different from that of Aleppo and Damascus in Ottoman times, as already mentioned. The buildings in those cities are not only much more numerous—as is only to be expected given their much greater size—but of much higher technical quality, larger, more ambitious, and much more lavishly decorated. Thus their impact in the urban environment is much more assertive than those of Jerusalem.

Yet this very remoteness from the world of the great provincial cities, let alone from the imperial Ottoman metropolis itself, brings concomitant advantages in its train. Jerusalem offers an excellent opportunity to investigate the physical environment of a small provincial Ottoman town of only minor commercial importance. Despite the ravages of war and the relentless pressures of commercial and industrial development, despite its ballooning population and its flawed record of conserving historic buildings, the Old City, at the beginning of the new

millennium, can claim—against all odds—to preserve the essence of a pre-modern Palestinian town. It is wonderfully all of a piece. This is due in large measure to its wealth of domestic and vernacular architecture built in the local stone, amidst which the Ottoman public buildings are randomly scattered. In other words, it is precisely because they have not lost their original setting—the workaday context out of which they grew—that these public buildings seem so natural a part of the cityscape. They are constructed of the selfsame local stone as the streets and houses all around them. Those streets maintain a comfortable human scale; apart from the main arterial thoroughfares, they are neither so wide as to be grand nor so narrow as to be unpleasantly constricting. Designed for pedestrians and animals only—cars are tolerated only close to the city gates—they follow the natural topography in their rise and fall, with short flights of wide, easily negotiable steps to mark transitions or to modulate a long vista. At second-storey level or above, arches like flying buttresses bridge the street (hence their name: *qantara*) and support passageways and rooms, thus making it possible for a single house to spread comfortably across a public thoroughfare. It is also common for the bridge to belong exclusively to the house on one side of the street, so that the wall of the house opposite serves only as a support for one end of the bridge. Over two dozen of these bridges survive.

(d) Vaulting

The small scale of most Ottoman architecture in Jerusalem discouraged significant innovations in vaulting technique and even militated against a lively interest in methods of roofing. Indeed, the domes of many of the smaller structures are grossly over-built. The frequency of minor infelicities and adjustments suggests that many masons worked by eye, confident in their ability to muddle through somehow. Cramped and irregular sites generated asymmetrical spaces to be vaulted, and later modifications, additions and rebuildings created still further problems of this kind. Yet the solid competence of these masons ensured that such vaults worked efficiently, even if they were not of drawing-board exactness. The most popular types were pointed barrel vaults, groin vaults, domes on squinches, domes on pendentives and pendentive domes, ribbed saucer domes, cross vaults over rectangular spaces (sometimes with tiercerons), domical vaults, umbrella domes, sail vaults, folded vaults with a hexagonal or octagonal crown or a saucer dome, and star vaults with 12, 16, 20 or 24 points. The 'Mamluk' cell (North-Western Khalwa of Ahmad Pasha) in the north colonnade even has a dome featuring 32 whorled ribs with 4 pendentives and 8 folded triangles; this ribbed dome rests on a star-shaped vault whose points touch the springing of the supporting arches, which in turn are of uneven height and thus have their apices follow a rising and falling rhythm. Qubbat

Yusuf has a dome on pendentives whose 38 ribs have a double zigzag frame. The Zawiya al-Muhammadiyah has a domical star vault with a scalloped outer rim, and also a dome on pendentives, whose collar is marked by a continuous open arcade. The interior acquires monumentality from the four arches which carry the dome and whose springing begins just above floor level. It would be a useful study to collect the terms used by local masons for these very varied forms of roofing; similar work done in Iraq by Reuther, Langegger and Herzfeld or in Morocco by Paccard suggests that every form had its own name: 'father of four', 'almond', 'spider's web', or 'four oil lamps'. Naturally the more complex types tended to be those in the most ambitious foundations, such as Khassaki Sultan and the *ribat* and *dar* of Bairam Jawish. On the other hand, the visible surface of the vault, with its lines picked out sharply in plaster, may not always correspond to what lies beneath, especially in cases where elaborations of the design are executed only shallowly in the plaster. In a few cases the dome bears external ribs in high relief.

(e) Capitals and plinths

The readiness of Ottoman architects in Jerusalem to use spolia explains the frequency of non-matching columns and capitals in their buildings. The variations in scale are especially intrusive. This suggests that the savings in time and money represented by the re-use in a new setting of existing Islamic capitals and columns counted for more than visual harmony. That said, the simple re-use of earlier capitals, such as basket- and bowl-shaped capitals, is rare. So too is the partial re-use of antique capitals, for example those with foliate scrolls in the upper part of the capital and Ottoman lanceolate niches below. All this is remarkable in view of the many scores of re-used antique capitals in the Dome of the Rock and the Aqsa mosque, whose presence shows that in the early Islamic period at least there was no inhibition about re-using earlier building material. A typical example of the variety of capitals encountered in a single building is provided by the Qubbat al-Arwah. Here some capitals are admittedly similar to each other, but only two are identical; they illustrate basket, *muqarnas* (some fully carved, some with large blank spaces between the *muqarnas* cells, some with plain cells, some whose cells have added internal ornament of vegetal or faceted type, some double-tiered and some triple-tiered) and debased and simplified Corinthian. In one case an extra block of white stone has been inserted below the capital to raise it to the required level. The abacus varies from one capital to the next, but the shafts are identical—which suggests that only the capitals were re-used.

Very little research on the forms of capitals in Islamic architecture has been carried out; there is, for example, no study devoted entirely to Ottoman capitals. This is a pity, for their variety is remarkable. Perhaps the

easy availability of antique models in the great Islamic shrines of the city—which, despite the fact of their re-use, were nevertheless sanctified by their Islamic context and thus became suitable models to be copied—inspired the general layout of the standard Ottoman capital. That typical Ottoman capital can be explained quite naturally as a schematised and abstracted version of the successive tiers of foliation in a Corinthian column. The space created by two half-leaves and the meeting-points of their tips resolves itself into a pointed niche which in turn becomes an element integrated into a *muqarnas* system. Similar forms are known in the capitals of late Ottoman Baghdad. Even the volutes of a Corinthian capital may be recognised, much reduced and denatured, in those capitals whose uppermost tier has a middle section which is empty, leaving elaborately carved corners, or conversely is crammed with ornament and leaves the corners quite plain. In both types the ghost of the classical volute can be sensed. It is an instructive example of how Islamic craftsmen understood and re-interpreted the classical heritage, and it is no less revealing even though the model was at that time more than a thousand years old. The sense of natural growth which permeates the classical original has been replaced by a love for regular repetitive pattern; there is variety enough, but each pattern is confined by its niche and cannot develop freely. In similar fashion, the essential three-dimensionality and spatial freedom of the Corinthian capital is toned down to such a degree that the volumes of these Ottoman capitals are compressed, even imprisoned, and thereby lose that suggestion of burgeoning life so appropriate to vegetal ornament. This Ottoman vegetal ornament is rigidly geometricised—for example, the treatment of the cypress motif—and it is not suffered to stray beyond the boundaries set for it. Even the sense of interpenetrating levels which makes classical foliate capitals so lifelike is ironed out so as to separate each tier from the one above or below it. Accordingly it is not surprising that some capitals display a clear hierarchy in their visual vocabulary, with a steady growth in complexity of ornament from the lowest to the topmost tier. Often a heavily ornamented level is set against a plain surface, such as a dossier.

Basically the interest of Ottoman capitals resides in the experiments made with the *muqarnas* form. When these variations are closely analysed, they prove to be very close to each other, but their sculptors managed to make them look different by various means. One was to alternate plain fields for the individual cells with vegetal (e.g. almond or cypress shapes) or geometric infill for them. Another was to contrast a richly carved upper structure for the capital with a plain lower one, or vice versa. Yet another was to leave the central upper portion of the capital plain. Occasionally the *muqarnas* theme is confined to chamfered corner cells. Other and somewhat aberrant types include open papyrus

capitals, globular capitals with scalloped bases, *jeux d'esprit* that combine the Ionic with the palm leaf capital, and capitals with plunging angular folded planes, a form possibly inspired by the folded vaults so popular in Ottoman Jerusalem. The abacus is often strongly emphasised, often with an intermediate *cyma recta* or torus moulding. The latter two mouldings are standard in plinths too, but *muqarnas* and basket designs are also encountered there.

(f) Arches

Such a wide range of arch types was in use during the Ottoman period in Jerusalem that no one type could be termed standard. The varieties include round or hemispherical, slightly pointed, four-centred, lancet, ogee, trefoil, equilateral, transverse and depressed arches. Segmental arches, often stilted, shouldered and flat-topped, are repeatedly found crowning the niches of *sabils*, and the horseshoe form turns up occasionally, though the return is much less pronounced than in Maghribi and Spanish architecture. These multifarious arch forms acquire extra visual interest by the use of two-colour voussoirs and by various mouldings, sometimes as many as six per arch. On occasion the keystone stands out by virtue of its rhomboidal shape, or because it breaks the contour of the arch, or thanks to the carved medallion which it bears. All these arches are of stone masonry.

Given the prevailing sobriety of Ottoman architecture in Jerusalem, the special attention paid to doors and windows is particularly striking. A wide range of lintels is employed for both forms. Flat lintels may consist of a simple horizontal stone beam, often singled out from the surrounding masonry by its smoothness and by its different colour and material—for example, marble. But they often stand out by means of joggled bi-coloured voussoirs, tapering stepped blocks at their centres, or by the flaring or irregular cut of their constituent blocks. Sometimes a shallow relieving arch, itself perhaps in two-tone masonry or bearing a carved medallion, surmounts the lintel. The arches of the door or window may exhibit some of these characteristics.

(g) Stonework

This stonework repays close attention. It is noticeable that subsequent repairs have frequently disfigured these walls, especially in that later repointing has tended to enlarge the apparent width of the joints and thus to blur the previously sharp edges of the stonework. This may seem a small detail, but it is enough to transform a wall and to blunt its sense of mass. Over-lavish use of mortar also serves to mask how often stones were cut precisely to fit some irregularity in the wall. A brief look at any one of the façades of the North-Western Khalwa of Ahmad Pasha is enough to reveal that the masons used stones of many different

dimensions and deliberately exploited this variety to add life to the wall. There are sufficient examples of the transgression of the main horizontal masonry courses to indicate that these breaks in rhythm, too, were deliberate. The eye is not allowed to dismiss the wall as a piece of mechanically accurate coursing made up of blocks of equal size with regular vertical and horizontal accents. Thus stones of exceptionally large size are framed by others which are exceptionally small. The rising joints zigzag unpredictably along the vertical axis. Nor are the differences in stonework confined to size and colour; texture is an equally significant factor. Thus the extreme smoothness of marble—particularly the grey marble used for lintels and sills, whose natural horizontal graining emphasises this tactile quality—contrasts with the pitted surface of the bulk of the stonework. Rustication was not part of the repertoire of the 16th-century Palestinian stonemason, but the outer surface of some stones is worked with such deliberate roughness that some sculptural effect seems to have been intended. Some of these stones are pock-marked or pitted, others veined, yet others relatively smooth. Rustication is employed in the hall of the Zawiya al-Qadiriyya, but since it is found only there it seems likely that it dates from some time other than the rest of the building (see below).

An assured stonework technique is the key to this architecture. Stonework can also have wider implications. Thus the different size of the blocks and the method of stonecutting employed on them sometimes has dating implications; for instance, the presence of different stonework at the lower level in many *khalwas* suggests that many of these monuments are mere superstructures to earlier buildings which respected the emptiness of the upper platform. In that case it would have been the location of these earlier buildings that dictated that of the Ottoman *khalwas*. No studies detailed enough to establish dating criteria on the basis of tools used, stone sizes and treatment of surface have yet been carried out. Nevertheless, it is plain that for much of the Ottoman period local fashion preferred a pitted surface to smooth ashlar, though sometimes a compromise was effected whereby the two types of surface were juxtaposed for greater contrast. Thus marginal drafting is employed for the outer edges as a frame for the roughly finished square or rectangular central area. The resultant cloisonné appearance has parallels in earlier Ottoman architecture, for example at Bursa, where—following Byzantine precedent—brick was used to frame stone blocks. In late Ottoman times the technique of rustication was introduced, presumably from Europe; the façade of the Dar al-‘Adl is a good example.

It would be wrong to characterise Ottoman masonry technique as even. The wall of the bakery at the Khassaki Sultan complex shows stones with a wide range of sizes and of smoothness; some are heavily, some lightly

pitted, and there is no pattern to where these variations occur, nor to where blocks are slightly recessed into the wall. Occasionally a course of narrow horizontal blocks breaks up the wall, or long and short blocks are juxtaposed. By such means the wall itself is animated. The stones of the Khalwat al-Dajani have several different types of dressing—one variety is roughly faceted and betrays the use of a pointed chisel—and this suggests that they were not quarried together but were in secondary use. Special care was taken with the external cladding of domes, for which stones of a uniform size were selected, as the roofscape of Dar Bairam Jawish shows. The stones used in this fashion to ‘pave’ the exterior of a dome were laid so that their largest surface area was visible. Nevertheless, the tiny size of the stones used for so many Ottoman buildings implies that speed and cheapness of construction were paramount factors. ‘Big’ in this context is 40cm x 1.92m (e.g. cat. no.25). Moreover, ashlar masonry, even in the buildings of higher quality, served only as a facing for much rougher masonry. Indeed, the *madrasa* of Ahmad Pasha uses plastered rubble for the area behind the façade—a ‘cheap and cheerful’ solution for surfaces not intended for normal public view.

(h) Windows

It is not surprising that an architectural style that developed in a crowded urban context should rely so heavily on ways of accentuating the street façade. Many devices to this end had been developed by the Mamluks, but under the Ottomans other original features also evolved. Among them the oriel window deserves special mention. Essentially a combination of balcony and window, and situated high up on the outer façade, it was not only a source of light but also gave the inhabitants of a house an excellent vantage point from which to view the street without being observed themselves. The balcony itself may be of stone or wood, and above it may be as many as five windows on the same level (Dar Muhtadi). Many windows were fitted with iron grilles which not only served to modulate the light that entered a room but also served to articulate a façade. Sometimes the window is framed by quoins, or a broad horizontal lintel may crown it. This suggestion of a boundary may be heightened by the sparing use of *ablaq* masonry or of joggled voussoirs.

In the case of windows, it is not the treatment of arch or lintel that is visually decisive, but its surroundings, and especially its superstructure. The ensemble of which the window is the centrepiece comprises a narrow recessed vertical panel. Apart from a richly moulded frame, the window itself is apt to be flanked by quoins alternating with stone blocks of a different colour or texture. Above the window proper an elaborate multi-tiered design unfolds, in which contrasting colours of stone, joggled voussoirs, glazed blue faience insets, carved roundels, medallions and

stars, flat *muqarnas* panels and a stalactite cornice may all play a part.

(i) *Pottery screens*

Often the bridges or private pathways over the streets—of which more than two dozen survive—are lightened by being constructed over tiers of hollow baked clay pipes whose openings are so disposed as to form triangular patterns. These pottery screens also serve to modulate light filtering into the areas behind them. Such pottery walls are also employed as screens marking off the top of courtyards and demarcating boundaries at parapet level. They are not peculiar to Jerusalem but are a feature of pre-modern Palestinian architecture, as at Ramla. Similar forms were also common in late Ottoman Baghdad.

(j) *Applied ornament*

It was standard practice to reserve the best decoration for key locations; thus the *madrasa* of Ahmad Pasha displays more decoration on the *qibla* side than elsewhere. But of course applied ornament has obvious financial dimensions, and in view of the obviously limited budget for most Ottoman buildings in Jerusalem it is not surprising that most of them rely principally on the aesthetic effect of good-quality stonework for their appearance. Blank recessed panels sometimes articulate a façade in an understated way. But the entire dimension of colour (see below) is much reduced, for no painted plaster survives and the only colour is that of the stone masonry itself, which is red, ochre and white; the latter has sometimes weathered to grey but often has a creamy tint. The black hue of much of this stonework is also not its natural colour; it has various causes, among them the effect of water, wind, shadow or fungal growth. The resultant contrast of surfaces can be quite startling: thus the *hujra* of Islam Beg has a main façade of predominantly white stone and a rear façade of predominantly black stone, all apparently due to weathering.

A very few buildings, notably the *sabils*, display varied and complex ornament. Qubbat Yusuf (1681) is another good example. This is a smaller building than the Qubbat Yusuf Agha by the same patron, but much more richly decorated. Why? The reason may be that it is on the upper terrace, where space is much more limited, and where a bigger building that might upstage the Dome of the Chain, let alone the Dome of the Rock, was excluded. But the very choice of the upper rather than the lower terrace (where the Qubbat Yusuf Agha is located) created an extra prestige and aura of sanctity for the building and made lavish decoration all the more appropriate. Indeed, this was the best available way of expressing extra importance where size was not an option. The inclusion of an inscribed Ayyubid plaque gives the *qubba* an ancient pedigree and, as van Berchem has argued, extra prestige.

Perhaps the favourite decorative theme of Ottoman architects in Jerusalem was the *muqarnas*. It turns up in all kinds of guises. Thus Sabil Birkat al-Sultan has a tympanum with three tiers of *muqarnas*, each one differentiated from the others; this is a highly developed use of this theme. Sometimes, as at Sabil Bab al-'Atm, the *muqarnas* is even used upside down. At the Zawiya al-Qadiriyya, as at Nabi Da'ud, a shallow *muqarnas* niche just above eye level marks the junction where two external façades meet at right angles: a modest but elegant boundary indicator. The *maktab* of Bairam Jawish has on its first-floor elevation a band of ten and a half triangular lancet panels of *muqarnas* type, all different. The *muqarnas* also serves a useful role as a support for the gallery of local minarets.

The range of mouldings is somewhat limited. The denticulated frieze used at the Qubbat al-Khadr to outline (and over-emphasise) the main arches on the external façade recurs in several other buildings of the period of Sulaiman and later in Jerusalem: Maqam Nabi Da'ud, the minaret of the Citadel, Sabil Bab al-Silsila and Sabil Bab al-Nazir. Other mouldings are more or less accurate versions of such classical types as the *cavetto*, *cyma recta* or *cyma reversa*. Occasionally they are serrated or bear applied ornament such as diaper-work. Roll and billet mouldings were also popular.

Cornices, too, follow set patterns. That on the Qubbat al-Khadr consists of a miniature arcade with a leaf form in the field of each arch. Another common form for cornices was a *muqarnas* system, whether single- or multi-tiered, or a band of faceted triangles or denticulations. The formula customarily involves a long or short perpendicular plane at the top of the cornice, with convex, concave or indented planes immediately below.

Much use is made of stone roundels with carved geometric (often stellar) designs. These are used as grace notes rather than as a regular element in the mason's repertoire. In this they conform to the taste for the sparing use of decorative accents. The fullest collection of these roundels is to be found on the city walls, but they also occur within each of the lower lobes of a trilobed arch, at the centre of the tympanum of a *sabil*, and more generally to highlight spandrels, to mark or crown the apices of arches, and to emphasise the key central and outer points of the entablature crowning doors and windows. Similar forms, but pierced, also serve as windows. A few examples of stone sculpture also deserve mention. The *sabil* of Mustafa Agha has hexagonal columns, of which four sides are decorated (all differently) and two are plain, and the same system is found at the *mihrab* of the Iwan of Sultan Mahmud II. Thus the capacity for applied ornament in stone was there, as in contemporary Damascus and Aleppo, ready to be called forth by the right kind of patronage.

What of the dimension of colour? This has many aspects. In general, it is much reduced, for no painted plaster survives and the only colour is that of the stone masonry itself. The nature of the local stone is therefore crucial. Its colour, as already noted above, is far from consistent, varying as it does from a blackish grey to off-white. Often quite marked variations occur on a single block of stone. Sometimes it takes on a mottled brownish tinge; in many cases it has weathered to black. The masons proved adept at varying the colour harmonies of their façades and creating accents at specific or random intervals by the placing of a single lighter or darker block, or by varying the colour as well as the tonality. The patchwork result bears a startling resemblance to certain types of modern abstract art. Grey, white, red and yellow stone or marble used in contrasting colours—a continuation of Mamluk *ablaq*—comes into its own for the decoration of window frames, *mihhrabs*, the fields of blind arches, two-tone or joggled voussoirs, or even simple single or double string courses, arch profiles, keystones, jambs and quoins, as at the North-Western Khalwa of Ahmad Pasha. The *mihhrab* of 'Ali Pasha uses four tones: white, grey, red and black, while two-tone marble floors are quite common. Coloured stone or marble, sometimes heightened by the use of tiny blue faience inserts in the shapes of stars or triangles, was ideal for the six-pointed star—often known as Solomon's Seal and perhaps intended too as a flattering reference to the great Ottoman sultan himself—which is such a leitmotif on these façades. The masterpiece of such marble compositions is to be found in the door-frame of the ancillary chamber of the North-Western Khalwa of Ahmad Pasha, whose beauty lies in its very understatement. The muted pastel tones set each other off to perfection, and because they are applied in such broad bands the cartouches and stars placed at such intervals along them function as grace notes to an abstract colour composition rather than as the focus of interest. This is also the role of the square glazed *tesserae* used so sparingly in these buildings; it is perhaps a reflection of the poverty of Ottoman Jerusalem in comparison with, say, Ottoman Damascus that—apart from the very special case of the Dome of the Rock, which represents an intrusion of top-level imperial patronage—the Iznik-style tilework of Damascus is so conspicuously absent. This is truly remarkable, especially as the enormous task of re-tiling the exterior of the Dome of the Rock meant that local workshops were established. Clearly their production was set aside for that building alone. Such tilework as survives elsewhere in the city is not only so rare as to be insignificant, as shown for example by the tiles over the doorway of Maktab Bairam Jawish, but of indifferent quality.

Colour is also used somewhat unexpectedly to create *mihhrabs* in floors. Sometimes this theme is echoed in

the elevation; thus the Qubbat wa Mihrab al-Nabi has a diminutive niche with a central red band running through a line of concave cylindrical indentations, a blind arcade, thereby emphasising—and in the same colours—the *qibla* already announced by the Mamluk *mihhrab* laid in reserve on the floor. It is not easy to explain the preference for reserved *mihhrabs* (*mihhrab makhtut fi 'l-ard*), for some of which two- or three-tone marble or stone is used. This is not an Ottoman idea; it was already in use at least in Mamluk times if not earlier. One may suggest that this type of *mihhrab* was used so as not to encroach too obviously on the more holy monuments all around.

(k) Spolia

Spolia are part of the stock in trade of the local architects. Indeed, the *sijills* are full of references to the sale and purchase of ready-made building materials. A *sijill* reference from 1530 indicates that a block of dressed stone fetched a silver piece at that time. Clearly, then, there was no lack of incentive for a thriving trade in these materials to develop. Re-used material came from several sources: whether spolia from destroyed buildings, gleanings from ruins or merely fragments from the stock kept by local masons. The prevalence of spolia is not surprising because Jerusalem was such a rich quarry for buildings of pre-Ottoman times, many of them non-Muslim and inadequately protected from despoliation. In a few cases, such as Sabil Bab al-Silsila, a foreign origin is manifest: here a truncated Crusader rose window is crammed into the tympanum. Similarly, at the Sabil Bab Sitti Maryam a Crusader arch and Crusader columns with a plaited central braid sit rather uneasily alongside Ottoman *muqarnas* work, while Sabil Bab al-'Atm uses a non-Ottoman chevron motif, and the Zawiya al-Naqshbandiyya has a chevron arch. It remains an open question why these spolia were such a marked feature of the *sabils* founded by Sultan Sulaiman. In any event, this use of spolia follows precedents set in Nurid, Ayyubid and Mamluk times, as illustrated by the antique patinas (*sigma*-shaped tables) re-used in 12th-century Syrian mosques and *madrasas*, the Turbat al-Nahawiyya on the Haram, Christian columns in Maghribi architecture, Byzantine capitals in the Aqsa mosque, and—most eye-catching of all—the Gothic portal of the church of St John at Acre, which was incorporated into the funerary *madrasa* of Sultan al-Nasir Muhammad in Cairo. Nor were such spolia confined to the *sabils*. The Qubbat al-Arwah boasts not only a chevron and gadrooned arch but also two Crusader columns and capitals. Indeed, it is a hotchpotch of borrowed elements, and shows how variously, therefore, Crusader spolia were incorporated into the Islamic repertoire. A triumphalist intention here, though politically quite outdated, is possible in this case because the concentration of foreign material is so strong and because this aedicule is close to the Nahawiyya, which

suggests an Ottoman sensitivity to making the same point as that building and in the same visual language.

Often enough, however, the spolia carry no extra charge of triumphalism. In the Hujrat Islam Beg, the shafts are in secondary use, which implies the desire to save money and an indifference to appearances even on the Haram. These are jerrybuilt columns, made up of slightly uneven blocks, and they carry disproportionately huge capitals. Columns are of different height, diameter and colour in a single building; sometimes a structure with only eight capitals will have no two that are identical. This readiness to use second-hand material betrays a certain indifference to the visual aspect of a building, which in turn may help to explain the gross asymmetries and disparities which disfigure façades that in other respects display exemplary craftsmanship, such as the four façades, each one quite different from the next, of the North-Western Khalwa of Ahmad Pasha. Such details bespeak not only a lack of coherence, a lack of vision about the project as a whole, but also an absence of oversight.

The structural dimension of using spolia should not be forgotten. Very often metal bands are applied around the columns. This is not only a sure sign that the elements thus joined had not been carved to be used together, but also suggests that the structure was perceived to be weak, perhaps even damaged, in which case such bands could serve to conceal the fact. They may also be a precaution against earthquake. Further uses for metal clamps are to be seen in the Qubbat al-Arwah, where rivets are employed to join some of the blocks forming the raised border of the floor and a metal tie-beam has been inserted at springing level.

(l) Inscriptions

It is too early to state definitively that a standard Ottoman local form for inscription panels evolved. The necessary detailed research remains to be done. Nevertheless, some continuity from earlier periods is quickly recognisable. In the Masjid al-Saif, the inscription in the name of Sulaiman continues Mamluk modes, especially the Qa'itbai style in its use of *naskh* not *thulth* and its uneven tripartite design. Further noteworthy features here are the thick forms of the letters and the unusual positioning of this inscription at the keystone of the *mihrab* arch. Equally unusual is the thick and chunky *naskhi* inscription on the Kursi Sulaiman. While a rectangular format for inscription plaques—another Mamluk heritage—was standard, the octagonal form was also known. Such panels were lightly ornamented with rounded corners or a plain fillet border; lobed cartouches, some of them richly ornamented with flowers, branches and leaves of various kinds, are also known. Sometimes these panels are recessed. A few inscriptions,

including those with a date, are in Ottoman Turkish, and sometimes both languages are used together. Many inscriptions are in Arabic poetry, and it is standard practice to give the date by chronogram as well as in figures. Two buildings only—the Qubbat Yusuf and the Qubbat Yusuf Agha—have two dated inscription panels of similar content.

The content of these inscriptions has not received separate study as a body of connected material. Not surprisingly, however, there are references or allusions to the special sanctity of Jerusalem, to the hope of paradise, to the performance of *ziyara* or to prophets who have a particular link with the city. Thus an inscription from Kursi Sulaiman quotes from the Qur'anic story of the encounter between Solomon and Bilqis, the Queen of Sheba, and thereby confirms that its popular name today accurately reflects the original purpose of the building, namely to commemorate Solomon.

(m) Summary

The local style changed remarkably little in the course of the Ottoman period. This in itself is an index of the remoteness of Jerusalem from the fashions which came and went in larger centres. The baroque and rococo elements which transformed later Ottoman architecture elsewhere occur only intermittently, like the rustication on the façade of the Dar al-'Adl. This architecture possessed the virtue of straightforward good manners, expressed in simple forms, clean, consistent, sober stereotomy, a generally uniform colour and material, restrained articulation and parsimonious ornament. Its preferred forms were simple, strong, cubic. These characteristics, though they may sound rather unexciting, do bear further scrutiny, and they work together very harmoniously.

Formal inventiveness is not the strong suit of local architects. It is well, however, to remember the modularity of Ottoman architecture, with its unflagging focus on the domed square as the base unit of the design. Thus the architecture of Jerusalem is thoroughly in tune with the spirit of Ottoman architecture generally. That domed square unit recurs repeatedly both in open-plan designs like the so-called *iwān* of Mahmud II and in the constricted space of the typical *khalwa* on the Haram terrace. Moreover, its visual impact could vary quite dramatically, not only according to its size but also to whether it was isolated, doubled, or attached to other forms such as the great arcades of the Haram. A popular fashion was to place a multi-domed arched portico in front of one or more domed squares, a formula very popular for small mosques from early Ottoman times onwards. No matter whether the buildings are large or small, the aim of their architects is consistent: to achieve maximum monumentality with minimum means.

8. Conclusion

The present book represents the first serious attempt to record the buildings of Ottoman Jerusalem in a comprehensive manner, but even so it cannot hope to say the last word on any of them, and should rather be regarded as a foundation on which future research can be based. It does show, however, that the architecture of Ottoman Jerusalem, which grows so naturally out of the rich Mamluk heritage in the city, repays close study. The absence of major buildings of international importance is less significant than the preservation, in largely excellent condition, of an entire pre-modern town. That town is overwhelmingly an Arab one, and to this day it is cherished by its Muslim inhabitants. Written records corroborate oral traditions that many of its distinguished families have been there for centuries. This book owes a great deal to the love which the local Muslims have for Jerusalem, and it is a matter for celebration that the city's heritage of Ottoman buildings has now been recorded in detail here.

Ottoman architects in Jerusalem had inherited from their Mamluk and still earlier predecessors an enviable confidence in the working of the local stone and a keen awareness of its possibilities. In general, their taste was austere, even minimalist, in comparison with Mamluk work. Buildings are often generically akin with their Mamluk counterparts, but have as it were lost their decoration. The beauty of the stonework and the simplicity of the basic forms—arcades, aedicules, domed squares, façades with recessed vertical panels—is allowed to speak for itself. The articulation is pared down to mouldings, capitals, plinths, embrasures and the like, and is consistently set off by expanses of plain stonework.

The Ottomans were the last major Islamic dynasty of international stature to rule Jerusalem. Theirs was by far the most sophisticated and powerful of the late medieval to early modern Islamic states; indeed, in some sense this was

the supreme Islamic dynasty. It brought to fruition many trends and ideas which were latent in earlier Islamic polities. It imposed its stamp on much of the Islamic world and for centuries it symbolised that world to the West. The Ottomans are the final link in a chain which, apart from a brief rupture under Crusader rule, stretches back well over a millennium to the beginning of Muslim rule in 638. The Islamic presence, then, is no transient episode; it is fundamental to an understanding of the city, past, present and future. Indeed, despite the evidence of Christian and Jewish presence in the Old City over the centuries, this is a Muslim town through and through. The intrinsically Islamic nature of the physical fabric of the Old City is frequently undervalued and even ignored in the West. It is sometimes demoted in the media to mere local colour. Yet even the most casual and uninformed visitor to the city cannot fail to notice this pervasive Islamic dimension. Most of the fabric which is an integral, tangible part of that dimension is of Ottoman date. Every stone of that fabric is part of a precious heritage and it deserves loving protection.

Note

I would like to express my deep indebtedness to Dr Sylvia Auld, who proved a fount of wisdom, information, ideas and inspiration at every turn in the preparation of this chapter. Her extensive knowledge of Jerusalem, built up over more than three decades, which she shared so generously with me and which is nourished by her deep personal commitment to the city and its people, was absolutely indispensable. My warm thanks go also to Martin Dow for much useful information on vernacular architecture in the city, and to Dr Yusuf Natsheh for his kindness in showing me around the Ottoman buildings to which he has devoted so much of his life. This chapter should be read in conjunction with those of Dr Natsheh and Mr David Myres; while all three inevitably cover a good deal of the same ground, the differences of approach and emphasis should ensure that the picture of Ottoman architecture in Jerusalem that finally emerges from these three contributions is a fully nuanced one.

Chapter 1

THE POLITICAL HISTORY OF OTTOMAN JERUSALEM

Abdul-Karim Rafeq

The political history of Ottoman Jerusalem is usually divided into two phases. The first begins with the Ottoman conquest of the city in 1516 and ends with the Egyptian occupation in 1831. The second phase extends between 1831 and 1917 when the British forces took over the city from the Ottomans. In both periods, the events in Jerusalem, and elsewhere in Ottoman Palestine and Syria,¹ were influenced by a number of factors on the local, regional, Ottoman and European levels. The factors and the events varied in intensity from one phase to the other.

Administratively and politically, Jerusalem, in the first phase, was not much different from the other towns in Palestine. Its history was identical to the other *sanjaqs*² attached to the governor of Damascus. But in this period Jerusalem witnessed, not unlike the other major Arab cities, a number of architectural works reflecting the peak of Ottoman power in the 16th century under Sultan Selim I (1512-1520) and Sulaiman the Magnificent (also called

the Lawgiver) (1520-1566). Signs of weakness, however, became apparent in the Ottoman state toward the end of Sulaiman's rule, and continued unabated throughout the 17th century. Weakness manifested itself basically in the devaluation of the currency and also in the economic, political and military spheres. Decline set in in the 18th century for the same reasons which had become aggravated with time. The vicissitudes in Ottoman power played into the hands of provincial potentates who began to challenge Ottoman authority.

Being the third most holy place for Muslims, after Mecca and Madina, Jerusalem received attention from the first two Ottoman sultans. Selim I is reported to have visited Jerusalem in late December 1516 while on his way to Egypt (al-'Asali 1990). It was, however, left to Selim's son and successor Sultan Sulaiman to undertake restoration work and to endow Jerusalem with a number of important structures. Foremost among the buildings he restored and decorated is the Dome of the Rock (Qubbat al-Sakhra). He also rebuilt the wall of the city which runs for about two miles. According to the Franciscan Father Noë Bianco, who visited Jerusalem in late August 1527, the wall of the city was almost in ruins at the time (Yerasimos 1984). The wall was intended to shield the city from attacks and to control access to it through authorised gates.

Caring about the welfare of Jerusalem's population and anxious to ensure the flow of water to the city, Sultan Sulaiman ordered the repair and the building of canals and pools inside and outside Jerusalem, some of which still carry his name or his title. The most important of these are the three pools, known as the Pools of Sulaiman (Birak Sulaiman) located to the south of Bethlehem. They bring

¹ Syria, a term of Semitic origin, was first used by the Greeks for the country extending between the Mediterranean and the Euphrates, and between Anatolia and Egypt. The Arabs referred to 'Syria' as *Bilad al-Sham*, meaning the country on their left, or to the north of Mecca. Palestine is called after the Philistines, the Sea People from the Aegean Sea who invaded the Biblical land of Canaan in the 12th century. Neither appellation was used in the Ottoman administrative divisions in Syria. A province of Syria appears only in 1864 during the Tanzimat period.

² The Turkish term *sanjaq* means 'standard' (in Arabic *liwa*). The *sanjaq* was carried in front of the governor of a sub-province or district, hence the governor's title is *sanjaq beg* or *amir liwa*. Since the term *sanjaq* was used more often than *liwa* for Jerusalem and its dependencies in the Ottoman writings, it will be used throughout this study.

water to Jerusalem and to the Pool of the Sultan (Birkat al-Sultan) outside the Khalil (Jaffa) Gate. A water fountain (*sabil*) was built next to this pool. A soup kitchen (*'imara*) to feed the poor was constructed in Jerusalem in 1551 at the request of Sultan Sulaiman's wife, the mother of Selim II, Khassaki Sultan (the former Russian Roxelana). *Waqfs* (charitable endowments) were created for the upkeep of these buildings.³ Revenue from *waqf* villages in five *sanjaqs* (Jerusalem, Gaza, Nablus, Safad and Sidon) was allocated to cover the expenses of the *'imara* (Heyd 1960: 90 n.1,2).

Despite all these works of restoration and renovation initiated by Sultan Sulaiman, Jerusalem still lacked municipal attention. When the French ambassador to Istanbul, Le Chevalier d'Aramon, visited Jerusalem on 18 July 1549, he mentioned the wall built by the Turks but he noted that it did not have a moat around it. He described Jerusalem as being of medium size, not overcrowded, and that its streets were narrow and unpaved (d'Aramon 1887: 113-27). The inhabitants of Jerusalem at the time were estimated by the Spanish Franciscan, Father Antonio de Aranda, who visited the city in 1530 and stayed in a monastery on Mount Zion, at 4,000. He says that 1,000 of these were Christians, 500 were Jews and the rest Muslims. But he makes the observation that the inhabitants could have numbered more in the past, judging by the ruins seen everywhere which accounted for about one-third of the total size of the city (Yerasimos 1984: 83). Another Portuguese Franciscan Father, Pantaleao d'Aveiro, who stayed in Jerusalem for twenty months in 1563-4, estimated the number of Jerusalem's inhabitants at 5,000 of whom 2,000 were Christians and 600 were Jews. He also observed ruins in some sectors of the city (Yerasimos 1984: 92). A century later, the Frenchman d'Arvieux, who came to Syria as a merchant in 1658 and then became French consul in Aleppo, mentions upon his visit to Jerusalem that it had a strong wall with defensive towers and a moat without water. He estimated the wall's circumference at 4,500 paces and its thickness at two metres (d'Arvieux 1735: 101-84).

Jerusalem was then one of ten *sanjaqs* which constituted the province of Damascus (Sham Sharif, 'Noble Damascus') in the early years of Ottoman rule. Syria was at the time divided into three provinces, Damascus, Aleppo and Tripoli, to which the province of Sidon, carved out from the province of Damascus, was added in 1660. The ten *sanjaqs* of the province of Damascus were: Damascus, the seat of the governor, Jerusalem (Quds-i Sharif), Gaza, Safad, Nablus, 'Ajlun, Lajjun, Tadmor (Palmyra), Sidon with Beirut, and Karak with Shawbak.⁴ Seven of the *sanjaqs* are in Palestine or

across the Jordan. The *sanjaq* of Jerusalem consisted of Jerusalem, the seat of the sub-governor (the *sanjaq beg* or the *amir liwa*), and its dependencies which consisted of 184 villages (Hütteroth and Abdulfattah 1977: 18). The geographical and administrative extent of its borders changed with time. Occasionally, the same governor would govern both Jerusalem and Nablus, as happened in 1030/1620-1 (al-Muhibbi 1966: 108).

The reasons behind the existence of several administrative units in Palestine are many. These include the varied nature of the terrain, the presence of several rural and nomadic chieftains entrenched in the valleys, the hills and the plains, and controlling the nearby cities who had been pushed there by the major tribes in control of the Syrian desert; the closeness of the *sanjaqs* to the main pilgrimage route (*al-Tariq al-Sultani*) between Damascus and the Hijaz, and its diversion, at times of danger, through Gaza; and the need of the Ottoman government to keep a close watch over the chieftains to ensure the safety of the pilgrimage and the security of the trade route, the Via Maris, linking Syria with Egypt. Like the pilgrimage route, the trade route within Palestine necessitated the building of several fortresses, post-stations and caravansarais to service and defend the caravans.

Since the chieftains were in control of their regions, in order to circumvent their misdeeds and to make good use of them, the Ottoman government legalised their position by appointing them *sanjaq begs* and tax farmers of their regions. More importantly, the state appointed them commanders of the Damascene pilgrimage and of the *jarda* (the convoy that carried supplies to the returning pilgrimage and escorted it on the way back to Damascus) in place of the defunct Mamluks in Syria. The Damascene pilgrimage assembled yearly in Damascus and consisted of about 15,000 to 20,000 pilgrims from Syria, Anatolia, the Balkans and even from Persia. The Persians were not allowed to have a separate pilgrims' caravan because the Ottoman sultan did not want to share his religious prerogatives in the Hijaz with any other ruler, let alone a Shi'i one. The identity of the commander of the pilgrimage and that of the *jarda* reflect to a large extent the political realities and the struggle for power within Syria in general, and between the *sanjaq begs* of Palestine and the other powers in the provinces of Damascus and Sidon in particular.

The appointment of the commander of the pilgrimage in the 16th and part of the 17th century from among the chieftains of Palestine indicates the prominence of the chieftains and the pragmatism of the Ottoman government which, by recognising the chieftains, managed to co-opt them and use them to serve its own interests. The governor of Jerusalem, Nablus, Gaza, 'Ajlun or Lajjun was appointed commander of the pilgrimage, not so much because of the importance of the town he governed but

³ For more details about these structures, see al-'Asali 1984: 200-02; *al-Mausu'a al-Filastiniyya*, (under Birka) 1984, 2: 541-3.

⁴ The divisions are based on the following works: Lewis 1954: 469-501; Mantran and Sauvaget 1951; Belin 1870, 15: 274-6.

because of his own power as a prominent chieftain. If the chosen chieftain was not already a governor, upon his appointment as commander of the pilgrimage he would be made one. Being mostly of Bedouin origin, the chieftains were in a better position to manage the Bedouin tribes who might threaten the pilgrimage along the route to the Hijaz.⁵ The appointment would also persuade the chieftains to contribute to the expenses of the pilgrimage from the taxes they collected in their capacity as tax farmers, and from another tax known as *mal al-hajj* (money for the pilgrimage) which their territories were under obligation to pay (cf. Heyd 1960: 76-8, 105-6, 116).

The chieftains of the *sanjaqs* of Palestine, including those of Jerusalem, provided security for the pilgrimage for over a hundred years. The Muslims were pleased and so was the sultan, whose title of servitor/custodian (*khadim*) or protector (*hami*) of the Two Holy Sanctuaries, Mecca and Madina, first bestowed on Sultan Selim I by the preacher in the Friday prayer in Aleppo upon its conquest, would thus be justified. Also, by investing the governor of a Palestinian *sanjaq* with the command of the pilgrimage, Damascus would be spared the depredations of the troops accompanying him had the commander been the governor of Damascus. The *sanjaq* governor-commander would wait with his troops outside Damascus at a place called Bab Allah (the Gate of God, abbreviated as *bawwaba*, which still exists) where he met the pilgrims and accompanied them to the Hijaz.

Fakhr al-Din Ma'n II, paramount *amir* of Mount Lebanon (1590-1635), weakened the chieftains of Palestine by eliminating some of them, interfering in the affairs of others and splitting their ranks. In 1623 he extended his rule over the *sanjaqs* of Safad, Nablus and 'Ajlun. Jerusalem was safe but its chieftains were weakened. With the defeat and execution of Fakhr al-Din by the Ottomans in 1635, Janissary chiefs from Damascus, Ottoman officials and the remaining chieftains, were appointed *sanjaq begs* in Palestine and commanders of the pilgrimage. The aim was to fill in the power vacuum in Palestine after the weakening of the chieftains, collect taxes for financing the pilgrimage and keep the troops accompanying the commander of the pilgrimage out of Damascus. During the period between 1031-48/1621-39, the chieftain Muhammad ibn Farrukh, governor of Jerusalem and Nablus, who succeeded his father in this office, was appointed commander of the pilgrimage for eighteen years. His two sons also succeeded him in both positions (Muhibbi 1966, 4: 108-10). In 1053/1643-4, Amir Mansur, son of Amir Hasan the governor of Gaza, was appointed commander of the pilgrimage and governor

of Nablus. When Amir Hasan died, his son Amir Husain succeeded him as governor of Gaza. Husain's son Ibrahim was appointed governor of Jerusalem. Shortly afterwards, Husain made Ibrahim governor of Gaza and he became governor of Nablus and commander of the pilgrimage for two years. Ibrahim died in the Biqa' valley in 1071/1660-1 in the service of the Ottoman governor who was fighting the Druzes. Amir Husain was executed in Istanbul in 1073/1662-3 (Muhibbi 1966, 2: 88). This example sums up the situation in Palestine and in Istanbul at the time. It shows the rise of a family of chieftains to prominence in Palestine between 1643 and 1663 and the appointment of its members to local governorships, including Jerusalem, and to the command of the pilgrimage. The weakness of the chieftains *vis-à-vis* the state at the time is evidenced by the upper hand it had over them. The Köprülü grand viziers in Istanbul were infusing vigour into the Ottoman administration during their tenure of office (1656-76). Janissaries and Ottoman officials stepped in to fill the power vacuum in the Palestinian *sanjaqs* created by the weakening of the local chieftains. They were appointed as *sanjaq begs* and commanders of the pilgrimage. The Ottoman official Ahmad Pasha Tarazi, for instance, was nominated in 1087/1676-7 as governor of Lajjun and of Jerusalem and also commander of the pilgrimage after the end of the rule of the local family of Turabay in the region of Lajjun.⁶ In 1098/1686-7, Ahmad Pasha, the son of the governor of Damascus, was appointed commander of the pilgrimage and governor of Jerusalem.⁷

The appointment of Janissary chiefs and government officials as commanders of the pilgrimage and at the same time governors of *sanjaqs* in Palestine, including Jerusalem, caused dislocation in the relationship between this new type of commander and the Bedouin along the route to the Hijaz. The commanders tried to withhold part or all of the customary annual payment, known as *sarr* (wrapped amount of money) made to the Bedouin to buy them off and to secure the right of passage in the desert. The payment was normally made in two instalments, one on the way to the Hijaz and one on the way back. With their income diminishing, Bedouin attacks on the pilgrimage intensified. A disastrous attack by the Bedouin on the pilgrimage, then commanded by a Janissary chief, occurred in 1081/1671 (Muhibbi 1966, 4: 434; al-Muradi 1966, 2: 63). A later attack in 1102/1690-1 was devastating. It occurred because of the neglect of the commander, the deposed Sharif Yahya of Mecca, who was appointed governor of Jerusalem and commander of the pilgrimage that same year (for more details, see Rafeq 1968: 229). Sharif Yahya was deposed, and the command

⁵ Muhibbi 1966, 1: 187-9; 2: 417; 3: 271, 299; 4: 108-10, 426-7; al-Ghazzi 1945-59, 3: 201; al-Burini 1959, 1966, 1: 186, 191-2, 202.

⁶ Muhibbi 1966, 1: 222; al-Mahasini 1960: 126; for the Turabays, see Abu-Husayn 1985: 183-98.

⁷ Mahasini 1960: 187; Ibn Jum'a 1949: 45 (trans. Laoust 1952).

of the pilgrimage was entrusted from 1708 onwards to the governor of Damascus. This shift in the command of the pilgrimage had far-reaching consequences for Damascus (Rafeq 1970: 56-8), and for the *sanjaqs* of Palestine, including Jerusalem.

The entrusting of the command of the pilgrimage to the governor of Damascus corresponded with the appointment of the governor of either Sidon or Tripoli as commander of the relief force, the *jarda*. The authority of the governor of Damascus was thus strengthened *vis-à-vis* the *sanjaqs* of his province, especially because he now insisted that a son or a member of the family be appointed as governor of either Sidon or Tripoli to enable him to lead the *jarda*. Thus, from sometimes in the past being commanders of the pilgrimage, the governors of Jerusalem were now deprived of this privilege.

Jerusalem from time to time profited from the money which the Ottoman sultan sent annually, in the form of a purse (*surra*) to the poor of the holy cities in the Hijaz. But there is no evidence that Jerusalem had a regular share in this purse. It seems, however, that a separate *surra* was sent annually from Istanbul and Egypt, apparently from *waqfs* created for this purpose, and possibly from the *waqfs* of the Two Holy Sanctuaries (*auqaf al-haramain*), to the poor in the city of Jerusalem (Stanford Shaw 1962: 261; cf. al-'Asali 1990: 220).

During the 18th century, Jerusalem not only lost its participation in the command of the pilgrimage, but it became politically a backwater. This occurred after a failed popular revolt there early in the century which was led by Naqib al-Ashraf Muhammad al-Husaini in protest against the injustices and atrocities committed by the newly-appointed Ottoman governor, Jurji Muhammad Pasha. The governor was expelled by the rebels and the Naqib al-Ashraf assumed *de facto* authority. Fresh troops soon regained control of the city, and the Naqib was eventually executed by Istanbul in 1707 (al-'Asali 1990: 215). The Jerusalem revolt seems to have been inspired by, or occurred simultaneously with, a similar rebellion in Damascus at about the same time. Top Damascene '*ulama*' defended the people against the injustice of the Ottoman governor who tried to extort money from them. As in Jerusalem, the rebels were suppressed and the leading '*ulama*' were exiled in 1707 (Rafeq 1968: 221).

The centre of political activity in Palestine in the 18th century moved to Upper Galilee, to Acre which Zahir al-'Umar al-Zaidani had fortified and made the seat of his government. The governor of Damascus, being commander of the pilgrimage, became directly responsible for financing the pilgrimage. It became imperative for him to make the annual tour (*daura*) of his province, prior to the departure of the pilgrimage, to collect the taxes from the local tax farmers. When the tax farmers refused to pay, the governor was forced to fight them. This was the case

with Zahir al-'Umar (c.1730-75), paramount chieftain and tax farmer in the region of Safad-Tiberias in Upper Galilee, and later governor of Acre, Haifa and Jaffa. Thus Zahir carved out for himself a semi-autonomous Arab principality in defiance of the Ottoman governors of Damascus and Sidon and ultimately of the sultan. Jerusalem and the other *sanjaqs* were politically dwarfed *vis-à-vis* Zahir. In 1770-1, Zahir joined the rebellious Mamluk 'Ali Beg of Egypt in occupying Damascus (10-17 June 1771) and defying the state. After the Ottomans ended their war with Russia (1768-74), their navy laid siege to Zahir in Acre in 1775, and he was killed by his own mercenary troops.⁸

Jerusalem was not within Zahir's zone of influence nor was she affected by his downfall. The governors of Damascus still retained control over it. In 1725, for example, the son of the governor of Damascus, 'Uthman Pasha Abu Tauq, was appointed governor over Jerusalem.⁹ The governor of Damascus, Isma'il Pasha al-'Azm, included the *sanjaq* of Jerusalem in his tour (*daura*) while collecting taxes (Rafeq 1970: 103-4). During the campaign launched by the governor of Damascus, Sulaiman Pasha al-'Azm, in 1742 against Zahir al-'Umar in Tiberias, the governor of Jerusalem and the governor of Gaza and Ramla were ordered by the sultan to support Sulaiman Pasha (Rafeq 1970: 159-60).

In 1756 Jerusalem was apparently made a province for no other reason than to be given to the governor of Gaza, Husain Pasha ibn Makki, the protégé of the Kizlar Agha (chief eunuch in the sultan's inner chambers—the *harem*—in Istanbul) who had much influence at the time. The boundaries of this province caused a controversy in the French consulate in Sidon. If it was restricted to the *sanjaq* of Jerusalem then the French gift to Husain Pasha would be less than if Ramla, which was important to French trade, were added to it. It turned out that the new province of Jerusalem included, besides the *nahiyas* attached to it, Gaza and Ramla as well (AE B1 1031: Sidon 16.1.56, Sidon 4.2.56). Husain Pasha remained governor of Jerusalem for nine months, after which he was deposed. He returned to his former governorship of the *sanjaq* of Gaza. Jerusalem then reverted to the jurisdiction of the governor of Damascus.¹⁰ Shortly afterwards, through the support of the same Kizlar Agha, Husain Pasha was made

⁸ Muhibbi 1966, 4: 434; al-Muradi 1966, 2: 63. For details about Zahir's career, see Rafeq 1970: 126-31, 155-60, 193-7, 241-82, 292-308; Rafeq 1990; *al-Mausu'a al-Filastiniyya, al-Qism al-Thani, al-Dirasat al-Khasa* 2, 1: 717-18.

governor of Damascus in 1757. Under his weak command, the pilgrimage was almost annihilated by Bedouin attack on it (for details see Rafeq 1970: 213-22).

During the invasion of southern Syria by Mamluk troops from Egypt in 1770-1 and the occupation of Damascus by the joint troops of 'Ali Beg and Zahir al-'Umar, Jerusalem remained loyal to the Ottomans. Also, after the elimination of Zahir al-'Umar and the domination of Ahmad Pasha al-Jazzar and his Mamluk troops in the province of Sidon (1776-1804), and his appointment four times to the province of Damascus, Jerusalem managed to remain neutral and was spared the atrocities of al-Jazzar (literally the 'butcher'). When Napoleon Bonaparte invaded Syria from Egypt in February 1799 and laid siege to Acre, Jerusalem was again spared attack. The French, however, by occupying Ramla and Jaffa, blocked access to Jerusalem from the coast. The road through Gaza, which the French had already occupied, was likewise blocked. French troops also occupied the fortress of Safad to cut off the road leading from Damascus to Palestine. When the Ottomans launched a counter-attack across the river Jordan and threatened the French troops at al-Fula near Mount Tabor, Napoleon hastened from Acre to relieve the French troops and defeated the Ottomans on 17 April 1799. The French then occupied Safad and Tiberias. Jerusalem was not threatened at the time because the initial aim of the French was to occupy Acre. They were, however, forced to withdraw altogether from Syria in May 1799.¹¹

The prestige of the governor of Damascus in the Palestinian *sanjaqs* of his province was rather low at the time. He had earlier failed to prevent the Mamluks and Zahir al-'Umar from occupying Damascus. The centre of power shifted to the province of Sidon under its able governors Ahmad Pasha al-Jazzar, his Mamluk successor Sulaiman Pasha al-'Adil (1804-18) and 'Abdallah Pasha (1818-31). Any military revolt in Palestine would be put down by these able governors. In 1807, for example, Sulaiman Pasha al-'Adil of Sidon put an end to the revolt of Muhammad Pasha Abu Maraq, the governor of Jaffa and Gaza, who had also extended his rule over Jerusalem. These towns were under the jurisdiction of the governor of Damascus, but the fact that the governor of Sidon intervened in their affairs indicates his growing influence in the region and the weakened position of the governor of Damascus. The governor of Damascus at the time was focused more on ensuring the security of the pilgrimage and providing for its finances than on the immediate affairs of his province. In 1806, for instance, the governor of Damascus, accompanied by three thousand troops, passed through Jerusalem while on the *daura* to collect taxes. He attacked the villages dependent on Jerusalem, extorted

money from their inhabitants, and sold in the Damascus market the cattle and horses he had confiscated from them as booty. After his withdrawal, the villagers, who had scores to settle among themselves, began attacking each other (de Châteaubriand 1950: 156-62). When rebels in Jerusalem took advantage of Abu Maraq's rebellion and rose in revolt against their governor, it was again the governor of Sidon who put down their revolt and reinstalled the ousted governor sent to them by Damascus. The governors of Damascus and Sidon, when not the same person, co-operated with each other because of the common threat posed to them by Wahhabi expansion from the Arabian Peninsula, as happened in 1809. Worried by the Wahhabi threat, the sultan in 1810 appointed the governor of Sidon, Sulaiman Pasha al-'Adil, governor of the provinces of Damascus and Tripoli as well. He was also entrusted with the *sanjaqs* of Jerusalem and Nablus (Rafeq 1990: 854-6).

In 1816, at the request of the sultan, Sulaiman Pasha al-'Adil renovated the Dome of the Rock and al-Aqsa Mosque in Jerusalem as well as the shrine of al-Nabi Da'ud, all of which cost him a lot of money (al-'Awra 1936: 159-91, 195, 267-8, 292, 297, 332).

The polarisation of power between the governor of Damascus trying to regain his authority over southern Syria and the governor of Sidon attempting to extend his authority reached dangerous proportions when the governor of Sidon, 'Abdallah Pasha (1818-31), a former aide to Sulaiman Pasha al-'Adil and like his master a Mamluk, called upon Muhammad 'Ali of Egypt for help against the governor of Damascus, who was supported by Istanbul and by Amir Bashir Shihab II of Mount Lebanon. Taking advantage of this polarisation of power, the inhabitants of the regions of Jerusalem and of Nablus rose in revolt and refused to pay the excessive taxes that the governor of Damascus had imposed on them under the pretext of financing the pilgrimage. The Bedouin chieftain, Ibrahim Abu Ghosh, who was in control of the road between Ramla and Jerusalem, supported the rebels. The Abu Ghosh family claim to have been entrusted with the security of this road by Sultan Sulaiman the Magnificent. Their headquarters were originally in the village of Qubaiba or 'Umwas, to the north west of Jerusalem, but they later on moved to the village of Qaryat al-'Inab, also known as Qaryat Abu Ghosh, to the west of Jerusalem. Encouraged by support from the Abu Ghosh family, several villages in the vicinity of Jerusalem in early 1825 refused to pay taxes to the governor of Jerusalem. The governor, referred to in the local sources as *mutasallim* (deputy), called upon his superior, the governor of Damascus, for help. Some villagers fled their villages as happened in Silwan, east of Jerusalem, in al-Malha, 'Ain Karem and Walaja, west of Jerusalem, and in Bait Hanina and Baitin to the north of it. The governor of Damascus laid siege to the

¹¹ For a detailed study of Napoleon's expedition into Syria and the military operations, see Rafeq 1990, 1: 719-27.

monasteries, both outside and inside Jerusalem, where the fleeing villagers had taken refuge. Fearing the worst, the villagers bought the governor off. The same happened in Bethlehem. Upon the return of the governor to Damascus, the villagers resumed their rebellion in early June 1825. The rebels in Jerusalem took control of the citadel, the walls and the gates of the city, and expelled the *mutasallim*. They also appointed two chiefs from among their ranks, Yusuf 'Arab and Ahmad Agha, to govern the city. Sultan Mahmud II was occupied at the time with the Greek War of Independence and with the abolition of the rebellious Janissaries in 1826. He therefore ordered 'Abdallah Pasha of Sidon to deal with the rebels. The commander sent by 'Abdallah Pasha bought off Abu Ghosh and proceeded safely to Jerusalem. Its inhabitants held out for seven days and defied the additional troops dispatched to the city. Dissension, however, weakened the resolve of the rebels to resist. Food shortages, caused by the blockade, and the prevalence of poverty within the city brought about a split in the ranks of the rebels. They surrendered after being promised that no extra taxes would be raised from them and that their leaders would be pardoned. The revolt came to an end in late 1826 (for additional details, see Spyridon 1938: 74-83). Other revolts were taking place at the time in different regions of Palestine, the most important one being in the Nablus region under the leadership of the Jarrar family. The occurrence of these revolts on the eve of Muhammad 'Ali's invasion of Syria was a welcome signal to him. And indeed his campaign did not encounter popular opposition.

The Ottoman attitude toward Jerusalem during the period between 1516 and 1831 is rather mixed. After the architectural contributions by Sultan Sulaiman the Magnificent to Jerusalem in the early years of Ottoman rule, no similar contributions were made by the later sultans. This is not to say that Jerusalem was neglected, but the lack of interest in it on the part of the later Ottoman sultans seems to have been largely due to their declining quality and their preoccupation with wars on almost all fronts. Jerusalem, nevertheless, fared better than other towns in Palestine by the appointment of a top judge to it, apparently because of its pre-eminence in Islam and also because of the religiously important towns and sites attached to it, such as Khalil and Nabi Musa. In fact the jurisdiction of the official Hanafi judge of Jerusalem extended far beyond the limits of the *sanjaq* of Jerusalem (Heyd 1960: 42, cf. 154-5). The judge of Jerusalem communicated directly with the sultan, as happened in 1568 when the judge pleaded with the sultan against levying troops for the Yemen campaign and financing them by raising additional taxes from the inhabitants of Jerusalem and Khalil. To make his plea stronger, the judge communicated to the sultan the contents of a previous *firman* absolving the inhabitants of the two cities from extra

levies and dues. The sultan concurred and ordered that the inhabitants of Jerusalem and Khalil be exempted, but not the villages of the *sanjaq* of Jerusalem (Heyd 1960: 71-2 cf. 117).

The Ottomans were keen to establish security and order in the *sanjaq* of Jerusalem and to combat illegal dealings by top officials (see, for example, Heyd 1960: cf. 87-8). They also took great care in raising feudal troops to ensure the security of the pilgrims departing from Jerusalem and Khalil to the Hijaz, apparently while on their way to join the Damascene pilgrimage. They also provided protection to the pilgrims visiting the tomb of Moses (Nabi Musa) near the Dead Sea (Heyd 1960: 76, cf. 85, 101). To achieve security, the authorities in Jerusalem took hostages from the troublesome tribes and villages to guarantee their good behaviour. The hostages were to be rotated every year to maintain equal punishment for all (Heyd 1960: 98).

To conclude the first phase of Jerusalem's political history under the Ottomans, it is noticeable that although Jerusalem did not figure as a major centre of political activity on its own in the way that Acre had figured under Zahir and al-Jazzar, its chieftains were by and large law-abiding and they also provided commanders for the Damascene pilgrimage. By ensuring the security of the pilgrimage, the chieftains served the interests of the sultan and satisfied Islamic religious opinion.

The second phase of Jerusalem's history begins with the establishment of Egyptian rule in Syria in 1831. Jerusalem then came to the forefront among the cities in Palestine. It became more active politically and also attracted much attention from abroad. Already in 1825-6, Jerusalem and its hinterland had risen in revolt against the state's attempt to levy troops and impose extra taxes on the inhabitants. The fact that the rebels in Jerusalem got what they wanted legitimised their role as defenders of the people's interests and established among them a revolutionary tradition which they invoked in similar circumstances. Indeed, the first revolt against Egyptian rule in Syria began in Jerusalem only three years after the Egyptians had conquered the country.

Muhammad 'Ali of Egypt occupied Syria for a number of reasons, chief among them his desire to make Syria a buffer zone shielding Egypt from the Ottomans, and to lay his hands on Syria's resources of timber, cotton, silk and tobacco. Their import from Syria was draining Egypt of much of its revenue. Important to Egypt too was control of the long-distance trade routes passing through Syria. The local, regional, Ottoman and European conditions were all favourable for Muhammad 'Ali's invasion of Syria. Revolts had already taken place in Jerusalem, Nablus and, more importantly, Damascus where the Ottoman governor Salim Pasha was killed by the Damascenes in 1831 (for details see Mikha'il al-Dimashqi

1982: 76-9). The governor of Sidon, 'Abdallah Pasha, and the amir of Mount Lebanon, Bashir Shihab II, were the protégés of Muhammad 'Ali. The Ottoman empire, on the other hand, had been weakened by its defeat in the Greek War of Independence and by its abolition of the Janissaries. The international situation was also favourable. Britain was occupied with the reform movement and Chartism, France was anxious to stabilise its internal politics after the 1830 revolution and also had to cope with the revolt in Algeria in 1831, and the Habsburg empire in Vienna was threatened by a revolt in Poland.

Muhammad 'Ali occupied Syria without opposition from its people, who must have seen him as a liberator from the injustice of the Ottoman governors and the local chieftains. Indeed, the redoubtable Abu Ghosh, had forty thousand armed followers, dominated the hilly section of the road between Jaffa and Jerusalem and who imposed irregular payments on passengers, was brought to heel by Muhammad 'Ali's son, Ibrahim Pasha, who was in charge of the Syrian campaign. No one before had questioned the origin of Abu Ghosh's authority nor its legality. It was merely recognised and obeyed as long as it stood unchallenged. Ibrahim Pasha apprehended Abu Ghosh's brother and freed him only upon representations from the French traveller, Alphonso de Lamartine, who interceded in his behalf at the request of Abu Ghosh (de Lamartine 1855, 6-2: 284-90).

From being a liberator, Ibrahim Pasha soon turned into a coercive occupier. Although he established security, expanded the frontier of settlement by keeping the Bedouin at bay, opened up Syria to Western influences and outbid the Ottoman sultan by introducing reforms and emancipating the Christians in Syria from Ottomans restrictions, he nevertheless antagonised the people by enforcing on them conscription, disarmament, forced labour (*corvée*) and heavy taxation. The *farda*, a *per capita* tax on male adults aged fourteen years and older, weighed heavily on the people. The *farda* was collectively levied on the members of a craft, a quarter, a village and a city. The emigration of a number of inhabitants and conscription of their adults were not accepted as excuses to decrease the amount of the *farda*. The remaining people therefore had to pay more for the collective *farda* tax. Conscription was the most detested measure because it deprived the working families in the cities and the countryside of their breadwinners. It also had no time limit. Ibrahim Pasha had warned his father against the early application of conscription in Syria and also requested a review of the *farda*—for what applies to Egypt does not necessarily apply to Syria.

A series of revolts occurred in Syria between 1834 and 1838 in protest against the malpractices of Egyptian rule. The revolts were basically rural and tribal occurring in the hilly, rugged countryside. Jerusalem stands out in this regard as the starter and the leader of the revolts. The rural

neighbourhood of Jerusalem was under obligation to provide 1,500 conscripts, the city of Jerusalem 200, Nablus and its countryside 2,000 and Hebron (Khalil) and its countryside 2,000. The meeting point of the rebels was Jerusalem. A crowd estimated at ten to twenty thousand persons from Jerusalem, Nablus, Khalil and their vicinity assembled there and attacked the Citadel, the symbol of authority. Ibrahim Pasha headed from Jaffa toward Jerusalem, defeating a group of rebels on the way at Qaryat al-'Inab, the stronghold of the Abu Ghosh family. Upon his approach to Jerusalem, the rebels there, who were suffering from famine and plague, fled the city. The Egyptians then took control of Jerusalem, Jaffa, Gaza and Acre while the rebels were disseminated throughout the countryside. The rebels, however, began regrouping, and a large number of them, estimated at 65,000, led by Shaikh Qasim al-Ahmad and Shaikh 'Isa al-Barqawa, headed toward Jerusalem to attack Ibrahim Pasha there. Ibrahim Pasha came out with his troops and defeated them. The rebels then resorted to a policy of launching surprise attacks to wear down Ibrahim Pasha and his troops. But he was able to defeat them three times at Bethlehem, Bait Jala and Bait Sahur. The rebels, however, were still in control of roads, and they managed to prevent supplies from reaching Ibrahim Pasha. Under increasing pressure, Ibrahim Pasha, at the insistence of the heads of the monasteries, agreed to waive the *farda* and accept money in lieu of military service. Before leaving Jerusalem on 20 June 1834, he entrusted its government to Shaikh Qasim al-Ahmad.

Strengthened by the arrival of his father, Muhammad 'Ali, from Egypt at the head of fresh troops, Ibrahim Pasha undertook the pacification of Palestine. He defeated the rebels and eliminated their chiefs in the regions of Jerusalem, Hebron, Nablus and Karak. The revolt had already spread to the Hauran and Jabal al-Duruz in southern Syria and to the 'Alawi/Nusairiyya mountain in western Syria. Ibrahim Pasha managed to suppress the rebels in all these places.¹²

When the international situation changed and the European powers, notably Britain, began in earnest to support the sultan against Muhammad 'Ali, the latter, abiding by the decisions of the London conference of July 1840, began to withdraw from Syria. The bulk of the Egyptian garrison in Jerusalem withdrew on 26 October, and the Ottoman army regained the city on 22 December 1840.

The Ottomans were able to restore stability to the

¹² For more details on the revolts, see Spyridon 1938: 80-120; Rustum 1938: 54-82; Anon. 1918, 'Translation of a Letter (dated Jerusalem 16th July 1834) in an old Welsh Magazine vol. XII (1835), by an Unknown Welsh Traveller', *PEF Quarterly Statement*, 142-3; E Finn 1879: 35-7; Macalister and Masterman 1906: 37-40; see also Anon. 1925 *Mudhakkirat Tarikhiyya*, 95-120; Rustam 1930-4, 2: 131-8; Qara'li 1937: 42-50.

northern and coastal regions of Palestine, but they failed to do the same in the highlands of Jerusalem, Nablus and Hebron. A revolutionary tradition had already established itself in those regions among the various clans who were ready to fight each other if they could not fight the state. Qaisi-Yemeni factionalism divided them, setting village against village and quarter against quarter in the same town. The Qaisis were known by their red banner and the Yemenis by their white banner.¹³ Tribal factionalism inherent in the early history of the local clans found the right milieu to persist and grow in the hilly regions of Palestine where geography, culture and economy kept these divisions and rivalries alive. Olive trees many decades old constituted the main revenue for the local inhabitants, were the major victims in the inter-factional wars.

To stabilise the situation, the Ottomans reverted to their traditional policy of recognising the chieftains who had proven their ability to survive and to lead. Thus they recognised Shaikh Mustafa Abu Ghosh, a Yemeni chieftain, as governor over the hilly region of Jerusalem, and also entrusted him with securing the roads leading to Jerusalem. A Qaisi rival, Shaikh 'Abd al-Rahman 'Amru, was made governor and tax farmer of Jabal al-Khalil (Macalister and Masterman 1906: 40-50).

The clans who predominated in the region of Jerusalem belonged to the Bani Hasan tribe which controlled about ten villages. Their main centre was in the village of Qalaja. To the north east of Bani Hasan were the Bani Malik who controlled about twenty villages. One of their major families were the Abu Ghosh, headed at the time by Mustafa Abu Ghosh whose centre was in Qaryat al-'Inab. To the east of Jerusalem, in the region of al-Wadiya, the 'Uraiqtat family predominated. Their chieftain was Shaikh Muhammad 'Uraiqtat, their main centre was in the village of Abu Dis and they controlled eight villages.

In the mountain of Jerusalem (Jabal al-Quds), which includes Jerusalem itself, four families predominated: the family of 'Abd al-Latif Samhan al-Kuswani centred in the village of Bait Iksa, the family of Ahmad 'Ali in the village of Dair Dibwan, the family of Hasan 'Abdallah in the village of Bait 'Anyā ('Aizariyya) and the family of 'Umar al-Shamma' in the village of al-Birah. To the north of Jerusalem, the region of Bani Harith was divided into two parts: Northern Bani Harith (Banu Harith al-Shamaliyya), where the Samhan family predominated and whose chief Shaikh Isma'il was killed by Ibrahim Pasha in 1834, and Southern Bani Harith (Banu Harith al-Janubiyya or al-Qibliyya) dominated by the Qa'raha family. Next to Northern Bani Harith were the Bani Murrah family, and to the east of them were the Bani Sulaiman family. To the north of Northern Bani Harith

were the Bani Zaid family to whom the wealthy and cultured Barghuthi family belong.¹⁴

There is some ambiguity in the available printed sources as to the exact administrative status of the *sanjaq* of Jerusalem, its composition and its relationship with the provinces of Damascus and of Sidon and also with Istanbul following the resumption of Ottoman rule in 1840. According to one source, the *liwa'* (*sanjaq*) of Jerusalem, consisting of the *qada's* of Jerusalem, Jaffa and Hebron, was attached to the province of Sidon until 1864 when the province of Syria was created and the *liwa'* of Jerusalem was included in it. In 1852 to 1855, the *liwa'* of Jerusalem was attached to the province of Damascus. In 1874 and until the end of Ottoman rule, according to this source, the *liwa'* of Jerusalem was made into a *mutasarrifate* consisting of the *qada's* of Jerusalem, Jaffa, Hebron and Gaza and was attached directly to Istanbul ('Abd al-Aziz 'Awad 1983: 10-12). Another source states that the *sanjaq* of Jerusalem was enlarged to include the *sanjaq* of Gaza-Jaffa and in early 1842 the *sanjaq* of Nablus as well (the first permanently and the second until 1858). It also mentions that the *sanjaq* of Jerusalem was separated from Damascus and put under the governor of Sidon. After that, according to this source, and until the fall of the Ottoman empire, the governors of Jerusalem were on the whole appointed directly by the central government (Abu-Manneh 1990: 8-10). Still another source mentions that in 1841 Jerusalem was made a district dependent directly on the centre (Gerber 1985: 6). A later source quoting others concludes that at times, as in 1841-54, Jerusalem was even placed directly under the Porte for short periods (Schölch 1993: 13).

There is no doubt that the *sanjaq* of Jerusalem was enlarged in 1841 to include the districts of Jaffa, Gaza and, for a short period, Nablus. This was part of the administrative reorganisation of certain regions in the Ottoman empire, like Mount Lebanon, which occurred in the early years of the Tanzimat period (1839-76). It was apparently at this time that the title of the governor of Jerusalem was changed from *mutasallim* (deputy) to *mutasarrif* (provincial governor). It is not clear, however, whether the governor of Jerusalem was at the time under the jurisdiction of the governor of Sidon or of Damascus, or whether he was directly answerable to Istanbul. A register from the court records of Gaza, found in the Damascus archives, which covers the period between 1273-7/1857-61, suggests that an *eyalet* (province) was established in Jerusalem at the time. It quotes an order dated 12 Jumada II 1273/7 February 1857 by the Jerusalem governor Isma'il Kamil Pasha emanating from the *divan* of 'our *mutasarrifate* the *eyalet* of Jerusalem, Nablus and Gaza'

¹³ For Qaisi-Yemeni rivalry in Palestine, see Haddad 1921: 209-14; Hoexter 1973: 249-311.

¹⁴ For more details about these families, see Macalister and Masterman 1905: 353-5; see also the recent study by Abu-Manneh 1990: 1-44.

(*min diwan mutasarrifiyyatina eyalet Quds Sharif wa-Nablus wa-Ghazza*). Governor Mustafa Pasha Thurayya, who succeeded Isma'il Kamil Pasha, referred to himself as *mutasarrif* of Jerusalem and *wali al-alwiya* (governor of the *liwa's*, meaning Nablus and Gaza under the jurisdiction of the governor of Jerusalem).¹⁵

The inclusion of Gaza, Jaffa, and, for a short period, Nablus within the jurisdiction of the governor of Jerusalem was not paralleled by the establishment of the governor's authority in these areas. The Swiss traveller Felix Bovet, who arrived in Jerusalem on 28 March 1858 by way of Jaffa and Ramla, describes the lack of security on the roads. Besides the Abu Ghosh, there were a number of local rebels who also attacked the caravans (Bovet 1895: 151). Apparently because of this chaotic situation, the *sanjaq* of Jerusalem was eventually attached to the newly-created province of Syria in 1864. This administrative arrangement continued until 1873, when the *sanjaq* of Jerusalem became independent and answerable directly to Istanbul.

In the *Salname* (official yearbook) of the province of Syria from 1288/1871-2, some two years before Jerusalem was made an independent *mutasarrifate*, the *sanjaq* of Jerusalem consisted of the following administrative divisions: the *qada'* of Jerusalem, encompassing the city of Jerusalem and the *nahiyas* (each *nahiya* is composed of several villages) of Bani Zaid, Bani Murra and Bani Salim, Bani Malik, Bani Hasan, Wadiya (including Bethlehem), Bani Haritha North and Bani Haritha South, and Jabal al-Quds; the *qada'* of Gaza composed of the city of Gaza and the *nahiyas* of Khan Yunus, Majdal and Gaza; the *qada'* of Jaffa made up of the city of Jaffa and the *nahiyas* of Jaffa and Lydda and the city of Lydda, and also the *nahiyas* of Ramla and the city of Ramla; and the *qada'* of Khalil (Hebron) consisting of the city of Khalil and the *nahiyas* of Khalil, 'Amama, Bait Jibrin and 'Arqub (Schölch 1993: 20-3). The total number of the inhabitants of the whole *sanjaq* or *liwa'* of Jerusalem according to this *Salname* was 186,642 (Schölch 1993: 17; see also *Salname* 1288/1871-2 *Daf'a* 3: 149-68).

In 1873 the *sanjaq* of Jerusalem was made into a separate *sanjaq* or *mutasarrifate* attached directly to Istanbul.¹⁶ This arrangement, similar to the arrangement already made for Mount Lebanon in 1861 and 1864,

continued until the British occupation of Palestine in 1917. The limits and the administrative divisions of the new *mutasarrifate* of Jerusalem, according to the *Salnames* of the late 19th and early 20th century, differ from the past divisions. They also changed periodically in matters of detail regarding the number of villages, towns and farms in each *qada'*. However, the *mutasarrifate* of Jerusalem consisted for most of the period of the *sanjaq* of Jerusalem (Quds Sharif), as the centre of the *mutasarrifate*, and the *qada's* of Jaffa, Bi'r Sab', Gaza and Khalil.

In the general *Salname* (*Salname 'umumi*) of the Ottoman empire of 1323/1905-6, the *sanjaq* (*mutasarrifate*) of Jerusalem consisted of 5 *qada's*: the *qada'* of Jerusalem which had 126 villages and farms and 4 *nahiyas* (Bethlehem, Ramallah, Safa and 'Ibwin); the *qada'* of Jaffa which had 126 villages and farms and 2 *nahiyas* (Ramla and Na'lin); the *qada'* of Bi'r al-Sab' which consisted of 5 tribes (the 'Azazima, Tayyaha, Jabarat, Tarrabin and Hanajira); the *qada'* of Gaza which included 75 villages and farms and 3 *nahiyas* (Majdal, Faluja and Khan Yunus); and the *qada'* of Khalil made up of 25 villages and farms and 2 *nahiyas* (Bait Tab and Bait Jibrin). The total for the *sanjaq* of Jerusalem is 5 Bedouin tribes, 407 villages and farms, 11 *nahiyas* and 5 *qada's*.

Six years later, in the *Salname 'umumi* of 1329/1911, the *sanjaq* of Jerusalem had different numbers: the *qada'* of Jerusalem now has 9 Bedouin tribes attached to it, where none were mentioned before, 120 villages and farms (6 less than before) and 5 *nahiyas* (Jericho—Ariha—is now added); the *qada'* of Jaffa has 95 villages and farms (31 less than before) and 2 *nahiyas*; the *qada'* of Bi'r al-Sab' has 5 Bedouin tribes (as before) and 2 new *nahiyas*: Hafir and Malaiha; the *qada'* of Gaza has 62 villages and farms (13 less than before) and 3 *nahiyas* (as before); and the *qada'* of Khalil has 62 villages and farms (10 more than before) and 2 *nahiyas* (the same as before). The total is 14 Bedouin tribes (9 tribes more than before), 339 villages and farms (68 less than before), 14 *nahiyas* (3 more than before) and 4 *qada's* (the same as before). Thus there was an increase in the number of tribes and *nahiyas* and a decrease in the number of villages and farms. All this indicates more centralisation and control and fewer rural centres and farms.

Within Jerusalem four families of notables—the Husainis, the 'Alamis, the Nashashibis and the Khalidis—figured in the various councils in the city and occupied top religious positions. The position of Hanafi *mufti* was monopolised by the Husainis and that of Naqib al-Ashraf by the 'Alamis. The Khalidis began their administrative career as secretaries in the courts. One of their members, Yusuf al-Khalidi, was appointed head of the municipality (mayor) after this institution was established in Jerusalem in the early 1860s. Later on, members of the Husaini, 'Alami and Dajani families shared with the Khalidis the appointment to this prestigious office. The city council of

¹⁵ Rafeq 1980; Law Court Register of Gaza (in the Damascus Archives) 12, case dated 12 Jumada II 1273/7 February 1857, cf. p. 59.

¹⁶ Some authors mention the year as 1874. Al-Qasatli 1876: 3 gives the date as 1873. Qasatli was well informed and was employed by the Palestine Exploration Fund expedition in Palestine; Abu-Manneh 1990: 43, n. 189, gives the date as 1872 and faults Schölch for giving the date as 1874. Apparently Schölch was quoting 'Awad 1983: 10. Schölch later repeated the 1874 date (1988: 79-80).

Jerusalem in 1908 was composed of ten members; according to Schölch, six of the members were Muslim, two were Christians and two were Jews (Schölch 1990: 228-48, see especially 239-40).

Factionalism, however, divided the notables in Jerusalem as it did in the countryside. The Husainis and the Nashashibis, for instance, were Yemenis; the 'Alamis and the Khalidis were Qaisis. Factionalism indeed went beyond Jerusalem and the Qaisi-Yemeni rivalry, cutting across city and countryside. But the Ottoman state in its drive for more centralisation was able to control the notables through their appointment to the municipality, the administrative positions, and even to the general council of representatives that was established in Jerusalem in 1913 (Schölch 1990: 24-41).¹⁷

European influence reached its peak in Jerusalem in the 19th century. Between 1838 and 1857, eight states established consulates in Jerusalem. These were Britain in 1838, Prussia in 1842, Sardinia and France in 1843, Austria in 1847, Spain in 1854, America in 1856 and Russia in 1857 (Schölch 1990: 224). In the *Salname* of 1312/1894-5, two more European countries, Greece and Portugal, are mentioned as having consuls in Jerusalem. The consuls of Prussia and Sardinia, after the unification of Germany and Italy by these two states, became the consuls of Germany and Italy respectively. Other states, like Sweden, Norway, Belgium, Denmark, Holland, Rumania and Brazil had deputy consuls in either Acre, Jaffa or Haifa (*Salname 'umumi* AH 1312: 952-72).

Most of the Oriental Christians had patriarchs in Jerusalem. The Ottomans traditionally recognised as *millets* (defined groups with a large degree of internal autonomy over the personal status of their members) the Greek Orthodox, the Gregorian Armenians and the Jews. European missionaries and churches were already established in Jerusalem, such as the Latins, the Franciscans, the Anglicans and the Presbyterians. Under European pressure, the Ottoman sultan recognised in the 1840s and the 1850s the Oriental Catholic and Protestant churches which had split from the local mother churches over the previous two centuries.

European royalty highlighted the growing interest of Europe in Jerusalem and the Holy Land in general by paying several visits to the country in the course of the 19th century. The most important of these visits was that by the German Kaiser Wilhelm II in late 1898. He visited Jerusalem and other places in Palestine as well as Damascus (for details of his visit see al-Aswad 1901: 97-136). The German Protestant Church of the Redeemer in Jerusalem was consecrated in the presence of the German emperor in 1898 (Schölch 1990: 233). Wilhelm II visited the German colonies of the Templars, one of which was

established to the south west of Jerusalem in 1873. In 1882, 257 persons lived in the Jerusalem colony, mainly craftsmen and their families. Three Templars' colonies had already been established—one in Haifa and another in Jaffa in 1869, and a third in Sarona in 1871 (Schölch 1990: 235). The Templars, according to Schölch, were 'a pietistic sect from Württemberg', who had set for themselves the goal of 'bringing together the people of God' in Jerusalem. They declared their principles in 1861 stating that 'The mind of the German nation should be directed toward the building of the Templars in Jerusalem and the occupation of Palestine' (Schölch 1993: 73; see also Schölch 1982: 82).

The Russians had their own establishments on the outskirts of Jerusalem. On 14 December 1872, the French traveller de Vogüé paid a visit to these establishments where the Russian consul had his residence. The establishments, built by Russian contributions, included a sixty-bed hospital, a pharmacy, a guesthouse catering for poor Russian pilgrims, and a church and annexes. De Vogüé refers to this complex as '*la Petite Cité Moscovite*' (al-Qasatli ms. 1874-5, 2: 5). The French also had their own buildings in Jerusalem. These included in 1880, according to the French traveller Gabriel Charmes who visited the city that year, a hospital and three vocational schools. He also refers to the French-based Alliance Israélite which opened, for the benefit of the Jewish community, hospitals, schools and houses for the elderly. He comments that this activity was opposed by the conservative Jews (Charmes 1891: 151-3).

Industrial Europe dominated the markets of the Middle East, indeed the world, with its highly competitive goods. Local manufactures suffered tremendously from this competition. European goods found their way into the interior largely through the port of Jaffa. In imitation of the Beirut-Damascus carriage road inaugurated in 1863, a carriage road linking Jaffa to Jerusalem was built in 1868 at the initiative of the Ottoman government. It cost more than ten times the cost of the Beirut-Damascus road, according to the French traveller Gabriel Charmes, because of the nature of the terrain and its topography (Charmes 1891: 151-3). It was primarily intended to facilitate the transport of an increasing number of foreign pilgrims visiting Jerusalem. In 1868, 12,000 pilgrims used this road. Their nationalities were as follows: Greeks 3,000, Americans 2,000, Russians 1,000, Jews 2,500, locals 2,500, and Turks 1,000. Non-pilgrims using the road amounted to 600 of whom 250 were Americans, 250 English and 100 of other nationalities.¹⁸ The road was badly built and had to be repaired at short intervals later on. The road was followed by the building of a railway connecting Jaffa with Jerusalem. The concession to build the railway was given to a French Company, Sociétés des Travaux Publiques et

¹⁷ For a detailed study of the role of Jerusalem's notables, see Abu-Manneh 1990: 14-43.

Constructions à Paris. Work started on 31 March 1890 and was completed in the summer of 1892. On 27 August of that year, the first train arrived in Jerusalem.¹⁹ A telegraph line was extended between Jaffa and Jerusalem in 1865 (Schölch 1990: 236-7).

The building of the road and the railway between Jaffa and Jerusalem to facilitate the transport of the increasing numbers of pilgrims and passengers was paralleled by intensified building activity in Jerusalem to accommodate the growing number of inhabitants both legal and illegal. In the early 1780s, the French traveller Volney, who had access to consular statistics, estimated the number of Jerusalem's inhabitants at between 12,000 to 14,000 (Volney 1959: 334). Shortly afterwards, in 1797, the traveller W G Browne estimated the number of Jerusalem's inhabitants somewhere between 18,000 and 20,000 (Browne 1799: 360-4). A French military source gave the number of its inhabitants in 1799 as between 12,000 and 15,000 (Hauet 1801-6: 80-114). In 1858, the Swiss traveller Felix Bovet, quoting the Prussian consul in Jerusalem, estimated the number of Jerusalem's inhabitants at about 15,400, of whom 3,400 were Christians, 5,000 were Muslims, and 7,000 were Jews. Fourteen years later, towards the end of 1872, the French traveller de Vogüé gave the number of the inhabitants of Jerusalem as 26,000, of whom the Jews counted for 14,000, the Christians between 7,000 to 8,000 and the Muslims between 4,000 and 5,000 (de Vogüé 1922: 210-13, 232-5). In 1874, the Damascene traveller and member of the Palestine Exploration Fund's expedition in Palestine, Nu'man al-Qasatli, estimated the population of Jerusalem at 40,000 inhabitants of whom 6,000 were Muslim, 12,000 Christian, and 22,000 Jewish. He also says that out of the 40,000 inhabitants, about 5,000 to 6,000 were living outside the walls of the city (al-Qasatli ms. 1874-5, 2: 5). These figures clearly indicate the

growth of Jerusalem's population, the building activity that was going on to accommodate these people, and the high rate of increase in the Jewish population.

If the figures below are compared with the figures given in the Ottoman sources, a clearer demographic and political picture emerges. According to the *Salname* of 1288/1871-2, the number of Muslims and non-Muslims in the *qada'* comprising the *sanjaq* of Jerusalem are as shown in Table 1.1.

The first Ottoman census of 1893 breaks down the population in the *sanjaq* of Jerusalem as shown in Table 1.1b.

The percentage of Muslims in the *qada'* of Jerusalem amounts to 67.06 per cent, Christians 24.06 per cent and Jews 8.76 per cent. The percentage of Muslims in the *sanjaq* of Jerusalem as a whole is 85.02 per cent, Christians 10.88 per cent and Jews 3.45 per cent. Despite its shortcomings, the Ottoman census was based on official records kept by the administration. It certainly did not take into account the illegal infiltration of Europeans, mostly Jews, into the city.

Two years before the Ottoman census in 1893, the American consul in Jerusalem, S Merrill, conducted a search to establish the actual number of Jews in the various cities of Palestine. He contacted Jewish organisations, heads of colonies, school principals, hospitals, hospices and houses for the elderly, and consuls providing protection to Jews. The number of Jews he arrived at for the city of Jerusalem was 25,322.²⁰ In the Ottoman census of 1893, the total number of Jews in the whole *qada'* of Jerusalem, meaning the city and the *nahiyas* attached to it, was a mere 7,105. The actual number of Jews, according to the American Consul's estimation, is thus 3.56 times their official number—an indication of the influx of Jews in their thousands into Jerusalem and its dependencies. Qasatli had estimated the number of Jews in Jerusalem in 1875 at

¹⁹ NAW M453 R4, Jerusalem, 14 August 1890, Jerusalem, 23 September 1890, Jerusalem, 5 September 1892, Jerusalem, 24 October 1892, see also R5, Jerusalem, 17 March 1902.

²⁰ NAW M453 R4, 'Report on the Jews and Jewish Colonies in Palestine', Jerusalem, 30 October 1891.

22,000 out of a total population of 40,000 for the whole city. This is a closer approximation to the figure given by the American consul in 1891. Qasatli also predicted that in a short time the population of Jerusalem would increase tremendously due to the immigration of Jews into the country from all over the world (al-Qasatli ms. II 5).

As early as the 1850s, the Ottomans had taken precautions to control the selling of property to foreigners in Palestine. An order from the governor of Jerusalem to the judge of Gaza, Sayyid Mustafa Efendi 'Alami Zadeh, dated 2 Jumada II 1275/7 January 1859, urges him to scrutinise the identity of the buyer of property to ascertain that he is an Ottoman subject. If he is a Christian, the order says, then the head of his religious community has to establish his identity. The judge was also asked to make sure that the property on sale had no legal impediment preventing it being sold (Rafeq 1980: 41; Law Court Register of Gaza, case dated 2 Jumada II 1275/7 January 1859). Although the Jews were not referred to in the order, the citing of a Christian was meant as an example. The Jews had the advantage of acquiring the citizenship of foreign countries which gave them immunity from Ottoman prosecution by virtue of the capitulations granted by the Ottomans to these countries at different times. In 1877, for example, there was a total of 1,416 Austro-Hungarian nationals in Jerusalem, Hebron (Khalil) and Jaffa of whom the overwhelming majority were Jews (Schölch 1993: 120). This assumed nationality worked well for the Jews, as attested in the court records of Palestine, when they bought property as foreign nationals; for the Ottoman government had issued a law in 1867 giving the nationals of England, France, Austria, Belgium, Sweden and Norway the right to buy property in the Ottoman empire.²¹

The increasing number of Jews in Jerusalem enabled them to dominate trade, the property market and the building industry. The municipality in Jerusalem issued, between March and August 1882, 15 permits for the restoration of houses, 63 permits for enlarging existing houses and 65 permits for building new houses. Two-thirds of all the permits were issued to Jews receiving aid money from abroad (NAW M453 Jerusalem 16 December 1886).

Many of the Jews in Jerusalem before 1882 were of Russian origin who stayed there during the Crimean War (1854-6) between Russia and the Ottoman empire and its allies. The Russians lost their right to return because they had stayed outside Russia for more than the five-year validity of their passports. The American Jews in Jerusalem protested to the American consul in 1879 against giving American money to the poor Jews from Russia, Austria and Germany who in Jerusalem numbered about 10,000 out of a total of 15,000 at the time (NAW M453 Jerusalem

15 March 1879).

The year 1882 is taken as the dividing line between two epochs in regard to the intensity of Jewish immigration to Palestine. The first wave of Jewish immigrants, the so-called '*aliya* (ascent to Zion) from Russia, reached Palestine in 1882. Thus an Askhenazi concentration of Jews was added to the Oriental and Sephardic Jews in Palestine. The first '*aliya* brought about 20,000 to 30,000 Jews, mostly Russians, to Palestine in the period between 1882 and 1903. The second '*aliya* (1905-14), in the wake of the failure of the 1905 revolution in Russia, brought about 25,000 Jews to Palestine. Other '*aliyas* occurred later on, bringing Jews mostly from Eastern Europe and Germany to Palestine.

The Ottoman empire under Sultan 'Abd al-Hamid II (1876-1909) officially opposed the immigration of Jews to Palestine, fearing the creation of yet another national problem for the already battered empire which was suffering from nationalism in the Balkans and among the Arabs. Pressured by the European powers, the Ottoman government in 1888 allowed Jewish individuals, not Jewish mass immigrants, to settle in Palestine. Since the Jews were buying property rather easily, largely from Arab and non-Arab absentee landowners, the Ottoman government ordered an end to the sale of land to Jews. A year later, however, the Jews were allowed to buy land as individuals, provided they had entered Palestine legally (NAW M453 R5 Jerusalem 12 August 1893). In the meantime, Theodor Herzl was sending emissaries to Sultan 'Abd al-Hamid, and also met with him in person, promising to write off the Ottoman debt to Europe if the sultan would agree to the establishment of a Jewish state in Palestine. The sultan refused, but no effective measures were taken by the Ottoman administration to stop the flow of Jewish immigrants into Palestine and their purchase of property.²² The convening by Theodor Herzl of the first Zionist conference in Basle in Switzerland in 1897, which proposed the establishment of a Jewish state in Palestine and the formation of the World Zionist Organization to implement it, alarmed Arab intellectuals in Palestine, in Istanbul and abroad. The Young Turks who came to power in the Ottoman empire in 1909 proved to be ineffective in dealing with the Palestine issue.

The British occupation of Palestine in 1917, the issue by the British government of the Balfour Declaration on 2 November 1917, promising the establishment of a national home for the Jews in Palestine, and the withdrawal of the Ottomans from Syria in October 1918 put the Arabs, the Jews and the British in the forefront of events. Jerusalem was and continues to be not only the concern of Muslims, Christians and Jews but the conscience and responsibility of humanity at large.

Chapter 2

THE LEADING INTELLECTUALS OF LATE OTTOMAN JERUSALEM AND THEIR BIOGRAPHIES

Khairia Kasmieh

Introduction

The object of this study is to introduce some eminent figures in the intellectual life of Jerusalem in the late Ottoman period. To a certain extent, my intention is to revise the conventional image of a cultural desert at this time. It would seem advisable, before we review the biographies of these figures and before we sum up their intellectual achievements, to clarify two dimensions of our subject—those of place and time.

As to the first of these, Jerusalem is unique in its status among the cities of the world because of its spiritual wealth. It is the focus (*qibla*) of three major religions. Jerusalem, as the third holiest city in Islam, was held in special reverence by the Ottoman sultans (Abu-Manneh 1990: 3).

The rise of Jerusalem under the Ottomans was not due to its importance in the realms of commerce, finance or communications—it was, rather, a function of the various and growing religious and political interests focused on the city. From the time of Egyptian rule (1831–40) its development reflected the rhythm of the interaction between Ottoman policies, European penetration and the response of the regions (Schölch 1989: 228, 230). As a result of the Ottoman Tanzimat policies there was a marked change in the political life in Jerusalem. One factor was the establishment of a municipal council (*majlis baladi*) in 1863 (Dabbagh 1975: 201). The important role of this council throws light on the rise of Jerusalem from a local perspective (Abu-Manneh 1990: 39–40).

European penetration of Jerusalem (and of

Palestine in general) took place on two interconnected levels: the ‘state level’ of diplomatic activity of the Great Powers, and the level of various churches, associations, movements and groups. In this way, Jerusalem became an arena for contemporary European rivalries (Schölch 1988: 42–59).

In order to counter-balance this European activity, the Porte tightened its own control over Jerusalem. In 1874 the *sanjaq* of Jerusalem became independent and its governor was made directly responsible to Istanbul (Dabbagh 1975: 42). One of the most important administrative developments of the late 19th century was the emergence of Jerusalem as a major administrative centre with a privileged status in Bilad al-Sham, and in a sense as the capital of Palestine, becoming identifiable as a political administrative entity beneath the fluctuating Ottoman divisions (Schölch 1989: 228).

The second aspect—that of time—is also important. A study of intellectual life in Jerusalem during the late Ottoman period must include a descriptive assessment of the cultural environment of Syria in general and of Palestine in particular. Palestine was historically not an independent unit within the region defined by Arab geography as ‘Bilad al-Sham’, for it is impossible to set up barriers that separate its culture from that of the neighbouring areas; they have many elements in common. If there are any apparent differences between them, they are a matter of detail only.

Palestine was experiencing the same social, economic and cultural changes that affected the whole region in the late 19th and early 20th centuries (R Khalidi

1991: 57). These cultural changes were manifested in many different ways:¹

(a) Scholarly writings about language, literature and history. The group of Arab scholars who emerged at this time rediscovered the classical Arab literary heritage. Most of their views, which emphasised Arabic rather than Islamic culture, were obviously secular in nature (Abu-Manneh 1990: 42).

(b) There was also a rapid spread of missionary education, both private and state-sponsored. The educational institutions varied a great deal in their standards and their socio-political orientations. The rich and the class of notables clearly had greater access to education (Tibawi 1956: 21) but poor students of merit and members of non-notable classes also had a far greater chance of obtaining an education than ever before. This marked the beginning of a broadening of the 'élite' and the inclusion among its ranks of other classes in prominent roles (R Khalidi 1991: 65-6). The Christian Arabs were at first more vulnerable to Western influence than the Muslims (Tibawi 1956: 21). By the beginning of the 20th century, the competing Western school system had succeeded in attracting both Christian and Muslim Arab students (T Khalidi 1981: 61-2). Furthermore, the colleges in Cairo, Beirut and Istanbul were attracting increasing numbers of Palestinian students (al-Asad 1970: 18).

(c) A large number of Arabic newspapers and journals were to appear in Palestine—as in the whole region—after the restoration of the constitution in 1908, and these offered a free forum for the expression of all points of view (T Khalidi 1981: 63). They tried both to foster the greatness of Arab cultural achievement and to disseminate the best scientific and literary thought of the West. At the same time they evolved a modern Arabic style suitable for the expression of Western ideas (Abu Ghazaleh 1972: 5).

It is from this period also that Zionism began to attract the attention of Palestinian journalists (Lesch 1977: 285-6). On the eve of the First World War, the Arabic press in Palestine, as well as in cities like Cairo and Beirut, had become fully alive to the dangers of the Zionist programme.²

These developments in the cultural life of Palestine and her neighbours failed to convince the traditional establishment of the importance of change. Consequently a kind of cultural dualism created a gap between two groups of people who were quite different in their approach. The first of these represented people who had been educated in the traditional way; they called for a

return to heritage, *al-turath*, stood by its essential tenets and advocated teaching it to the new generation. The other group represented intellectuals who had acquired modern culture (as well as full knowledge of *al-turath*); they considered Western ideas and trends an aid in their desire to catch up with the march of progressive civilisation ('Abbas 1990: 17).

The figures who have been selected for this study from among the many representatives of the intellectual élite in Jerusalem during the late Ottoman period all belong to the second of these groups. Their education was multifaceted and followed diverse paths. It was seldom that any of them specialised in one sole intellectual field. I found it difficult for two reasons to make a choice among the possible candidates to act as representatives.

Firstly, it is almost impossible to draw distinct borders between Jerusalem and the neighbouring areas. The cultural source for many of these people was in institutions and universities outside Jerusalem, and this inevitably had an effect on their work. Some came to Jerusalem from different districts, but most of their output was within the Holy City. Others worked, contributed and settled abroad in search of wider fields for their intellectual development, and this altered the outlook which they had acquired from their initial cultural roots.

Secondly, it is quite difficult to make a temporal distinction between this period and the one that follows. Very few of the intellectuals chosen here had stopped production by the end of our period; many completed their life's work following the maturing of their views and the adjustment of their development in accordance with changes in political circumstances. Any study of their contribution during the period must therefore be in a sense insufficient. And this is the reason that some names who might have been expected to appear here have been omitted—by this stage, their output had not yet reached any great significance.

Yusuf Diya' al-Din al-Khalidi
(*b. Jerusalem 1842; d. Jerusalem 1906*)³

Born into one of the most prominent families of 19th-century Jerusalem, Yusuf was a unique figure in a city which was heading towards a new future under the impact of the Tanzimat policy. He acquired a kind of education that was different from that of other young men of his age and station. First he studied at an Anglican school (established by Bishop Gobat) in Jerusalem, then for two years at the Protestant College at Malta, and then for a short time at Robert College in Istanbul before returning

¹ For factors and manifestations of the Arab cultural revival, see Abu Ghazaleh 1972: 24; see also Zaidan 1922, vol. 4, for a general view of the modern awakening.

² For a full account of Arab reaction, see Kasmieh 1973: ch. 4.

³ Al-Asad 1958: 30; W Khalidi 1971: 31-90; Dabbagh 1975: 359, 361; *Palestinian Encyclopaedia* 1984, vol. 4: 653; Schölch 1989: 241-5; Yaghi 1968: 329, 579; al-Zirikli 1979, vol. 8: 245.

home. With such a cultural background, it is not surprising that Yusuf was well acquainted with foreign languages and was deeply aware of European penetration. The strength to face this had to be acquired through a modern education and an intellectual regeneration.

A supporter of reform policy (*islah*), he was appointed mayor (*ra'is al-baladiyya*) of Jerusalem in 1867, despite his comparative youth. He remained in this post for six years, devoting all his energies to this new task. Early in 1874, he was called by the foreign minister to Istanbul to serve in the Porte's translation bureau, and then as Ottoman consul in Poti on the Black Sea. He returned to Jerusalem to resume his function as mayor.

Early in 1877 Yusuf was elected to represent the *sanjaq* in the first Ottoman parliament (1877/8). In Istanbul, Yusuf became an ardent defender of the constitution against arbitrary measures by the sultan. He demanded a new political philosophy, at the centre of which he placed the concepts of freedom, patriotism and a sense of duty. The political trend to which Yusuf belonged shows his adherence to the idea of *islah*. He remained a liberal and loyal Ottoman reformer. The American consul general in Istanbul at the time observed that Yusuf was almost 'as liberal as a French republican both in politics and religion'.

As one of the leaders of the opposition he had to leave the capital following the dissolution of parliament. He reached Vienna where he accepted a position as teacher of Arabic and Ottoman Turkish at the Oriental Academy. A little later he held several administrative posts in various Syrian and Anatolian districts.

Yusuf al-Khalidi was one of the first Arab intellectuals to become aware of the Zionist problem. He wrote a letter in 1899 to the French Rabbi Zadok Khan, who was an acquaintance of Herzl. He implored the Zionists to leave Palestine in peace. If they insisted on their programme, he predicted a popular movement against the Jews which nobody would be able to quell.

All contemporaries of Yusuf Diya' acknowledged his literary culture and his aptitude for languages. Whenever he took up a post in a foreign country, he soon mastered its language. He wrote a book about the grammar of the Kurdish language entitled *al-Hadiyya al-Hamidiyya fi 'l-Lugha al-Kurdiyya* ('The Hamidian Gift in the Kurdish Language'), which was published in 1903.

In 1880 he edited and published in Vienna a collection of poems by the pre-Islamic poet Labid ibn Rabi'a. As a postscript to the edition Yusuf Diya' added some remarks which shed light on his own views: 'We have a strong hope that the Arabs will soon be restored to their place among the leading civilised nations ...' He thanked the European orientalists for their translation of many Arabic books into European languages, hoping that their

example would arouse Arab zeal (*al-hamiyya al-'arabiyya*). He is considered one of the pioneers who collaborated with orientalists in work on manuscripts and this enterprise became a fundamental academic base for the revival of the Arabic language. He left a collection of memoirs and views called *Ana* ('I') as well as many lectures. With the support of a number of other intellectuals, he set up a literary market called Ukaz in Istanbul.

Nakhla Zuraiq
(b. Beirut 1861; d. Jerusalem 1920)⁴

Nakhla was educated first at his Orthodox community school and then at the school of Mu'allim Butrus al-Bustani. He also attended circles of scholars of the Arab cultural revival in Beirut. He mastered Arabic and learned some English. He came to Jerusalem in 1889 at the request of the Anglican missionaries to run a religious bookstore. In 1892 he was elected headmaster of Madrasat al-Shubban al-I'dadiyya (The Boys' Preparatory School—later known as the English College), where he was responsible for teaching Arabic. Al-Mu'allim Nakhla was extremely proud of the language and a great admirer of the eloquence and rhetoric of the Holy Qur'an. He also had wide knowledge of Arab Islamic literature, the Hadith, poetry, proverbs (*amthal*) and the ancient glories (*ayyam*) of the Arabs.

The name of Nakhla Zuraiq features among those of outstanding teachers who transmitted their pride in the treasures of classical Arab history and literature to their eager students. He was a figure who enjoyed enormous respect and affection from his many followers. He strove not only to instruct his pupils but to transform their lives in accordance with the idea of Arab *adab*. He compiled a collection of his students' verses which he printed in Jerusalem in 1903. His house in Jerusalem became a shrine for scholars and intellectuals who listened attentively to him while he lectured on literature, poetry, the Arabs and Arabism. His rich library was full of masterpieces in the fields of language, literature and history.

His career as a teacher did not allow him the space to write books himself; he was, however, given credit for reviving Arabic after a long silence at the *kuttab*. He was so proud of his Arabism that he chose to wear the traditional Arab *kufiyya* and *'uqal*, despising the fashion of imitating Western civilisation, despite his companionship and friendship with Europeans.

⁴ *Al-Kitab al-'Arabi al-Filastini* 1946: 55;22; al-Asad 1958: 55-7; al-'Awdat 1978: 234-6; T Khalidi 1981: 63; *Palestinian Encyclopaedia* 1984, vol. 4: 458.

Ruhi al-Khalidi
(b. Jerusalem 1864; d. Istanbul 1913)⁵

Ruhi was another scholar born into the well-known Jerusalem family. He received his education first at the *kuttab* and then at the government elementary school in Jerusalem. Later he joined the Rushdiyya School at Nablus, going from there to the higher secondary school in Tripoli.

After his return to Jerusalem, Ruhi attended classes at al-Aqsa Mosque where he studied jurisprudence, rhetoric, elocution and similar subjects. He also attended classes at the Alliance School and the Salahiyya School in order to become acquainted with different religions and foreign cultures.

He then went on to attend the Sultaniyya School in Beirut. He managed to get a place in Istanbul to join the Mulki Shahani (a higher institute for administrative and political studies) whose certificate he received in 1893. Because he frequented the Jamal al-Din al-Afghani circle in Istanbul, he was forced to leave Ottoman territory and went to France. He joined the political science school in Paris for three years, and then attended the Sorbonne where he studied philosophy, Islamic studies, and oriental literature. During this period he became familiar with various aspects of modern culture.

He was assigned to teach Arabic at the Foreign Languages Society in Paris, where he used to participate in scholarly seminars and conferences, to give lectures in Arabic and to explain oriental, Arabic and Islamic issues. In 1898 he was appointed consul general of the Ottoman empire in Bordeaux. In the meantime, he published articles in Arabic newspapers and journals in the Lebanon and in Egypt under the name of 'al-Maqdisi'.

In 1908, on the proclamation of the constitution, al-Khalidi was free to return to Jerusalem where he was elected deputy of his city in the Ottoman parliament and where he was chosen as the first vice-speaker. He was re-elected in 1912. After parliament was dissolved that same year, he visited Jerusalem briefly before returning to Istanbul, where he died at the age of fifty.

A study of Ruhi's biography and an analysis of his books and articles lead to the conclusion that he was both a prominent intellectual and a considerable writer. He was known for his love of knowledge and his eagerness to obtain it from many different sources. During his studies

he became acquainted with modern European culture in addition to his own mother tongue. His far-reaching scholarly interests were diverse and the range of topics in which he dealt was sweeping—history, politics, sociology, language, literature and criticism. His abundant works—articles, essays, lectures and books, some of which are still in manuscript form—are spiced with critical observations and personal views, usually derived from his own personal experience. His simple and symmetrical style reflects a deep concern for objective precision in the use of words.

Among his published work is *al-Muqaddima fi 'l-Mas'ala al-Sharqiyya* ('An Introduction to the Eastern Question'), where an account is given of the origins of the Eastern Question up to the second quarter of the 18th century. It is in fact a neo-Ibn Khaldunian *Muqaddima* in which the fate of the Ottoman empire is placed in the much older context of the pendulum of conflict between East and West. The work was originally presented as a lecture in Paris in 1897, and was only much later published in Jerusalem in 1925.

His other published work is *Ta'rikh 'Ilm al-adab 'inda 'l-afraj wa'l-'arab wa Victor Hugo* ('The History of Science of Literature among Europeans, Arabs and Victor Hugo'). The book contains an important series of comparisons between Arabic and European literature at intellectual, literary and, occasionally, doctrinal levels. Al-Khalidi's endeavours to present selected works of Victor Hugo provided Arab readers with an accurate translation of specimens of French literature. The work was originally a series of articles published in *al-Hilal* in 1902-3. It was then published as a separate book by al-Hilal Press in 1904 under the name of 'al-Maqdisi'. It was only in a later edition in 1912 that the true name of the author was revealed.

Ruhi's most prominent manuscripts were *'Ilm al-Alsina* ('Comparative Linguistics') and *al-Syunizm* ('The Zionist Question'). Both are in the possession of the Khalidi family. In his unpublished essay on Zionism, written between 1909 and 1912, Ruhi gives a sweeping and brilliant account of the history of the Jews, especially in Russia and the Ottoman empire, and his own observations on Zionist activity in the Ottoman capital in the late 19th century. He highlights the socio-economic factors in the rise of Zionism. He describes Herzl's role as one of transforming the 'Zionist question or the colonisation of Palestine' from its early origins as a charitable and agricultural movement to an economic and political one, and he ends by listing all Zionist establishments in Palestine. As a member of the Ottoman parliament, he was a consistent and forthright critic of Zionism, right up to the time of his death.

⁵ Al-Asad 1970; al-'Awdat 1976: 155; Dabbagh 1975: 363; Daghir 1955: 333-5; T Khalidi 1981: 70-2; W Khalidi 1990: 37-81; al-Khatib 1990: 346-54; *Palestinian Encyclopaedia* 1984, vol. 2: 491; Yaghi 1968: 527-32; al-Zirikli 1979, vol. 3: 34-5.

Bandali Saliba al-Jauzi
(b. Jerusalem 1871; d. Baku, USSR 1942)⁶

Born in Jerusalem, Bandali received his first education at the Orthodox Dair al-Musallaba School, and then at the Orthodox Kifteen School near Tripoli. He had mastered Arabic by the time he was seventeen. He left for Russia to study theology in Moscow but instead enrolled as a student of orientalist studies and Semitic languages at Kazan University near the River Volga, which had been founded in 1804 and was one of the many cultural establishments in the city. His research for his MA in 1899 was *Al-Mu'tazila—Historical and Scholastic Research into Islam*.

He was in due course appointed a professor of Arabic at Kazan University, and later nominated to the Chair of Arabic Language and Literature at the University of Baku, a port on the Caspian Sea. He remained there until his death, visiting his homeland three times in 1909, 1928 and 1930.

Al-Jauzi mastered many ancient and modern languages—Arabic, Syriac, Hebrew, Greek, French, German, English and Russian. He also produced early translations from German as well as books on teaching Russian and English to Arabs. Orientalists describe him as their 'fruitful source', calling him Pendéli. Together with other Palestinian intellectuals who were graduates of the Russian schools, Bandali worked hard to develop orientalism at the Russian universities and to present Arab culture in a Russian milieu. Al-Jauzi is considered a scholar in linguistics and an accurate historian and his work reflects his persistence and patience in collecting and investigating texts.

He published extensively both during this period and later in the Arabic press in Egypt and Syria, where he excited much attention for the novelty and profundity of his subject matter and its treatment. Where the East-West theme is concerned, his historical works, like those of Ruhi al-Khalidi, are of special merit. Among his works completed during our period in Arabic and Russian (all of which except the last were printed in Kazan) the following deserve special mention: *Al-Mu'tazila—Historical and Scholastic Research in Islam*, 1899; *Tuhfat al-'Arus fi Lughat al-Rus*, 1903 (a Russian dictionary); *Muhammad al-Makki and Muhammad al-Madini*, 1903; *The History of the Jerusalem Church*, 1910; *Mount Lebanon, its History and Present Status*, 1914; *Researches in the Qur'an*, 1914; *Muslims in Russia and their Future*, 1917.

Beyond our period, Bandali continued to write on

history and in particular the intellectual movements and civilisation of the Arab Muslims.

Khalil Baidas
(b. Nazareth 1875; d. Beirut 1949)⁷

Khalil Baidas received his elementary education at the Orthodox School in Nazareth. He then joined the Russian Teachers' Training Centre for Men in Nazareth in 1886. Following graduation in 1892, he was appointed headmaster of Russian elementary schools in many parts of Syria and Palestine. He was in particular interested in Arabic and trained a generation of Arab intellectuals. In 1908 he was transferred to Haifa.

Following the proclamation of the constitution, he founded the journal *al-Nafa'is al-'Asriyya* in Haifa and became widely known in cultural circles. Owing to his efficiency, the Arab Orthodox of northern Palestine selected him to represent them at the Combined Council of Arab Orthodox and Greek clergy which was charged to administer Orthodox community affairs in Jerusalem.

Baidas left the Orthodox School in Haifa and settled in Jerusalem, to which he transferred *al-Nafa'is al-'Asriyya* in 1911. It was printed at Dar al-Aitam al-Suriyya (the Syrian orphanage connected to the German Protestant mission). Baidas was in full control of *al-Nafa'is* technically, editing most of its contents himself. It became a mouthpiece for all active writers in Palestine, Syria, Lebanon and al-Mahjar, and was distributed widely in these countries. He turned *al-Nafa'is* into a distinguished institution, which benefited from the universal study of literary and scientific matters. The journal ceased production during the First World War, and then resumed publication for nine years during the Mandate period.

In Jerusalem, Baidas established a unique library of old manuscripts and valuable books. In addition he contributed to the Arab movement and wrote articles in *al-Ahram* and *al-Muqattam*, urging the Turks to treat the Arabs fairly. Once the Arab Revolt began, he was sentenced to death; he took refuge in the Orthodox Patriarchate in Jerusalem until British troops entered the city.

Khalil Baidas' education was on a solid basis of classical Arab culture. He made use of his Russian education to encourage knowledge of the Russian language and in particular Russian literature. He was also interested more generally in European culture as a whole, especially with its humanitarian and social aspects. He called for a

⁷ Abu al-Shabab 1990: 141-2; *al-Kitab al-'Arabi al-Filastini* 1946: 12, 17, 20, 22-3; al-Asad 1958: 64-5; al-'Awdat 1976: 67-70; Daghir 1955: 313-14; al-Khatib 1990: 354-6; Khuri 1976: 16; *Palestinian Encyclopaedia* 1984, vol. 2: 367; Yaghi 1968: 441-50, 452-6; al-Zirikli 1979, vol. 2I: 313.

comprehensive revival of modern culture. His activity was multi-faceted—literary journalism, translation of fiction and novels, educational textbooks, works on linguistics, presentation of the Russian language to Arab readers, Arab and European writers of history, and so on.

He had the specific effect of drawing readers' attention to the significance of narrative art from the intellectual, social and moral points of view. He laid down this specific aim in the preface to the first issue of *al-Nafa'is* with the statement that he considered novels to be one of the great pillars of civilisation in the enlightenment of the mind. Together with a number of other Palestinian interpreters, Baidas introduced the heroes of Russian literature—Pushkin, Tolstoy, Dostoevsky, Gorky and others—to the Arab reader. His technique in translation was peculiarly his own: he translated freely, adding or omitting until he achieved what he considered to be the basic aim of the novel, that which is derived from everyday life and human nature. His style tended to be naturally elegant, humorous and sarcastic.

His works during the period in question were prolific. As already stated, he began his literary career by translating from Russian, and in 1898 he published three Russian novels in Beirut—*Ibnat al-Qubtan* ('The Captain's Daughter'), *al-Quqazi al-Walhan* ('The Distracted Caucasian'), and *al-Tabib al-Hadhiq* ('The Skilled Physician'). That same year he also published in Lebanon a book on the history of ancient Russia and several educational books and textbooks on arithmetic.

After 1908 Baidas published a collection of novels translated from Russian in serial form either in *al-Nafa'is*, or at the end of each volume of his journal, or in their entirety. These included *Shaq'a al-Muluk* ('The Misery of Kings') published in 1908 and transposed from English into Russian, *Ahwal al-Istibdad* ('The Terrors of Totalitarianism') in 1909, *al-Hasna' al-Mutanakira* ('The Disguised Beauty') which had been translated into Russian from the Italian, and *Henry al-Thamin wa zawjatahu al-sadisa* ('Henry VIII and his Sixth Wife') in 1912-13, which had been translated into Russian from German.

His historical and educational books were *al-Tayaran* ('The History of Flight'), Cairo 1912, *Rihla ila Sina* ('Trip to Sinai') Beirut 1912, *Muluk al-Rus* ('The Kings of Russia') Jerusalem 1913, *Darajat al-hisab* ('Grades of Arithmetic') in 2 parts, Jerusalem 1914, *al-Qira'a* ('Grades of Reading') in 7 parts, 1913-21, *Umam al-Balkan* ('The Balkan States'), Jerusalem 1914.

Baidas' career both as translator and author continued during the Mandate period.

Khalil al-Sakakini
(b. Jerusalem 1878; d. Cairo 1953)⁸

Sakakini passed his earliest years in the Orthodox School in Jerusalem, after which he joined the Anglican School (GMS). Finally he went to the Boys' Preparatory School which was later to be known as the English College. Nakhla Zuraiq was his tutor in Arabic, and Khalil greatly admired him for his efficiency and grace.

Sakakini finished his schooling in about 1893 and began to teach in Jerusalem. He became a member of the literary society called *Zahrat al-Adab* (The Flower of Literature) which had been established in 1898. His intention was to leave for Russia to study medicine, but instead he later travelled to England in 1907 and then on to the United States of America to continue his studies at Colombia University. However, his financial situation prevented him from continuing his studies and he moved from one job to another in order to survive, working in a store and a factory, and writing for the journal *al-Majalla* published by Farah Antone. Travel broadened his perspective.

After a year or so he decided to return home following the restoration of the constitution. In his diaries, Khalil expressed the hope that this step would provide the citizens of Palestine with the opportunity to establish schools, newspapers and youth circles. Once he had arrived home in Jerusalem, he began to revise drafts for the journal *al-Asma'i* and for the newspaper *al-Quds*. He also gave private lessons in Arabic to foreigners as well as writing articles. He joined a branch of *al-Ittihad wa'l-Taraqqi* (Union and Progress) Society in Jerusalem; he was also one of the founders of a branch of *al-Ikha' al-'Arabi al-'Uthmani* (The Arab-Ottoman Fraternal Society) there. Sakakini was an activist in the Orthodox movement *al-Nahda* (Awakening) whose aim was to resist domination by the Greek clergy, and to reform the conditions of the Orthodox community, but his efforts were unsuccessful.

In 1909, together with other Jerusalemite Muslim and Christian men, Sakakini established a national school called *al-Madrasa al-Dusturiyya* (The Constitutional School). Students of all religions were enrolled and a modern curriculum was adopted. Arabic was to be the medium of instruction. The school aimed to disseminate Arab national awareness amongst its students. In 1914 he was appointed a member of the administration of *al-Ma'arif* (education) in the *sanjaq*. At the outbreak of the First World War, Sakakini was appointed a teacher of Arabic in the Salahyia College which had been established by Jamal Pasha. In 1917, as the British troops advanced,

⁸ Al-Asad 1958: 57-9; al-'Awdat 1976: 273-84; Dabbagh 1975: 392-4; Daghir 1955: 458-60; al-Khatib 1990: 367-71; *Palestinian Encyclopaedia* 1984, vol. 2: 371-2; al-Sakakini 1955; Yaghi 1968: 342-6; al-Zirikli 1979, vol. 2: 321.

the Ottoman authorities decided to exile Sakakini to Damascus so that he could be imprisoned. His friends exerted a great deal of pressure in order to secure his release at the beginning of 1918. After he was freed, Sakakini returned to his work of private English tuition. At the same time, he was meeting his colleagues in cultural seminars. In August 1918 he and a group of his friends left Damascus to join the Arab Revolt for which he composed a national anthem. Early in 1919 he returned to Jerusalem after a short stay in Egypt to resume his activities in the field of education.

Sakakini was another multi-sided man of letters—a linguist, teacher, orator, gifted writer of prose and criticism, and eminent poet, although after the war he stopped writing verse. His role in the modern Arab cultural revival was very important both during this period and later. He recorded in his diaries all the events which affected his life, as well as his views on politics, literature, society, religion and education. Sakakini was an innovator in several fields, and a rebel against old traditions. He revolted against Ottoman totalitarianism; he also rejected Greek authority in the Arab Orthodox church and inflexible ecclesiastical rites. Long before many others, he recognised the danger of the Zionist movement ‘because it tries to construct its existence on the destruction of others.’ He called for national unity and felt contempt for sectarian division. In every way he was ahead of his contemporaries in his awareness of nationhood—he wrote in his diaries ‘it is my duty to endeavour to awaken this depressed nation.’

Sakakini saw schools as the best and most important medium to prepare the new generation. At al-Dusturiyya School, he chose works from Arabic literature that would arouse enthusiasm in the hearts of the students. But on the other hand, Sakakini also displayed a spirit of tolerance which was at the time a prominent characteristic of educated Arabs. He favoured internationalism, seeing in militant nationalism a threat to the welfare of the world. ‘Nationalism’, he wrote, ‘implies morality, enlightenment and orderly behaviour.’

Sakakini’s name was connected to that of Is‘af al-Nashashibi despite their differences in origin, standpoint and opinion. They both concentrated on Arabic and devoted their lives to enhancing it and defending it in the face of biased attack. But their views differed widely. While Nashashibi called for linguistic conservatism and elegance of expression, Sakakini was one of the most eminent supporters of flexibility and tolerance in the technique of writing, for his deep concern was with the priority of content over artificiality, rhetoric and embellishment. Sakakini’s innovatory approach was not a rejection of the heritage of classical Arabic but rather a step on the way to understanding it once again. Sakakini’s opinions did not lead to a break with Nashashibi because it was understood that both stood for the preservation of Arabic in ways that

were both similar and original.

Sakakini enriched Arabic literature both at this period and later by adding to it books, textbooks and essays which greatly profited future generations of Arabs. He, like Nashashibi, had an effect on his contemporaries which was greater than the sum of his books and articles. Apart from his many diverse essays and diaries, two works of the period should be mentioned—*al-Ihtidha bi-hidha’ al-Ghair* (‘Follow an Example of Model’) published in Jerusalem in 1896, and *al-Nahda al-Urthudhuyya fi Filastin* (‘The Orthodox Renaissance in Palestine’) Jerusalem 1913. But the period after 1917 witnessed the production of the majority of Sakakini’s work.

Muhammad Is‘af al-Nashashibi
(b. Jerusalem 1895; d. Cairo 1948)⁹

Muhammad Is‘af was born to a well-known, wealthy family in Jerusalem where he studied first in its primary school (*kuttab*). At the age of twelve, he finished this elementary stage of his education, and his father registered him at the Patriarchal School in Beirut, *al-Dar al-Hikma*, where he stayed for four years. His tutors there were among others Shaikh ‘Abdullah al-Bustani and Shaikh Mustafa al-Ghalaiyini, and one of his contemporaries was Prince Shakib Arslan. There he had his first taste of literature and became infatuated with the Arabic language and the elegance of its vocabulary. He also learned a good deal of French so that he could read newspapers and scientific books in that language.

When he returned to Jerusalem before the proclamation of the constitution, he began to read, to write and to compose poetry. He tried to make contact with the educated classes, most of whom were graduates of foreign schools, but he remained closest to Khalil al-Sakakini. Muhammad Is‘af was deeply attached to literature and this led to a dispute between him and his father, because he refused to invest in his father’s estates.

After 1908 he began to write literary essays for several Jerusalem journals (*al-Asma’i*, *al-Manhal*, *al-Nafa’is*) as well as other Arab literary publications. After Sakakini’s return from America, Nashashibi renewed contact with him and they both wrote as circumstances inspired them.

Muhammad Is‘af greatly admired Badi‘ al-Zaman al-Hamadhani and tried to emulate his style. In the meantime, he devoted himself to reading other masterpieces of classical Arab literature. During the war, he was

⁹ Al-Asad 1958: 59-60; al-‘Awdat 1976: 626-30; Dabbagh 1975: 383-4; Daghir 1955: 84-88; al-Khatib 1990: 364-6; Muhafza 1987: 98; *Palestinian Encyclopaedia* 1984, vol. 4: 136-7; al-Sakakini 1955: 381; Yaghi 1968: 350-9; al-Zirikli 1979, vol. 6: 30-1.

appointed a teacher of Arabic at al-Salahiyya College. At the end of it, he turned back to teaching, writing and reading.

Muhammad Is'af devoted his life to two inter-related causes: linguistic revival and moral awakening. He exerted all his efforts to serve both. Although he was a mouthpiece of the higher social class of society and took the more conservative viewpoint, he insisted on the necessity of keeping up with modern progress to a certain degree.

Nashashibi was greatly in love with the Arabic language; he had a vision of Arabic as the leader of all other languages of the world. None of Nashashibi's contemporaries in Palestine defended it with such genuine passion and this coloured his speeches. He had a unique facility with rhetoric and within the Arab world was given the appropriate name *al-Adib al-'Arabiyya* (The Arabic Man of Letters). Sakakini described him as 'the dictionary of *Lisan al-'Arab* who walked on two feet' because of his wide knowledge of the language—a knowledge which was morphological, syntactical and rhetorical. He continued his work into the later period, following a clear trend in technical writing and a tendency to maintain the classical *turath* in an original and effective way. Although his methods did not coincide with those of Sakakini, there is no doubt that literary life profited greatly from the different approaches of both intellectuals.

Nashashibi enriched Arabic literature with various

collections of his work—including speeches, lectures, essays, prefaces and discussions of particular issues—most of which were printed at a later date. Besides his educational production, in his youth he also wrote enthusiastic nationalistic poetry, most of which was published in *al-Nafa'is* from 1908-14. After the onset of war, however, he no longer wrote verse.

His linguistic publications during the period were *Al-Lugha al-'Arabiyya wa su' Haliha* ('The Arabic language: its Bad State') *al-Nafa'is* 1911 and *Amthal Abi Tammam al-Ta'i* ('The Proverbs of Abi Tammam al-Ta'i') and *al-Nafa'is* 1912. Most of his points of view, scattered through his various publications, were collected together in books at a later period. In his book *al-Islam al-Sahih* ('The Genuine Islam'), published in Jerusalem in 1935, he stressed that 'Islam, if truly understood, is capable of solving all problems faced by Muslims today.' In his book *Kalima Mujaza fi Sair al-'Ilm wa Siratuna ma'hu* ('A Brief Word on the Process of Science, and our Story within it') published in Jerusalem in 1921, Nashashibi demonstrated that his understanding of Islam did not prevent him from backing Darwin's theory of evolution, just like Shmeyyil and Antone. Nor did his faith prevent him from supporting Western civilisation in his book *Qalb 'Arabi wa 'Aqil Urupi* ('An Arab Heart and a European Mind'), Jerusalem 1923. As in the case of Sakakini, the effect of Nashashibi as a person on his own generation was far greater than the effect of his written work.

Chapter 3

THE 'ULAMA' OF OTTOMAN JERUSALEM (16TH-18TH CENTURIES)

Abdul-Karim Rafeq

Jerusalem had a large number of Muslim 'ulama' due to the fact that it is the third most Holy City in Islam and contains important religious monuments and institutions. The Aqsa Mosque, associated with the ascent of the Prophet Muhammad to Heaven, constitutes the nucleus of a religious complex known as the Haram al-Sharif (the Noble Sanctuary) which encompasses the Mosque (Dome) of the Rock, schools and other religious sites revered by the followers of the three major monotheistic religions. Other religious monuments outside the confines of the Haram also generate much scholarly activity in the city. Scholars from other cities in Palestine and also from nearby Bilad al-Sham (Syria) and Egypt, as well as from more distant regions of the Muslim world, visit Jerusalem throughout the year to see its religious monuments. Many visitors stay in Jerusalem for some time, while others settle there as residents (*nuzala*'), usually in the neighbourhood of religious shrines as *mujawirs*. North Africans (*Maghariba*), for example, had a quarter, a mosque and a *zawiya* (*sufi* retreat) in Jerusalem, all of which carry their name. One of the gates leading to the Haram is also known after them (*Bab al-Maghariba*). Indians and Afghans had their own *zawiyas* which were also used as schools.

Jerusalem's native 'ulama' in turn visited other towns in the Muslim world to study or for other religious purposes, and many of them settled there and were known as *Qudsis* (after al-Quds, Jerusalem). Generations of *Qudsis* thus settled in the major Arab cities, such as Damascus, Cairo, Mecca, Madina and Baghdad. These 'ulama' deserve special study on account of their large numbers and the contributions they made to the culture of the host cities.

Many of the Arab travellers who visited Jerusalem

mention the 'ulama' of the city. 'Abd al-Ghani al-Nabulsi, for example, who twice visited Jerusalem in 1690 and 1693 (al-Nabulsi 1990), spent most of his time in Jerusalem in the company of 'ulama', notables and *sufis*. The information provided by the Arab travellers about the 'ulama' of Jerusalem is voluminous and diverse. Given the large number of these 'ulama', it would be impossible to list all of them in this short survey or even to find a common denominator which would classify them as upper or lower, eminent or popular, or orthodox or *sufi*. The Medinese traveller Ibrahim al-Khiyari, who paid a short visit to Jerusalem between 9 and 11 December 1670, exaggerates when he says that he failed to find in the Haram al-Sharif a single accomplished 'alim with whom he could converse. He wrote: *wa-fi khilal hadhihi al-mudda wa-ana altamis bi jaddin wa-ijtihadin taliban li'l-'ilm wa-'uhurwi al-isnad 'aliman yashuhu li'l-diraya aw rawiyan tu'khadhu 'anhu al-riwaya fa-a'yani dhalika al-talab wa-akda sa'yi duna an ya'laq bi marami sabab* (al-Khiyari 1969-80, 2: 184). Al-Khiyari's statement should not be taken literally (al-'Asali 1990: 213). The fact that al-Khiyari was a Medinese scholar visiting Jerusalem apparently for the first time, staying in it for less than two days, occupying himself with visits to various religious places, praying and going to a public bath certainly did not give him the opportunity to really look for the accomplished 'ulama' of Jerusalem. Unlike al-Khiyari, later travellers, like 'Abd al-Ghani al-Nabulsi, Muhammad Khalil al-Bakri al-Siddiqi, who visited Jerusalem in 1710 (al-Siddiqi ms. 6149 Mq 466), and Mustafa As'ad al-Luqaimi, who made his visit to the city in 1731 (al-Luqaimi ms. 5248), met large numbers of 'ulama' in Jerusalem. The biographical dictionaries written by

Damascene scholars during the 16th, 17th and 18th centuries, which are dependable, selective and comprehensive, provide us with the names of several eminent '*ulama*' of Jerusalem.

Many of the '*ulama*' of Jerusalem figure among the eminent Muslim '*ulama*' at large (the *a'yan*) who are mentioned in the Damascene biographical dictionaries century after century. Thus, for the 10th Hijri century (16th century AD), there is the biographical dictionary of Najm al-Din al-Ghazzi which is entitled *al-Kawakib al-Sa'ira bi-A'yan al-Mi'a al-'Ashira* (1945-59); for the 11th Hijri century (17th century), there is the biographical work of Muhammad Amin al-Muhibbi, *Khulasat al-Athar fi A'yan al-Qarn al-Hadi 'Ashar* (1966); and for the 12th Hijri century (18th century), there is the work of Muhammad Khalil al-Muradi, *Silk al-Durar fi A'yan al-Qarn al-Thani 'Ashar* (1966). There are also other works of a biographical or autobiographical nature for the same centuries, chief among which is the biographical dictionary of al-Hasan al-Burini about the notables of the 16th and the early 17th century, which is entitled *Tarajim al-A'yan min Abna' al-Zaman*. Burini hailed from the village of Burin in the region of Nablus from where his parents emigrated to Damascus (al-Burini 1959, 1966: 2).

The only extant biographical dictionary which deals specifically with the notables of Jerusalem in the 12th Hijri century (18th century) is that of Hasan ibn 'Abd al-Latif, entitled *Tarajim Ahl al-Quds fi 'l-Qarn al-Thani 'Ashar al-Hijri* (1985). Hasan compiled his book at the request of Muhammad Khalil al-Muradi of Damascus for whom he acted as correspondent in Jerusalem, supplying him with the biographies of its notables. Al-Muradi had correspondents in the major Islamic cities to provide him with the biographies of the notables in their locality for his biographical dictionary *Silk al-Durar*. The correspondent for al-Muradi in Egypt, for instance, who was recruited through the intermediary of the linguist Murtada al-Zabidi, was 'Abd al-Rahman al-Jabarti, author of the famous Egyptian work *'Aja'ib al-Athar fi 'l-Tarajim wa'l-*

Akhbar (1879-80). When al-Muradi died before receiving al-Jabarti's notes, the latter, not knowing for whom he was collecting them, used them in writing his work which is part chronicle and part biographical (Rafeq 1985: 103-14).

Al-Muradi does not mention all the notables of Jerusalem who appear in Hasan ibn 'Abd al-Latif's work *Tarajim Ahl al-Quds*. Out of the thirty-eight biographies mentioned in the latter work, al-Muradi includes only seventeen in *Silk al-Durar*. The remaining twenty-one seem to have been of inferior quality and did not qualify, in the judgement of al-Muradi, to be among the biographies of the eminent notables. In fact, Hasan ibn 'Abd al-Latif himself acknowledges that he had limited knowledge and expertise in selecting people's biographies (1985: 399).

Viewed from Damascus within the broad context of the biographies of the eminent notables in the Muslim world at large, only those '*ulama*' of Jerusalem who qualify to be among those notables are mentioned in the Damascene biographical dictionaries. '*Ulama*' of modest qualifications, who did not make it into the lists of the eminent '*ulama*', are thus excluded even though they might have occupied prestigious religious positions, perhaps undeservedly, and were respected by their communities. By surveying the '*ulama*' of Jerusalem in the Damascene biographical dictionaries during the first three centuries of Ottoman rule, their eminence in the context of the Muslim world at large can thus be established.

The biographical dictionaries provide information about the schools of law to which these '*ulama*' belonged, their teachers and the places where they studied, the *sufi tariqas* (orders) to which they belonged, the diplomas they obtained, the positions they occupied, the cities where they established themselves, the journeys they made, the works they wrote, their birth and death dates and their children.

The number of the eminent '*ulama*' given in the biographical dictionaries for Jerusalem far exceeds the number of '*ulama*' of any other Palestinian town during the same period. In fact, the '*ulama*' of Jerusalem outnumber

Table 3.1. The number of '*ulama*' in Palestinian towns (10th-12th centuries AH/16th-18th centuries AD)*

Century	Jerusalem	Safad	Nablus	Khalil	Ramla	Gaza	Total
10th Hijri/ 16th AD	31 (50.82)	12 (19.67)	5 (8.20)	6 (9.83)	4 (6.56)	3 (4.92)	61 (100.00)
11th Hijri/ 17th AD	37 (55.22)	8 (11.94)	6 (8.96)	2 (2.99)	5 (7.46)	9 (13.43)	67 (100.00)
12th Hijri/ 18th AD	27 (45.76)	1 (1.69)	25 (42.37)	3 (5.09)	-	3 (5.09)	59 (100.00)
Total	95 (50.80)	21 (11.23)	36 (19.26)	11 (5.88)	9 (4.81)	15 (8.2)	187 (100.00)

* This table is based on biographical data from the dictionaries of al-Ghazzi, al-Muhibbi and al-Muradi.

the 'ulama' in all the other Palestinian towns taken together. Table 3.1 shows their numbers.

The 'ulama' of Jerusalem thus constitute the overall majority of the 'ulama' of Palestine in the 16th, 17th and 18th centuries taken all together. They amount to 50.80 per cent of the total. Their majority, however, diminishes sharply—though it is narrowly maintained—in the 18th century in favour of Nablus. The large number of eminent 'ulama' from Jerusalem is to be explained by the abundance of religious monuments and institutions and the positions attached to them, as well as the establishment of visiting scholars in Jerusalem. The growing number of 'ulama' of Nablus in the 18th century, which comes close to that of Jerusalem, is paralleled by a decrease in the number of the 'ulama' of Safad. It could be that Nablus attracted some of the 'ulama' of that turbulent city. Under the rule of the semi-autonomous chieftain Zahir al-'Umar al-Zaidani who governed Safad, Acre and Upper Galilee

for the greater part of the 18th century, Safad in particular suffered not only from the attacks of the governors of Damascus against Zahir, but also from revolts of Zahir's sons against their father and from the invasion of Syria in the early 1770s by the Mamluk troops of 'Ali Beg of Egypt who was in alliance with Zahir. Zahir was eventually killed in 1775 and his petty amirate, as well as his Zaidani dynasty, came to an end. Nablus, by comparison, was more secure under Ottoman rule. Moreover, the Hanbali 'ulama' of Nablus seem to have increased in importance at the time, as indicated by their larger number among the eminent 'ulama' of the 18th century.

The majority *madhhab* in Syria, including Palestine, in the pre-Ottoman period was the Shafi'i *madhhab*. This was also the case in Egypt. No one *madhhab* was singled out in the pre-Ottoman period as the official *madhhab* of the state. The Ottomans, however, adopted the Hanafi *madhhab* as the official one of the state, but they

† This table is based on data from the same dictionaries.

allowed the other *madhhabs* to function, albeit in a subordinate fashion, because in many matters their rulings had to be legalised by the chief Ottoman Hanafi judge. The majority of the eminent '*ulama*' of Jerusalem in the 10th/16th century belonged to the Shafi'i *madhhab* as indicated in the biographical dictionary of Najm al-Din al-Ghazzi. With the coming of the Ottomans, a number of '*ulama*' in Syria, as in other places, began to shift to the Hanafi *madhhab* either in order to retain judicial positions they already occupied or to obtain new ones. Partly because of this shift and partly because of the growing prominence of the Hanafi *madhhab* under the Ottomans, the majority of the eminent '*ulama*' of Jerusalem in the 11th/17th century were Hanafis. The Hanafi '*ulama*' became even more numerous in Jerusalem in the 12th/18th century, which indicates the establishment of the Hanafi *madhhab* as the majority one among the '*ulama*' of Jerusalem. Table 3.2, which is based on the dictionaries of Najm al-Din al-Ghazzi, Muhammad Amin al-Muhibbi and Muhammad Khalil al-Muradi, indicates how the prominence of the Shafi'i '*ulama*' in Jerusalem in the 10th/16th century changed in favour of the Hanafi '*ulama*' in the following two centuries.

Compared to other towns in Palestine, where the Shafi'i '*ulama*' remained comparatively a majority, the increasing number of Hanafi '*ulama*' in Jerusalem indicates the close relationship the city had with the Ottoman religious establishment. Table 3.3 shows the affiliation of the eminent '*ulama*' in the other Palestinian towns.

Tables 3.2 and 3.3 indicate that the eminent Hanafi '*ulama*' in the towns of Nablus, Safad, Khalil, Ramla and Gaza had increased from 0 per cent in the 16th century to 43.33 per cent in the 17th century, but they fall back to 22.58 per cent in the 18th century. The eminent Hanafi '*ulama*' in Jerusalem, by comparison, increased steadily throughout the three centuries in the following proportions: 9.68, 29.73 and 51.85 per cent respectively. The eminent Shafi'i '*ulama*' in the other towns remain, as a whole, more numerous than their colleagues in Jerusalem. Their proportions in those towns during the three centuries are 70, 26.67 and 48.39 per cent respectively. In Jerusalem the percentage of '*ulama*' that are Shafi'i declines sharply from 61.29 in the 16th century to 24.32 in the 17th and then to 18.52 per cent in the 18th century. This variation in the percentages of the eminent Shafi'i '*ulama*' in Jerusalem and the other Palestinian towns indicates that the Shafi'is in those towns did not have the high number of Hanafi positions to occupy as in Jerusalem, hence they were not tempted to curry favour with the Ottomans and shift to the Hanafi *madhhab*. In Jerusalem itself, not all the eminent Shafi'i '*ulama*' shifted to the Hanafi *madhhab*. Several positions in mosques, courts and schools had been specifically assigned to the Shafi'is by the wish of the founders of these institutions.

The senior teaching position in the Salahiyya School in Jerusalem (established by Salah al-Din al-Ayyubi after he had regained control of Jerusalem from the Crusaders in 1187), for instance, was to be given to the most learned Arab Shafi'i '*alim*'. Shaikh Ishaq ibn 'Umar Abi 'l-Lutf al-Maqdisi al-Shafi'i was appointed to this position in the 17th century (*wulliya tadrīs al-madrasa al-Salahiyya bi'l-Quds wa hiya mashruta li 'alam 'ulama' al-Shafi'iyya fi diyar al-'Arab*). Shaikh Ishaq's father, 'Umar, was a Hanafi *mufti* in Jerusalem and taught in the 'Uthmaniyya Madrasa in the city. His son, Shaikh Ishaq, shifted to the Shafi'i *madhhab* 'of his ancestors' (*wa ibnuhu hadha tahawwala ila madhhab ajdadihi*) (al-Muhibbi 1966, 1: 394). Shifting from one *madhhab* to another within the same family, or even having children of whom each one was affiliated to a different *madhhab*, was not uncommon in Jerusalem and indeed in other places (al-Muhibbi 1966, 3: 110).

By examining the overall numbers of the eminent Hanafi and Shafi'i '*ulama*' in Palestine as a whole, one finds that during the first three centuries of Ottoman rule the Shafi'i '*ulama*' in the various towns, excluding Jerusalem, number forty-four out of a total of ninety-one, the percentage being 48.35, while the Hanafi '*ulama*' number twenty, the percentage being 21.97. In Jerusalem, the number of the Hanafi '*ulama*' during these three centuries is twenty-eight out of ninety-five, the percentage being 29.47. The Shafi'i '*ulama*' number thirty-three, the percentage being 34.74. Thus the overall number of the Shafi'i '*ulama*' in Jerusalem remains the greater.

In the other Palestinian towns during these three centuries, Nablus had thirty-six eminent '*ulama*' out of a total of ninety-one, the percentage being 34.06. Twelve of the '*ulama*' of Nablus were Hanbalis, comprising 48 per cent of the total number. No other town had any eminent Hanbali '*ulama*' with the exception of Jerusalem, which had one eminent Hanbali '*alim*' in the 16th century. Safad ranks second after Nablus in the number of its '*ulama*'. It had twenty-one '*ulama*' (23.07 per cent of the total '*ulama*' of the five towns in the tables excluding Jerusalem). Gaza comes next with fifteen '*ulama*' (16.48 per cent), followed by Khalil (Hebron) with eleven '*ulama*' (12.08 per cent), and Ramla with nine '*ulama*' (9.89 per cent). Jerusalem, in the final analysis, had an overall number of ninety-five '*ulama*' during these three centuries compared to ninety-one '*ulama*' for the other five Palestinian towns. This indicates the prominence of Jerusalem in the number of its '*ulama*' and the positions they occupied.

According to the Damascene biographical dictionaries, the eminent '*ulama*' of Jerusalem from the different *madhahib* went more to Cairo than to any other place to study. The dictionaries do not, however, give the places of study for all the eminent '*ulama*'. The following Table 3.4 shows the preferred places of study of the '*ulama*' of Jerusalem outside their city, where these are available.

Table 3.4. Places of study of the 'ulama' of Jerusalem

Century	Cairo		Damascus		Istanbul		Total
	no.	%	no.	%	no.	%	no.
10th/16th	4	80.00	1	20.00	-	-	5
11th/17th	17	62.96	3	11.11	7	25.93	27
12th/18th	6	33.33	4	22.22	8	44.45	18
Total	27	54.00	8	16.00	15	30.00	50

The table clearly shows that Cairo attracted the largest number of the 'ulama' of Jerusalem, especially because of the presence of the Azhar Mosque university. Istanbul ranked second, followed by Damascus. It is significant, however, that it is only in the 17th and the 18th centuries that the eminent 'ulama' of Jerusalem went to Istanbul to study. There they attended the prestigious religious schools established by the Ottoman sultans. Upon graduation, they were appointed as teachers, judges and *muftis* throughout the empire.

The biographical dictionaries of Damascus also mention the religious position or positions held by some of the 'ulama' in Jerusalem. Such information, however, is not available for all the 'ulama' of Jerusalem. The following table (3.5) is based upon information provided by the biographical dictionaries.

The eminent 'ulama' of Jerusalem were more involved in the majority of the religious positions in their city in the 17th than in any other century. Out of a total number of eighty-six religious positions identified over the three centuries in question, 47.67 percent occur in the 17th century. When the Ottoman administration was at the peak of its efficiency in the 16th century, more Ottoman officials were sent from Istanbul to take charge of religious positions in Jerusalem and elsewhere. In the 17th century, however, more local 'ulama' trained in the religious professions were in a position to be appointed to these positions. When corruption infiltrated the Ottoman administration in the 18th century, the professional quality of the occupants of religious positions declined. The number of eminent 'ulama' likewise diminished. This is evident in the case of

Jerusalem. The total number of its eminent 'ulama', which rose from thirty-one in the 16th century to thirty-seven in the 17th century, diminished to only twenty-seven in the 18th century.

The declining number of Jerusalem's eminent 'ulama' in the 18th century is paralleled by the declining number of those of them who resided outside Palestine in the same century. Table 3.6 shows the places of residence of the 'ulama' of Jerusalem outside Palestine in the 16th, 17th and 18th centuries.

Despite the fact that most of the 'ulama' of Jerusalem had studied in Cairo, the majority of them preferred to reside in Damascus, which is closer to Jerusalem and had the famous Umayyad Mosque and a variety of schools catering for the different *madhhabs*. Damascus was also the meeting-place for thousands of pilgrims who assembled there every year to join the pilgrims' caravan to the Hijaz. Scholarly contacts occurred on this occasion between the resident 'ulama' and the visiting 'ulama' among the pilgrims. Historically also, as explained above, many 'ulama' from Jerusalem established themselves in Damascus, where they were referred to as *Qudsis*. Over time, more Qudsi 'ulama' lived outside Jerusalem than inside it.

Viewed from Damascus within the context of the eminent 'ulama' of the Muslim world at large, very few of the 'ulama' of Jerusalem attained scholarly prominence. None of them, for example, attained the scholarly stature of the famous Hanafi *mufti* of Ramla, Khair al-Din al-Ramli (993-1081/1585-1671), who studied Hanafi law at the Azhar in Cairo and became an acknowledged authority in jurisprudence.³

The 'ulama' of Jerusalem may be divided into three groups: those who originated in the city and achieved

³ For the biography of Khair al-Din al-Ramli, see Muhibbi 1966, 2: 134-9. For a study of his career and work, see Ihsan 'Abbas 1979: part 2, vol. 6, no. 3, 49-71; also Samir Seikaly 1984: 397-408.

religious prominence there, those who were of alien origin, emigrated to Jerusalem and established themselves there, and those who emigrated from Jerusalem and settled elsewhere. A representative of each group will be discussed here.

Sayyid Muhammad ibn 'Abd al-Rahim al-Qudsi (d.16 Rabi' I 1141/20 October 1728), known also as al-Lutfi after the title Abi 'l-Lutf by which his ancestors were known (Bait Abi 'l-Lutf), represents the first group. He was described by the Damascene biographer al-Muradi as the most learned of the Hanafis of his time (*afqah al-Hanafiyya*). Sayyid Muhammad is one of the few 'ulama' of Jerusalem whose life features in the biographical dictionaries of both Hasan ibn 'Abd al-Latif al-Husaini (1985: 197-203) and Khalil al-Muradi (1966, 4: 52). The fact that al-Muradi agreed with Hasan ibn 'Abd al-Latif, his correspondent in Jerusalem, about this particular 'alim, to the exclusion of many others, indicates that Sayyid Muhammad fits into the category of the eminent 'ulama' noted in *Silk al-Durar*. This was not so, for instance, with Shaikh Najm al-Din, son of the famous Hanafi *mufti* of Ramla, Khair al-Din al-Ramli, who became Hanafi *mufti* of Jerusalem and was included by Hasan ibn 'Abd al-Latif among his notables (al-Latif 1985: 288-9). Al-Muradi chose not to mention him in *Silk al-Durar* apparently because he did not measure up to the other eminent 'ulama' that were included in the dictionary.

Sayyid Muhammad al-Qudsi, who was a Sharif descended from the Prophet, became Hanafi *mufti* in Jerusalem in place of his father, who died on a visit to Istanbul. The father, Sayyid 'Abd al-Rahim (1037-1104/1627-92), had studied in Egypt and became Hanafi *mufti* in Jerusalem. The son, Sayyid Muhammad, collected his father's juridical opinions in a big volume entitled *al-Fatawa al-Rahimiyya fi Waqi'at al-Sada al-Hanafiyya*. According to his two biographers, Hasan ibn 'Abd al-Latif and al-Muradi, Sayyid Muhammad measured up to the responsibilities of his office and challenged the administrators of customary law (*hukkam al-'urf*) who were active in Palestine's nomadic and factional society. He collected his juridical opinions in a work in which he included his name in the title, *al-Fatawa al-Muhammadiyya fi Sahih Aqwal 'Ulama' al-Hanafiyya*. Sayyid Muhammad died in Jerusalem and was buried in the cemetery of Bab al-Rahma. Hasan ibn 'Abd al-Latif, unlike al-Muradi, includes in the biography of Sayyid Muhammad much poetry by his contemporaries praising him for his character, scholarship and effectiveness as Hanafi *mufti* of Jerusalem.

Muhammad al-Taflati al-Maghribi (d.? 1191/1777) is an example of the second group of Jerusalemite 'ulama' who originated elsewhere, emigrated to Jerusalem and attained a high position in the Ottoman religious establishment there. Taflati is mentioned in the

biographical dictionaries of both Hasan ibn 'Abd al-Latif and al-Muradi (al-Latif 1985: 267-85; al-Muradi 1966, 4: 102-8), which indicates his eminence as a notable 'alim in Jerusalem. Born in al-Maghrib al-Aqsa (Morocco), Muhammad al-Taflati memorised the Qur'an at the age of eight, moved to Tarablus al-Gharb (Tripolitania) and from there headed toward Cairo where he studied in the Azhar Mosque for two years and eight months. At the age of nineteen, upon returning by sea to visit his mother in the Maghrib, he was captured by Frankish pirates and taken to Malta where he stayed for about two years and engaged in discussing controversial religious issues with Christian monks. Taflati does not say how he escaped from Malta. He went from there to Egypt, visited the Hijaz several times, went to the Yemen, Oman, Bahrain, Basra, Aleppo, and Damascus and also went to Rum (Istanbul). He then settled in Jerusalem (Bait al-Maqdis) where he got married in 1172/1758-9.

Taflati began his career in Jerusalem by teaching in the Dome of the Rock within the Haram. His attitude toward the local Ottoman authorities, represented by the governors of Damascus, was somewhat mixed. Initially he kept apart from the governor and from officials, but later on he sought their help for personal favours, which brought him much criticism. His shift from the Maliki *madhhab* to the Hanafi *madhhab* also earned him the enmity of many of his erstwhile followers. Hasan ibn 'Abd al-Latif says that Taflati sought, while in Rum, the office of Hanafi *mufti* of Jerusalem which was duly offered to him (al-Latif 1985: 268). Al-Muradi, however, says that he accepted his appointment as *mufti* of Jerusalem with much reluctance (*ja'atni al-futya wa ana laha karih*) (al-Muradi 1966, 4: 104-5). He was however deposed several times from this high office.

As a high religious dignitary and Hanafi *mufti* of Jerusalem, Taflati is reported to have met the Egyptian Mamluk Amir Muhammad Beg Abu 'l-Dhahab in Ramla in June 1771. After occupying Damascus in early June of that year, Abu 'l-Dhahab decided to withdraw, contrary to the instructions of his Mamluk master in Egypt, 'Ali Beg, who had ordered the attack on Syria. The meeting between Taflati and Abu 'l-Dhahab is significant because Taflati was apparently acting as intermediary between Istanbul and Abu 'l-Dhahab, who eventually disavowed his allegiance to 'Ali Beg and later killed him. Istanbul recompensed Abu 'l-Dhahab by appointing him governor of Egypt (for details see Rafeq 1970: 276-7).

Taflati was also a poet. His poetic activity is reported by both Hasan ibn 'Abd al-Latif and al-Muradi. He died in Jerusalem in Dhu 'l-Qa'da 1191/December 1777 according to al-Muradi. Hasan ibn 'Abd al-Latif mentions that he died in 1192/1778. He was buried in the cemetery of Ma'man Allah (Mamilla) among the righteous people (*al-salihin*) (al-Latif 1985: 268).

One representative of the third group of 'ulama'—those who originated in Jerusalem but established themselves elsewhere and achieved prominence there—is 'Ali ibn Muhammad al-Qudsi (al-Ghazzi 1945-59, 2: 191-3). Born in Jerusalem in mid-Jumada I 856/early June 1452, 'Ali ibn Muhammad was a Shafi'i scholar who studied first in Jerusalem with distinguished 'ulama', then went to Egypt where he continued his education in jurisprudence and Hadith. Later he resided in Damascus as *nazil* (in residence) and eventually made the city his home (*istawtana*). He attended the classes of the top 'ulama' in the city. Of the schools he attended in Damascus, only al-Shamiyya al-Barraniyya is singled out by his biographer Najm al-Din al-Ghazzi who, like him, was a Shafi'i. Al-Shamiyya al-Barraniyya was the main Shafi'i school in Damascus.

'Ali ibn Muhammad al-Qudsi later went to Mecca where he stayed in the neighbourhood (*jawara*) of its religious monuments. He attended the lectures of the distinguished chief Shafi'i judge Shaikh al-Islam ibn Zahira. He married in Mecca and had children. He then came back to Damascus with his family and became a teacher in the Umayyad Mosque, where he was assigned a distinguished spot bordering the tomb of Yahya (Saint John). Besides teaching and copying manuscripts, he wrote a book entitled *Marr al-Nasim fi Fawa'id al-Taqsim*.

Shaikh 'Ali al-Qudsi witnessed the first decade of Ottoman rule in Syria. He died in Damascus on 15 Safar 934/11 October 1527. Like other Syrian 'ulama' who were critical of the innovations in the legal system introduced by the Ottomans at the time, he was extremely unhappy with the imposition by the Ottoman chief Hanafi judge in Damascus of fees for drawing up marriage contracts. The fees—referred to as *resm-i 'arus*—were incorporated in the Ottoman Code of Laws, the *Qanun-name*, and were applied throughout the empire. Shaikh 'Ali considered this innovation as *fitna* (civil strife) in Islam. Because of his excessive anger at the introduction of the fees, he 'vomited blood', according to his biographer Najm al-Din al-Ghazzi (2: 193). In Egypt, the 'ulama' of al-Azhar also protested at

the imposition of marriage fees and the people went on strike, neither marrying nor divorcing (Rafeq 1994: 9-32).

The religious eminence of Shaikh 'Ali al-Qudsi, coupled with his daring criticism of the Ottoman authorities when the empire was at the peak of its glory under Sultans Selim I and Sulaiman the Magnificent, as well as his upholding of Arab-Islamic traditions against breaches made in them by Ottoman law, earned him the respect of the Damascenes. When he died, the people twice prayed for him: in his popular locality of Midan al-Hasa, a southern suburb of Damascus, and then in the large Mosque of al-Musalla (Musalla al-'Idain), in the lower Midan known as Bab al-Musalla. This mosque was usually reserved for the prayer of the Two Feasts and for the prayer for rain (*salat al-istisqa*), because it accommodates large numbers of worshippers. He was buried in the historical cemetery of Bab al-Saghir next to the tomb of the Caliph Mu'awiya, the founder of the Umayyad caliphate, which again underlines his popularity and importance (al-Ghazzi 1945-59, 2: 193).

The large number of religious institutions in Jerusalem, notably mosques, schools and *zawiyas*, ensured that scholarly activity was continuous. When Evliya Çelebi visited Jerusalem in 1672, he mentioned in his travel account (*Seyahatname*) that the city 'has two hundred and forty *mihrabs* (prayer niches), seven schools for the teaching of Hadith (Traditions of the Prophet Muhammad), ten for teaching the Qur'an, forty *madrasas*, and *zawiyas* for seventy *sufi* orders' (al-'Asali 1990: 211). The decay that afflicted many of these religious institutions, especially the *madrasas*, in the 18th century, largely because of the abuse and misuse of the endowments (*waqfs*) allocated to them, eventually affected scholarly activity in the city (al-'Asali 1990: 218). This situation occurred in other places as well. In mid-19th century Gaza, for example, many streets still carried the names of mosques which no longer existed there (Rafeq 1985). Damascus also witnessed similar irregularities (Rafeq 1992; see also Badran 1379/1960: 53, 145). Religious scholarly activity suffered as a result.

Chapter 4

THE PLACE OF JERUSALEM IN OTTOMAN PERCEPTION*

Klaus Kreiser

The limited significance of Jerusalem in the Ottoman administration and the restricted importance of the city as a centre of Muslim learning and pilgrimage have been underlined several times (de Jong 1983: 173). The aim of this contribution is to provide further evidence for the place of Jerusalem in the Ottoman empire. Three subjects—the pilgrimage, the *‘ilmiyye*-hierarchy and the case of the *Mevlevi-khane*—will be studied in more detail for the period between the middle of the 16th and the beginning of the 18th centuries.

As a holy place Jerusalem occupied an intermediate position between the great sanctuaries of the Hijaz (Mecca and Madina) and the pilgrimage towns in Iraq (‘Abd al-Qadir al-Jilani, Kazimain, and Karbala) and Anatolia (Seyyid Ghazi and Konya). But several of the less prominent sanctuaries were restored by Ottoman rulers, such as the Sultan Hasan Mosque in Tabriz or the grave site of the head of Shams-i Tabrizi in Khuy (Jelal-Zade 1981: fol. 274a, 275b).

In recounting the building activities of Ottoman rulers, the chronicles do not always mention Jerusalem. A case in point is the popular *Ta’rikh-i Nishanji Mehmed Pasha* completed in the last years of Sulaiman I. References to Jerusalem in the works of the imperial historians before Jevdet Pasha (covering the period between 1774 and 1826) are also not very frequent. The revolt of a local *naqib* in 1118/1706 or the sending of an official for the ‘renovation

of the Mesjid-i Aqsa’ in 1133/1720-21 are events worth mentioning for Rashid (1741 II: 40a; III: 70b).

The name of Jerusalem is sometimes included as part of the titles of Sulaiman Qanuni. In a document of 1565 the sultan is called: ‘Lord of the fortunate conjunction, of the divinely protected dominions of the Ottomans, Persians and Arabs / Owner of the esteemed Ka’ba, Madina the illuminated and Jerusalem the holy’ (*Sahib-qiran-i memalik-i Rum ve ‘Ajam ve ‘Arab / Ka’be-i mu’azzama ve Medine-i münevvere ve Quds-i sherif*), but this detail must not be overestimated since the constituent formulae of imperial titulature were still in a state of flux in this period (Fekete 1926: *passim*). In other words, I do not think that it reflects a ‘consciousness of Jerusalem’s status as the third holiest city’ (Imber 1995: 149 n. 31). Equally, the preference for Arabic as a language for the inscriptions of Jerusalem cannot be claimed as a glorification of ‘arabicité’ (pace Raymond 1992: 374), since inscriptions in the eastern part of the Ottoman realm in the era of Sulaiman were without exception (as far as I can see) in Arabic (to say nothing of the use of Arabic for inscriptions in regions far to the west, such as Hungary and Albania).

The Pilgrimage to Jerusalem: permitted or prohibited?

The Syrian pilgrim road to Mecca did not take in Jerusalem. It is well known that the caravan moved southward after mustering in Damascus, leaving Jerusalem to its right (Faroqhi 1990). But one may ask if the hospices

* Acknowledgement: My friend and colleague Hans-Georg Majer (Ludwig Maximilians-Universität, München) allowed me to use his list of *qadi*-appointments for the period 1032-1142/1622-1729. I am very grateful for his generous support for a modest article.

endowed in Jerusalem in the middle of the 10th/16th century were destined exclusively for pilgrims to that city. This question is particularly relevant to the function of Ribat of Bairam Jawish (947/1540-1) and the Takiyya of Khassaki Sultan (before 959/1552) (Meinecke 1988).

Surprisingly, no ruling member of the Ottoman dynasty entered the Holy City after Selim I (1512-20), who performed his prayers in Jerusalem after the victory of Khan Yunus and the conquest of Egypt (Speiser 1946: 59). But there are two independent sources which deal with Sulaiman the Magnificent's intention to go to the Holy City.

(1) A letter of the imperial residence in Constantinople dated 23 December 1548 refers to a rumour, then rife in the Ottoman capital. According to the report, the sultan spent some time in the vicinity of Aleppo after the unsuccessful Persian campaign: '*Da pochi giorni in qua se dice che Sua Alteza andarà fin in Hierusalem a spasso*' (Nehring 1995: 336). Some weeks later, the envoy writes to Vienna (26 January 1549), that the sultan 'went to/in the direction of Jerusalem' for hunting: '*anchora che io ho inteso che el Sig.or Turcho si è andato verso Hierusalem alla caza (caccia); però che ha So (Sua) Alteza de ritornar in breve in Alepo*' (Nehring 1995: 345).

(2) The chronicle of Jelal-Zade Mustafa, *Tabaqat ül-Memalik ve Derejat ül-Mesalik*, is a comprehensive historical panorama with many accounts of victories (*fethname*) during the greatest part of the rule (1520-1557) of Sulaiman Qanuni. Describing the Baghdad campaign of 1553/4 Jelal notes that the sultan during the period had his winter quarters in Aleppo and that he wished to visit the 'Third of the sacred cities (*Thalisü'l-Harameyn*)' with the Masjid al-Aqsa. However the necessities of the campaign blocked the fulfilment of this 'happiness' (*sa'adet*) (Jelal-Zadeh 1981: fol. 445a).

One may speculate whether non-military considerations prevented Sulaiman from seeing the sanctuaries of Jerusalem (and the completion of Khürrem Sultan's foundation), although the distance from Aleppo should not be underestimated. In the period of Sulaiman the spiritual rank of Jerusalem was still important, but it was not undisputed. The renowned Turkish theologian Mehmed Birgiwi (d. 981/1573) in a popular pamphlet addresses the question of the 'two' directions of prayer (1281 AH: 26-33). He calls it a great blasphemy (*küfür*) to mention the *qibla* of Jerusalem without making clear that it is the *previous* direction of prayer. Birgiwi follows here the famous Ibn Taimiyya (1263-1328) who came out openly against the idea of the sanctity of Jerusalem in Islam, which, he said, 'distorted its original stature' (Matthews 1936: 1-21; Sivan 1967: 149-182; Perlmann 1973: 251-

293). Birgiwi's *risale* was written in the later years of Sulaiman's rule (c. 1563) and reflects the thinking of many learned and pious contemporaries (Mandaville 1979: 514-524; Yüksel 1992: 191-194). Ibn Taimiyya says also that going to Jerusalem during the period of pilgrimage to Mecca (namely in Shawwal, Dhu'l-Qa'da and the first nine days of Dhu'l-Hijja) is objectionable (*makruh*). When Sulaiman passed the winter in Aleppo, the beginning of the pilgrimage season coincided with 9 October. In other words, a visit to Jerusalem by the ruler could have been looked upon with horror by the religious establishment.

Since the overwhelming majority of Ottoman subjects who performed the journey to Mecca did not pass by Jerusalem, the number of Ottoman pilgrimage or travel reports on Jerusalem is extremely low. Only in the late 17th century do we have two important testimonies by Ottoman authors. Evliya Çelebi (d. after 1683), the famous professional traveller, spent ten days in Jerusalem (Ramadan 1082/January 1672) before he joined the pilgrimage caravan in Damascus (Dankoff/Kreiser 1992: index). Among the limited number of published Ottoman pilgrimage reports only a small but substantial *Tuhfetü 'l-Harameyn*, written by Yusuf Nabi (1642/43-1712) a few years after his journey which was undertaken in 1678, contains some pages on Jerusalem. Yusuf Nabi's chapter on Jerusalem is the result of a three-day stay in the Holy City (Nabi 1265/1848). Other 17th-century Ottoman pilgrims who have left reports, such as 'Abdurrahman Hibri (1603/4-1676), whose *Menasik-i Mesalik* deals with the pilgrimage season of 1041/1632, and a certain Mehmed Edib (transl. Bianchi 1825), who travelled in 1682, do not mention Jerusalem at all.

Without considering the large number of Ottoman *haji*-guides, printed and in manuscript, it is impossible to describe definitively the place which Jerusalem occupied for pilgrims. At least one lithographed booklet contains an annex for Jerusalem: *Menasik-i Quds-i sherif* (Özege Nr.13124: without date?).

There are rare examples of Ottoman intellectuals who settled in Jerusalem for a longer period without the intention of pursuing a formal career there. The scholar and poet 'Ismet Hajji Mehmed Efendi (d. 1160/1747) is one of these exceptions. Aywanserayi (1975: 359) says that he took up residence in the vicinity of the sacred places of Jerusalem (*müjaweret*) after his return from Mecca.

The great *mullas* of Ottoman times: exiled or promoted?

Although the continual patronage of the Ottoman rulers in the Haram district proves that Jerusalem had an extraordinary place in the hierarchy of cities and towns, the

rank of the *qadi* of Jerusalem in Sulaiman's time was no higher than that of most other provincial positions. Jerusalem did not harbour a single Ottoman *medrese* within its walls (Gibb/Bowen 1957: 155; Baltacı 1976: index).

The first *qadi* of Jerusalem after the Ottoman occupation is called Akhfesh-Zade by Evliya Çelebi (> Ibn Akhfash?). He is not mentioned in the earliest biographical dictionaries of the Ottoman 'ulema because their authors do not condescend to register simple provincial judges unless they made a later career in the capital. In the time between 1516 and the first years of Murad III (who acceded to the throne in 1574) the *mullas* seem to have accepted (rarely enough) the offices of *qadi* in Cairo, Damascus, Aleppo or Baghdad, but not the lower-ranking position in Jerusalem. 'Ali Miniq's appendix to Tashköprü-Zade's *Shaq'a'iq* (transl. Rescher 109) and 'Ata'i (236-7) both give the name of the first *mevleviyyet* incumbent of Jerusalem, Mulla Muhammad/Mehmed ibn 'Abd al-'Aziz (Rajab 983/October-November 1575). He was called Mu'id-Zade since he was born, in Elbistan, as the son of a *medrese* tutor. After he had finished the usual curriculum, he entered upon the higher career path of the *'ilmiyye* system. His last positions before his appointment to Jerusalem were as professor of the Darü'l-Hadith in Edirne and as professor in the *medrese* of Sultan Sulaiman in Damascus (where he also held the office of *mufti*). His salary increased from 60 *aqçe* in Edirne to 80 in Damascus and 500 in Jerusalem. He died in Dhu'l-Qa'da 983/February 1576 before he was able to convene the first hearing in his law-court at Jerusalem. His successor was a well-known personality, Ahmed Çelebi, who was also called 'Mazlum Melek' (Jumada I 989/1581). This former tutor of the sons of Selim II was entrusted successively with the *qadliqs* of Jerusalem, Mecca and Medina ('Ali Miniq 123; 'Ata'i 263).

Nominations to Jerusalem were not considered as prestigious at the beginning of the 11th/17th century. 'Ata'i (455) has left us the information that the office of the *qadi* of Jerusalem was not in demand by the haughty professors of the *medreses* attached to the mosque of Fatih in Istanbul (*Quds-i sherif qadasına Sahn müderrisleri ragbet etmez*). Hasan Kefevi (appointed in Sha'ban 1007/1599) apologises, saying that he accepted the position in order to 'cleanse his sins with the pure earth and to clarify his dirty heart with the soil of the Holy Valley.'

The promotion of the *qadiliq* of Jerusalem to so-called *mahrej mevleviyyeti* ('going-out places') had the theoretical consequence that its incumbents were qualified for the highest position in the juridical administration of *bilad-i erba'a* (the four 'old residences' Bursa, Edirne, Damascus, Cairo). On the other hand, according to a description in 1095/1684 of a certain Mehmed ibn 'Osman (Uzunçarsılı 1965: 273-6) 'ulema with the rank of *Meharij-i Süleymaniyye* could be promoted to the *qadiliqs* of

Damascus, Aleppo, Yeñişehir (Larissa), Saloniki or Jerusalem. On the other hand, according to a description in 1095/1684 former judges of Medusa or Jerusalem had the right to become *qadi* of Damascus or Bursa. In the 18th century the rank of the *mevleviyyet* of Jerusalem (Uzunçarsılı 1965: 277) was the highest after the two *qadi-askerliks*, the *qadi* of Istanbul and the *qadis* of the four 'old residences'.

Both published and unpublished material on *'ilmiyye* careers allows a preliminary comparison between the earlier period (980-1042/1572-1632) (Baltacı 1976) and the 107 years between 1032-1142/1622-1729. In the first period we have a number of *qadis* who served as *müderres* in Istanbul or provincial colleges. An important percentage had taught in Edirne and Bursa. A frequent pattern is the sequence Yeñişehir > Jerusalem > Madina. After their term of office in Jerusalem many occupied even higher *mevleviyyet*-ranks. A certain Mehmed Efendi Samsuni-Zade (d. 998/1589-90) exceptionally held the office of *qadi* twice. He intensified his relationship with Jerusalem with a number of (unspecified) pious foundations ('*müberra*t'; see 'Ata'i 312-13). But there were others who preferred dismissal to being sent to Jerusalem.

During the second period altogether one hundred and one *qadis* of Jerusalem were recruited from *müderres* positions in Istanbul alone (sixty-six appointments). There were no nominations from the 'old residences', let alone provincial towns. Twenty-eight of the sixty-six ex-*müderres* had occupied chairs at the Süleymaniyye *medreses*, nine more came from the highest-ranking *medrese*, the Darü'l-hadith-i Süleymaniyye, whose professors held the title '*Kibar-i müderresin*' (distinguished professor). The others came from less prestigious colleges—Walide Sultan: eight, Khaqaniyye-i Wefa: seven, Ahmed Khan: three—to mention only some of them.

Thirty-one *qadis* had already rendered service as judges before they came to Jerusalem. In four cases the *qadis* had occupied *Bilad-i erba'a* positions (Cairo: one, Damascus: three). There are ten nominations of former *makhrej*-places such as Üsküdar (five), Aleppo (one), Izmir (two), Sofya (one), and Eyüp (two). So-called *menasib-i dewriyye* positions appear five times (Diyarbakir: one, Baghdad: four). Madina corresponded to the rank of Jerusalem in the 17th century, but was of a higher rank after 1722. It appears six times. The remaining appointments came from Anatolian and Rumelian towns such as Manisa (two), Ankara (one), Sinop (one), and Filibe (two).

Besides the sixty-six ex-*müderres* and thirty-one former *qadis* the remaining four persons were functionaries of the highest class. They were:

- (1) 'Abdurrahim Efendi (appointed Sha'ban 1060/1650),

who died in office in Belgrade 1656 (Sheykhi 235-236). He was nominated *Sheykhülislam* in 1647, but was dismissed after the accession of Mehmed IV to the Ottoman throne (1648). He was sent to the Holy Places to perform the *hajj*. After his return from the Hijaz he was offered the *qadıhıq* of Jerusalem, but being a very politically-minded member of the *'ulema* he soon returned to Istanbul, thanks to his excellent connections with the *ojaq* of the Janissaries (İpşirli 1988: 289).

(2) Hüsam-Zade 'Abdurrahman (appointed c. 1066/1656-7, died in Egypt 1670) was *Sheykhülislam* between 11 May 1655 and 5 March 1656 (Sheykhi 1: 370). After he had been deposed he was sent at his own request to Jerusalem (Jumada I 1066/20 March 1656). In the present context it is worth mentioning that he returned to a place where he had already studied, accompanying his father Tulumju Hüsam Efendi, himself a prominent member of the *'ulema* (Sheykhi 1: 124-125).

(3) Mehmed Esiri Efendi (appointed Sha'ban 1083/22 November 1667, died 1092/1681) climbed the *'ilmiyye* career-ladder up to the highest rung (*qadi* of Cairo, Edirne, and Istanbul, *qadi 'asker* of Anatolia, and finally *Sheykhülislam* between 20 March 1659 and 3 February 1662). Following his deposition he was allowed to perform the pilgrimage in 1671. After his return he served, like his forerunners mentioned above, as *qadi* of Jerusalem (1672-74, Sheykhi 1: 478-9).

(4) Yeñibahçeli Çeleb: Mehmed Efendi (appointed Dhu'l-Hijja 1127/29 October 1715) was a former chief palace physician (*re'isü'l-atibba*) between Rajab 1119/28 September 1707 and Safar 1127/6 February 1715, with the honorary rank (*paçe*) of Anadolu (Sheykhi 2: 429; Mehmed Tahir 3: 250). He died in Damascus in 1723.

Special interest attaches to an Ottoman family of *'ulema* (Öztuna 1989: 714-15) which was connected more closely to Jerusalem than other representatives of the *'ilmiyye* class. On 1 Shawwal 1117/25 April 1705, Kevakibi-Zade Mustafa, a former incumbent of a Süleymaniyye *medrese*, was transferred to Jerusalem (Sheykhi 3: 581). In 1133/1720-21 his brother (?), the chief military judge Kevakibi-Zade Veliyeddin, repaired the 15th-century grave of Abu 'l-Hasan al-Ardabili (d. 832: Mujir ad-Din 1973:

510; Sauvaire 1876: 157; van Berchem 1923: 131). Neither the year nor the title of the inscription entirely correspond to the career data of Veliyeddin (Sheykhi 2-3: 635-7: he was *qadi 'asker* of Rumelia 1134/1135 and must have restored the Jerusalem mausoleum during a short period when he was without office after his banishment to Midilli/Lesbos).

Service in Jerusalem seems to have marked in many cases the end of an *'ilmiyye* career. In only fifteen of one hundred and one appointments do we have evidence for further promotions to the position of *qadi*—Madina (five), Damascus (three), Belgrade (three), Eyüb (two), Izmir and Mecca (one). On the whole the impression prevails that Jerusalem was not a place for which the majority of *'ulema* volunteered, even if there were a number of personalities who tried to combine the pilgrimage with subsequent service in the Holy City. Since the *qadi sijilleri* of Jerusalem exist in a complete series almost from the beginning of Ottoman rule (Mandaville 1975) there are ample opportunities for a closer look at the *qadis* and their relationships with the centre.

The case of the Mevlevi-khane

The dervish convents of Ottoman Jerusalem were very prominent as in other parts of the empire (de Jong 1983: 171). It is striking that Evliya Çelebi mentions only the Mevlevi-khane by name. The Mevleviyye was the only *tariqa* with a strong central authority with the consequence that the *mevlevi-khanes* in the provinces were controlled by the *asitane* in Konya (Kreiser 1995: *passim*). Evidence of a pre-Ottoman *mevlevi-khane* in Jerusalem is dubious (Mujir al-Din 1973: 405, van Berchem 1923: no. 310). There was obviously no topographical and institutional continuity until the 17th century. Given the fact that the *mevlevi-khanes* are almost always constructions *extra muros* it cannot be excluded that their first establishment was at the site of a graveyard outside the Golden Gate and opposite the Mount of the Olives. An inscription for a fountain (*fisqiyya*) dated 1034/1624-25 (not a *'caveau funéraire'* as translated by van Berchem in 1923: 130) is an important hint for the presence of the brotherhood of Mevlana. Later the convent may have been reconstructed *intra muros* (Hara Sa'diyya) in the compound of a former Latin church (al-'Arif 1961: 500-1; Aron 1992: map 6; 'Abd al-Ghani al-Nabulsi 1902: 57).

Chapter 5

AL-KULLIYYA AL-SALAHIIYYA, A LATE OTTOMAN UNIVERSITY IN JERUSALEM*¹

Martin Strohmeier

Dedicated to the memory of Ishaq Musa al-Husaini

Al-Kulliyya al-Salahiyya (abbreviated Salahiiyya)² was a product of the First World War and the progress of the war determined the fate of the school. Its foundation coincided with the attack on the Suez Canal by German and Turkish forces in January 1915. The school was established on the premises of the Crusader church of St Anne, which had been transformed into a Shafi'ite Qur'an school by the Ayyubid Sultan Salah al-Din after the conquest of Jerusalem in 1187. Sultan 'Abdūlmecid gave the church to France in 1856. In 1877 the White Fathers, a Roman Catholic missionary society, were charged with guarding St Anne. A Bible Museum was opened next to the church and a seminary for Greek Catholic (Melkite) clergymen was established overlooking the Via Dolorosa. Ahmed Jemal Pasha, who was the High Commander in Syria and a member of the ruling Young Turk triumvirate, confiscated all the schools belonging to England, France and Russia. The church of St Anne remained in the hands of the Greek Catholic Patriarchate, whereas the Salahiiyya or, as it was called in Turkish, the Salahaddin-i Eyyubi Külliyye-i

Islamiyyesi, moved into the former seminary.

The opening celebration of the Islamic successor to the Christian institution was held on the Prophet's birthday, 28 January 1915. That relations between the college and St Anne were neighbourly can be attributed in part to Jemal's support for the coexistence of religions. But the rather brutal way in which schools and monasteries had been seized embittered the Christian population. Dr Curt Prüfer,² a German officer assigned to the Fourth Ottoman Army, reported the following:

Jerusalem had always been a city with an abundance of opposing national and religious interests. The administrative policies of the High Commander of the Fourth Army, General Jemal Pasha, after his move to Jerusalem were neither conducive to conciliation between the conflicting parties nor likely to gain support for the unpopular idea of Ottoman unity ... The Muslim population of Jerusalem, of which only a small fraction speaks Turkish as a mother tongue, feels injured in its national pride by such measures (sc. the 'Turcification' and centralisation) ... The transformation of the seminaries belonging to St Anne into a school directed by the Egyptian nationalist 'Abd al-'Aziz Shawish, known for his intransigent Islamic attitudes, is perceived as an affront and a provocation to the Christian

* I would like to repeat my thanks to several people and their institutions in Jerusalem which were helpful in my research, especially Khadr Salameh (Maktabat al-Aqsa), 'Abdallah Kalbuna (Islamic Museum in the Haram al-Sharif), Dr Paul Alsberg (Israeli State Archives) and Père Michel Deffrennes (St Anne).

¹ This article draws heavily on my book (Strohmeier 1991). Detailed references not given in this article are to be found in the book. I have refrained from giving sources for the biographies of the many persons mentioned. In general the biographical dictionaries of Zirikli 1984 and 'Awdat 1976 were useful. Another valuable reference book is *Al-Mausu'a al-filastiniyya* 1984. The Salahiiyya is briefly mentioned in Tibawi 1969: 230, and al-'Asali 1981: 59, 73-76.

² For his remarkable career, see McKale 1987.

Pl. 5.1 Photograph of February 1916 (Kurd 'Ali 1334/1916 after page 224), showing from right to left in front row: Ahmed Jemal Pasha and Enver Pasha. Jemil al-Nayyal is in the second row, first to the right.

population? ... (Israeli State Archives A.III. 15. vol. 4, file no. 27)

Although observers of the Salahiyya inauguration ceremony attest to the presence there of both pupils and teachers, it was wartime and therefore preparations to staff adequately and equip the school ran into difficulties. It was not until June 1915 that the announcement was made that instruction would begin. Although statutes regulated administration, entrance requirements and arrangements, curriculum and testing, many regulations were not always complied with.³ The initiators of the university saw it as a revival of the *madrasa* created by Salah al-Din. The objective was to educate Muslim theologians (*'ulama'*) who would also be trained in secular disciplines. The Salahiyya was subjected to the control of the *sheykhülislam* and the *Ewqaf*-ministry. The director of the school was appointed by sultan's decree (*irade*). Additional authority was accorded to the deputy director and the inspector of instruction (*ders nazım*).

It took ten years to complete the course of studies, which was divided into two parts, the first of which lasted seven, the second three years. But on the basis of the curriculum one can more accurately speak of three blocks

of studies. The first three years were devoted to general education, i.e. languages, history, mathematics and natural sciences. In the middle level (classes 4-7) religious subjects were dealt with (*'ilm-i fiqh*, Qur'an exegesis, Hadith) while the study of secular law (*'ulum-i huquqiyye*) was reserved for the upper level (classes 8-10). The focus on history, natural sciences and mathematics as subjects is significant. The language of instruction was Arabic, thus relegating Turkish to a position of minor importance. Students could choose one language from each of the two language groups: they could take Persian, Urdu or Tatar and choose either German, French, English or Russian from the Western languages. The class schedule exhibited today in the Islamic Museum in the Haram al-Sharif contradicts this model somewhat. According to this time-table classes 4, 9 and 10 were not occupied, the reason being probably that both upper classes could not have been filled until pupils from the preceding classes had been educated. Furthermore, many of the older students were drafted for military service in the course of the war.

The terms of admission required at least five years attendance at elementary school (*mekteb-i iptida'i*) which meant that students entering the school were at least twelve years of age, although exceptions were made. Entrance examinations were held once a year in the Ottoman provinces. Applicants with elementary school diplomas were tested in the following subjects: Qur'an, religious knowledge, Arabic, arithmetic, history, geography and calligraphy. Regulations provided for the annual admission of one hundred students according to a regional quota. Ten places were allotted for candidates from the district of al-Quds and fifty from the provinces of the Ottoman empire. The remaining positions would be filled with students from other Islamic regions, but in practice almost all students came from Syria and Palestine, thus limiting the sphere of influence of the school. The appeal of the Salahiyya was nevertheless considerable and the selection of students had to be restrictive. In Damascus alone sixty-five applicants took part in the entrance examination in 1916. But personal contacts and family standing also played an important role. Children from elite families with high religious prestige received preferential treatment. The Salahiyya was conducted as a boarding school with room, tuition and clothing free of charge. In the streets of Jerusalem the students attracted attention with their colourful garb (*jubba* and turban).

What was the significance of the Salahiyya within the structure of the Ottoman educational system? A student at the Salahiyya studied as long as an Istanbul University (*darülfünun*) student, who attended elementary school for five years, followed by seven years at the *lycée* (*sultani*) and three years at the university. Thus, the Salahiyya was an institute of higher education but differed from the *darülfünun* in that it joined secondary and

³ *Salahaddin-i Eyyubi Külliyye-i İslamiyyesi Ta'limatnamesi*. Quds 1333/1915.

university education under the same roof. In this respect it resembled the *Mekteb-i Mülkiyye* (School of Civil Administration). A look at the state of education in Greater Syria (*Bilad al-Sham*) is instructive. In 1913 the Ottoman government had set up in the cities of Beirut, Damascus and Jerusalem one *lycée* each with Arabic as the language of instruction. This had been a concession to the nascent Arab nationalist movement. Two years later, when the persecution of Arab nationalists had reached a decisive stage, the Beirut and Damascus schools were closed in order to deprive the movement of a field of activity (Strohmeier 1993). But the *sultani* in Jerusalem, known as al-Madrasa al-Rashidiyya,⁴ was allowed to carry on its functions because the Arab movement here was not as developed as in Beirut or Damascus and thus not perceived as a threat by the authorities.

Both the foundation of the Salahiyya as well as the reorganisation and modernisation of the higher religious schools (*medreses*) in Istanbul must be seen in the context of the growth of Islamic reformism in the Ottoman empire. The syllabi of the Istanbul *medreses* which had been united in the *darülkhilafetül ‘aliye medresesi* in 1914 exhibited many similarities with that of the Salahiyya. It is, however, interesting that the percentage of subjects pertaining to secular law was higher in the Salahiyya than in the Istanbul *medreses*. A basic difference between the *medrese* and the Salahiyya was that the latter was conceived as a response to Arab demands for their own university. The reform of al-Azhar initiated by Muhammad ‘Abduh, which had included the introduction of secular disciplines, was to be continued at the Salahiyya. A German Orientalist, Martin Hartmann, even speculated that the college would eventually surpass al-Azhar in importance (1917: 430). The orientation of the school was by no means exclusively religious. Jemal encouraged the leadership of the Salahiyya to look also to the Syrian Protestant College as a model of academic excellence. In a talk with its president, Howard Bliss, the director of the Salahiyya indicated that he was impressed but also daunted by the achievements of the College. It was obvious that the Salahiyya still had a long way to go (Munro 1977: 67, 189).

The names of the teachers explain the high expectations placed in the Salahiyya. Leading scholars of Arabic language and literature as well as renowned reform theologians, most of whom came from Syria and Palestine, had been recruited. The first president of the Salahiyya was the famous champion of Pan-Islamism and Ottomanism, ‘Abd al-‘Aziz Shawish (or Jawish, 1876-1929).⁵ Shawish

Pl. 5.2 Ishaq Musa al-Husaini in front of the Salahiyya, March 1987.

had already been linked with the effort to establish a university (*darül‘ulum*) in Madina. Its aim was ‘... to enable its graduates to promote the great Islamic truths’. The foundation stone was laid by Shawish, Shakib Arslan and ‘Abd al-Qadir al-Maghribi in 1913, but due to opposition by the ruler of Hejaz, Sharif Husain, and Arab nationalists, the university never commenced instruction.⁶ As editor-in-chief of several newspapers, Shawish influenced public opinion in Egypt. After being expelled from Egypt he went to Istanbul and served as editor of the journal *al-‘Alam al-Islami*. He was a close associate of the Young Turks although they considered him unreliable. Shawish was also active for the *Nachrichtenstelle für den Orient*, the German counterpart of the *Arab Bureau*. Shawish’s activity at the Salahiyya did not last long as there were soon disagreements with Jemal.

In autumn 1915 Jamil al-Nayyal (1879-1949) of Damascus, a jurist and graduate of the Mekteb-i Huquq, became president. He represented the school in public but he was seldom on the premises owing to his other offices as director of the *auqaf* in Jerusalem and interim (1917) district governor (*mutasarrif*) of al-Quds. In 1925 he was

⁴ Named after Ahmed Reshid [Rey] who was district governor (*mutasarrif*) when the school was founded in 1906. Rey (1870-1956) has left some memories of his governorship (1945: 82-102).

⁵ There are several biographies, the most comprehensive of which is Qunaybar 1968.

⁶ ‘Medine’deki darül‘ulum haqqında nizamname’, *Düstur* 1332/1916-17, 319-322. Arslan 1969, 110 f. ‘Aleyh diwan-i harb-i ‘örfisinde tedqiq olunan mes’ele-i siyasiyye haqqında izahat, 101. French edition with slight changes: *La vérité sur la question syrienne*. Publié par le commandement de la IV^{me} Armée. Stamboul 1916. Cf. now Tauber 1991.

charged with founding the first institution of higher learning in the newly established capital, Ankara (Hukuk Fakültesi). After the introduction of the law on family names he was known as Cemil Bilsel. In 1934 he became rector of the University of Istanbul (İstanbul Üniversitesi) and implemented there Kemalist academic policies.⁷

The key position of inspector of education (*ders nazır*) was held by Rustum Haidar (1886-1940) who is one of the most interesting figures of the Arab national movement in the first half of the 20th century. Unfortunately his significance has not been adequately recognised and appreciated.⁸ After studies at the Mekteb-i Mülkiyye and at the Sorbonne, he worked as a teacher at the *lycée* in Beirut which was closed in 1915. He then became a member of the Salahiyya staff. Together with Ahmad Qadri and 'Auni 'Abd al-Hadi he was founder of the most important Arab secret society *al-Jam'iyya al-'Arabiyya al-Fatat* (1911) and joined forces with the rebellious Arab troops at the end of the First World War. Under Faisal and his son and successor Ghazi, Haidar occupied high positions in Iraq. The motives for his assassination in 1940 were never satisfactorily determined.

Other prominent teachers include 'Abd al-Qadir al-Maghribi (1868-1956) from Lattakia. Together with Kurd 'Ali he founded the Arab Academy in Damascus. Amin al-'Uri, Musa al-Budairi and Husam al-Din Jarallah were all candidates in the famous *mufti* election in April 1921. Jarallah won but Britain was able to have Hajj Amin al-Husaini named (Jbara 1985: 42-45). 'Adil Jabbar (1885-1953) taught geography and French. Khalil al-Sakakini (1878-1953), a Greek Orthodox Christian from Jerusalem and friend of Haidar's, occasionally held lectures at the Salahiyya. Rafiq al-Tamimi (1890-1957), who was a member of *al-Fatat*, had previously been the director of the trade school (Tijaret Mektebi) in Beirut. Is'af al-Nashashibi (1885-1948) was instructor of Arabic literature. Because of his reputation as an excellent linguist and man of letters he was called *adib al-'arabiyya*. Also worthy of mention are 'Abd al-Rahman Salam (1871-1941) from Beirut and Muhammad Amin Suwaid (1855-1936) from Damascus. There were also prominent figures who were closely connected to the college despite the fact that they did not have permanent positions. As'ad al-Shuqairi (1860-1940) from 'Akka (Acre) was a student of 'Abduh's and Afghani's. He was a member of the Ottoman parliament and an intimate friend of Jemal Pasha. The same was true for 'Abd al-Qadir al-Muzaffar (1880-1949) who was a graduate of al-Azhar and a member of the Committee for Union and Progress (*Ittihad ve Teraqqi Jem'iyyeti*) in Jerusalem.

Unfortunately only a few of the students could be

identified. Among them was Ishaq Musa al-Husaini, who accompanied me on a visit to the site of the Salahiyya in 1987 and to whom I am indebted for many details concerning the school. Husaini, born 1904, came from the *naqib al-ashraf* branch of the Husainis. He studied with Hamilton Gibb at the University of London and received a PhD in 1934. Later he became professor at the American Universities in Beirut and Cairo. He was renowned not only for his scholarship but also for his work as a novelist. Husaini died in December 1990 in Jerusalem. Yusuf Yasin (1892-1962) of Lattakia had an unusual career, managing to advance to foreign minister of 'Abd al-'Aziz b. Sa'ud (1882-1953), the founder of the kingdom of Saudi Arabia. Other students who achieved prominence in letters or politics were Muhyi al-Din al-Hajj 'Isa al-Safadi (1897-1974), Hasan Abu Su'ud and 'Umar Yahya al-Faraji from Hama. Sa'd al-Din 'Abd al-Latif (born 1899), who moved to Cairo in 1948, provided me with a photograph of the Salahiyya students with Jemal Pasha. Subhi al-Khadra' (1895-1954) became a member of the Arab Executive Committee (*al-lajna al-tanfidihiyya al-'arabiyya*). Probably the youngest student was Khalil al-Budairi (Budairi 1982: 710). A study of the personal records and careers of the students and teachers of the Salahiyya indicates that they left their mark on 20th-century Arab—and especially Palestinian—political and intellectual history.

The significance of the Salahiyya can only be understood in the context of the three competing movements of the time, Ottomanism, Pan-Islamism and nationalism (both Arab and Turkish) and the political background. When the Ottoman empire entered the war in autumn 1914 on the side of Germany and Austria-Hungary, one of its assignments in this alliance was to engage the British troops in Egypt in order to allow Germany greater freedom of action in Europe. But, as is well known, the Suez Canal expedition organised by the German colonel, Kress von Kressenstein, was a failure. After the Balkan wars (1912-13) the Turks had become by far the largest ethnic group in the Ottoman empire. This encouraged the growth of Turkish nationalism. Ottomanism referred to the concept of a multi-ethnic state incorporating peoples of various religions and languages under the rule of the Ottoman dynasty. Arab nationalists did not generally favour breaking away from the empire. The 'honeymoon' (Antonius) of Turkish-Arab relations after the restitution of the constitution in 1908 came to an end when Arabs ceased to hope for greater reform and more self-determination. As the Young Turk centralisation policies manifested themselves with increasing clarity, the signal was given for the formulation of more radical goals. Jemal's objective was to neutralise Arab nationalist activities in Syria. But his rule, which was widely perceived as despotic, hastened the process of Arab alienation which reached its zenith during the war. Jemal's persecution of

the Arab societies (e.g. *Hizb al-Lamarkaziyya al-'Ahd*) and the execution of several members only made their comrades in *al-Fatat* whose existence remained unknown to the Ottoman authorities more determined to put their originally somewhat hesitant plans into practice. Under these circumstances it is most interesting that *al-Fatat* was represented at the Salahhiyya by two of its cofounders, Haidar and Tamimi.⁹

One of the last efforts to gain sympathy among the Arabs for pan-Islamism and Ottomanism was the propaganda tour to Madina undertaken by Enver and Jemal in February 1916.¹⁰ They attempted to present religion as the unifying bond between Arabs and Turks. The Arab revolt nullified these efforts. In the middle of *jihād* the government of the *sultan-khalif* was deprived of the Holy City of Mecca just as Madina was being besieged. The only Holy Place of Islam still in Turkish hands was Jerusalem. But even this control was doubtful, as it was said that '... a Turkish Jerusalem had never existed' (Atay 1981: 6). Jemal had come to Syria with the intention of persuading the Arabs of the wisdom of loyalty to the Ottoman empire. He was in no way disposed to recognise the demands of Arabs for more autonomy. His strategy consisted of complying with certain demands in a way that exploited the disagreements between the more radical forces which had found their way into the societies, and the steadfast exponents of Ottoman statehood such as Shakib Arslan and Shawish. One such concession was the establishment of a university with studies conducted in Arabic.

The founding fathers—Shawish and Jemal—had

foreseen an institution which would serve several purposes. The Salahhiyya would function not only as a counterweight and as a concession to Arab nationalism, but also as an instrument of appeasement with which to bind the Arabs to the empire in the spirit of Ottomanism. The school was also to be a vehicle of pan-Islamism. Graduates would convey Turkish claims to the caliphate to the entire Islamic world. Moreover, the Salahhiyya would be rooted in a programme of theological reform inspired by eminent scholars. Contemporary observers varied in their assessment of the Salahhiyya. We have found little evidence to support Kress' view that the school was '... one of Jemal Pasha's stillborn children' (1938: 115). Kurd 'Ali (1332/1916-17: 561-563), on the other hand, had witnessed the foundation of the school with optimism. In the spirit of 'Abduh he had stressed that Islamic precepts were not incompatible with the requirements of modern life and recent scientific findings. He argued that Islam had to be opened up to an authentic understanding (*fahman sahihan*). This would be the task of theologians who had received a reformed education. Only on the basis of such training could a revival of the *umma* be expected. This was, then, one of the goals of the Salahhiyya: to train theologians who would be both open-minded and intellectually equipped to deal with secular and scientific concerns.

Although the Islamic character of the Salahhiyya is indisputable, the claim that it was a centre of pan-Islamism is inaccurate (Kohn 1969: 52). War conditions prevented the development of a religious élite school representing the entire Islamic world reaching out to Central Asia and the Indian subcontinent. It is probable that Shawish's departure also reduced the pan-Islamic element. Several people from the Salahhiyya staff, such as its president Nayyal and Maghribi, were advocates of Arab loyalty to the Turks. Those teachers who were no longer able to imagine a common state for Turks and Arabs were certainly in no

⁹ Of the abundant literature on this topic it must suffice to mention only one book, Zeine 1973, *passim*.

¹⁰ On their way to Madina, Jemal and Enver inspected the Salahhiyya and were received with great honour. Kurd 'Ali 1334/1916: 244-247 has described this visit in detail.

position openly to propagate Arab secession. Nevertheless, the Salahiyya was a place where it was possible to take certain liberties. The paradox is that, under the very eye of its founder, an institution had evolved which was pervaded by the spirit of Arab nationalism, which Jemal so vehemently opposed. This aspect of the Salahiyya was clearly recognised by the author of a report in the *Arab Bulletin* (3 159: No. 89, 14 May 1918):

Jemal's idea was firstly to ingratiate himself with the Arabs by giving them an Arab University run on apparently liberal lines, and secondly, by putting his own men on the staff, covertly to create pro-Turkish and pan-Islamic feeling. Like many other Turkish enterprises it began with a flourish and ended in smoke. It acquired a reputation as a centre of pan-Islamic propaganda, but it is now clear that practically nothing of this kind existed ... The *sheikhs* on the staff seem to have been worthy old men who knew a little of their subjects, but were neither capable nor desirous of exercising any political influence on the boys. What influence existed in the college at all seems to have been that of the more modern Arab teachers, and as such must have been diametrically opposed to the object of the founder.

The running of the college resembled a balancing act between Islamism, Ottomanism and Arabism. That Haidar was given an important function is truly astonishing given the fact that several members of the Haidar clan from Ba'labakk had been arrested and convicted of nationalist activities. On the other hand, Nayyal was unconditionally pro-Turkish. To a certain extent the two men in charge of

the Salahiyya symbolised a compromise between Arabs and Turks, a settlement between Ottomanism and Arabism. Whether or not this course was effective at the Salahiyya, it proved unviable elsewhere. As early as September 1915 members of the Salahiyya had experienced events that portended difficulties ahead. Just two weeks earlier the first nationalists had been executed. Some of them had been friends and relatives of the Salahiyya staff. It is certain that this and other events strengthened their nationalist convictions. The increased orientation towards separation from the Ottoman empire found its way into the classroom at the Salahiyya. The result was that an institution which had been founded to promote Ottoman statehood became a centre for the dissemination of Arab national thought.

The surrender of Jerusalem to the British on 9 December 1917 sealed the fate of the Salahiyya.¹¹ Several days earlier a group of teachers had left Jerusalem and set out for Damascus where the work of the Salahiyya was to be continued.¹² By the middle of 1918 the traces of the Salahiyya had been lost. When the White Fathers, the former guardians of St Anne, returned they were surprised at the good order and condition of the buildings: '... *les Turcs avaient la vanité de leur Université et la maintenaient en bon état.*'¹³ The Bible Museum, the archive and even cult objects had remained untouched. Only the crucifixes had been removed. In the autumn of 1918 they set about reopening the seminary in which priests were trained until 1967. The statue of Cardinal Lavigerie, the founder of the White Fathers, which had been removed on order of the Salahiyya administration, was set up in the garden of St Anne again. A marble plaque with the inscription *Kulliyyat Salah al-Din al-Ayyubi*, which had probably been mounted on the portal, was brought to the Bible Museum where it remains today. A visitor will find little else to call to mind the memorable episode of the Kulliyya al-Salahiyya.

¹¹ The document of the capitulation is in al-'Arif 1986, 383. A photograph of the surrender is reproduced in Khalidi 1984: 48, no. 14.

Chapter 6

OTTOMAN JERUSALEM IN THE WRITINGS OF ARAB TRAVELLERS

Abdul-Karim Rafeq

Several Arab travellers wrote accounts of their journeys to Jerusalem during the Ottoman period. Some of the accounts have been published; others are still in manuscript form. Most of the accounts quote earlier historical sources which described the religious monuments in Jerusalem and other places in Palestine and very often reproduce their descriptions almost in full. This explains the identical accounts appearing in almost all of their works, irrespective of their time frame. Personal, factual observations by the travellers, however, abound in their works and these highlight their value within the context of a specific place and time. The information culled from the travel accounts in many ways reflects the identity of the traveller and the way he perceived individuals and monuments. The social status, religious formation, affiliation with one school of Islamic law or another, and especially his *sufi* (mystical) leanings and his adherence to a certain *tariqa* (*sufi* order) usually colour the traveller's observations and explain what he saw and described—and what he failed to see.

Hailing from different countries at different times and having different backgrounds and professions, the Arab travellers, no matter to what religion, school of law or *sufi* order they belonged, have one aspect in common. They all shared a heightened expectation of their visit to Jerusalem and a great respect for its religious monuments. Muslim travellers, no less than Jewish and Christian travellers, refer to the early history of these monuments, considering them a religious legacy to be respected, protected and cared for. Indeed, under Arab rule, the monuments of Jerusalem, no matter to what religion they appertained, were well respected.

Whether the ultimate goal of the Arab traveller was to pay a special visit to Jerusalem, or to visit it while on his way from Egypt or the Hijaz to Damascus or Istanbul, the observations of all these travellers complement one another and are noteworthy. They provide over time a tapestry of information which delineates the physical changes affecting the religious monuments of Jerusalem, the quality of religious learning displayed by religious scholars (the '*ulama*') who functioned there, and the degree of security in the city and its environs. The physical condition of the walls and the gates of Jerusalem, as well as the fees collected from the travellers at the gate of entry whether by civil or by unruly persons, were the first matters to attract the attention of every traveller. Interest then shifts to the degree of security in the city and the attitude of the governor and the power groups there.

The restricted nature of this article, which focuses only on the writings of Arab travellers, should not minimise the importance of the writings of scores of European travellers who flocked into Jerusalem throughout the ages. Some European travellers visited Jerusalem alone; others passed through it on their way to other cities and lands, notably to Egypt, Damascus and Istanbul or to Mesopotamia, Persia and the Far East. They were motivated by religious zeal to visit the Holy City, by geographical adventurism in the Orient, or by their obligations as emissaries of their governments and commercial companies. Their descriptions of the city complement the descriptions of the Arab travellers on a variety of subjects.

One of the earliest available travel accounts in Arabic about Ottoman Jerusalem is the work of the Hijazi

Madinese scholar, Ibrahim al-Khiyari (1037-83/1628-72). His travel account is titled *Tuhfat al-Udaba' wa Salwat al-Ghuraba'* (1969-80). A Shafi'i scholar from Madina, Khiyari accompanied the Damascene pilgrimage caravan on its way back from the Hijaz to Damascus, where he arrived on 28 Safar 1080/28 June 1669. From there, al-Khiyari continued his journey to Istanbul. He came back from Istanbul to Damascus apparently with the Ottoman (Rumi) pilgrims to avail himself of the protection provided for them. From Damascus, Khiyari went on to Egypt where he joined its pilgrimage caravan to the Hijaz. On his way to Egypt, he visited Jerusalem.

After staying in Damascus for twenty-four days, al-Khiyari set out on 15 Rajab 1081/28 November 1670 heading toward Egypt in the company of travellers proceeding along the trade route which skirted the coast in Palestine (the Via Maris). He describes in detail the halting-places along the route, the towns and villages he passed through, the dangers he was exposed to, and the people, both good and bad, he met (for details see al-Khiyari 1969-80, 2: 160-70). In Ramla, al-Khiyari met the famous Hanafi *mufti* (jurist) Khair al-Din al-Ramli (993-1081/1585-1671), author of the important juridical work *al-Fatawa al-Khairiyya fi Naf' Khair al-Bariyya* (1974), about two months before the latter died. Among the notables and scholars who attended the meeting between al-Khiyari and Khair al-Din was Khair al-Din's son, Shaikh Najm al-Din, who later became *mufti* of Jerusalem. At midnight on Wednesday 26 Rajab/9 December, al-Khiyari, accompanied by troops for security, left the trade caravan, which continued its way on the Via Maris to Egypt, and headed toward Jerusalem. He passed through a mountainous region avoiding the village of Qaryat al-'Inab, the stronghold of the highwayman Abu Ghosh. Upon approaching Jerusalem, al-Khiyari saw its imposing walls, which had been reconstructed in the late 1530s by the Ottoman Sultan Sulaiman the Magnificent, and their surrounding trench. He entered the city through Bab al-Khalil (now called the Jaffa Gate, then called after the city of Khalil [Hebron] where the Patriarch Ibrahim al-Khalil—Friend of God—is buried). The gate was also known as Bab al-Mihrab (the Gate of the Prayer-niche). On his right, al-Khiyari took note of the Citadel, which had also been reconstructed. Crossing the market place, which was full of people, al-Khiyari finally came to the caravansarai (*khan*) where he was to stay (for details see al-Khiyari 1969-80, 2: 171-5). After he had performed his ablutions, al-Khiyari headed towards the Aqsa Mosque to explore its beauty. He spent one and a half days in Jerusalem and then departed on Friday 28 Rajab/11 December for Hebron on his way to Egypt.

While describing the architectural details of the complex of al-Haram al-Sharif (the Noble Sanctuary), al-Khiyari quotes from the same books later used by the

Damascene traveller, Shaikh 'Abd al-Ghani al-Nabulsi, who twice visited Jerusalem in 1690 and 1693. Among the buildings described on the Haram are the Dome of the Rock and the Aqsa Mosque. The two most quoted works are those by Shaikh 'Abd al-Rahman b. Muhammad Mujir al-Din al-'Ulaimi al-Muqaddasi al-Hanbali, *al-Uns al-Jalil bi-Ta'rikh al-Quds wa'l-Khalil* and by Shaikh Ibrahim al-Suyuti, *Ithaf al-Akhissa fi Fada'il al-Masjid al-Aqsa*.¹

In describing the *mihrab* in al-Aqsa Mosque, both al-Khiyari (2: 170) and al-Nabulsi (*al-Rihla al-Qudsiyya*: 142) refer to seventeen coloured marble facets or rows (*dil'*) inside the *mihrab* and give details of the significance of the colours. Both of them quote the mosque attendant who explained the colours to them in the same way—the eight white sides signify the number of prostrations (*rak'at*) at the noon prayer (*salat al-zuhr*) and the afternoon prayer (*salat al-'asr*); the four red sides signify the sunset prayer (*salat al-maghrib*); the three black sides signify the evening prayer (*salat al-'isha'*) when darkness sets in; and the two green sides signify the prayer of daybreak (*salat al-subh*).

Despite the similarities in the description of the Haram written by almost all the Arab travellers who quote from the same sources, each traveller, nevertheless, made personal observations about his own experiences during his visit to Jerusalem. Impressed by the imposing architectural details and the sanctity and splendour of al-Aqsa Mosque, al-Khiyari says (2: 189) that a single prayer in al-Aqsa Mosque equals five hundred, even a thousand prayers, elsewhere. The *mihrab* of the Aqsa, according to al-Khiyari, was reserved for the use of the Shafi'i *imam* (leader in prayer) in the same way as the *mihrab* of the Dome of the Rock was reserved for the Hanafi *imam*. The Maliki *imam* was assigned a place in the corner of al-Aqsa Mosque, and the Hanbali *imam* prayed in the Sultaniyya school (al-Madrassa al-Sultaniyya), also known as al-Madrassa al-Ashrafiyya and al-Madrassa al-Ashrafiyya al-Sultaniyya, which is located on the west side of the Haram near Bab al-Silsila (the Gate of the Chain).² In matters of precedence, however, al-Khiyari says that the Maliki *imam* ranked first, followed by the Shafi'i, the Hanafi and the Hanbali *imams*. The precedence of the Maliki *imam* over the other *imams*,

¹ Al-'Ulaimi 1973; al-Suyuti (ms) *Ithaf al-Akhissa fi Fada'il al-Masjid al-Aqsa*. A published work under the same title is ascribed to Shams al-Din ibn Shihab al-Din Ahmad al-Suyuti, 2 vols, (ed.) Ahmad Ramadan, Cairo, 1982-4. Al-Khiyari and al-Nabulsi, however, mention the author's name as Ibrahim al-Suyuti. Both works need to be compared.

² Al-Madrassa al-Sultaniyya/al-Ashrafiyya was built in 875/1470 by Amir Hasan al-Zahiri for al-Malik al-Zahir Khushqadam. After the latter's death, Amir Hasan offered it to al-Malik al-Ashraf Qa'itbai who did not like the style of its building. He pulled it down and rebuilt it in 885/1480. It became known as al-Madrassa al-Ashrafiyya and al-Madrassa al-Sultaniyya; see Burgoyne 1987: 589-604; see also *al-Mausu'a al-Filastiniyya* 1984, 1: 169 (under al-Madrassa al-Ashrafiyya).

as a custodian of al-Aqsa Mosque told al-Khiyari, dated back to the second conquest of Jerusalem by the Muslims under Salah al-Din (Saladin) in 1187. When the four *imams* were asked at that time about their wishes after the conquest, they had indicated their desire to retain their ranking as it was. This was granted them. Al-Khiyari comments upon the custodian's anecdote by saying that in the mosque in Mecca, where the four *imams* prayed during the pilgrimage season, the Maliki *imam* had precedence over the others. However, the Friday prayer in al-Aqsa Mosque, according to al-Khiyari, was held in the place allocated to the Shafi'i *imam* (2: 191-2).

Al-Khiyari spent the whole day of Thursday, 27 Rajab/10 December in al-Aqsa Mosque, performing the mid-afternoon and sunset prayers there with the Shafi'i *imam*, and the evening prayer with the Hanafi *imam* in the Dome of the Rock. He visited a public bath on Friday morning, performed the daybreak prayer in the Dome of the Rock and afterwards attended the Friday prayer in al-Aqsa Mosque (2: 194).

Al-Khiyari says that he spent the whole of Friday morning in al-Aqsa Mosque earnestly seeking to meet an accomplished scholar to benefit from his knowledge. He failed to find one. The two persons assigned to him fell short of meeting his scholarly expectations (2: 194). Al-Khiyari, in fact, was in a hurry to leave Jerusalem and continue on his way to Cairo after he had spent only a day and a half visiting the Haram al-Sharif, touring its religious monuments and praying with different *imams*. He simply did not have the time to meet Jerusalem's accomplished scholars, of whom there was no shortage, as al-Nabulsi later came to recognise. Used as he was to the Hijaz, where Mecca and Madina were bustling all year round with 'ulama' from all over the Muslim world, al-Khiyari's anxiety at not finding accomplished scholars in Jerusalem becomes all the more understandable. His statement should therefore not be taken too literally. Not meeting qualified scholars in Jerusalem was al-Khiyari's problem, not Jerusalem's.

The ancestors of Shaikh 'Abd al-Ghani al-Nabulsi (1050-1143/1641-1731) hailed from the town of Nablus in Palestine. He was a distinguished Damascene Hanafi jurist, a *sufi* and a prolific author who wrote over three hundred books and monographs, most of which have been located and a number of them published. He made two journeys to Jerusalem (for the biography of al-Nabulsi, see al-Muradi 1966, 3: 30-8). The first journey, which took place in 1101/1690, is described by al-Nabulsi in a work entitled *al-Hadra al-Unsiyya fi 'l-Rihla al-Qudsiyya* (1990). The journey lasted forty-five days, of which al-Nabulsi spent eighteen days in Jerusalem. Al-Nabulsi's second journey to Jerusalem occurred in 1105/1693 and was part of a major expedition during which he visited parts of Bilad al-Sham, including Palestine, as well as Egypt and the Hijaz. He

describes the journey, which lasted 388 days, in a book entitled *al-Haqiqa wa'l-Majaz fi 'l-Rihla ila Bilad al-Sham wa Misr wa'l-Hijaz* (1986). This time, al-Nabulsi spent seventeen days in Jerusalem.³

Al-Nabulsi left Damascus on his first journey on Monday, 17 Jumada II 1101/28 March 1690. He arrived in Jerusalem on Tuesday, 2 Rajab/11 April, and left the city on the way back on Saturday, 20 Rajab/29 April, which coincides with the thirty-fourth day of his voyage. He arrived in Damascus on Wednesday, 1 Sha'ban/10 May. On his second journey, al-Nabulsi left Damascus on Thursday, 1 Muharram 1105/2 September 1693 and arrived in Jerusalem, by way of Sidon, Acre, Nazareth and Nablus, on Sunday, 2 Rabi' I/1 November, which was the sixtieth day of his journey. He left Jerusalem on his way to Egypt on Wednesday, 19 Rabi' I/18 November, passing through Hebron and Gaza. Upon arriving in al-'Arish, al-Nabulsi comments that this was the first town in Bilad al-Sham that a traveller coming from Egypt would encounter.

Al-Nabulsi's main concern on his journeys was to locate mosques, schools, *sufi* shrines and *zawiyas* (*sufi* retreats) in the towns he passed through. He visited the living—the 'ulama' and Sufis—and paid his respects to the dead at shrines and tombs. He also described the state of security on the roads, the conditions of the caravansarais and halting-places, and the commercial activity there. Al-Nabulsi had much experience in travelling by the time he made his first visit to Jerusalem in 1690. He had already visited Ba'labakk and the Biqa' valley in 1688 and is said to have visited Istanbul in 1664. He called this first voyage to Jerusalem *al-Hadra al-Unsiyya fi 'l-Rihla al-Qudsiyya*, his middle voyage *al-Rihla al-Wusta*, and his next voyage in Bilad al-Sham, Egypt and Hijaz (*al-Haqiqa wa'l-Majaz fi 'l-Rihla ila Bilad al-Sham wa Misr wa'l-Hijaz*) his grand voyage (*al-Rihla al-Kubra*). His earlier voyage to Ba'labakk and the Biqa', which he entitled *Hillat al-Dhahab al-Ibriz fi 'l-Rihla ila Ba'labakk wa'l-Biqa' al-'Aziz*, he also called his small voyage (*al-Rihla al-Sughra*). He made a later voyage to Tripoli in Syria in 1700 which he entitled *al-Tuhfa al-Nabulsiyya fi 'l-Rihla al-Tarabulsiyya*. All of these travel accounts have been published with the exception of his unconfirmed journey to Istanbul of which there has been no record discovered so far.

On his first journey to Jerusalem, al-Nabulsi entered the city through Bab al-'Amud (now also known as the Damascus Gate). He remarks that both the gate and the wall of the city were strongly built of durable material. He then enumerates the gates giving access to the city—to the north, there were Bab al-'Amud, Bab al-Da'iyya, Bab Dair al-Rabb, and Bab al-Sahira; to the south, Bab Harat al-Maghariba, and Bab Sahyun, known at the time as Bab

³ For a scholarly discussion of al-Nabulsi's journeys in Palestine, see Siriyya 1979 and 1985.

Da'ud (and later as Bab al-Silsila/Gate of the Chain and Bab al-Sakina/Gate of the Holy Spirit); to the west, there was a small gate (*bab saghir*) not further identified by al-Nabulsi, which was adjacent to the Armenian monastery; then Bab al-Mihrab (Gate of the Niche), known at the time as Bab al-Khalil (Gate of Khalil/Hebron), and Bab al-Rahma (Gate of Mercy/the Golden Gate);⁴ and finally to the east, Bab al-Asbat (Gate of the Tribes, now also known as St Stephen's Gate).⁵

Upon entering al-Haram al-Sharif through Bab al-Qattanin (Gate of the Cotton Merchants), al-Nabulsi remarks that this is one of fourteen gates which lead to the Haram. According to al-Nabulsi, three of the gates were located in the east wall—Bab al-Tauba and Bab al-Rahma, which are joined (the two names are also used alternately), and a third (not identified) next to them, all closed (*masduda*). The eleven other gates—all located in the west wall—were Bab al-Qattanin, Bab al-Ghawanima (after a celebrated 12th-century family, the Banu Ghanim, descended from Shaikh Ghanim who was appointed *shaikh* of the Salahdiyya Madrasa by Salah al-Din al-Ayyubi) (Burgoyne 1987: 178), Bab al-Nazir (Gate of the Inspector), Bab al-Hadid (Iron Gate), Bab al-Mutawadda' (also called Bab al-Mathara, Gate of the Place of Ablutions), Bab al-Silsila (Gate of the Chain), Bab al-Sakina (Gate of the Holy Spirit), and Bab al-Maghariba (Gate of the North Africans); this last gate was also known, according to al-Nabulsi, as Bab al-Nabi (Gate of the Prophet). In the north wall, there were Bab al-Asbat (Gate of the Tribes), Bab Hitta (Gate of Remission), and Bab Sharaf al-Anbiya' (Gate of the Glory of the Prophets).⁶

By comparing the list of gates given by al-Nabulsi with the list given in 1496 by Mujir al-Din al-'Ulaimi,⁷ one finds that al-Nabulsi has used the same names for the gates, which suggests either that Nabulsi was copying from Mujir al-Din, or that the names given by him were still in use at the time of al-Nabulsi. Al-Khiyari, on the other hand, who visited Jerusalem some twenty years before al-Nabulsi, mentions only twelve gates to the Haram which apparently were in use during his time. Al-Khiyari also gives slightly different names for two of the gates, either because he was relying on other sources or because the names had changed by the time of al-Nabulsi. Al-Khiyari mentions the following gates to the Haram—Bab al-Maghariba, Bab al-Buraq, Bab al-Silsila, Bab al-Sakina, Bab al-Mutawadi'in, Bab al-Qattanin, Bab al-Hadid, Bab

al-Nazir, Bab al-Ghawanima, Bab Hitta, a *bab* next to it whose name al-Khiyari does not know (apparently it was Bab al-Tauba), and Bab al-Rahma (al-Khiyari 1969-80, 2: 193). By comparing these two lists, one finds that al-Khiyari mentions Bab al-Buraq which does not occur in Nabulsi, a *bab* whose name al-Khiyari does not know, and Bab al-Rahma, which is mentioned by al-Nabulsi as being closed. Al-Nabulsi, on the other hand, mentions Bab al-Asbat and Bab Sharaf al-Anbiya', both of which do not occur in al-Khiyari's list.

During his second visit to Jerusalem in 1693, al-Nabulsi again mentions that two of the gates leading to the Haram (Bab al-Rahma and Bab al-Tauba) are still closed. But now he gives an explanation for their closure by saying that they open on to a deserted area where no human being lives (*likawnihima yuftahan ila al-jiha al-khaliya min sukna insan*) (*al-Haqiqa*: 116). This might imply that security in the vicinity of the gates was lax both times that al-Nabulsi visited Jerusalem. Al-Nabulsi, however, does not elaborate in his second journey to Jerusalem on the details of the gates leading to the city or to the Haram. Nor does he describe in detail, as he did in his first journey, the architectural features of the various buildings. He merely says that he has already done so in his earlier account in *al-Hadra* (*wa dhahabna ila al-Masjid al-Aqsa wa zurna ma fihi min al-amakin al-sharifa al-lati fassalna al-kalama 'anha fi rihlatina al-wusta al-musammata bi'l-Hadra al-Unsiyya fi 'l-Rihla al-Qudsiyya*) (*al-Haqiqa*: 116).

On his first visit to Jerusalem, al-Nabulsi stayed in the Sultaniyya Madrasa (al-Madrasa al-Sultaniyya al-Ashrafiyya). On his second visit, he stayed in the Qadiriyya Madrasa which apparently belonged to the *sufis* of the Qadiriyya Tariqa with which al-Nabulsi was affiliated. He says, on one occasion, that the Qadiriyya Madrasa had *al-khalwat al-latifa* ('pleasant *sufi* retreats') and *al-jalwat al-'aliyya* ('heavenly pleasantries') (*al-Haqiqa*: 114). At first he refers to his place of residence four times as al-Madrasa al-Qadiriyya (*al-Haqiqa*: 110, 114, 116, 119), but in the latter part of his travel account al-Nabulsi shifts to calling it al-Zawiya al-Qadiriyya (*al-Haqiqa*: 132-4, 138). Since the Madrasa al-Qadiriyya does not figure in present-day literature on the *madrasas* of Jerusalem, whereas the Zawiya al-Qadiriyya does feature, it seems probable that the two names, al-Madrasa al-Qadiriyya and al-Zawiya al-Qadiriyya, which are used by al-Nabulsi, refer to the *madrasa-zawiya* of that name. The *zawiya* at the time had teaching (*dars*) in it which explains the alternate use of the terms *zawiya* and *madrasa* for the same place. The Tariqa al-Qadiriyya, according to Mujir al-Din 'Ulaimi's *Uns al-Jalil*, written toward the end of Mamluk rule, was the most important *sufi* order in Jerusalem (Burgoyne 1987: 63). As such, it must have had its own *zawiya-madrasa*. An Afghani *zawiya* (al-Zawiya al-Afghaniyya), which was built in 1633,

⁴ For variations and equivalents, see Burgoyne 1987: index under Bab/Gate; Raby and Johns, (eds.) 1992, pt. 1: 105-24.

⁵ For these gates, see al-Nabulsi, *al-Hadra*: 96-7.

⁶ For these gates described by al-Nabulsi, see *al-Hadra*: 98-9.

⁷ See the list in Raby and Johns 1992: 121, table 2.

was also called al-Zawiya al-Qadiriyya.⁸ It is therefore less likely that the word 'Qadiriyya', quoted as such in several manuscript copies of al-Nabulsi's *al-Haqiqa*, could be a misreading, as some suggest, of the word 'Ghadiriyya', which is the name of a better-known *madrasa*. The Madrasa al-Ghadiriyya was located between the Madrasa al-Karimiyya and Bab al-Asbat at the north border of the Haram. It was constructed in 836/1432, and was named after Amir Nasir al-Din Muhammad ibn Dhu'l-Ghadir who endowed it after his wife had built it (Burgoyne 1987: 526 ff). The difficulty with the Madrasa or Zawiya al-Qadiriyya is that there is no clue in Nabulsi's *al-Haqiqa* as to its location. On his first journey to Jerusalem in 1690, al-Nabulsi mentions al-Madrassa al-Qadiriyya; but at the time he chose, as reported above, to stay in al-Madrassa al-Sultaniyya/al-Ashrafiyya (*al-Hadra*: 207, 235). Another example of al-Nabulsi's affiliation with the Tariqa al-Qadiriyya and his stay in one of their *zawiyas* is provided during his visit to al-Khalil/Hebron. Al-Nabulsi was accommodated there in the *zawiya* of the Qadiriyya where he enjoyed watching on two consecutive days the *dhihr* (invocation of the names of God) performed by the Qadiriyya Sufis (*al-Haqiqa*: 121-2).

Like al-Khiyari, al-Nabulsi elaborates in *al-Hadra* on the comparative ranking of the *imams* representing the four Sunni schools of law in regard to their prayer locations in the Haram al-Sharif. At the noon and the mid-afternoon prayers, the Maliki *imam* is the first to pray in the Maghariba Mosque, located in the eastern side of the Haram. When he finishes prayer, the Shafi'i *imam* prays in the Aqsa Mosque, followed by the Hanafi *imam* who prays in the Dome of the Rock. After the Hanafi *imam* finishes prayer, the Hanbali *imam* prays in the mosque below the Madrasa al-Sultaniyya (*al-Hadra*: 104). This mosque, known as the Hanbali Mosque, was apparently the lower assembly hall (*majma'*) of the Madrasa Sultaniyya/Ashrafiyya (Burgoyne 1987: 592). At the sunset, evening and daybreak prayers, each *imam* leads his followers in prayer without ranking or timing. Prayer during the Two Feasts (*salat al-'idain*) and prayer for rainfall (*salat al-istisqa'*) were held according to him in the *mihrab* of the Dome of the Rock.

Al-Nabulsi's concern with sufism, and his interest in visiting both the living and the dead among the Sufis, took him to their *zawiyas*, shrines and burial places. Among the *zawiyas* he visited were those of al-Adhamiyya, al-Bustamiyya and the Tekke of al-Maulawiyya (*al-Hadra*: 235, 240, 242; *al-Haqiqa*: 134). Al-Nabulsi also visited on more than one occasion the main cemetery of Mamilla

(Ma'man Allah), where the tombs of several Sufis and religious scholars, including Companions of the Prophet, were to be found. He also visited other cemeteries, such as the cemetery of Bab al-Rahma and the cemetery of Bab al-Sahira.

Unlike al-Khiyari, who failed to find in Jerusalem qualified scholars to whom he could talk, Nabulsi was always in the company of scholars. He identifies many religious scholars and notables who are not mentioned in other sources. He details their religious importance, describes their role in Jerusalem society, and also maintained a correspondence with them. Among the chief '*ulama*' encountered by al-Nabulsi, he mentions 'Ata Allah Efendi, the chief judge of Jerusalem, Shaikh Najm al-Din, son of the great *mufti* of Ramla Shaikh Khair al-Din al-Ramli, and Sayyid Mustafa Efendi, Naqib al-Ashraf of Jerusalem.

While in Jerusalem, al-Nabulsi visited a distant relative of his, Shaikh Muhammad ibn Jama'a, who was orator (*khatib*) in the Aqsa Mosque, in his residence in the Madrasa al-Jauhariyya. The notables who visited al-Nabulsi in his residence, on both journeys, and whom al-Nabulsi visited in their homes, mosques or *zawiyas*, run into a long list. Chief among them were members of the 'Alami family, notably Shaikh Abu 'l-Wafa and his sons, and Shaikh Ahmad al-'Alami, the Hanafi *imam* in the Dome of the Rock and orator in the Aqsa Mosque, together with his son and brother. Al-Nabulsi also met members of the Dajani family, the *imams* of the four schools of law, and several '*ulama*' from outside Jerusalem who lived there as *mujawirs*. He attended classes and gave lessons in mosques and schools, and also engaged in scholarly discussions with students and scholars during the visits he exchanged with them. He gave *ijazas* (diplomas) in the sciences in which he excelled to students and scholars alike.

One of the main features of al-Nabulsi's travel accounts was his visits to religious places which have special significance for Christians and Jews. As a Muslim, al-Nabulsi revered these places and the venerated persons associated with them because they are respectfully mentioned in the Holy Qur'an and also because they form part of the Arab heritage. On both voyages, al-Nabulsi was keen to visit again many of these religious sites. Upon his visit to Mount Tur (Tur Zaita or the Mount of Olives), for example, al-Nabulsi visited several sites venerated by Jews, Christians and Muslims alike. He mentions that Jesus ascended to Heaven from the Mount of Olives and that his footprints are still viewed at the Place of Ascension (*al-Hadra*: 195-7; *al-Haqiqa*: 116). Al-Nabulsi also visited the tomb of Mary (Maryam bint 'Umrān) at Gethsemane where a church had been built and which was frequented by Christian and Muslim visitors. He read the Muslim prayer 'The Opener' (*Fatiha*) at the tomb of Mary (*al-Hadra*: 195-6; *al-Haqiqa*: 138). He visited the grave of the

⁸ *Al-Mausu'a al-Filastiniyya al-Qism al-Thani al-Dirasat al-Khassa* 1990; see vol. 4: 823, which refers to al-Zawiya al-Afghaniyya built in 1633 as al-Zawiya al-Qadiriyya. Al-Nabulsi stayed in al-Madrassa/al-Zawiya al-Qadiriyya in Jerusalem in 1693.

Prophet David (Nabi Allah Da'ud) at Dair Sahyun outside Jerusalem. He went there through the southern gate of the city known as Bab Sahyun and Bab Da'ud. The Dajani family were the custodians of the grave at the time (*al-Hadra*: 175; *al-Haqiqa*: 118-9).

On both journeys, on his way to Jericho, al-Nabulsi visited the shrine of the Prophet Moses (Mazar al-Sayyid Musa). He elaborates, on his first journey, on the traditions, miracles and dreams associated with the shrine of Moses. He composed several poems on the occasion, depicting his expectations and emotions before, during and after the visit to the shrine (*al-Hadra*: 208-26; *al-Haqiqa*: 135-6). Between Jerusalem and the shrine of Moses, al-Nabulsi, on both journeys, passed through the village of al-'Aizariyya and visited the grave of the Prophet 'Aizar (Lazarus) ('Aizar al-Nabi). On each occasion al-Nabulsi repeated the current belief that 'Aizar was the same man whom Christ raised from the dead (*al-Hadra*: 233; *al-Haqiqa*: 135, 138).

Al-Nabulsi's interest and joy in visiting the graves of the earlier prophets mentioned in the Holy Qur'an reaches its peak on his visit, on both voyages, to Bethlehem and its Church of the Nativity which traditionally marks the place where Jesus was born. Al-Nabulsi refers to Jesus as 'the prophet without sin' (*al-nabi al-ma'sum*). Al-Nabulsi also says that he saw the date palm to which Mary clung during labour. On his first voyage, al-Nabulsi describes the architecture and the decoration of the Church of Nativity. He quotes from earlier writers the traditions connected with the church. Al-Nabulsi also visited a mosque in Bethlehem. He explains that one half of the inhabitants of Bethlehem are Christians, the other half Muslims and that they make beads from olive wood which they sell to the tourists (*al-Haqiqa*: 295-9).

On the later visit to Bethlehem during his second journey in 1693, al-Nabulsi and his companions were given hospitality by monks with whom they dined and spent the night. Al-Nabulsi was very much impressed by, and indeed rejoiced in, the music of the organ played by the monks which he likened to the sweet voices of the blackbird, the nightingale and the bulbul (*asma'una fihi saut al-urghula fa-ka'annahum istantaqu shahruran wa hazaran wa bulbula*) (*al-Haqiqa*: 125). Al-Nabulsi's visit with his companions to the monks and the hospitality the latter offered them are clear indications of the religious tolerance of both parties and the spirit of co-existence that prevailed among them. On another occasion, while visiting the shrine of the Prophet David, al-Nabulsi spent the night in total happiness, as he says (*wa bitna fihi tilka al-laila fi surur tamm*) (*al-Haqiqa*: 138). Belonging to the Qadiri and the Naqshbandi *tariqas*, and as a Sufi dedicated to the love of God and His creation, al-Nabulsi was open to other faiths. He wrote a treatise entitled *Hadha Kitab al-Qaul al-Sadid fi Jawaz Khulf al-Wa'id wa'l-Radd 'ala al-Rumi al-Jahil al-*

Anid ('This is the Book of Sound Doctrine on the Permissibility of Dropping the Threat and Refutation of the Ignorant and Obstinate Rumi') in which he faulted a Rumi (Turkish) *'alim* who insisted that non-Muslims are destined to go to hell. Al-Nabulsi reasoned that Muslims are promised they will go to paradise and that non-Muslims are merely threatened they will go to hell. A threat can be dropped, according to al-Nabulsi, because forgiveness is one of the attributes of God and also because non-Muslims by paying the poll-tax do good to Muslims. Al-Nabulsi goes on to say that all will be Muslims in the hereafter.⁹

During his second journey to Jerusalem, al-Nabulsi, while on a visit to a local notable, Shaikh Abu 'l-Wafa al-'Alami, on Thursday evening, 13 Rabi' I 1105/12 November 1693, was asked by Abu 'l-Wafa's son Mustafa to name the most eminent prophet other than the Prophet Muhammad. Al-Nabulsi answered that it was Ibrahim al-Khalil. Moses ranked after Ibrahim, and then came Jesus, according to al-Nabulsi. Mustafa then asked al-Nabulsi to write a treatise about the ranking of the prophets, which he did—*Safwat al-Asfiya' fi 'l-Tafdil Baina al-Anbiya' 'Alaihim al-Salam* ('Choicest of the Chosen: on Preference among the Prophets, Peace Be Upon Them') (*al-Hadra*: 235).

While al-Nabulsi was visiting al-Madrassa al-Qadiriyya during his first journey to Jerusalem in 1690, Shaikh Musa al-Maghribi raised with him the issue of smoking tobacco, which was banned by the *'ulama'*. This was a hot issue in the Ottoman Empire at the time and Jerusalem was no exception to the controversy over the permissibility of smoking tobacco. Al-Nabulsi, who was inclined to allow smoking, comments on the conversation that Shaikh Musa finally accepted his argument. Around 1720, al-Nabulsi, in his capacity as Hanafi jurist and a notable *'alim*, officially legalised smoking tobacco in his famous treatise *al-Sulh baina al-Ikhwan fi Hukm Ibahat al-Dukkhkhan* ('Peace among Friends on the Permissibility of Smoking').¹⁰ Al-Nabulsi's pragmatic reasoning was that smoking is like food—if it hurts a person, he should not take it; if it does not hurt him, why not take it? Jurists in Istanbul and Egypt, among other places, also allowed the smoking of tobacco at about the same time.

Seventeen years after al-Nabulsi's second journey to Jerusalem in 1693—that is, in 1122/1710—Shaikh Mustafa al-Bakri al-Siddiqi (1099-1162/1688-1749) went on a journey from Damascus to Jerusalem (for his biography see al-Muradi 1966, 2: 190-200). He recorded his account of the journey in a work entitled *al-Khamra*

⁹ Al-Nabulsi ms. *Hadha Kitab al-Qaul al-Sadid fi Jawaz Khulf al-Wa'id wa'l-Radd 'ala al-Rumi al-Jahil al-Anid*, Berlin National Library, Mq. 1581.

¹⁰ 'Abd al-Ghani al-Nabulsi (ed.), Muhammad Ahmad Dahman, *al-Sulh baina al-Ikhwan fi Hukm Ibahat al-Dukkhkhan*, Damascus, 1343 AH.

al-Hasiyya fi 'l-Rihla al-Qudsiyya.¹¹ A Damascene scholar and Sufi, on separate journeys Siddiqi visited Istanbul, Baghdad, Aleppo, Mount Lebanon, Jerusalem, Hebron and Egypt. He left an account of each journey. He visited Jerusalem several times because for him it was home (*baladihi Bait al-Maqdis*) just like Damascus, according to his contemporary Damascene biographer al-Muradi. Aged twenty-two when he began his journey from Damascus to Jerusalem on 19 Muharram 1122/20 March 1710, Siddiqi, accompanied by his uncle, travelled with a group of visitors and merchants. He does not mention dates nor enumerate the days of his journey, as al-Nabulsi had done, but he says that he was back in Damascus in the middle of Sha'ban 1122/9 October 1710. His trip thus lasted about six and a half months.

Upon arriving at the gate of Jerusalem, Siddiqi and his companions sought permission from the local authorities to enter the city. At the time, this was required for all those who entered and left the city. He entered through the 'Shami Gate' (al-Bab al-Shami), as he put it, meaning Bab Dimashq (Damascus Gate), which was another name for Bab al-'Amud. He lodged in the house of al-Sayyid Muhammad al-Tawaqi near the Aqsa Mosque.

Unlike al-Nabulsi, who associated himself with a number of people in Jerusalem, Siddiqi gives the names of only two Jerusalem notables whose company he enjoyed. They were al-Sayyid 'Alam al-Din al-'Alami, a distinguished notable, and Shaikh Yahya al-Dajani, a Khalwati Sufi, like Siddiqi.¹² The day following his arrival in Jerusalem, Siddiqi, with a group of people, set out to visit the shrine of Moses, the Interlocutor of God (*Kalim Allah*). It was the season of visitation to the shrine when Sufis flocked there carrying flags and beating drums, which pleased Siddiqi. On the way to the shrine, Siddiqi passed through the village of 'Aizariyya. Like al-Nabulsi, he quotes Mujir al-Din al-Hanbali about Lazarus being the one raised by Christ from the dead (*al-Khamra*: 10a). At the shrine of Moses, Siddiqi was entertained in the tent of 'Alam al-Din al-'Alami who had accompanied him from Jerusalem.

Siddiqi stayed at the shrine of Moses for six days. He saw men and women of the lower strata of society mixing together and groups of Sufis parading daily beating their drums and hoisting their flags. Like al-Nabulsi, he speaks about the spiritual experiences which the visitor to the shrine feels and he invokes the appropriate quotations from the earlier sources on this occasion. He absolves the participants in the celebrations from the guilt of their actions (*al-Khamra*: 10b-15a).

For Siddiqi, however, the main attraction was the Aqsa Mosque, where he spent much of his time sitting in one of the window embrasures gazing at the Mukabbar Mountain (Jabal al-Mukabbar) and the Khatuniyya gardens. He wrote much poetry in praise of al-Aqsa. He prayed most of the time with the Hanafi *imam*, attended the study circle of Shaikh Muhammad al-Khalili, and read *sufi* invocations written by the son of his *sufi* master Jamal al-Din Muhammad al-Azhari. He himself also wrote invocations and tracts inspired by his Jerusalem visit, the most famous of which is *al-Fath al-Qudsi wa'l-Kashf al-Unsi* (an alternative title is *al-Nahj al-Qarib ila Liqa' al-Habib*). The inspiration to write this work, according to Siddiqi, occurred to him while on a visit to his uncle's shop in Jerusalem.

After visiting Hebron with friends and accompanied by guards for security, Siddiqi spent about three months in the Khalwat al-Najawiyya (*sufi* retreat) in Jerusalem. In the course of his stay, he made visits to nearby religious spots, such as the shrine of the Prophet David and Tur Zaita. He also visited the village of Baituniyya, which was a *waqf* for the Dome of the Rock, and was accompanied by members of the Dajani family. They all visited the tomb of the mother of Ahmad al-Dajani there (*al-Khamra*: 21a-26a).

The atmosphere in Jerusalem was congenial for a *sufi* master like Siddiqi. He fraternised with Sufis, propagated his Khalwatiyya Tariqa, and won over to it many persons from all *madhhabs*. He was elated by his success (*al-Khamra*: 22a-23a).

Siddiqi does not give a date for his departure from Jerusalem. On the way to Damascus, he mentions the persons he met in the villages and halting-places, most of whom were Sufis. He arrived in Damascus in mid-Sha'ban 1122/9 October 1710, after spending about six and a half months on his journey to Jerusalem. Later, Siddiqi returned several times to Jerusalem on what was described by his biographer al-Muradi as 'pilgrimages to meet Sufis'.

Twenty years after Siddiqi's journey to Jerusalem, in 1721, Mustafa As'ad al-Luqaimi al-Shafi'i al-Dimyati (1105-78/1693-1765) journeyed from Dimyat to Jerusalem (for his biography see al-Muradi 1966, 4: 154-66). Al-Luqaimi's ancestors were from and took the name of a village called Luqaim in the region of Ta'if in the Hijaz. Mustafa was born and raised in Dimyat (Damietta) in Egypt, but he was no stranger to Bilad al-Sham (Syria); he eventually moved to Damascus where he made his residence (*nazil Dimashq*), and he died there.

Al-Luqaimi's account of his journey from Dimyat to Jerusalem in 1731 is entitled *Mawanih al-Uns bi-Rihlati li-Wadi al-Quds*.¹³ Because of al-Luqaimi's earlier interest

¹¹ Reference here is to the manuscript copy in the Berlin National Library no. 6149, Mq. 460.

¹² Mustafa al-Bakri al-Siddiqi, ms. *al-Khamra al-Hasiyya fi 'l-Rihla al-Qudsiyya*, Berlin National Library no. 6149, Mq. 466 10a.

¹³ Mustafa As'ad al-Luqaimi, ms. *Mawanih al-Uns bi-Rihlati li-Wadi al-Quds*, Zahiriyya Library (currently in Asad National Library, Damascus), no. 5248.

in Jerusalem, while still at Dimyat, he summarised the work of Ibrahim al-Suyuti, (*Ithaf al-Akhis* fi Fada'il al-Masjid al-Aqsa, and that of 'Abd al-Rahman ibn Muhammad Mujir al-Din al-'Ulaimi al-Muqaddasi al-Hanbali, *al-Uns al-Jalil bi-Ta'rikh al-Quds wa'l-Khalil*, and included the summary in a work entitled *Lata'if al-Uns al-Jalil fi Taha'if al-Quds wa'l-Khalil*¹⁴ to which he referred in *Mawanih al-Uns*.

Al-Luqaimi began his journey from Dimyat to Jerusalem by land on 8 Dhu'l-Qa'da 1143/15 May 1731. He reached Gaza on 25 May, Ramla on 27 May, and on the following day he arrived in Jerusalem. As he approached the city, al-Luqaimi remarked on the solid wall of the city. He says it had six gates: Bab al-Asbat, Bab al-Sahira, Bab al-'Amud, Bab al-Khalil, Bab Da'ud, and Bab al-Maghariba (*Mawanih*: 23a). Al-Luqaimi apparently was referring only to those gates which were much frequented during his time. He does not include all the gates mentioned by Suyuti and Mujir al-Din 'Ulaimi nor those mentioned by al-Nabulsi, from whose travel account he quotes. Al-Luqaimi was accommodated in Jerusalem in the Khalwat al-Khalwatiyya of Mustafa al-Bakri al-Siddiqi who happened also to be in Jerusalem at the time.

Like the earlier Arab travellers, al-Luqaimi visited the Haram al-Sharif, the Citadel, Tur Zaita, the village of 'Aizariyya and the shrines of the prophets. He also visited the tombs of eminent scholars and Sufis either in their separate locations or in the cemetery of Mamilla. In addition he went to Hebron on 2 Dhu'l-Hijja 1143/8 June 1731 and relates the stories associated with the Patriarch Ibrahim al-Khalil, his family and descendants at much greater length than the stories related by either al-Nabulsi or Siddiqi (*Mawanih*: 35a-47a). On the way back from Hebron, he visited Bethlehem and the Church of the Nativity. He elaborates on the history of Jesus on this occasion. He quotes a Hadith (tradition) attributed to the Prophet Muhammad in which he said that the four most virtuous women in the world were Maryam bint 'Umran (the mother of Christ), Khadija bint Khuwailid, Assya bint Far'un and Fatima bint Muhammad (*Mawanih*: 48b).

After Hebron, al-Luqaimi visited the shrine of the Prophet David. He delves into the details of the traditions connected with the shrine (*Mawanih*: 49a). Describing the religious sites whether in Jerusalem or elsewhere, al-Luqaimi quotes from the same books that were used by earlier travellers, notably Suyuti's *al-Akhis* and Mujir al-Din 'Ulaimi's *Uns al-Jalil*, as well as the travel account of Siddiqi (*al-Rihla al-Qudsiyya*) and that of al-Nabulsi, although this he does not specify (*Mawanih*: 56b).

While he was in Jerusalem, al-Luqaimi visited the

Shafi'i scholar Muhammad al-Khalili and was entertained by the orator of the Aqsa Mosque, Shaikh Nur al-Din al-Jama'i (Ibn Jama'a) (*Mawanih*: 24a, 33a). The peak of the visit for al-Luqaimi was his initiation into the Khalwatiyya Tariqa at the hands of Mustafa al-Bakri al-Siddiqi (*Mawanih*: 50a). Taking pleasure in his visit to Jerusalem and its environs, at the Spring of Silwan ('Ain Silwan) al-Luqaimi recalled the saying of Abu Huraira that of all cities, God has chosen only four, Mecca, Madina, Bait al-Maqdis (Jerusalem) and Damascus, and of all water springs, He also chose only four—'Ain Bisan, 'Ain Silwan, 'Ain Zamzam and 'Ain 'Akka (Acre) (*Mawanih*: 50b-51a). 'Ain Zamzam is in Mecca, the other three are all in Palestine.

Before ending his visit to Jerusalem, al-Luqaimi visited a number of shrines, including the tomb of Moses on 11 Muharram 1144/16 July 1731 and the shrine of Abu Thaur in the village named after him on 20 Muharram/25 July. It took al-Luqaimi five hours to reach the shrine of David from Jerusalem. He elaborates on its history and traditions. Abu Thaur, al-Luqaimi recalls, participated in the first Muslim conquest of Jerusalem (*Mawanih*: 53a-57a).

Al-Luqaimi ended his visit to Jerusalem on Sunday, 1 Safar 1144/5 August 1731 and headed back towards Damascus in the company of Siddiqi and others. Reflecting on his visit, al-Luqaimi highlights his acquaintance with Mustafa al-Bakri al-Siddiqi who initiated him into the Khalwatiyya Tariqa, upgraded him in its ranks and taught him how to face the difficulties of life by utilising *sufi* invocations. Al-Luqaimi also recalls his friendship with Shaikh Muhammad al-Khalili al-Shafi'i, his attendance in his scholarly circle, and the *ijaza* he received from him. Other religious notables whom al-Luqaimi had met included Shaikh Ahmad al-Maliki the time-keeper (*al-muwaggit*) in the Haram, Shaikh 'Ali al-Daghistani, who sat in the Madrasa al-Sultaniyya in the Aqsa Mosque and from whom he learned the discipline of the soul, which he characterises as the Great Holy War (*al-jihad al-Akbar*), Abu Bakr al-'Alami, the Hanafi *mufti*, and Shaikh 'Abd al-Mu'ti al-Shafi'i whom he met in the Madrasat al-Nahawiyya in the Haram (*Mawanih*: 61a-63a).

Although several Muslims from North Africa (the Maghrib) visited Jerusalem as travellers, the majority came to stay there as Maliki scholars and *mujawirs*. Not much is known about the travel accounts of the *maghariba*. A published Maghribi travel account which deserves a citation is written by the Moroccan Abu 'l-Qasim al-Zayyani (1147-1249/1734-1833) under the title of *al-Tarjumana al-Kubra fi Akhbar al-Ma'mur Barran wa Bahran* (ed. al-Filali 1991). Al-Zayyani apparently visited Hebron and Jerusalem only in the last decade of the 18th century or the early years of the 19th. His visit seems to have occurred after he performed the pilgrimage to the Hijaz

¹⁴ Mustafa As'ad al-Luqaimi, ms. *Lata'if al-Uns al-Jalil fi Taha'if al-Quds wa'l-Khalil*, Berlin National Library, no. We.1104.

about the year 1791. He came from the Maghrib to Alexandria by sea on a merchant vessel, then went to Rhodes, Acre, Tripoli and Antioch. From Antioch, he went by land to al-Khalil and then visited Jerusalem. He does not describe how he travelled.

Al-Zayyani's visit to al-Khalil was in spring. He was overjoyed to visit the Great Mosque and gives both religious and architectural detail. In Jerusalem, however, he limits his curiosity and detail to the Haram. He mentions that Jerusalem has seven gates—Bab al-'Amud where he entered the city, Bab al-Zahira (al-Sahira), Bab al-Asbat, Bab al-Maghariba, Bab al-Nabi Da'ud, Bab al-Khalil and Bab Khitta (Hitta). Like the other Muslim travellers to Jerusalem, al-Zayyani uses the terms al-Haram al-Sharif and al-Masjid al-Aqsa alternately. He states that the Haram is seven hundred and eighty *dhira'* long (the *dhira'* in general measures seventy centimetres) and four hundred and fifty *dhira'* wide. The wall that surrounds it is three paces in depth and has twelve gates, all of which are open. Al-Zayyani first singles out Bab al-Rahma and Bab al-Tauba which he says are on the eastern side. Quoting from historical anecdote, al-Zayyani explains that Bab al-Rahma was so called because it opens on the inside into the mosque and on the outside into the valley of hell (al-Zayyani 1991: 267). When al-Zayyani later elaborates on the Aqsa Mosque, he says that the number of its open gates is eleven (not twelve, as he had mentioned earlier). These include the two joined gates on the eastern side (Bab al-Rahma and Bab al-Tauba), Bab al-Asbat, Bab Hitta on the northern side, Bab Sharaf al-Anbiya' also on the northern side, where 'Umar ibn al-Khattab is reported to have entered Jerusalem, Bab al-Maghariba to the east, and Bab al-Ghawanima, Bab al-Hadid, Bab al-Qattanin, Bab al-Silsila and Bab al-Sakina, whose locations he does not indicate. He says, however, that Bab al-Maghariba is so called because it is adjacent to the Maghariba Mosque and also leads to the Maghariba quarter (Harat al-Maghariba) (al-Zayyani 1991: 273-4). The measurements of the Haram and the number of its gates mentioned by al-Zayyani differ from those given, for example, by al-Nabulsi a century earlier. Al-Nabulsi based his information on Mujir al-Din 'Ulaimi's work (see for example al-Nabulsi, *al-Hadra*: 98 ff), but al-Zayyani gives no source for his information.

Al-Zayyani's main focus is on the Aqsa Mosque which he says is located on the southern side of the Haram. He praises it as being the place of the Friday sermon, the Friday prayer and the pulpit (*fihi al-Khutba wa'l-Jum'a wa'l-Minbar*) (al-Zayyani 1991: 267). He engages in a detailed description of the decorative colours in the mosque among which he says gold predominates, gilding being lavishly and profusely used. He says that to the east of al-Aqsa and attached to it is the mosque built by Caliph 'Umar ibn al-Khattab, in the middle of which is a square leading to the *mihrab* of Zakariyya (Zacharias) on which is written in gold God's announcement to him that he will

have a boy to be named Yahya (John) (al-Zayyani 1991: 268). Outside al-Aqsa, on the east side, according to al-Zayyani, there is a mosque with two domes which is the Mosque of 'Isa (Jesus), and to the east of it there is a door which leads to the lower floor where the Cradle (*mahd*) of 'Isa is to be found. Earlier Arab travellers, such as al-Nabulsi (see for example *al-Hadra*: 146) also visited the Cradle of 'Isa here.

Al-Zayyani then goes on to describe the Dome of the Rock and the mosque. His praise of it is no less than that of earlier travellers but with one major difference—they mostly quote earlier works whereas al-Zayyani simply expresses his admiration and is satisfied to quote anecdotes. Shaikh Shams al-Din al-Karmi told al-Zayyani that the lead which covered the dome weighed thirty thousand Damascene *qintars* (a unit which varied in weight according to date and place but in Syria from 100 pounds to 256.4 kilograms).

Al-Zayyani, unlike his predecessors, cited the texts of the writings inscribed either on the religious edifices themselves in the Haram or on copper plates attached to them. On a window in the southern side of the Dome of the Rock, for instance, al-Zayyani saw a large copper plate on which were inscribed praises to God, to the Prophet Muhammad, and to the 'Abbasid rulers followed by the date of Rabi' I 216/April-May 831 (al-Zayyani 191: 271-2).

Al-Zayyani ends his description of the Aqsa Mosque by giving a brief historical survey. He says that the mosque was built by the Prophet of God Adam forty years after Adam had built the Ka'ba (*al-Bait al-Haram*). But, he continues, al-Aqsa was built thousands of years before Adam until it was destroyed by the Flood. Then he recounts the different phases of its history and how it was misused until Caliph 'Umar ibn al-Khattab cleared the site and built the mosque there (al-Zayyani 1991: 275).

A new type of travel account appears with the journey to Palestine of the Arab Christian historian from Damascus, Nu'man al-Qasatli (1856-1920). What establishes al-Qasatli's reputation as an historian rather than a chronicler is the history of Damascus which he wrote under the title of *al-Rawda al-Ghanna' fi Dimashq al-Fayha* in which he dealt with almost all aspects of life in the city with much insight and analysis. He mentions at the end of this book that he will follow it by another book entitled *Mir'at Suriyya wa Misr* (al-Qasatli 1876). Sadly, nothing is known of the whereabouts of this volume. However, some of al-Nabulsi's travel account in Palestine, which seems to be part of it, has recently been found. Two of its three sections (al-Qasatli refers to them as *defters*) have been discovered.¹⁵

¹⁵ Abdul-Karim Rafeq discovered the two *defters* of al-Qasatli's *al-Rauda al-Nu'maniyya fi Siyahat Filastin wa ba'd al-Buldan al-Shamiyya* in the Zahiriyya manuscripts collection (geography section) under an anonymous author, nos. 4919-20, and used them extensively in Rafeq 1990, 2: 849-990.

Al-Qasatli's new approach, especially in the description of his voyage in Palestine, and the way he looked at events, interpreted them and reached logical conclusions based on them, constitute a major change in Syria's traditional historiography. Al-Qasatli apparently acquired much insight from his work with scholars sent to Palestine by the Palestine Exploration Fund who published their research in the Fund's publication, *The Quarterly Statement*. In his travel account on Palestine, al-Qasatli refers, for instance, to Captain C R Conder, who was a noted scholar and member of the Fund (al-Qasatli 1876: pt. 123). The experience thus acquired by al-Qasatli shows in his travel account in which he includes both architectural sketches and plans of ancient sites in Palestine.

Al-Qasatli departed from 'my town' (*madinati*—Damascus—as he refers to it), on Saturday, 26 September 1874, heading towards Palestine by way of Beirut. He toured many towns and sites before arriving at Jerusalem. His account of Jerusalem, where he says he stayed for three months and one day, is unfortunately rather fragmentary and incomplete compared to what he wrote about the other Palestinian towns. It could be that the third missing *defter* of his account would fill this gap.

Unlike the earlier Arab travellers who never gave any figures concerning the number of inhabitants, al-Qasatli, in the style of European travellers, gives a reasonably accurate estimate of their number. To judge by the accuracy of what he has written about Damascus, he seems to have had access to Ottoman and European sources on population figures and other details. Chief among the Ottoman sources to which he had access is the *Salname* (yearbook) of Syria of the year 1288/1871-2, which is extremely important, given the varied information and statistics it offers for that early period. After giving a brief survey of the ancient history of Jerusalem (*Urshalim* and *al-Quds al-Sharif*), al-Qasatli estimates its population at the time of his visit in 1874, at 40,000 inhabitants, of whom 6,000 were Muslims, 12,000 Christians of different denominations, both foreign and native (*min jami' al-tawa'if Afranj wa wataniyyin*), and the remainder 22,000 Jews, made up of natives (*wataniyyin*, apparently Oriental and Sephardic Jews) and *Siknaj* (Ashkenazim—German Jews—and affiliates). Al-Qasatli records his insight that probably after a short time the population of this city will

increase considerably because of the influx of Jews to it from all over the world (al-Qasatli 1876, pt. 1: 5-8 of unnumbered pages).

Al-Qasatli describes the population of Jerusalem as being composed of different nations with different languages and tastes. The houses of the city are, he says, built of stone, and the population enjoys a good life. Crafts there are limited in number, with the exception of the profession of construction which is almost monopolised by Christian builders. The building activity is concentrated mainly outside the walls of the city. Al-Qasatli estimates that 5,000-6,000 of Jerusalem's 40,000 inhabitants live outside the walls and suffer from lack of water. He estimates that in the past the circumference of the city had been nine or more miles but in his day it was a mere three miles (al-Qasatli 1876, pt. 1: 96).

The craft of carpenters, catering for the new buildings, and that of shoe-makers were both making good progress at the time, according to al-Qasatli. Wood was also used in making religious souvenirs for tourists. Soap-making was mainly the profession of peasants. Candle-making and the icon industry were also flourishing because of demand by tourists and for religious occasions. Al-Qasatli, however, laments the small number of crafts in Jerusalem overall and he urges the population to introduce a greater variety. He also encourages them to teach mathematics in the schools to avoid calamities awaiting them in the future. He refers to the poor commercial activity in Jerusalem which is in the hands of Europeans and Jews. The only commodities Jerusalem exports, according to al-Qasatli, are soap and a limited number of icons and rosaries, most of which were made in Bethlehem (al-Qasatli 1876: 8-9 unnumbered pages).

The perspective of the Arab travellers, whether Muslim or Christian, visiting Jerusalem differs from that of the European travellers who came more frequently to Jerusalem. In much the same way as the Muslim travellers were primarily interested in describing the holy places of Islam, the European travellers were mainly interested in describing the Christian religious establishments. However, the Muslims travellers, for their part, also visited those Jewish and Christian shrines which were cited in the Qur'an. The accounts of both groups of travellers thus complement each other.

Chapter 7

OTTOMAN JERUSALEM IN WESTERN EYES

Ernst Axel Knauf

In the course of the last millennium, few cities of the Old World have received more visitors than has Jerusalem, or have been so thoroughly drenched in ink by their visitors.¹ First came the pilgrims who proclaimed the glory of the holy city (and the heroic achievement of going there) in all European languages, from Rhetoromanian (Bundi 1880-3: 151-96) to Catalan (Vallespinosa 1926). There followed² the explorer-traveller of the Enlightenment, the knight errant of empiricism and rationalism and, so one would have expected, more curious and less prejudiced than his medieval predecessors. Finally the 19th century arrived, and with it the beginning of the end of the Ottoman empire and of Ottoman Jerusalem. The relapse into romanticism as attested by Châteaubriand quickly evolved into mass tourism which flooded the Promised Land with hordes of the not-so-innocent (for the rapid change in travelling conditions between 1800 and 1900 see Berchet 1985: 4-9). In the company of both the romantic and the tourist, we now encounter the antiquarian like Melchior de Vogüé who, although

a turcophobe himself (Berchet 1985: 18), was the first to make the architecture, mosaics and inscriptions of the Dome of the Rock known to the scholarly world; and, in the company of the antiquarian, the archaeologist—that scavenger-bird of decaying cultures which he haughtily disregards in search of what was no longer, or even never, there (cf. Silberman 1982). The last decades of the Ottoman empire added to Jerusalem's population the refugee and the carpet-bagger.

And nearly everybody who came felt compelled, it seems, to leave his report for posterity. One would expect Ottoman Jerusalem to be the most thoroughly documented city of Western travelogues. The opposite is the case. In western eyes, Ottoman Jerusalem did not exist. The pilgrims did not visit Jerusalem in order to see what was there but to imagine what had been there. They knew what their audience at home expected to hear and they reported it, without omitting or adding anything. Faithfully they reproduced again and again the accustomed catalogue of holy places. It mattered little that some 'pilgrims' plagiarised their predecessors blatantly, preferring the amenities of armchair travel to prolonged presence among foreign—and 'pagan'—people without forfeiting the prestige, the privileges (and the knighthood) that the pilgrimage, once accomplished, could bestow (Welten 1977). By its very nature, the pilgrim's report could not avoid matching the public's expectations. The Jerusalem pilgrims inaugurated a tradition of theological urban topography from which no later visitor, religious or not, would be able to escape.

The Turk—also and indiscriminately known as Arab, pagan, Moor, and infidel (few visitors remarked that Turks and Arabs lived in the Holy Land)—only appears as

¹ An impressive, if not wholly exhaustive bibliography of Holy Land travelogues has been compiled by Röhrich (1890; 1963). For the period 1878 to 1914 which is, however, for reasons that will become obvious in the course of this contribution, of less interest, Röhrich's work has been continued by Thomsen (1911-1916; 1960). All dates are AD due to the nature of the sources and the scope of the article.

² In the canton of Fribourg, the last pilgrim's report was composed shortly after 1640; the date may be taken as representative (cf. de Diesbach 1893: 262). Even if there were fewer pilgrims and no more pilgrims' reports during the 18th century, the touristic infrastructure of the Jerusalem pilgrimage remained intact, as travellers like Niebuhr and Châteaubriand illustrate in detail.

a figure of oppression and of divine punishment. He represents the power of darkness which, when defied, serves to make the achievements of the pilgrim shine brighter. 'Turks' and 'Pilgrims' are no longer inhabitants of the real world; they become actors in a metaphysical drama. Instead of innumerable tedious examples from pilgrims' prose, one may adduce a pilgrims' song of 1581 AD for this stereotyped view (de Diesbach 1893: 281):

*Es soll uns syn ein härte Buss,
Mit grossem Gelt man jährlich muss
Die heillgen Stetten fristen,
S'Land ist verwüst, s'Volk umgestalt
Ist alles in des Türcken Gwalt
Zu Straff der Sünd der Christen,
Den Pilgern gschicht auch grosse Schmach,
Mit Schahen, Stossen, Werfen zwar
Sie lydends Christi Exempell nach.*³

Rarely does a pilgrim note that the Ottoman administration policed the country, provided security, and dispensed justice.⁴ Turks or Arabs (and Jews) have only one role to fulfil—that of a *massa perditionis*, in order to illustrate the divine justice which inflicted utter desolation upon those who strayed from the path of the true believer or, as the 19th century would have it, from the ways of right-thinking Europeans.

The last of the pilgrims and first of the cultural imperialists, Châteaubriand, may serve as a prime example of a visitor to Ottoman Jerusalem who observed nearly everything and understood next to nothing. Visiting Jerusalem in 1806, he paid for his Knighthood of the Holy Sepulchre (Châteaubriand 1969: 1122-3) by a blindness to everything that did not conform to a romanticised past.⁵ Not that he did not pay attention to Turkish Jerusalem: he did, and to a much larger extent than many of his predecessors or successors. After the lengthy and exhaustive recollection of each and every biblical or Christian memorial, he seizes the opportunity to describe Ottoman Jerusalem—'*cette dix-septième ombre de la Jérusalem primitive*' (Châteaubriand 1969: 1059)—by quarters and even by streets (the names in only slightly

hackneyed transcription); he observes the functioning of at least one Muslim charitable institution, and duly attributes the construction of the city wall to Sulaiman the Magnificent (Châteaubriand 1969: 1959-67). But the lasting impression which he took with him when he parted was the expected one of utter desolation:

Les maisons de Jérusalem sont de lourdes masses carrées, fort basses, sans cheminées et sans fenêtres; elles se terminent en terrasses applaties ou en dômes, et elles ressemblent à des prisons ou à des sépulcres. . . A la vue de ces maisons de pierres, renfermées dans un paysage de pierre, on se demande si ce ne sont pas là les monuments confus d'un cimetière au milieu d'un désert ? Entrez dans la ville, rien ne vous consolera de la tristesse extérieure ... (Châteaubriand 1969: 1124-5).⁶

The pilgrim-savant saw what he wanted to see. Having explicitly stated who built the city wall of Jerusalem does not prevent Châteaubriand from calling it and its bastions more than once '*gothique*' (Châteaubriand 1969: 1041, 1063, 1124). For those who might assume, in the author's favour, '*gothique*' to be a synonym for 'medieval', he defines the term when describing the architectural heritage of Jerusalem: '*5° les monuments gothiques sous les rois français*' (Châteaubriand 1969: 1070). After trying to do justice to the Umayyads, Châteaubriand concludes his survey of architectural history:

Quant aux monuments turcs, derniers témoins qui attestent à Jérusalem les revolutions des Empires, ils ne valent pas la peine qu'on s'y arrête: j'en ai parlé seulement pour avertir qu'il ne faut pas du tout confondre les ouvrages des Tartares avec les travaux des Maures. Au fond, il est plus vrai de dire que les Turcs ignorent absolument l'architecture; ils n'ont fait qu'enlaidir les édifices grecs et les édifices arabes, en les couronnant de dômes massifs et de pavillons chinois. Quelques bazars et des oratoires de santons, sont tout ce que les nouveaux tyrans de Jérusalem ont ajouté à cette ville infortunée (Châteaubriand 1969: 1086).

Desolation, utter desolation: there is no pilgrim or pilgrim-out-of-his-time who does not chant this line.

Le paysage qui environne la ville est affreux: ce sont de toutes partes des montagnes nues ... Ces montagnes ne sont pas tellement serrées, qu'elles ne présentent des intervalles par où l'oeil va chercher

³ 'This should be heavy penance for us / by much money year by year / to keep the holy places. / The land deserted, people changed, / all in the power of the Turk / to punish Christian sins. / The pilgrims suffer much distress, / namely by being mobbed, pushed and thrown at; / suffering they emulate Christ.'

⁴ As does François Rudella in 1648 (de Diesbach 1983: 254-5), but Rudella was himself a captain in the infantry (later a colonel), and does not report the activities of his Ottoman comrades without remarking that 'the Turks exercise their power with much tyranny' (*ibid.* 254).

⁵ True pilgrim and would-be saint, he preserved until the end of his life the shirt which he wore on that occasion, a sleeve of which—a true relic!—is now in the possession of the Bibliothèque Publique et Universitaire de Genève (Châteaubriand 1969: 1733).

⁶ Châteaubriand characterises the interior of the average Jerusalem house as '*une assez grande salle et une quinzaine de trous qu'on appelle des chambres*' (Châteaubriand 1969: 1091).

*des autres perspectives; mais ces ouvertures ne
laissent voir que d'arrière-plans de rochers aussi
arides que les premiers plans,*

wrote Châteaubriand (1969: 1060), and half a century later Herman Melville joins in:

Barrenness of Judea. Whitish mildew pervading whole traces of landscape—bleached—leprosy—encrustation of curses—old cheese—bones of rocks—crunched, gnawed & mumbled—mere refuse and rubbish of creation—like that outlying of Jaffa gate—all Judea seems to have been accumulation of that rubbish. So rubbishy, that no chiffonier could find any thing all over it.—You see the anatomy—compares with ordinary regions as skeleton with living & rosy man.—No moss as in other ruins—no grace of decay—no ivy—The unleavened nakedness of desolation (Melville 1989: 83).⁷

If this is less elegant than Châteaubriand would have phrased it, Melville is far more powerful and outspoken. He is right—Ottoman Jerusalem was no city of the élite. 'No country will more quickly dissipate romantic expectations than Palestine—particularly Jerusalem. To some this disappointment is heart sickening &c' as the author himself said in his analysis (Melville 1989: 91). Although Melville, too, paid his toll of the appropriate religio-philosophical reflections,⁸ it was no longer the heavenly nor Ottoman Jerusalem that he visited, but already the Jerusalem of the tourists⁹—and the evangelical Jerusalem of the empire-builders, where unsolicited charities from every continent and a broad variety of denominations began to gather and to compete. In Melville's time, the sceptical pilgrim and the puritan poet handed out a full serving of Christian Jerusalem and the

habitually meagre sample of the Ottoman city, consisting of the Dome of the Rock (Melville 1989: 85) and cemeteries: 'Opposite, the cemetery of the Turks—close up to the walls of the city, & barring the way of the closed arches of the Beautiful Gate ... The city besieged by army of dead—cemeteries all around' (Melville 1989: 86).

Did no Western visitor ever perceive Ottoman Jerusalem as a living, functioning town? If anyone, the travellers of the Enlightenment, betrayed by Châteaubriand and largely unknown to Melville, might be expected to have relinquished most contemporary prejudices. Indeed, it is one of the most amiable explorers of the 18th century, the Danish Lieutenant of Engineers Carsten Niebuhr, who visited Jerusalem in August 1766, who left a description which might help at least partially to rectify the imbalances inherent in Western perceptions of the city:

Nach den vielen Erzählungen, welche ich auf dieser Reise von der Grausamkeit der hiesigen Araber hörte, glaubte ich anfänglich selbst, dass in Palästina jetzt die allerschlechteste Menschen-Race wohne. Bey einer näheren Untersuchung aber wird man wohl finden, dass die Einwohner dieses Landes nicht bössartiger sind, als die in andren Gegenden (Niebuhr 1837: 44).¹⁰

[Jerusalem] liegt in einer etwas bergichten und sehr fruchtbaren Gegend; denn der Waizen giebt hier wohl 16 fältig, wenn der Acker gut bearbeitet, und das Jahr nicht zu trocken ist, und die Durra, (kleiner Mais), vermehrt sich wohl 200 fältig. Die Baumfrüchte, besonders die Oliven, gerathen hier noch eben so gut, als in den ältesten Zeiten. Aber das allermeiste Land liegt jetzt wüste . . . Die Stadt ist nach türkischer Art mit einer Mauer umgeben, und hat ein kleines Castell; die Häuser sind zum Theil von gehauenen Steinen gebaut und haben nach morgenländischer Art platte Dächer. Eins bemerkte ich, dessen Mauer nach der Strasse ganz von Marmor aufgeführt war. Handlung und Fabriken sind hier von keiner Bedeutung. Hier leben die Mohammedaner auf Kosten der Christen und Juden ... (Niebuhr 1837: 47-8).¹¹

⁷ Diary entry for January 1857. When Melville visited Jerusalem, he endured one of the major crises of his life. One has to concede that Jerusalem in January can be depressing.

⁸ 'Mosque of Omar—Solomon's Temple. Here the wall of Omar rises upon the foundation stone of Solomon, triumphing over that which sustains it, an emblem of the Moslem religion, which at once spurns that deeper faith which fathered it & preceded it. &c' (Melville 1989: 85)—'Is the desolation of the land the result of the fatal embrace of the Deity? Hapless are the favorites of heaven' (*ibid.* 91). Unfortunately, it is more the first and less the second sentiment that one finds elaborately expressed in *Clarel* (Melville 1991), that 19th-century puritan-pilgrim's epic which was Melville's substitute for Châteaubriand's knighthood, and leaves as bad an impression of a failed cross-cultural encounter.

⁹ 'How it affects to be cheated in Jerusalem' (Melville 1989: 85); 'Talk of the guides "Here is the stone Christ leaned against, & here is the English Hotel. Yonder is the arch where Christ was shown to the people, & just by that open window is sold the best coffee in Jerusalem. &c &c &c"' (*ibid.* 89).

¹⁰ 'According to numerous accounts of the local Arabs' cruelty which I heard in the course of this journey, I did initially believe that Palestine is inhabited now by the most vile of human races. Having a closer look one may, however, learn that the inhabitants of this country are no more mischievous than those in other regions.'

¹¹ '[Jerusalem] is situated in a slightly mountainous and very fertile region; for wheat yields 16-fold, if the soil is tilled diligently, and the year not too dry, and durra (small maize) multiplies a good 200 times. The fruits of trees, especially olives, still do as well here as in remotest antiquity. But most

Thus runs approximately one of the more than twenty pages devoted to Jerusalem. Knowing agriculture intimately, and having crossed some of the real deserts of Arabia and Persia, this peasants' son and experienced traveller perceives Jerusalem from a perspective different from that of the savant or the novelist. His genuine piety makes him respect monks, Jews and Muslims alike without preventing him from questioning the veracity of their tales and traditions. Niebuhr is one of the few Christian travellers who adds a list of Jewish holy places to his enumeration of the Christian ones (Niebuhr 1837: 67-70). Niebuhr's simple religious mind has no need of architectural (or archaeological) corroboration of eternal truths; thus he is able to see Jerusalem for what it was—a perfectly normal Ottoman provincial town, no Cairo or Constantinople (Niebuhr 1837: 51), nor the navel of the world. It was, rather, a perfectly normal town except for its economic foundation which consisted, as Niebuhr also noticed, primarily in the marketing and taxing of religion. Like his predecessors, contemporaries, and successors, he attributed the obvious decline of the country to Ottoman misrule, which is neither wholly correct nor completely incorrect.¹² But instead of bemoaning Muslim insolence in supplanting Solomon's Temple with the Dome of the Rock, he simply admires the latter's beauty (Niebuhr 1837: 53).

Niebuhr dedicates to Ottoman Jerusalem approximately one page out of more than twenty devoted to the city as a whole—perhaps the most appropriate page written by a western visitor. *Nobis cum semel occidit brevis lux*. For more than twenty pages Niebuhr also deals with biblical and Christian Jerusalem. The accumulated weight of a literary Jerusalem—which the author had to cope with and with which his public expected him to deal—was

of the land has fallen waste ... The town is surrounded by a wall in the Turkish fashion, and has a small castle; some of the houses are constructed from dressed stones and have flat roofs in the oriental manner. I noticed one which had its façade entirely built of marble. Commerce and factories are of no importance here. Here the Muslims live at the expense of the Christians and Jews ...'

¹² Europe has survived many a monarch who behaved worse than the Padishah of the most outrageous fantasy. The factors which may be adduced with some degree of probability to explain the decline of the Orient from the 16th century onwards have little or nothing to do with government but are rather to do with attitudes of mind (it was 'Occam's razor' that made Europe think efficiently centuries before European capitalists and politicians started to act efficiently) and with economics, especially the spread of absentee landlordism and the *latifundia* principle (Wirth 1973). Usually, however, this is an indicator that capital could not be invested more productively and thus points to the marginalisation of the eastern Mediterranean within the world economy of the 17th and 18th centuries (Wallerstein 1979). As the history of the former Ottoman possessions after the empire's demise amply demonstrates, it is easy to criticise a mode of government, but extremely hard and sometimes impossible to replace it by something better.

overpowering.¹³ The tradition which told Western eyes what to perceive in, at and behind Ottoman Jerusalem always had been and finally remained the more real reality, and paved the way to disaster.

Desolation, utter desolation: first projected to make the combined curses of the prophets and of Jesus come true, and finally upheld to mark the superiority of the West. At the beginning of the 19th century Châteaubriand easily combined both motives, but the explorers, who by the end of the 19th century had become institutionalised in Jerusalem, were able to abandon the former. This is not the place to rehearse the economic, cultural and political penetration of Palestine by the West in the second half of the 19th century. Suffice it to state that what was denied perception as long as it existed was finally denied existence. What was beyond the destructive capacity of any single European power to achieve was finally accomplished by the interacting rivalry of all. One may cite one last voice from the last days of Ottoman Jerusalem, representative, one fears, of many:

*Mehr als je zuvor sind unsere Augen jetzt auf den 'nahen Osten' gerichtet. Die Waffenbrüderschaft zwischen Deutschland und der Türkei hat neue, gegenwärtige Beziehungen auch zwischen uns und dem Heimatlande unserer Religion geschaffen. Noch in ganz anderer Weise als schon zuvor wird, so hoffen wir, nach dem gemeinsamen Siege deutsche Arbeit, auch deutsche Wissenschaft dort die Türen geöffnet finden. ... Während ich diese Zeilen schreibe, dröhnt in der Ferne der Geschützdonner der Schlacht von Verdun, und unsere Feldgeschütze und Haubitzen hier stimmen krachend und fauchend mit ein.*¹⁴

Fortunately, the Kaiser's soldiers did not win. Unfortunately, what had been the Ottoman empire fared no better under the victors.

¹³ For the impact of the learned and the pious tradition on Enlightenment travelogues, see Brahimi 1982: 21-39.

¹⁴ 'More than ever before, our eyes are now fixed on the "Near East". The fraternity in arms between Germany and Turkey has also created new and current relationships between us and the Motherland of our religion. Far beyond anything so far, German industry and German scholarship will, as we hope, find doors open there after we have shared victory ... While I am writing these lines, the battle of Verdun rumbles from afar, and our field-pieces and howitzers here join in the roaring and thunder.' H Schmidt, preface to Schmidt-Kahle (1918: 8*-9*). The preface is dated 27.2.1916, and the book is dedicated to G Dalman, then Director of the Deutsches Evangelisches Institut für Altertumswissenschaft des Heiligen Landes. The authors had conducted their field-work as his assistants. The preface reveals much of the *raison d'être* of this institute (and similar institutions), and of the mentality of its first director. The book remains a milestone in the dialectology of Palestinian Arabic.

Chapter 8

JERUSALEM IN ISLAM: THE THREE HONORIFIC NAMES OF THE CITY

Angelika Neuwirth

1. The spiritual triangle—Mecca-Madina-Jerusalem

Thaur ibn Yazid said:

The sanctuary of the earth (*al-quds al-ard*) is Syria; the sanctuary of Syria is Palestine; the sanctuary of Palestine is Jerusalem; the sanctuary of Jerusalem is 'the Mount'; the sanctuary of the Mount is the place of worship (*masjid*); the sanctuary of the place of worship is the Qubbat al-Sakhra.¹

On the authority of Abu Sa'id al-Khudri it is related 'The Apostle of God said: "Set out only for three mosques—the mosque of Medina, the mosque of Abraham and the mosque of Jerusalem"'. Ibn 'Asakir says that al-Bukhari and Muslim relate this. Then he mentions in another citation: "The sacred mosque (in Mecca), and the mosque al-Aqsa and my mosque (in Medina)."²

Islamic Jerusalem has never lost its inherited aura of being a uniquely blessed and central sanctuary, so lucidly revealed in the words of Thaur ibn Yazid. However, it does not figure in Islamic tradition as a Holy City in its own right, as a sanctuary viewed in isolation, separated from other sanctuaries. On the contrary, Jerusalem, having emerged during the time of the Prophet as a counterpart to Mecca, soon after came to represent one of the points of an extensive triangle of imaginary space that stretches from the Arabian Peninsula into Palestine, with Mecca and Madina as the other two points. This spatial cohesion between the three sites has been evident throughout the ensuing history of Islam. Jerusalem functioned as a station—whether as a starting post or the final stage—in the Muslim's journey, which was dramatised annually during the season of canonical pilgrimage, to the holy places.³ The well-known *hadith* quoted above from Abu Sa'id al-Khudri, dating back to the second century of the Hijra, can be taken as the *locus probans* for the high—though not equal—rank held by Jerusalem within the triad of Muslim places of pilgrimage from the early years of Islam. But it is not only in terms of space that Jerusalem is

¹ Ibn Asakir, *Ta'rikh Madinat Dimashq*, (ed.) Salah al-Din al-Munajjid, Damascus 1371 AH, vol. I: 142. As Busse, who adduced this text earlier (1968: 441: 68) points out, 'the statement reflects more ancient sources—see Mishnah tractate Kelim, Chapter I: 6-9 where ten steps of sanctity are given, beginning with Palestine and ending with the Holy of Holies.' For information about the transmitter, Thaur ibn Yazid (died 153/770) see van Ess 1991: 114-17 and van Ess 1992: 89-90.

² Al-Fazari 1935-6: Chapter 2. English translation by Matthews 1949: 4. Al-Khudri died in 136/735. The well-known tradition is amply documented and discussed by Kister 1969: 173-96, 1-8 (additional notes).

³ Al-Fazari 1935-6: Chapter 4; Matthews 1949: 13—'On authority of Umm Salimah it is related: The Apostle of Allah said, "Who goes on pilgrimage or pious visitation from the Mosque of al-Aqsa to the Sacred Mosque, there shall be covered for him the faults he has committed and those he may later [commit]; and he shall be duly granted Paradise." This is mentioned from an account by al-Daraqutni.' Al-Fazari adds two further traditions on the merit of Jerusalem as a starting point of pilgrimage to Mecca; see also Busse 1968: 467.

linked to the Arabian sanctuaries. There is a link in time as well, for tradition holds that Mecca and Jerusalem will eventually merge when, at the end of time, the Ka'ba will transport itself to Jerusalem to perform the *hajj* and to embrace the sacred Rock.⁴ The strong relationship between the two sanctuaries which is taken for granted in this mythical vision rests on a firm historical basis. Jerusalem, although enveloped in a celebrated heritage from the pre-Islamic period, has been deeply affected by concepts of holiness that originated within the Meccan tradition,⁵ thus becoming fit to constitute a vital link between the core of the Arabian heritage, with its strong ritual imprint originating from the Meccan sanctuary, and the more universal language shared by Islam with the two other monotheistic religions stemming from Jerusalem.

Jerusalem's significance, however, may be traced back even deeper into the formative period of Islam once its triple honorary name,⁶ still valid today, which was bestowed on the city not later than the time of Salah al-Din,⁷ is subjected to a closer reading. This multiple *epitheton* not only attests that Jerusalem was second in rank to Mecca in terms of the age of its sanctuary, and, in third place after Mecca and Madina as a proper destination for Muslim pilgrimage, but also recalls that Jerusalem had earlier played a primary role—and this leads us back to the very beginnings of Islam.

The triple *epitheton* reads:

<i>ula al-qiblatain</i>	first of the two directions of prayer
<i>thani al-masjidain</i>	second of the two sanctuaries
<i>thalith al-haramain</i>	third after the two places of pilgrimage

⁴ Ibn al-Faqih al-Hamadani 1885: 94. See Busse 1968: 467-69.

⁵ Busse 1968: 449-51 has drawn attention to the fact that tradition tends 'to make the very conquest of Jerusalem into a kind of re-enactment of the conquest of Mecca to raise the city to the same level.' He also holds that the sequence of fifteen sites to be visited as described by al-Fazari 'which at first glance seems disorderly and would send the pilgrim back and forth over the Temple area, becomes meaningful if one assumes that the pilgrim will circle the Dome of the Rock several times, steadily increasing his radius. ... By following Fazari's advice the pilgrim carries out the circling (four times) in the same direction that is decreed for the Ka'ba, where however it has to be done seven times' (1968: 466-68). For further liturgical practices shared with the Meccan sanctuary, see Elad 1995.

⁶ For the emergence of particular *epitheta ornantia* for Islamic cities and regions, see Gruber 1975.

⁷ The triple *epitheton* can be traced back to the Ayyubid era; it is cited by the preacher Zaki al-Din in his sermon in praise of the reconquest of Jerusalem by Salah al-Din, cf. Ibn Khallikan, *Wafayat al-a'yan*, (ed.) Ihsan Abbas, Beirut, n.d. Vol. 4: 232. An English translation is given by De Slane, *Ibn Khallikan*, Paris 1843 Vol.2: 636-7. The same preacher appears as Muhyi al-Din in Ibn Shaddad, *al-A'laq al-khatira*, (ed.) S Dahhan, Damascus 1956: 214 (quoted by Busse 1968: 463).

The arrangement of the sequence of attributes within the context of a laudation seems somewhat surprising on closer inspection. Although the qualifications contained within it can be understood as being in praise of Jerusalem, the arrangement hardly fits the pattern of the literature on the particular 'merits of Jerusalem' (*fada'il al-Quds*).⁸ The sequence itself, on the contrary, presents a striking demonstration of the inconsistency of the historical process of attraction and repulsion through which Jerusalem has passed as a religious symbol. A reader with a historical bent will not fail to recognise that the truth is exactly opposite to what is suggested by the rhetorical device of the apparent increase in the numerical values of the anaphorical beginnings of the three honorary titles, their true implication being that Jerusalem is ousted from the first place it inherited as the centre of monotheistic worship.

The triple title, indeed, suggestive as it is of a mnemonic, may be seen to serve as an apt shorthand expression of the change in recognition enjoyed by Jerusalem during the three successive stages of the formative period in the religion of Islam. The first stage would be reflected by the title 'the first of the two directions of prayer'. This recalls the physical orientation of prayer towards Jerusalem, the ritual practised by the Muslim community during the earliest period of the beginnings of Islam, when the Prophet's activities were centred on Mecca. The title 'the second of the two sanctuaries' equally alludes to a development dating to the time of the Prophet. It refers to the problematic relationship that had emerged between the two foundations of monotheistic worship soon after the *hijra* to Medina turning the two sites into rivals. Mecca, with the Ka'ba, came to be looked on as the place where Abrahamic worship had originated—in other words, primarily as the original site of the rituals of pilgrimage, the *hajj*. Jerusalem, on the other hand, 'the further sanctuary' (*al-masjid al-aqsa*), was perceived as the centre of the blessed land (*al-ard allati barakna fiha*)—the home of those prophets of the Qur'an whose message had been transmitted primarily in verbal rather than ritual form, namely Moses and Jesus. In view of the fact that the origins of the Abrahamic foundation⁹ were earlier than those of the sanctuary of the people of the Children of Israel (the Banu Isra'il), which was known to have been built by Solomon, Jerusalem was relegated to second place.

⁸ For the collection of literature on *Fada'il al-Quds* ('Merits of Jerusalem'), see Hasson 1973: 7-29.

⁹ The wording of the Qur'anic verse, Sura 3: 96, '*inna awwala baitin wudi'a li-l-nasi*' generated an *awa'il* discussion about the sanctuaries. The exact position of Jerusalem among the oldest foundations is treated in traditions related by al-Fazari 1935-6: Chapter 1, Matthews 1949: 2-4 and Hasson 1973: 16. For the inner Qur'anic development that led to the statement in Sura 3: 96, see Section 2.2.

The last honorary name—‘third after the two places of pilgrimage’¹⁰—reflects an even later compromise. Probably coined a few generations after the time of the Prophet, it represents the last concession made by certain religious scholars to those growing circles within Islam who were, in the estimation of the orthodox, exaggerating the importance of Jerusalem.¹¹ This last title, therefore, can be seen to express a restriction¹² rather than a laudation. Jerusalem is now conceded only the third place after Mecca, and after Madina¹³ as well, once the tomb of the Prophet had also become a place of pilgrimage.

It is, however, most questionable if this set of titles would ever have survived into the modern period as honorary names if they had been intended to be understood in this way—that is, as the description of a successive loss of significance. There must be a second way to decode them if we are to reach an understanding of their meaning as intended in their contemporary setting. It is the poetic aura conferred on them by their rhetorical form that should provide the clue for an analysis of the apparent paradox—between the loss of status of Jerusalem on the one hand, and on the other the city’s increase in meaning—that lies hidden behind the three titles. The sequence of names can, indeed, be read as a reflection of an expansion of space, an imaginary widening of horizons. Each single element of the title presents a view of the city that implies a particular relationship to the sanctuaries in time and space, demonstrating a growing awareness of their interrelationship. What particular instances of the collective memory are hidden behind each of the three titles? What were the cultural experiences particularly related to

Jerusalem that appeared so crucial to the emergence and preservation of an Islamic identity that the Islamic community found them worth preserving in the sophisticated form of a sequence suggestive of a mnemonic? The following observations constitute a modest attempt to address a complex problem, one which appears hitherto not to have received its due consideration in research.¹⁴

2. The orientation of prayer (*qibla*)¹⁵ towards Jerusalem and its symbolic value

2.1 *Sura 17:1 and its exegesis within Islam*

What is the significance of Jerusalem as ‘the first Muslim direction of prayer’? It seems rather surprising that Islamic tradition¹⁶ should have preserved an honoured memory of the ritual custom of facing Jerusalem in prayer, even though this was adhered to only temporarily,¹⁷ and

¹⁰ On the concept of the three Islamic sanctuaries, see Kister 1969.

¹¹ Ibn Taimiyya, *Iqtida’ as-sirat al-mustaqim mukhalafat ashab al-jahim* (ed.) H M al-Fiqi, Cairo 1950: 434 even denies the title of a *haram* for Jerusalem. This he reserves exclusively for Mecca and Madina; he states (1950: 440) that Madina and Jerusalem, as against Mecca, are similar in that they are bound to the same ritual rules as those which apply in any ordinary mosque; their sole privilege is that—in view of existing canonical traditions—prayers said in them are considered to be worth a multiple of prayers said elsewhere. For Ibn Taimiyya’s views on Jerusalem in general, see his ‘Qa’ida fi ziyarat Bait al-Maqdis’, *Majmu’at al-rasa’il al-kubra*, Cairo 1323 AH. For the practice of grading the sanctuaries by ascribing to them a particular value for the prayers performed in each of them, see Busse 1968: 467 and Kister 1969.

¹² This attempt at imposing censorship has not been successful—the neighbouring sanctuary of Abraham at Hebron, *al-Haram al-Ibrahimi*, is one example of a much-frequented *masjid*, mostly visited in continuation of a *ziyara* to Jerusalem. For the social aspects of the custom of pilgrimage to Hebron, see Nazmi al-Ju’beh, *Hebron (al-Halil). Kontinuität und Integrationskraft einer islamisch-arabischen Stadt* (unpublished doctoral thesis) Tübingen, 1991.

¹³ For the development of Madina, see W M Watt, ‘al-Madina’ *EP*, 1984: 994-8.

¹⁴ Busse’s many and valuable studies quoted throughout in this essay, as well as two comprehensive collections of source texts compiled and commented on by Peters (1985 and 1986), would supply a useful basis of material for such an investigation. The problem of the continuity of a public awareness regarding the sanctity of Jerusalem in Islam deserves, however, further and different treatment. In a study of the sources concerning the Crusader period, Sivan has attempted to show that the consciousness of the religious significance of Jerusalem during that period was—at least outside Syria—rather weak; see Sivan 1967: 149-82. Still, pious memory, even outside Syria, had not been completely obliterated, as the collection of *fada’il* literature, compiled by the Iraqi author al-Wasiti in the 10th/11th century, proves. The decisive revitalisation of a militant awareness of the dignity of the real city of Jerusalem as an Islamic sanctuary was, of course, due to a considerable degree to the rhetorical appeals made by the Zengids and Ayyubids; see Richter-Bernburg 1999.

¹⁵ Not only in Islamic tradition but also in research, the significance of the direction of prayer towards Jerusalem suffers by being overshadowed by the prominence of the final establishment of the *qibla* towards Mecca. Thus, the question of the precise role of the *qibla* towards Jerusalem in the development of Islamic worship has never been seriously raised, cf. A J Wensinck, ‘Kibla’, *EP*, 1979: 82-3; Rubin 1986: 97-131; Busse 1986b: 236-46.

¹⁶ The honorary name itself appears to originate from local Jerusalemite tradition; there are however several *hadith* utterances with a tendency to recognise Jerusalem as the ‘natural *qibla*’. See al-Wasiti 1979: 49-51; Ibn al-Murajja 1995: 98. Ibn al-Jauzi 1323 AH, vol. 2: 35, stresses that Jerusalem retained specific signs of divine affection even after the abrogation of its *qibla*.

¹⁷ There is no consensus as to the duration of the first *qibla*. For the traditional accounts, see A Th. Khoury, *Der Koran*, vol. 2, on Sura 2: 142. ‘Abd al-Aziz Duri accepts as the earliest those traditions that date the introduction of the Jerusalem *qibla* to immediately after the Hijra. See al-‘Asali 1989: 105-28.

moreover remained undocumented in the Qur'an. As is well known, during Muhammad's own lifetime the increasing conflict with the Jewish tribal groups in Madina began to undermine the credibility of the orientation of prayer towards Jerusalem.¹⁸ It was abolished by a Qur'anic revelation during the year 2 AH, and was thus considered abrogated in later theological terms.¹⁹ Muslim exegesis on this passage,²⁰ codified from the early third century Hijra onwards, betrays in addition a tendency to minimise the duration of the custom, viewing it as an undesirable expression of affinity towards Judaism. In some sources, indeed, it was presented as a mere interim solution between an assumed initial orientation towards the Ka'ba in prayer, which was claimed to have been practised by Muhammad at the beginning of his career in Mecca, and the re-inauguration of this custom authorised by the Qur'anic passage Sura 2: 144, which made the ritual facing of the Ka'ba a binding religious duty.²¹ Still, as the honorary title itself attests, these polemical traditions have not succeeded in denying Jerusalem's real share in the genesis of Islam. This chapter will try to present an explanation for the particular vitality of the memory attached to Jerusalem which was overshadowed neither by the abolition of the Jerusalem *qibla* in Madina, nor by the later attempts to minimise Jerusalem's early importance.

It appears, indeed, that the first honorary title alludes to a highly significant memory, which leads back to a particularly eventful period of development in the Meccan community. This was a time when the ritual orientation of prayer towards Jerusalem was newly introduced into worship as a gesture that could immediately be understood in symbolic terms. What particular consciousness was it that found its expression in this ritual gesture? It is not easy to find a solution to the problem as long as the search depends solely on the later historical sources, including those that concern the biography of the Prophet, the *Sira*, redolent as they are of the controversial accounts of the genesis of Islam. The only text available that accompanies the development of the earliest phase of Islamic worship chronologically and substantially is the Qur'an itself. One particular verse is of special interest here, since it alone associates the person of

the Prophet himself with the sanctuary of Jerusalem.²² Moreover, it fits roughly into the chronological framework established by the exegetes for the introduction of the *qibla*.²³ Sura 17:1 reads:

Glory be to Him, who carried His servant by
night
from the Holy Sanctuary to the Further
Sanctuary
the precincts of which We have blessed,
that We might show him some of Our signs.
He is the All-hearing, the All-seeing.

This somewhat enigmatic verse tells of a nocturnal journey, or rather a flight, conceived as an experience of liberation analogous to the exodus of Moses and the escape of Lot,²⁴ which led the Prophet out of Mecca towards the 'other sanctuary' *par excellence*. In the context of the religio-geographical horizons of the early community, this can hardly be located anywhere else other than on the Temple Mount of Jerusalem, the location of the *masjid* of the Banu Isra'il.²⁵ The most plausible explanation of the event is to assume it is the experience of a dream. This explanation, although upheld only by a minority of Muslim exegetes, is preserved in a tradition related by al-Tabari. A cousin of

²² The interpretation of *al-masjid al-aqsa* in Sura 17: 1 is still subject to controversy in research. In the end, opinions depend on the position of the researcher in the debate on the historicity of the basic traditions concerning the career of the Prophet Muhammad. Once these are dismissed as unreliable, their interpretation as 'topoi of revelation', in our case the vision of a 'Heavenly Temple', will blur the empirical data of the Qur'anic social setting—in our case the familiarity of the followers of the Prophet with the Solomonic Temple. For possible identifications of *al-masjid al-aqsa* in the sense of a heavenly sanctuary, see Busse 1991: 1-40; and, in the sense of the Jerusalem Temple Mount, Neuwirth 1993.

²³ The close relationship between the institution of a direction of prayer (*qibla*) and the Prophet's nocturnal journey (*isra'*) is clearly recognised in the Islamic tradition. The presumed causality between the two is, however, conceived in the opposite sense to our assumption. Tradition usually holds that it was the experience of the *isra'* that brought about the introduction of the *qibla* not *vice versa*.

²⁴ The verb *asra'* is used twice in the Qur'an to denote the flight of Lot (Sura 11: 81 and 15: 65), and appears three times in the context of the account of the Exodus (Sura 20: 77, 26: 52, and 44: 23). Wansborough 1977: 68-9 was the first to draw attention to the Exodus metaphor in Sura 17: 1, although he drew a completely different conclusion on the basis of his particular hypothesis about the genesis of the Qur'an. For this discussion, see Gilliot 1996.

²⁵ This is made plausible by the use of the unspecific word *masjid* to denote the Temple of Jerusalem a few verses (Sura 17: 7) after the *isra'* verse itself. For a detailed commentary on the complete Sura, see Neuwirth 1993. A critical review of the interpretations of the verse to date is given by Gilliot 1996. The unlikelihood of another sanctuary being understood by the listener was already stressed by Caskel in 1963.

¹⁸ This already becomes clear from the Qur'anic verses on the change of *qibla*; see Sura 2: 142-5, cf. Section 2.1.

¹⁹ See A J Wensinck, 'Kibla', *EP*, 1979: 82-3.

²⁰ See al-Tabari, *Jami' al-bayan fi tafsir al-Qur'an*. Bulaq, vol. 2: 1-16, on Sura 2: 142-5; cf. Rubin 1986: 29.

²¹ Rubin (1986), who holds this opinion, relies on a rather narrow, purely mechanical concept of *qibla*, and does not admit to any symbolic value in the ritual gesture. The crucial problem of the significance of the new forms of worship, that developed with the move of the community from the Ka'ba into separate places of assembly (later called *masajid*), remains beyond the scope of this essay.

the Prophet, Umm Hani', is quoted to have related the following:

'As to the nocturnal journey (*isra'*) of the Messenger of God, the following took place: He had been staying in my house overnight. After performing the last evening prayer, he retired to sleep, and so did all of us. At dawn the Messenger of God woke us up for morning prayer, and when we had performed it together, he said to me: "Umm Hani', you remember that I performed with you in this very place the evening prayer. Thereupon, however, I was in Bait al-Maqdis and have prayed there. And now I have been praying again with you the morning prayer in this place.'"²⁶

There is nothing supernatural involved in this account. The miraculous element inherent in the experience, which is echoed so distinctly in the allusive style of the Qur'anic verse, is reflected exclusively through the astounding phenomenon of a cessation of the passage of time—or at least a time-lapse—as well as the compression of a vast spatial distance into a journey of a few hours' duration. Both features are familiar in dreams. It should in no way detract from the convincing force of this simple, sober account that, only a short time later,²⁷ the same Qur'anic verse, Sura 17: 1, was to become the *locus probans* for the elevation of the Prophet to the rank of an ecstatic. The majority of the traditions present Sura 17: 1 as an allusion to a unique nocturnal ride, which was miraculous not only in so far as time and space were reduced to minimal quantities, but also iconographically as well. The Prophet is envisaged as riding a beast in the guise of Pegasus, the Buraq, on whose back he travels from Mecca to Jerusalem, passing *en route* several sites of importance from the point of view of salvation history (Busse 1993). At the apogee of the exegetical development, the nocturnal journey (*isra'*) is even envisaged as going beyond the city of Jerusalem, and leading up through the seven celestial spheres²⁸ to heaven. This ascent (*mi'raj*), according to the tradition of the scribe of the Prophet, Ibn Mas'ud, reaches its climax in the presentation to Muhammad by God Himself of the institution of the five Islamic prayers.²⁹

²⁶ See al-Tabari, *Jami' al-bayan*, Bulaq, vol. 15: 3.

²⁷ For the *Isra'* see J E Bencheikh, 'Mi'radj', *ET*, 1993: 97-103, J A Wensinck, 'Isra', *ET*, 1934: 505-8 and more recently Gilliot 1996.

²⁸ See J E Bencheikh, 'Mi'radj', *ET*, 1993: 97-103, G Böwering, 'Mi'radj', *Encyclopaedia of Religion* 9: 552-56, and Busse 1991; see also Gilliot 1996.

²⁹ See Abu Hisham and others, *Al-sira al-nabawiyya*, (ed.) Mustafa al-Saqq'a, Cairo 1955, vol. I: 39: 407-8. See Section 3.1.

Muslim exegesis of Sura 17: 1 thus produces two opposing images of the Prophet.³⁰ On the one hand, the person of the Prophet appears as he emerges from the Qur'an, i.e., devoid of any miraculous powers, and functioning as a messenger of verbal transmission only. On the other hand, he is presented as an ecstatic who is supported by supernatural faculties.³¹ It is, however, worth noticing that the sober, descriptive version and the fantastic, mythologising interpretation do share a trait. They both identify the ultimate aim of the journey—the 'signs' promised by the Qur'anic verse which will be revealed at the end of the movement—as being nothing else than the unique proximity to God granted to the Prophet. In both accounts, the event is connected with prayer (*salat*). In one version the Prophet himself performs the *salat*, or he even acts as *imam* before the older prophets in the Jerusalem sanctuary. In the other version, the Prophet is granted the very institution of prayer by his divine Lord. It is tempting to identify the relation to prayer which underlies both accounts as the 'historical nucleus', perhaps a trace of the social setting of the experience which remained excluded from the wording of the Qur'anic verse. The nocturnal journey, the 'exodus' to the *masjid* of the Banu Isra'il, would then appear to be associated with the 'last evening prayer' of the account by Umm Hani'. It could be interpreted as a spiritual movement which continued the journey that had already begun in the imagination of the Prophet by his facing the *qibla* in the direction of the 'further sanctuary'. The latter, newly introduced as the orientation of prayer, might be assumed to have been still forcefully present in the minds of the worshippers.

2.2 Ritual as allusion to history—the orientation towards Jerusalem as a significant gesture

The question remains as to why the taking up of the *qibla* appeared to be so significant a departure that it was conceived as being an 'exodus' into the space of the memory of the Banu Isra'il. A close reading of the whole of Sura 17 shows that the chapter is dominated by an undertone of strong yearning for release³² from the situation of the inner

³⁰ The particular diversity of the two images of the Prophet Muhammad is the focus of Sellheim's comprehensive 'stratigraphic' study 1967: 33-91; see more recently Rubin 1995.

³¹ For the type of prophet who was gifted with ecstatic capabilities, see Wilson 1980.

³² Within the framework of an analysis of the whole of Sura 17, Neuwirth (1993) has tried to trace the particular significance of the narrative element of 'moving out' which is at first introduced by the allusion of the Exodus (*isra'*) and then taken up again several times within the Sura in the context of descriptions of prayer where the worshipper 'moves out' of the real into a transcendental world.

'exile' experience in Mecca. This points to a spiritual need which in itself would suffice as the motive for the imaginary exodus to the house of the One God. The situation here appears to be not totally dissimilar to the one presupposed in 1 Kings 8, where a comparable longing can be traced as underlying the prayer of Solomon at the inauguration of the Temple. The biblical text promises the worshipper a similar form of spiritual release from exile (1 Kings 8: 23-53). The memory of the only freely-accessible sanctuary—the great 'other sanctuary', *al-masjid al-aqsa*—remained the only guarantee for the closeness to God desired by the worshipper, in view of the fact that access to the local Ka'ba had become less certain to the increasingly isolated group of Meccan believers. Once the adherence to the ritual community of the Ka'ba itself was broken up, the worshipper could hope to envisage the Face of God by intentionally turning his face towards His further house—that is by taking up the direction of prayer³³ towards the 'more distant sanctuary'. The close association of Jerusalem with prayer that was established through this episode of the Jerusalem *qibla*, although it was historically short-lived, was to become a fixed *topos* in Islam. It remained prevalent in later periods too. Time and again in Sufism (hagiographical biographies of early *sufis* often contain details about a stay in Jerusalem; see Goitein 1980: 323-7), poetry and instructional literature present Jerusalem as the ideal place of prayer.³⁴ Thus, despite the lack of any real physical association with the biography of the Prophet, Jerusalem is affirmed as an Islamic sanctuary through its spiritual attachment to the Prophet's career.

This particular vision of Jerusalem as the cradle of Islamic liturgy, preserved in Islamic tradition, may appear astonishing since the *Sira*, here in accordance with the Qur'an itself, attests unequivocally to the fact that it is rather the rites performed at the Ka'ba in Mecca that should lie at the origins of Islamic ritual prayer.³⁵ Moreover, the Ka'ba is named explicitly in a passage in the Qur'an as the place where the prayer rites were implemented through a divine decree.³⁶ Two separate 'memories' confront each

other here—the memory of the ancient prestige of the *masjid* of the Banu Isra'il being obviously the more powerful of the two. The Qur'an, it is true, relates several significant events in the history of salvation as being staged in Jerusalem. These include the annunciation of the birth of a son gifted with prophecy to the aged Zacharias in the sanctuary (*mihrab*; Sura 19: 11),³⁷ the sojourn of the Virgin Mary under the care of Zacharias in the sanctuary (*mihrab*; Sura 3: 37, 39) the judgment of David in the sanctuary (*mihrab*; Sura 38: 21)³⁸ and, finally, the catastrophe of the desacralisation and destruction of the Temple (*masjid*; Sura 17: 2-7) through foreign conquest.³⁹ The last of these was understood to be a punishment imposed on the Banu Isra'il. But, although these references to Jerusalem in the Qur'an may have contributed to the esteem of the city within Islam, they can hardly suffice to explain how Jerusalem could retain its high rank, even after its 'aura' as the central monotheistic sanctuary had been transferred to Mecca. After all, Mount Sinai,⁴⁰ another important monotheistic sanctuary, which significantly is also evoked several times in the Qur'an, remained almost without relevance in later Islam. Jerusalem's high rank throughout history must therefore be due to other factors which served to promote that memory.

It seems that the sanctuary of Jerusalem in its function as a ritual orientation, the focus of an imaginary space which becomes accessible in prayer, did not occur to the consciousness of the community either as an isolated new discovery, or at a random time. It occurred, rather, at a stage of development when a remarkable broadening of the horizons of the young community had taken place in terms of both time and space, thanks to a complex process of new orientation: the community's change from a ritually-

³⁷ Sura 19: 11, 3: 99. Here the Temple (or sanctuary) is described as '*mihrab*', i.e. its description points to a particular architectural shape of the place. In view of the fact that both Biblical figures are related to the New Testament, their appearance in a '*mihrab*' (which in a pre-Islamic context can mean a building—G Fehérvári, '*Mihrab*', *EI*², 1993: 7-15) is less surprising, for their particular association with this type of architecture might have been inspired by pictorial rather than written sources. In Byzantine iconography, both figures often appear standing in a ciborium, an open vaulted structure; for examples, see Weitzmann et al. 1980 and Zibawi 1995. Such an edifice could have been rendered as a '*mihrab*' in Arabic.

³⁸ Sura 38: 21 (*mihrab*). The singular association of an Old Testament figure with the *mihrab* might be due to the role of judge carried out by David as described in this passage; in ancient Arabia, the function of judge was associated with a place called the *mihrab*: see G Fehérvári, '*Mihrab*', *EI*², 1993: 7-15.

³⁹ Sura 17: 7. The Temple that figures here in the context of Jewish history is called *masjid* in accordance with the Meccan sanctuary.

⁴⁰ Al-Tur is mentioned ten times in the Qur'an—eight times in the story of Moses, twice (Sura 52: 1, 95: 2) in association with the Meccan sanctuary in an allusion to the theophany that occurred there; see Neuwirth 1993b.

³³ The new situation of the worshipper achieved by the change of *qibla* is characterised as a 'purposeful turning of the face' (cf. Sura 2: 144, 149, 150) after a period of 'turning the face around and around without a firm direction' (Sura 2: 144).

³⁴ This affinity is further enhanced by the prophetic traditions that attempt to quantify the relative value of prayers performed in the different sanctuaries; for those which agree on a particularly high rank for Jerusalem, see Kister 1969.

³⁵ The initial attachment of the followers of the Prophet to the Ka'ba rites is clearly discernible in the earliest Suras; see Neuwirth 1996.

³⁶ In accounts of the building—or restoration—of the Ka'ba through Abraham following a divine decree (Sura 2: 125, 22: 26-7), the group envisaged as becoming the local beneficiaries of the sanctuary is characterised by their particularly 'Islamic' ritual gestures, such as standing upright (*qiyam*), prostration (*sajda*), and bowing (*ruku'*); it is, then, a heritage of the Ka'ba that lies behind the origin of these forms.

to a scripturally-oriented group. As is well known, during the Prophet's career in Mecca, the young community was forced to segregate itself—at least locally—from the traditional Meccan rites. This process, attested in the *Sira*, finds additional proof in literary evidence. It can be shown to be reflected in the evolution of new Islamic forms of worship, which became less dependent on the worshipper's physical presence in the holy places, and concentrated more strongly on verbal expression than on ritual gesture. This process is not, however, to be understood simply as a change in form. Its full dimensions reach much deeper. It amounts to no less than the radical break with inherited tradition which 'is caused by the intrusion of writing into the space of memory' (Assmann 1983: 272). For the first time in Arabic literature, the Qur'anic texts of the so-called middle Meccan period⁴¹ consistently integrated the medium of writing into the composition and technique of textual preservation—even if the wording had not yet been fixed for a projected reader, but rather for a second mediator, a reciter of the text.

Two things, then, were essentially new. One was the newly attained state of the convergence of the Qur'anic revelations with the scriptures of the other two monotheistic religions, considered to be represented primarily by the Torah, the scripture of the Banu Isra'il. At the same time, the adoption of the *topographia sacra* of that same group created a new self-consciousness in the young community that was no longer based on the rites practised at the Ka'ba but on the new awareness that they were numbered among the recipients and bearers of a Scripture, and thus had a share in the memory of the history of salvation which is conveyed through the medium of writing. Jan Assmann has coined a new technical term for this type of change in orientation; he speaks of the transition of a society from 'ritual coherence' to 'textual coherence' (Assmann 1997b: 87-103). The very choice of the *qibla* towards Jerusalem by the emerging Islamic community points to this new connection with the older religions.

It is thus not surprising that the Qur'anic allusions to the Meccan sanctuary and its rites⁴²—which had been so numerous in the introductory sections of the Meccan *suras* and which had been the previous guarantors of social coherence—were now replaced by a stereotypical, introductory evocation of the Book (*kitab*), for this was now realised to be the most significant common spiritual possession. The images that now appear in the opening sections of the *suras*—the book and its requisites (Neuwirth 1993, 1993b)—unequivocally point to the awareness that a stream of tradition has come to a standstill, and has now become accessible by means of writing. It is a new form of

memory which finds expression here, one which soon also penetrates the daily ritual practices. The strong attachment to place, which was characteristic of worship at the Ka'ba, gives way to the new situation of the Muslim worshipper in space—that is, in a spiritual space that reaches far beyond the horizons of the inherited rites into the world and the history of 'the others', of the Banu Isra'il.⁴³ This realm of memory is inseparable from its traditional vehicle of transmission, i.e., the cultic recitation within a complex form of worship. While in the earliest *suras* of the Qur'an there had been hardly any other places considered worth mentioning or alluding to except for Mecca, now—with the single exception of Sura 17—there are no further references to Mecca, but instead the Blessed Land⁴⁴ is introduced as a space in which the oppressed believer may take refuge, and in which most of the prophets had worked.

There is accordingly a substantial change of orientation in terms of time as well. Instead of the many allusions to ritually relevant times of the day which appear in the early *suras*⁴⁵—allusions which have been taken as evocations of the Meccan sanctuary—the *suras* revealed in the new phase of development display a substantially new setting in time. They culminate in an often-repeated appeal, which is formally introduced with a simple reference 'at the time when' (*idh*) (Horovitz 1926), addressed to the examples set by their spiritual forebears in salvation history, the Banu Isra'il, as transmitted by their Scriptures. Jerusalem is the central sanctuary of the space marked by this Scripture and thus by writing. It is to Jerusalem that all prayers gravitate as their natural destination; it is to Jerusalem that the worshipper turns his face in prayer.

Substantial changes have thus taken place. On the one hand, in the Middle Meccan period of the Qur'anic development, with the now frequent stories of the prophets emerging from the collective memory of the older monotheistic religions, time has widened into the salvation history of the Banu Isra'il. On the other, the space of communication between God and man has expanded as well. This is made clear through the new form of worship, which becomes increasingly complex. A new element is

⁴³ It is this particular period from which those *Suras* originate that allude in different ways to the close relationship of earlier messengers to Scripture. These accounts of the earlier prophets are presented not only as divine revelations communicated to Muhammad, but also, at the same time, point to a second function communicated to be transmitted to the listeners as excerpts, or *pericopes*, from a heavenly Scripture. For the formulaic devices used here, see Neuwirth 1996.

⁴⁴ Only Mount Sinai (ten times) and the 'overturned' cities (*al-mu'tafikat*) Sodom and Gomorra (Sura 53: 53, 69: 9, 9: 70) are mentioned in addition to Mecca. See Horovitz 1926: 13-14. Palestine is alluded to as 'the Blessed Land' (*al-ard allati barakna fiha*) in Sura 17: 1, 21: 71, 34: 18, 7: 137, or else as 'the Holy Land' (*al-ard al-muqaddasa*) in Sura 5: 21.

⁴⁵ For the introductory sections of these *Suras*, see Neuwirth 1993b.

⁴¹ We use Th. Nöldeke's classical scheme of periodisation (1909) as a basis.

⁴² The sanctuary is always recalled in the early *Suras* of the Qur'an in the context of prophetic oaths, with the one exception of Sura 106: 3.

integrated into the context of those parts already in existence and well known to the community—the fixed routine of gestures demanded by traditional ritual prayer such as proskynesis (*sajda*) and bowing (*ruku'*), and the variable element of recitation from the Qur'an whose textual basis is chosen individually by the worshipper with every prayer: for the first time, a fixed verbal part, the community prayer (*fatiha*)⁴⁶ is introduced to complement the recitation of the word of God and the ritual gestures of self-abasement. The *fatiha* is recited by the worshippers in an upright position (*qiyam*); they express themselves in the grammatical form of the first person, and thus act as autonomous partners in the communication process. This prayer, together with the recitation of the Qur'an *pericope* immediately following it, which is also performed by the worshippers in an upright position, allows them to create additional space above themselves. It constitutes a ceremony that comes close to a customary religious service *in nuce*. It is entirely oriented towards the sanctuary of Jerusalem. Jerusalem, the site *par excellence* for divine-human communication, is the focus in space towards which a movement from the profane 'now' to the extra-temporal vicinity to God becomes possible at certain cosmically-determined times of the day.⁴⁷ Thus, with the recognition of Jerusalem as the focus, even if the temporal determinant for the rite of prayer has remained Meccan in that it follows the periods of the day inherited from the rites at the Ka'ba,⁴⁸ the temporal and spatial horizons of the consciousness of the community have expanded substantially.

3. The sanctuary of Jerusalem as a monotheistic temple, *masjid*

3.1 *Jerusalem overshadowed by Mecca as the new embodiment of the sanctuary*

After the transfer of the direction of prayer to Mecca, what was to remain of Jerusalem's earlier status? It is well known that the Muslim community at Madina dissociated itself from Jerusalem in face of the increasingly precarious relationship with the Medinan Jews. At the same time, the dissociation bears witness to a return to an earlier memory, with the rediscovery of Mecca as the essential focus of the longing of those exiled in Medina. It was barely two years after the Hijra that the change in orientation occurred, this time attested by a Qur'anic passage. Sura 2: 142-44 reads:

The fools among the people will say
'What has turned them from the direction
they were facing in their prayers aforetime?'

Say:

'To God belong the East and the West.

He guides whomever He will to a straight
path.'

Thus we appointed you a midmost nation
that you might be witnesses to the people,
and that the Messenger might be a witness
to you; and We did not appoint the direction
thou wast facing, except that We might know
who followed the Messenger from him
who turned on his heels—though it were a
grave thing

save for those whom God has guided; but
God would never leave your faith to waste—
Truly God is all-gentle with the people;

All-compassionate.

We have seen thee turning thy face about
in the heaven, now We will surely turn thee
to a direction that shall satisfy thee.

Turn thy face towards the Holy Mosque (*al-
masjid al-haram*);

and wherever you are, turn your faces towards
it.⁴⁹

The spiritual return of the worshippers to the Ka'ba in Mecca which is heralded in these verses marks Jerusalem's removal from the centre. However, as a prototype of a centre to be visited in the imagination of the believer and a distant focus, the direction of prayer towards Jerusalem remained intact, even though the first *qibla* was viewed in retrospect in the Qur'an as a mere touchstone for the obedience of the believers. In exegetical literature, indeed, the Jerusalem *qibla* even appears to have been scorned as an obsolete institution after the Muslim community's dissociation from the Medinan Jews. The abandonment of the Jerusalem *qibla* should not, however, be viewed solely from the negative viewpoint as a merely pragmatic, politico-religious step. A ritual re-orientation in space expressed by means of such a dominant gesture in worship reflects the reality of a genuine change in spiritual longing. Mecca was able to replace Jerusalem because the shared memory of the Banu Isra'il and the Medinan community had been blotted out to a certain extent in the interim period by the novel experience of exile, which in turn caused a substantial increase in the symbolic value of the central Meccan sanctuary. Decisive political success had allowed the community to become sufficiently detached from the more traumatic aspects of the Meccan

⁴⁶ For the development which Islamic worship had reached at the time of its introduction, see A and K Neuwirth 1992: 332-57.

⁴⁷ See A J Wensinck, J Jomier, 'Ithram' in *EP*², 1970: 1052-3.

⁴⁸ For the particular time periods which determined ancient Arabian worship, see Rubin 1987: 40-64.

⁴⁹ Except for Sura 17: 1, the English translation of the Qur'an used here is taken from Arberry 1964.

experience to be able to view Mecca in a positive light as the genuine seat of their own tradition. Moreover, it must be borne in mind that a total break with Meccan ritual practice had never in fact taken place, despite the leap in development manifest in the newly introduced, predominantly verbal forms of worship, and the replacement of the sanctuary by the *masjid* of the new community. In this way, substantial elements of Meccan worship, such as the ritual gestures and the three set times of prayer which were cosmically determined,⁵⁰ had been retained in the Islamic worship in Madina. Once the evocation of a central sanctuary through a ritual gesture had been realised as a precondition of prayer, there could hardly be any other orientation, especially after the symbols shared with the Banu Isra'il had become a problem, except towards the Ka'ba in Mecca, whose sacred role had never been abandoned. But, more important, the ideal Mecca as conceived during exile had itself gone through a substantial change. It had become integrated into that particular form of memory which is transmitted by the vehicle of writing, a memory which we might identify with the Biblical tradition, and this bestowed on Mecca the rank of a place honoured by a significant episode in the history of salvation. It had become the central place in the career of a biblical *heros*—Abraham himself.

3.2 *The inauguration prayer of the Ka'ba*

The prayer of inauguration of the Ka'ba by Abraham⁵¹ has been correctly associated (Busse 1986) with the prayer of inauguration of the Temple by Solomon. In both prayers, the sanctuary is conceived not only as a place of pilgrimage for the group who specifically adhered to its worship but also as a sign set up for all mankind. In the Qur'anic prayer, the Ka'ba appears as the monument of a new divine foundation. It has become the first monotheistic temple. Sura 2: 127-29 reads:

'... My Lord, make this
a land secure, and provide its people
with fruits, such of them as believe in
God and the Last Day.
... And when Abraham and Ishmael with him
raised up the foundation of the House:
'Our Lord, receive this from us; thou art
the All-hearing, the All-knowing;
and, our Lord, make us submissive to Thee,

and of our seed a nation submissive
to Thee; and show us our holy rites, and
turn towards us; surely Thou turnest, and art
All-compassionate;
and, our Lord, do Thou send among them
a Messenger, one of them, who shall recite
to them Thy signs, and teach them the Book
and the Wisdom, and purify them; Thou art
the All-mighty, the All-wise.'

It is true that the foundation or restoration of the Ka'ba by Abraham—accounts of which can be assumed to have been circulating in the peninsula for a long time before Islam⁵²—does not necessarily imply his role in initiating the institution of pilgrimage, which is the most significant of the functions associated with the greater Meccan Haram. But the *hajj*, whose rites originally marked seasonal change, had already begun to be perceived as an assembly of all mankind (Sura 3: 97), and was gaining an increasingly spiritual significance. The fact that admission to the annual rituals (Wellhausen 1889/1961), which were celebrated in the vicinity of Mecca and had participants who attended from all over the peninsula, was at the discretion of the most obstinate enemies of Islam, who were thus able to deny access, must have been particularly offensive. It is understandable that in the new theology of exile the ceremonies of the *hajj*—once the Haram of Mecca had been conceived as a monotheistic foundation consecrated by the patriarch—should equally take on the aura of a festival going back to Abraham as was indeed expressed in Sura 22: 27. At all events, the Islamic *hajj* was definitively stripped of any association with the framework of seasonal change through one of the last verses of the Qur'an declaring a reform of the traditional calendar through the introduction of a purely lunar year (Sura 9: 37).⁵³ The *hajj* in its Islamic context thus received a totally new meaning: henceforth it was performed in response to a divine order for pilgrimage uttered by Abraham. As such it became an obligatory rite incumbent on all future

⁵⁰ Three of the five times of prayer later to be canonised can be presumed with certainty to have existed for the Medinan community; see A J Wensinck, 'Salar', *EI*, 1934: 96-105.

⁵¹ The utterances of Abraham which accompanied the establishment, or the purification, of the Ka'ba rites are presented in different versions in the Qur'an. For a synopsis of these texts, see Beck 1952: 73-94.

⁵² For this concept, which appears to have been developed earlier within the Hanifiyya movement that was constituted by pre-Islamic Arabian monotheistic believers who were not directly associated with either Christianity or with Judaism, see Rubin 1990: 85-112. Beck 1952: 73-94 dates the Qur'anic testimonies for the association of Abraham with Mecca to the Meccan period of the Qur'anic development.

⁵³ Watt 1956: 299, states that 'the abolition of intercalary months is a slight change introduced under Muhammad which has given a definite stamp to Islamic civilisation. The pre-Islamic Arabs observed the lunar months, but kept their calendar in line with the solar year by introducing intercalary months where necessary. The matter is referred to in a passage of the Qur'an, 9: 63-64. Muhammad is said to have made public these verses during the address he gave during the pilgrimage of farewell'. See too Watt's further discussion on calendar reform (1956: 299-300).

generations of believers. It became a feast in commemoration of a particular episode in the history of salvation, comparable to the situation described in 1 Kings 8: 41-3, where, too, Temple and pilgrimage appear interconnected. Sura 22: 26-7 reads:

And when we settled for Abraham the place
of the House: 'Thou shalt not associate
with Me anything. And do thou purify
My House for those who go about it
and those that stand, for those that bow
and prostrate themselves;
and proclaim among men the Pilgrimage,
and they shall come unto Thee on foot
and upon every lean beast, they shall come
from every deep ravine.'⁵⁴

Through this new aetiology, the Islamic *hajj* can be seen to have gone through a change that can be compared to the development of the Israelite feasts reflected in Deuteronomy. That is, it had changed from a ritual which celebrated seasonal change into a ceremony which commemorated an episode in the history of salvation (Rendtorff 1991: 185-205). This statement holds true even though the association of the *hajj* with salvation history remains limited to acts of obedience performed by the worshippers in response to the call of Abraham, according to the explicit text of the Qur'an.⁵⁵ Mecca has thus become the locus of a monotheistic pilgrimage of remembrance.

As is well known, the local destination of the *hajj* within Islam was now no longer Arafat,⁵⁶ as it had been in the pre-Islamic period, but rather primarily Mecca and the Ka'ba. The prayer of inauguration culminates in the plea that in this place verbal worship and the reading of the scriptures should take place, as well as those rites which had been essential to the cultus since time immemorial (Sura 2: 129, quoted above). Abraham's inauguration prayer ends with the plea that a prophet should arise, who

would read aloud from the Book to the participants in the rites at the Ka'ba. These participants are conceived as being Arabian monotheists already familiar with ritual prayer (*salat*) and the rites of pilgrimage. Thus the prayer reached its fulfilment with the appearance of Muhammad, whose mission completed the complex structure of Islam as a religion based equally on ritual and on verbal worship.

With this additional layer of meaning, yet another part of the previous aura of Jerusalem was transferred to Mecca. After the change of *qibla* had already moved the centre of gravity of prayer from Jerusalem to Mecca, the Qur'anic verse already quoted above (Sura 2: 129) now affirmed for Mecca what had previously been the prerogative of Jerusalem; as the words of the Prophet Isaiah attested: 'Torah will go out from Zion and the word of the Lord from Jerusalem' (Isaiah 2: 3). From this time on, in the new concept of Mecca as a foundation of the patriarch Abraham, not only would the city share its most significant merits with Jerusalem, but it would also boast of encompassing a sanctuary older than the Temple of Solomon. Jerusalem, thus reduced to a mere prototype, now fades into the background behind the Islamic Mecca. Mirrored in the Qur'an, Mecca emerges both physically⁵⁷ and spiritually as an obvious antipode to Jerusalem. In fulfilment of the prayers of the first propagator of the worship of the One God, Mecca has become for a second time the site of a theophany. This new hierophany also fulfilled new expectations, which had been aroused by examples from the salvation history of other religions, demanding that a genuine theophany—a divine revelation—should take the shape of a book, a scripture.

Mecca is thus not only associated with the memory of the times of prayer, always in force within Islam and originating from the Ka'ba. Its recollection from this time on is constantly reinforced through the spatial orientation of the worshippers towards Mecca with the *qibla*. Mecca has at the same time also become the main destination of the *hajj*—that is, the site of the most significant event in the cultic year. This is a ritual that may be conceived as reproducing on a larger scale of time and space the rite of prayer as the most significant caesura of the day,⁵⁸ in that it constitutes a unique form of communal withdrawal from profane time and profane space (Busse 1986). Just for the duration of the cosmically determined sacred time of the *hajj*—and for this duration only—the Meccan Haram, conceived as carrying cosmic associations

⁵⁴ Busse (1986) stresses the significance of the sanctuary as a universal destination of pilgrimage (*wa-adhdhin fi 'l-nasi bi-'l-hajj*), a trait that the Ka'ba shares with the Temple of Jerusalem as portrayed in 1 Kings 8: 41-3.

⁵⁵ The short passage in the Qur'an which presents Abraham's call to pilgrimage has inspired many accounts related to the literature of legends of prophets (*Qisas al-anbiya'*) and concerning the life of Abraham and his relatives. These give a totally new aetiology of the *hajj* rites insofar as these are presented as acts to be carried out in imitation of specific actions of biblical figures. See also Busse 1993: 169-86.

⁵⁶ For the worshippers' stance (*wuquf*) beneath Mount Arafat in the expectation of a theophany which in the ancient Arabian context marked the climax of the *hajj* rites, see Wellhausen 1889. Within Islam, the ceremony is re-interpreted as an anticipation of the assembly of mankind on the Day of Judgment. For a modern interpretation along these lines, see Shari'ati 1983.

⁵⁷ The awareness of a particular divine mercy bestowed on Mecca, which enjoys prosperity, security and cultic hegemony despite its geographical location in the middle of the desert, is clearly reflected in the Qur'an, cf. Sura 14: 37, '*bi-wadin ghairi dhi zar'in*'. Jerusalem, unlike Mecca, is situated in a land blessed all around (Sura 17: 1).

⁵⁸ The period of the *hajj* already appears as a forceful symbol in an early Meccan Sura (89: 2); see Neuwirth 1993b: 25.

of its own,⁵⁹ becomes sacred space. It is worth noticing that for both time and space the quality of sanctity is viable only at the intersection of the Haram of Mecca and the *hajj*.⁶⁰ Beyond the space designated by the Haram, all the taboo prescriptions (*ihram*) of the *hajj* are no longer in force. In addition, the time of the feast itself is shortened outside the Haram. For those who remain at home, it is reduced to a single day, the concluding day of the sacrifice (*'id al-adha*). This is due to the unique nature of these rites, which originated in Mecca and which were sanctioned by the Qur'an. They were perceived not only as preceding in terms of time but also in terms of evolution the phenomenon of revelation through scripture which was so closely associated with the symbol of Jerusalem. Thus we find at the end of the Qur'anic development, after Mecca had been regained and its sanctuary had found a final anchorage in Islam, the statement in Sura 3: 96:

The first House established for the people
was that of Bakka [Mecca], a holy place, and
a guidance
to all beings.

4. Jerusalem as a place of pilgrimage—al-Haram al-Sharif

4.1 The triad of Islamic sanctuaries

What was to be the destiny of Jerusalem after it had been thus re-embodied in Mecca? It was to be recognised as a holy place, a legitimate destination of Islamic pilgrimage, no later than the end of the first Islamic century. This development is documented early on through the Hadith of al-Khudri quoted at the beginning of this chapter, which presents a *locus probans* for the definitive ranking of Jerusalem within the canon of Islamic sanctuaries—'You shall only set out for three mosques: the Sacred Mosque (of Mecca), my Mosque (in Medina), and al-Aqsa Mosque (in Jerusalem).' Kister (1968) has illuminated the wider context of this pronouncement and has stressed the restrictive nature of the Hadith, which has to be interpreted as a veto against admitting further sanctuaries into Islam. Jerusalem is admitted to the canon only as a concession since it was too strong a symbol to be repressed, but the city is only granted third rank. The pilgrimage to it is

reduced to the status of a *ziyara*—a pious visit without a particular period being assigned to it.⁶¹

In the meantime, Jerusalem had for a long time been determined in terms of space and time by the other two sanctuaries. It was integrated in terms of real time into the framework of the new era which had originated in, and been introduced from, Medina—the place of the worldly self-affirmation of early Islam. In terms of space, the sacred buildings of Jerusalem are oriented towards Mecca. It should be kept in mind that, by perceiving the holy places of Islam as being three in number—that is, by including Medina into the canon of sanctuaries—a most significant new fact had been taken into account, a fact which manifests itself even more conspicuously in the new dating system relating to the *hijra* of the Prophet. It is the entry of Islam as an historical phenomenon in its own right into real time and real space. The significance of this new reality became enhanced through the Qur'anic reform of the calendar. Through the lack of congruence between the new Islamic dating system and the older ones, those practised by the pre-Islamic Arabians as well as those of neighbouring societies, a smooth association of Islam with the historical past of any of the surrounding societies became permanently impossible. With the breakthrough of Islam as a new politically dominant identity (even if its adherents were not in the majority), its own memory was canonised and all other memory was censured. In this way, with the final redaction of the Qur'an under the third caliph 'Uthman around the year AD 653, canonical Scripture is limited once and for all to the revelation received by Muhammad. The Torah and Gospels are thus excluded from this more restrictive concept of scripture. Over against this, however, the central symbol of the Banu Isra'il, the monotheistic Temple of Jerusalem, which had been already integrated into Islamic memory by the Qur'an, was now further affirmed as an Islamic sanctuary.⁶²

⁵⁹ See A J Wensinck, 'Ziyara', *EI*, 1934: 1234-35.

⁶⁰ Busse (1986: 458-60 and again in 1991: 144-54) holds the opinion that the erection of the Dome of the Rock is to be considered as a new attempt to rebuild the Temple, a view documented in the early Umayyad era in certain old Jewish and Islamic traditions, recorded by Ibn al-Murajja and al-Wasiti. See also Gil 1992: 65-74. To judge by the building inscription, however, it should be stressed that the new sanctuary was destined not so much to be another restoration of the Solomonic Temple as such, but more generally a monotheistic place of worship imprinted with the particular message conveyed to Muhammad. To ignore the fact that long before the *masjid* of the Banu Isra'il had been physically reached by the Muslims, it had already been recognised as the sole antipode to the Ka'ba as 'the further', 'the other', sanctuary (*al-masjid al-aqsa*), and had as such played a significant role in the emerging Islamic worship, would be to underestimate the factor of continuity. The integration of the sanctuary into the horizons of the emerging community is part of the genesis of the structure of Islam.

⁵⁹ An existentialist testimony to the experience of a '*rite de passage*' at the entrance point to the Haram (*miqat*) is found in Shari'ati 1983.

⁶⁰ In a Qur'anic commandment, only Mecca and its Haram are declared to be a site where personal presence is essential for the fulfilment of a ritual obligation incumbent on every Muslim. In contrast, the Jerusalem sanctuary becomes the aetiological focus of a feast which developed after the genesis of the Qur'an (*Dhikr al-isra' wa 'l-mi'raj*) and does not require the worshipper's presence at the original site.

4.2 Jerusalem as one of the Three Sanctuaries—on the expressive value of the place of pilgrimage, the Haram al-Sharif

About sixty years after the death of the Prophet, the central symbol of the Temple Mount of Jerusalem was adorned by a unique, imperial Islamic monument—the Dome of the Rock (al-Qubbat al-Sakhra).⁶³ It is obvious that the Dome of the Rock, maintaining a central position within the whole area of the Haram al-Sharif, was primarily intended as a challenge addressed to the Christians, whose magnificent churches⁶⁴ dominated a city which was itself equally sacred to the two older religions. This intention is made manifest through the peculiar structure and the decoration of the building. The octagon crowned by a cupola reflects—down to its very dimensions—the rotunda above the tomb of Christ built by Constantine.⁶⁵ The Dome of the Rock, moreover, was originally decorated by mosaics not only on its interior but on the exterior walls as well. And—last but not least—not only is the location itself distinguished by being part of the site of the Jewish Temple,⁶⁶ but the building was in addition raised above a most significant requisite of cult history—that is, the Rock. To this rock are attached a multitude of cosmological and ethico-historical traditions,⁶⁷ as attested by the rich

Haggadic tradition and confirmed by an extensive Hadith literature codified somewhat later. These texts may be assumed to have been in circulation among the Muslim community settling in Syria, and among the local educated circles surrounding them, at the time of the Umayyad construction work. On the basis of some of these ‘Haggadic’ traditions the hypothesis has recently been put forward that a particular detail of the Rock formed the nucleus of the veneration of the place, providing the motive for the erection of the Dome.⁶⁸ This is a cavity in the surface of the Rock, which can be taken for the imprint of a foot. In the Haggadic imagination it had become associated with the creation of the world, being interpreted as the imprint of God’s own foot, left in the Rock after He had completed the six days of creation, as He rose from His worldly throne, the Temple Mount of Jerusalem, to return to Heaven.

The assumption that such mythical beliefs lie behind the erection of the Dome would be in stark contradiction with the evidence in the Dome’s long foundation inscription dating to AD 692 left by the founder, ‘Abd al-Malik ibn Marwan.⁶⁹ The building contains no anthropomorphic or figurative representative of the Holy whatsoever. The inscription, which consists mainly of quotations from the Qur’an, does, it is true, twice include the beginning of Sura 2: 225—the so-called Throne verse.⁷⁰ The imagery of this might, of course, recall the Haggadic throne tradition in question. However, the full text of the inscription—apart from two polemic passages addressed to the Christians⁷¹—attests mainly the two basic articles of the Islamic catechism: namely the Unity of God⁷² and the dignity of Muhammad as His

⁶³ The problem of a secondary intention for the building, which aimed at the self-legitimation of the new dynasty at that time confronted by an anti-caliphate at Mecca, is discussed again by van Ess 1992: 93-101. Busse (1986: 460) rejects the idea that ‘Abd al-Malik, by building the Dome, might have intended to replace the Ka’ba which had fallen under the jurisdiction of his rival; this view is again explored by Elad: 1992: 33-58. Busse continues to support the view that the alleged existence of precious relics in the Dome of the Rock (among them the ‘crown of Khusrau’), as well as the fact that Mu’awiya and later Sulaiman accepted homage there, ‘would mean nothing less than the elevation of that shrine to the ideological and political center of Omayyad rule.’

⁶⁴ The most telling Islamic testimony for the thesis that the building activities of ‘Abd al-Malik were inspired by the Church of the Anastasis (*Qubbat al-qiya*)—as the Holy Sepulchre is called in the Byzantine tradition—and other Jerusalem churches is given by al-Muqaddasi 1877: 159. The passage, which is frequently quoted, is translated by Le Strange 1896/1971: 22-3.

⁶⁵ For the physical relationship between the Church of the Anastasis and the Dome of the Rock, see Bieberstein and Bloedhorn 1994, vol. 3: 72-92.

⁶⁶ For the Umayyad building complex on the Temple Mount, see Bieberstein and Bloedhorn 1994 and particularly Rosen-Ayalon 1989, cf. Busse’s diligent review of research to date (1991: 144-54). For the influence still exerted on Islamic architecture by the Dome of the Rock, see Hillenbrand 1990: 64-71.

⁶⁷ For the idea of the Haram as the centre of the world, see the testimonies collected by van Ess (1992: 89) and the account of al-Muqaddasi referred to in note 64 above; see too Miquel 1984: 127-35.

⁶⁸ See Busse 1986: 455-60, and van Ess 1992: 89-104.

⁶⁹ The building inscription is published by van Berchem *CIA*, vol. 2, *Jérusalem Haram*, no. 215-7 and has been translated into German by Busse 1977: 8-24.

⁷⁰ The quotation of the initial phrase of the Throne Verse taken alone could be interpreted as an allusion to the debate that took place in the presence of Caliph ‘Abd al-Malik on whether the Temple Mount in Jerusalem could be considered as the worldly throne of God. See van Ess 1992: 98-99. A late polemic against that assumption is to be found in Ibn Taimiyya, *Iqtida’ al-sirat al-mustaqim fi mukhalafat ahab al-jahim* p. 445, cf. the English translation by Muhammad ‘Umar Memon 1976. The entire Throne Verse is reproduced in the Ottoman inscription in the cupola; the possibility that it is none other than the restoration of a former epigraphic decoration of the cupola cannot be ruled out, for nothing is known of the former Umayyad appearance of the dome.

⁷¹ Polemical statements against Christianity are found in the inner ambulatory—Sura 4: 171-2, 19: 34-6, and in the outer ambulatory 17: 111. For these texts in detail, see Busse 1981: 168-78. For the whole inscription, see, too, van Ess 1991: 10-16.

⁷² The first part of the Islamic confession of the Unity of God and Muhammad’s status as Messenger (*shahada*) appears nine times; in addition, the idea of unity is taken up several times in the context of quotations from the Qur’an.

messenger.⁷³ Both are affirmed in the inscription in a way very similar to their appearance on contemporary coinage.⁷⁴ As might be expected from a caliphal edifice, the issue of self-legitimation is also prominently reflected. This is expressed by the repeated statement that sovereignty belongs to God alone and is granted by Him to whomsoever He wills.

If there is a single, comprehensive message to be read from the inscription, it should be seen as the following—the Prophet of Islam, Muhammad, who is mentioned in the text more than ten times, is, very much like Jesus,⁷⁵ a servant and messenger of God. He is, as the Christians hold to be true of Jesus, highly esteemed in heaven as on earth.⁷⁶ He even transcends the border between heaven and earth, as affirmed by the Qur’anic verse Sura 33: 56, which is either quoted in full or alluded to several times in the inscriptions; and he is expected to be the intercessor for his community on the Day of Judgment. The prayer in the inscription, which culminates in this plea for the eschatological intercession of Muhammad,⁷⁷ is the longest and most emotional passage of all, only equalled by the polemical verses directed against the Christians. The association of Muhammad with the world of angels established by the quotation of the unique verse 33: 56 bestows on him the aura of a mediator *par excellence*. The only comparable figure is Jesus, whose person, venerated in so many places in Jerusalem, is strongly felt to be present in the Islamic sanctuary too.

⁷³ The distinguished position of Muhammad is referred to five times in the repetition of the second part of the *shahada*, as well as frequently in other contexts; twice Sura 33: 26 recalls his elevation to a rank even above that of the angels, who pronounce their benedictions upon him.

⁷⁴ The shared identity of the formulas used in the inscription and in contemporary Umayyad coinage is also stressed by van Ess 1992: 10–11. Welch underlines the paradigmatic character of the forms created by ‘Abd al-Malik in coinage as in epigraphy. These were to become prototypes for the later development of Islamic epigraphy as well as numismatics; see Welch 1977: 63–74.

⁷⁵ The formula, which reappears as a stereotype in the inscription ‘May God bless Muhammad, His servant and prophet’, is echoed in the inscription found in the inner ambulatory, ‘Oh God! bless our messenger and our servant, Jesus.’

⁷⁶ Sura 33: 26 is to be found in both outer and inner ambulatories. It reads: ‘God and His angels bless the Prophet. Oh believers! do you also bless him and pray him peace.’

⁷⁷ The full text of the inscription reads: ‘Oh God! we pray You to grant us—through Your beautiful names (*al-asma’ al-husna*), Your noble face, Your elevated majesty, and Your perfect word by which You preserve heaven and earth, through Your mercy which shelters us from Satan and saves us from Your punishment on the Day of Resurrection, through Your overflowing generosity, through Your kindness, through Your gentleness and Your omnipotence, through Your forgiveness and Your magnanimity—that You might utter Your blessing over Muhammad, Your servant and prophet, and that You might accept his intercession for his community—may God bless him and grant him mercy.’

In view of the eschatological role of Muhammad reflected in the inscription, it is hardly surprising that the footprint, ascribed by the Jewish Haggada to the divine ascent to Heaven by God Himself, was re-interpreted at some stage—we cannot determine the date—after the erection of the Dome of the Rock. It was recognised as belonging to the Prophet Muhammad. Muhammad, of high standing in heaven as on earth and over whom God and the angels pronounce benedictions (Sura 33: 56), was himself touched by the aura of Jerusalem, as the Qur’anic allusion to his nocturnal journey attests. As to his proximity to God, he is in no way inferior to that other prophet, Jesus, who is revered above all in Jerusalem and whose own ascent to heaven is recalled in a special building in the close neighbourhood of the Dome of the Rock. In this way it is completely plausible that Islam elevates the Prophet Muhammad on the one hand to a figure closely related to the founder of monotheistic Jerusalem, David, and on the other to the man deemed by his adherents to be the restorer of creation through his own death in Jerusalem, Jesus. Tradition, as presented in the account ascribed to Ibn Mas‘ud, the scribe of the Prophet, has Muhammad entering Jerusalem in Davidic guise, riding on a beast closely associated with the messianic ass. From there he ascends to heaven, and, passing through the celestial spheres, meets God Himself. The account culminates in the following scene, which is a miraculous aetiology for the introduction of the Islamic institution of prayer:

He (i.e., the Prophet), accompanied by the angel Gabriel, finally reached the seventh heaven and his Lord. There the duty of fifty prayers was laid upon him.

The apostle said: ‘On my return I passed by Moses and what a fine friend of yours he was! He asked me how many prayers had been laid upon me and when I told him fifty he said, “Prayer is a weighty matter and your people are weak, so go back to your Lord and ask Him to reduce the number for you and your community.” I did so and He took off ten. Again I passed by Moses and he said the same again; and so it went on until only five prayers for the whole day and night were left. Moses again gave me the same advice. I replied that I had been back to my Lord and asked Him to reduce the number until I was ashamed, and I would not do it again. He of you who performs them in faith and trust will have the reward of fifty prayers’ (Ibn Hisham 1955: 397–98).

This narrative, which is related in the ‘official’ biography of the Prophet regarding Muhammad’s

ascension (*mi'raj*) from Jerusalem, gives a new, prophet-oriented meaning to the otherwise cosmically-determined worship of Islam. The account of the *mi'raj*, which eventually also resulted in the establishment of a particular feast in honour of the Prophet, was to become henceforth the main basis of the notion of the holiness of Jerusalem within Islam. From the second half of the 8th century onwards, when the *mi'raj* account was integrated into the first biography of the Prophet by Ibn Ishaq (died 150/767), the narrative was widely enough known to contribute to the mythical aetiology of the construction of the Dome of the Rock, which is thus conceived by the Muslim believer first and foremost as a memorial to the Prophet Muhammad. The concept of Muhammad transcending the borders between heaven and earth, alluded to only in the restrained language of the Qur'an in 'Abd al-Malik's inscription, thus becomes material in a narrative, figurative way.⁷⁸ In this way, Jerusalem, the place of pilgrimage ranking only in third place within the canon of sanctuaries, retains a wealth of meaning which is hardly less honorific than that of the other two sanctuaries.

There is no allusion in the inscription of the Dome of the Rock to God's work of creation—in spite of the fact that the Rock in Haggadic tradition and also in popular Muslim piety is heavily laden with cosmological associations that may even have contributed to the erection of the dome over the Rock in the first place. There are, however, many references to the re-establishment of creation on the Last Day, when the Islamic Prophet will act as mediator. In this function, he is analogous to Jesus, who plays a similar role as the restorer of creation within a Christian context. Whether the interior decoration of the Dome of the Rock evokes a heavenly paradisaical landscape, as has been convincingly argued by Miriam Rosen-Ayalon

(1989), or even an earthly paradise (which would accord with the Dome's symbolism, characteristic of sacred buildings and already familiar to the educated observer from the iconography of contemporary Christian churches), the idea of paradise in the Dome of the Rock is still primarily related to the situation *after* the Last Judgment rather than that at the beginning of creation. The inscription explicitly refers to the Day of Resurrection and, repeatedly, to God's power to resuscitate the dead.⁷⁹ Moreover, there are emblems of the Last Judgment to be discovered within the mosaic decoration—horns that may be interpreted as trumpets (Rosen-Ayalon 1989: 68–69)—and these find an echo even in the names of two of the gates of the Dome of the Rock: Bab al-Sur (the Gate of the Trumpet), and Bab Israfil (the Gate of the Angel of Death).

It is true that the architecture of the Dome of the Rock attests a strong awareness of the centrality of the sanctuary. This is even more true of the design of the whole building complex of the Haram al-Sharif, marked as it is at the intersection of its axes by a specific building, the Dome of the Chain, whose sole function is to point to the *omphalos mundi*.⁸⁰ But this awareness is never expressed verbally. The epigraphic articulation relies heavily on the Qur'an which speaks a different language, its basic objective being ethico-historical. The only detail of the inscription which allows a cosmological interpretation is the Qur'anic quotation of God's creative imperative—'Be!', '*kun*' (Sura 19: 35). This is adduced with a theological purpose, as a guarantee of His Unity, for, being able to create, He is not in need of procreation. It is a certainty to which believers may appeal when they pray to Him to bless Muhammad and to accept his intercession on behalf of his community.⁸¹ It is noteworthy that the inscription, thanks to the oft-repeated benediction of the Prophet (*tasliya*), the confession of God's Unity (*shahada*), and the evocation of the formula 'in the name of God the Merciful, the Compassionate' (*basmala*), reflects some of the most substantial elements of Islamic prayer. The Dome thus becomes a uniquely appropriate place for the articulation

⁷⁸ Although we cannot definitely solve the chronological question as to when the association between the Dome of the Rock and the *mi'raj* was made, the pertinent Hadith material may be assumed to have originated during the Umayyad era, and thus hardly in isolation from the dynastic self-manifestations in the city of Jerusalem itself. The heavenly world, as reflected in the iconography of the Dome of the Rock, could well remind later visitors of the *mi'raj* experience of the Prophet. A recent study by Rosen-Ayalon (1989: 46–62) shows that angels appear prominently in the iconography of the mosaics of the Sakhra. She presents a most convincing re-interpretation of the somewhat ambiguous amphora-like shapes that dominate the mosaic decoration of the drum of the dome; following the interpretations of Creswell (1969: 31–33) and Grabar (1959: 33–62), these had previously been understood to be stylized images of precious spolia (cf. the legend of the 'crown of Khusrau' referred to in note 67 above) reputedly brought back by the victorious rulers of Islam from their expeditions against the neighbouring empires. The new interpretation is enhanced by the inscription according to which it is the angels who, even before mankind, pronounce blessings over the Prophet (Sura 33: 56), and who testify with God Himself to the Divine Unity.

⁷⁹ The portion of the inscription above the eastern gate culminates in the long prayer that the intercession of Muhammad on the Day of Judgment (*yaum al-qiyama*) might be accepted; a shorter version of this prayer is found in the outer ambulatory. Jesus is similarly placed within an eschatological context through the quotation of Sura 19: 34; God appears as the One who gives life and takes it again (*yuyhi wa-yumit*). The term 'resurrection' (*qiyama*), which is twice repeated, for the local reader at least also evokes the official name of the central church of Jerusalem—the Church of the Resurrection, or Anastasis (Kanizat al-Qiyama).

⁸⁰ For the interpretation of the Qubbat al-Silsila as *omphalos mundi*, see Rosen-Ayalon 1989: 25–29. The cosmological idea behind it, that Jerusalem is the centre of the world, is evolved in detail by al-Muqaddasi, cf. Miquel 1984: 133–35.

⁸¹ In the prayer of intercession of the Prophet, which is placed over the eastern gate, there is an explicit recourse to the 'perfect word' (*al-kalima al-tamma*).

of prayer, because prayer is already echoed in the scriptural adornment of its architectural forms. What is missing, however, is the verbalisation of the parallel between the Prophet and Abraham which is so prominent in the wording of ritual prayer. Instead, the inscription rather draws a parallel between the Prophet and Jesus. This is probably due to a kind of catalytic effect produced by the *genius loci*, which is also reflected in the prominence given to the eschatological functions ascribed to Muhammad in the text. It seems, then, that in the 7th century the cosmological traditions associated with the site of the Temple Mount, so abundant in Haggadic literature (Schäfer 1974: 122-23), had become marginal compared to the sober, restrained spirituality of the Qur'an, reflected so tellingly in the epigraphic expression of the Dome of the Rock.

4.3 The Haram and its vicinity as the destination of eschatological pilgrimage

The symbolic dimension of the inscription is hardly surprising given the locality, where the borders between heaven and earth, between time and eternity, are permeable. The whole of the Temple Mount had been discovered to be a *topographia eschatologica* by the Muslim conquerors of Jerusalem. All that was needed was the identification of the individual elements. In this way, as already pointed out, one of the gates of the Dome of the Rock was called after the Angel of Death, Israfil. His presence is also signified by his symbol, the trumpet, both in the mosaic decoration on the intrados of the northern arcade of the Dome (Rosen-Ayalon 1989: 68-69) and in the name of a second gate. What is heralded only as a prediction in the Dome of the Rock—that earthly image of paradise—will be fully realised in its surroundings on the Last Day. The small dome, whose sole original function was to mark the axial centre of the Haram, will then reveal its eschatological function as the Dome of the Chain (*qubbat al-silsila*)—that is, the place in which will hang the chains to carry the scales of judgment. It will take centre stage in a vast scenario of Judgment. Behind the Dome, to the east, the Gate of Mercy will open to receive the Blessed. To the south, lying below the Haram, stretches the Wadi Jahannam, once believed to be the destination of the Damned.⁸² Further north, beyond the wall of the Haram on the slope of the Mount of Olives, is the area called *al-*

sahira,⁸³ where all of mankind will be summoned to Judgment. Later, a gate leading into the city of Jerusalem will allude to this site (*bab al-sahira*).

It was not only the literature in praise of Jerusalem (*Fada'il al-Quds*), codified from the 9th century onwards, and a number of mediaeval travelogues⁸⁴ that stressed the idea of the Haram as the site of the Last Things. The post-Umayyad epigraphic testimonies inside the Dome of the Rock also underline the eschatological function of the place. Whereas the Haram inscriptions installed by Salah al-Din still concentrate on the miracle of the Dome of the Rock's metamorphosis back into a Muslim sanctuary from a Christian shrine,⁸⁵ the Ottoman inscriptions unequivocally take up the eschatological theme. In addition to the Throne verse, which obviously remained closely associated with the Rock, the whole text of Sura 32 (*Ya Sin*), which has a markedly eschatological character, is cited. The unique Qur'anic verse, Sura 17: 1, which associates the Prophet with the site through his nocturnal journey, and which at this later stage has become understood exclusively as an allusion to the Prophet's ascent to heaven, his *mi'raj*, is also adduced, serving to underline Jerusalem's affinity to the transcendental realm.

The awareness of the transitory quality of the Jerusalem sanctuary—where space is felt to turn into time⁸⁶—and thus of the resultant merit of the believer's approach to the shrine, reached its climax in the Mamluk period. It is remarkable that proximity to the place where creation would in future dissolve, and where the dead would be resurrected to another life, should have aroused

⁸³ The place name *al-sahira* seems to go back to a rather daring interpretation of a Qur'anic passage with somewhat unusual phraseology. The verse in question is found in Sura 79: 14. It is speaking of the resurrection: 'But it shall be only a single scare / and behold, they are awakened.' The expression 'in the state of being awake', '*fi al-sahira*' was re-interpreted to become a toponym for the place traditionally associated in Jerusalem with the event of the assembly of the resurrected.

⁸⁴ A most useful anthology of relevant travel accounts is to be found in al-'Asali 1992. The Haram as the site of the Last Things was already described by writers in the 10th and 11th centuries; see al-Muqaddasi 1877: 171-72 and Nasir-i Khusrau 1975: 26-40.

⁸⁵ The inscription of Salah al-Din, which was published by van Berchem (1927: 363-71), cites the beginning of Sura 21: 1-21, *Ta Ha*, where the event of the Burning Bush is associated typologically with the consecration of the sanctuary. Just as Moses was made aware that he was treading on holy ground, so should the visitor to the re-consecrated Dome of the Rock be aware that this too is a holy site. In a similar way, the event of the reconstitution of the rod of Moses should be interpreted, according to Busse 1977: 8-24, as a prototype for the reconstitution of the Dome of the Rock to its original status as an Islamic sanctuary. The Qur'anic quotation ends with the words 'We will restore it to its first state' (Sura 20: 21).

⁸⁶ See too Miquel's analysis (1984: 135) of al-Muqaddasi's account of Jerusalem.

⁸² For the Haram gates in general, see Burgoyne 1992: 125-40. The double gate to the south known as the Bab al-Rahma goes back to the original building complex of 'Abd al-Malik. The Gate of Darkness, Bab al-'Atm, which was originally a double gate like the Bab al-Rahma, also belongs to the original complex. The Wadi Jahannam (in Hebrew, Ge Hennom, 'Gehenna') is located to the south-east of Jerusalem. For the traditions that migrated there, see Peters 1985: 455-8.

the desire of self-perpetuation. This took the form of building mausolea⁸⁷ and other architectonic structures which should be seen as memorial buildings, if not in their primary intention then at least as a secondary purpose.⁸⁸ This is perhaps most evident in the luxuriously-adorned main access road to the Haram described by Burgoyne (1987: 84ff) as an architectonic complex in itself. That sense of self-perpetuation is expressed by the super-elevated, thoroughly expressive façades, which are decorated with monumental epigraphic and heraldic⁸⁹ emblems of royal—or at least amiral—self-legitimation. These buildings conceal a multitude of institutions that were charged with the preservation of memory: these include religious endowments laden with minutely fixed prescriptions for the maintenance of liturgical, meditative and theological activities.⁹⁰ These institutions preserved the memory of their founder long after his death, not only through the continuous evocation of his name in prayer, but even more through another auditory device, the ‘remembrance of God’ (*dhikr Allah*)—ceremonial recitation of the Qur’an. The sound of the recitation was carried out into the street and heard by believers passing through the Bab al-Silsila Road on the way to worship in the Haram, who thus received a blessing on behalf of the pious founder.⁹¹

But it should be borne in mind that the Haram al-Sharif is not only a place of pilgrimage for the living, who during their stay in Jerusalem enjoy the blessing of the neighbourhood of the sanctuary, the *jiwar*.⁹² It is also the

final destination of the eschatological pilgrimage of mankind. On the Day of Judgment, all men will stand there before their Lord, in the same way as in the *hajj* ceremony of *wuquf*, when pilgrims stand motionless beneath Mount ‘Arafat. This final destination has already been approached by those who were able in some way to erect a memorial for themselves in Jerusalem by commissioning a professional Qur’an reader in their will, thus ensuring that long after their death a continuous recitation of the Qur’an would be performed at their tomb. Other monuments with an inscription that contained or evoked Qur’anic verses would serve a similar purpose: their founders, long after their deaths, could hope for continuous blessings to be returned to them from passers-by, who were expected to utter a pious formula on reading a written verse in the inscription, or on hearing a Qur’anic *cantilena* resounding into the road from a mausoleum. These reciprocal blessings were apt to create a singular communication between the living and the dead, and help to bridge the time that still remained until the day when they would be allowed to enter the Haram, located so close to their tombs in terms of space. A verse of the Qur’an which is often quoted in a funerary context gains additional significance when it is encountered in an inscription over a mausoleum in Jerusalem, in this particular case erected by a lady from distant Transoxiana, who either died in Jerusalem or, in accordance with her will, was transported there after her death. Sura 3: 185⁹³ reads:

*Kullu nafsin dha’iqatu l-mauti
tuwaffauna ujurakum yauma l-qiyamati
fa-man zuhziha ‘ani l-nari wa-udkhila l-jannata
fa-qad faza
wa-ma hayatu l-dunya illa mata’u l-ghurur*

Every soul shall taste of death; you shall surely be paid in full your wages on the Day of Resurrection. Whosoever is removed from the Fire and admitted to Paradise shall win the triumph. The present life is but the joy of delusion.

5. Conclusion

The significance of Jerusalem to Islam becomes fully

⁸⁷ Burgoyne 1987 lists at least seven mausolea located in Bab al-Silsila Road.

⁸⁸ Stephen Humphreys 1972: 69–119 stresses the importance of realising the effective nature of a secondary intention, which communicates a particular consciousness or even ideology, in addition to the primary function of a building.

⁸⁹ See Mayer 1933 and Meinecke 1972. I owe this reference to the kindness of my colleague, Ulrich Haarmann.

⁹⁰ See Little 1984. The texts have been published by Little 1984b, and by al-‘Asali 1983–9.

⁹¹ The survey by Burgoyne (1987) has shown that buildings were deliberately constructed with their main space opening onto the street through large windows in order to allow the recitation of the Qur’an, which was taking place inside the tomb of the founder or within one of the lecture halls, to be heard outside in the street. The fact that certain areas of Jerusalem resounded to the recitation of the Qur’an is attested by Muslim pilgrims congregating from distant lands. See, for example, the account left by Abu Bakr ibn al-‘Arabi, who lived in Jerusalem in the years 1093 and 1095; see al-Maqqari n.d: 42.

⁹² Accounts describing pious visitors (*jiran*), who had come to Jerusalem to seek spiritual experience through meditation on the Temple Mount, are to be found in the *Fada’il* literature; see al-Wasiti, Ibn al-Murajja and al-Suyuti 1982–84. Cf. the quotations of several *fada’il* traditions presented by Busse (1986), as well as in the biographies of sufi mystics. They are particularly numerous in Mujir al-Din al-‘Ulaimi (15th century) and Burhan al-Din ibn al-Firkah al-Fazari (writing in 1350).

⁹³ For the mausoleum of Turkan Khatun dating from the year 753/1352–3, see Burgoyne 1987: 321–4. The quotation, which in the inscription is limited to the first phrase only, is mnemotechnically strong enough to evoke in the reader’s mind any one of three possible continuations. The short *gnome* in the quotation appears in no less than three different Qur’anic passages, Suras 3: 185, 21: 25 and 29: 57. In each case, the verse finishes with an eschatological prediction which is most vividly expressed in Sura 3: 185.

evident only in the context of the three sanctuaries. This conclusion to the foregoing study is perhaps communicated more vividly through a drawing than through any written testimony. In a simple image which, according to Jerusalemite custom, is drawn in a naive, popular technique on the wall or the door of the house of a pilgrim returning home from the *hajj*, the three Islamic sanctuaries are arranged to form a triangle. The Ka'ba of Mecca and the Mosque of the Prophet in Madina mark the two angles below. The Qubbat al-Sakhra marks the apex. The two sanctuaries of Mecca, the site of the establishment of the key religious rites through Abraham and their restoration through Muhammad, and of Madina, the place to which the beginnings of the worldly political self-

assertion of Islam are attached, could become the holy places of a universal religion only because Islam sees itself as a new rendition of those older religions of the book whose bedrock is the Rock of Jerusalem. Muhammad himself was touched by the particular aura of the place. The Prophet's experience was formulated in the powerful image of the Nocturnal Journey and Ascent to Heaven, both easily remembered and full of evocative power for every Muslim believer. The unquenchable aura of the place as an opening to 'the other world'—to heaven—is matched in architectural terms by the form of the cupola of the Dome of the Rock, the Qubbat al-Sakhra, which still today asserts its identity as an icon of Islamic spirituality.

Chapter 9

POPULAR AND SYMBOLIC ICONOGRAPHIES RELATED TO THE HARAM AL-SHARIF DURING THE OTTOMAN PERIOD

Michele Bernardini*

In Islamic historiography the tradition regarding the holiness of the city of Jerusalem, and in particular of the sacredness of the Haram al-Sharif, had undergone a long evolution by the time of the Ottoman conquest in 1516. In fact from the early Islamic period there had been different and often contrasting views that had substantiated these traditions. In the early Islamic centuries the debate centred on the holy nature of the city and pertained in particular to its designation as a pilgrimage centre (Kister 1969). The discussion was based mainly on the interpretation of the relative *Hadiths* and on the references to the city found in the Qur'an, which are allusive rather than explicit.¹

The debate, in an earlier period, found a first response in the construction of the Qubbat al-Sakhra by the Umayyad Caliph 'Abd al-Malik.² However it was the reaction ensuing from the Crusades, and the conquest of

the city by Salah al-Din, that led to a more pronounced awareness and recognition of the sacred character of the city. This trend is underlined by the phenomenon defined by E Sivan as *Fada'il al-Quds* ('The Merits of Jerusalem') literature, which, as pointed out by this scholar, dates from the 11th century.³ A guiding theme highlighted by such literary production is that one of the ultimate aims of the *jihād* was the conquest of Jerusalem, with a special emphasis placed on the religious value of the Haram al-Sharif and in particular of al-Aqsa mosque.

A further constituent element of the traditions concerning the sacred character of the city is to be found in the mediaeval literary elaboration of Muhammad's *mi'raj*. Though this theme was duly underlined in Islamic historiographical works, it was mainly in literary (especially non-Arabic⁴) works that the *mi'rajnama* ('Book of the Ascension') typology had a considerable success. This is

* My sincere thanks to Maria V Horra Fontana, Amedro Maiello and Rachel Milstein for important help supplied.

¹ See J W Hirschberg, 'The Sources of Moslem traditions concerning Jerusalem', *Rocznik Orientalistyczny*, 17 1951-2: 314-50; among the Qur'anic references to Jerusalem, the *sura* of the Nocturnal Journey (*al-Isra'*, 17), certainly the most discussed by the commentators, contains a reference to the Distant Temple, *masjid al-aqsa* (for other quotations probably relating to Jerusalem see also Qur'an 17 1; and 53 1-8). It should be noted that the *ayat al-isra'* was, according to Abu 'l-Hasan 'Ali ibn Abi Bakr al-Harawi, *Guide des Lieux de Pèlerinage*, trans. and notes J Sourdel-Thomine, Damascus 1957, inscribed on the mosaics inside the al-Aqsa Mosque in the year 1035. My grateful thanks to Rachel Milstein who very generously gave me a copy of her article, 'Drawings of the Haram of Jerusalem in Ottoman Manuscripts', in advance of its publication in *Aspects of Ottoman History, Papers from CIEPO IX*, (eds.) A Singer, A Cohen, 1994: 62-9. This scholar writes that the mosaics have since disappeared (64), but remained the *raison d'être* for a visit to Jerusalem for pilgrims, as well as for Harawi.

² See O Grabar, 'The Umayyad Dome of the Rock in Jerusalem', *Ars Orientalis* 3 1959: 33-62; M Rosen-Ayalon, *The Early Islamic Monuments of al-Haram al-Sharif. attested by the place that the subject had in Persian *belles lettres* from the Saljuq period onwards.⁵

A third consideration is that prior to the Ottoman conquest of Jerusalem the views of the city presented by Islamic historiography had become highly composite. The hagiographical traditions associating the city with Solomon's Temple⁶ and Muhammad's *mi'raj* became interwoven with subsequent narratives concerning the historical role played by the city, including the destruction of the Holy Sepulchre by the Fatimid Caliph al-Hakim.⁷ Another factor that led to this particular consideration of Jerusalem prior to the Ottoman conquest was the high esteem with which mystics, in particular Iranians, viewed the city.⁸ A manifestation of this growing interest is to be found in the illustrated manuscripts linked by tradition with the *mi'raj* which, from the 15th century onwards, were to find a considerable success in Persian lands.⁹

It is within the Persian tradition that the Turkish literary production of the *mi'rajname* develops, although remote non-Iranian influences can be traced in its evolution.¹⁰ Within the Ottoman cultural context, the *mi'raj*

tradition quite quickly became popular. An early description is furnished by Sulaiman Çelebi (who lived in Bursa in the second half of the 14th century) who is known primarily for his literary composition regarding the nativity of the Prophet, the *Mevlid*.¹¹ At almost the same time, the *Iskendername* of Ahmedi is to be found, a *masnavi* which describes Muhammad's heavenly flight. It is noteworthy that this work was subsequently to become the subject of several illustrated manuscripts.¹²

But it was during the Timurid period that we are first presented with illustrated manuscripts concerning the *mi'raj* in which a systematic treatment of the subject matter is evident. One of the earliest of such works is the Supplement Turc 190 of the Bibliothèque Nationale of Paris, written in Uighur characters and dated 1436, which has been studied by several scholars.¹³ In 1957 R. Ettinghausen published isolated leaves from another manuscript mounted in the album H. 2154 of the Topkapi Sarayı Library dated 951/1544, and this focuses on the Prophet's *mi'raj*. These leaves, datable to the 14th century, are most likely the work of the famous Ahmad Musa.¹⁴ One particular miniature in the album (f.107r) raised discussions among scholars who identified the city depicted in it with Constantinople (Ettinghausen 1957), Jerusalem,¹⁵ or Medina.¹⁶

One miniature illustrating the *mi'raj* of Muhammad found in a manuscript copy of Ahmedi's *Iskendername* and datable to c.1450, can be found in E Grube, 'The Date of the Venice Iskandar-Nama', *Islamic Art* 2 1987: 196, fig. 1.

¹³ The manuscript was first edited by A J Pavet de Courteille, *Mirâdj-Nâmeh. Publiée pour la première fois d'après le manuscrit ouïgour de la Bibliothèque Nationale (traduit et annoté)*, Paris 1882. Its miniatures have been investigated on different occasions: E Cerulli 1949, reproduced all of them; I Stchoukine, in his 'Notes sur les peintures persanes du Sérail de Stamboul', *Journal Asiatique* 206 1935: 133-4, offered the first discussion of two of them, which was taken up again by R Ettinghausen, 'Persian Ascension Miniatures of the Fourteenth Century', *Atti dell'Accademia Nazionale dei Lincei*, vol. 12 (Convegno di scienze morali storiche e filologiche 27 maggio-1° giugno 1956: Oriente e Occidente nel Medio Evo), Rome 1957: 360-1; M R Séguy, *The Miraculous Journey of Mahomet. Mirâj nâmeh. Bibliothèque Nationale, Paris (Manuscrit supplément turc 190)* London 1997.

See Piemontese, 1980 and 1987; de Fouchécour 1987; for the links between the Masjid al-Aqsa and the *mi'raj* see also Hillenbrand 1990: 70-1.

¹⁰ See A Metin, *Türk edebiyatında manzum mi'racnameler*, Ankara 1987; one example of a Mamluk Kipchaq Turkish *mi'rajname*

Some of these scholars, moreover, have identified the Aqsa Mosque on one of the leaves of H. 2154, although the representation hardly mirrors its real appearance,¹⁷ for it tends instead to represent Timurid architectural typologies.¹⁸

The present work does not aim to fathom the unsolved questions relating to the illustrated tradition of the *mi'rajnama*.¹⁹ Instead the aim is to bring into focus the fact that in the Ottoman period the earlier representational tradition, which had achieved definitive form within the Timurid cultural setting, was to continue.

The link with the earlier iconographical heritage is graphically shown by the recourse to a 'sacred topography' which had been a salient feature of the earlier *mi'rajnama*. From this perspective, a basic role was played by the area of the Haram, and in particular by the 'Distant Mosque' (Masjid al-Aqsa), from which the Prophet left on his heavenly journey. Moreover the sacred area of the Haram had come to be closely associated in the Islamic iconographical tradition with the sacred precincts of Mecca and Medina. This identification was to play a significant iconographical role in the Ottoman popular representations of this subject, as we shall demonstrate below.

The Ottomans turned back to and revived those popular elements which had played a conspicuously significant role in the description of the city. The continuity of this trend in the 15th century is attested by the description of the Haram area by al-Suyuti, written in 1470.²⁰ M Perlmann, in his edition of the 17th century

Arabic work of Abu'l-Fath al-Dajjani, the *Jawahir al-Qala'id fi Fadl al-Masajid*, has focused his attention on the survival of popular customs associated with the sacred area of the Haram.²¹ Al-Dajjani in fact denounced the adoption of circumambulatory *tawaf* ceremonies performed around the Dome of the Rock which imitated the prescribed ritual Meccan *tawaf* (Perlmann 1973: 264-5).

Such popular aspects were most likely fully exploited for economic ends by the Ottomans.²² However, far more important appear to be the ideological implications associated with the growing religious importance of this holy centre, which were also fully exploited by Ottoman rulers.

According to Evliya Çelebi, the delivery of the keys of al-Aqsa Mosque and of the Dome of the Rock to Selim I brought a real feeling of exaltation, causing the sultan to claim to be 'the possessor of the first *qibla*'.²³ It is well known that Sulaiman I, in his urban renewal of the city, paid particular attention to the restoration of the holy places.²⁴ O Grabar has duly underlined that on the basis of such activities, the sultan conceived of himself as a 'second Solomon' (1990: 152). Moreover it appears that this self-perception is confirmed by literary and historical sources²⁵ and has ancient origins, especially in Turkish tradition. It is certainly the case for the post-Mongol Turkish rulers of Fars and their explicit identification with Solomon.²⁶ But

¹⁷ The mosque is depicted on f. 45v in the ms. Suppl.Turc 190, of the Bibliothèque Nationale of Paris, and in f. 62r of the Topkapi Sarayı's ms. Hazine 2154; Ettinghausen 1957: 366, n.1, writes about the H. 2154 miniature 'That only a limited number of the characteristic aspects of a building has to be reproduced is shown by the "Qubbat al-Sakhra" which occurs in another miniature of the 14th century, an illustration to an *'Aja'ib al-makhlūqat* ms. dated 790/1388 Bibl.Nat.Suppl.pers.332, fol. 140b). Here the artist rendered only the "dome", although in his more schematic design he gave both outside and inside features and could therefore have included the "rock" ... by contrast the "Rock" is represented in the Istanbul painting and the "dome" only indicated.'

¹⁸ For the architecture to be found in f. 45v of the Bibliothèque Nationale ms. Suppl.Turc 190, see the identification with the Mausoleum of Baisunghur in Herat dated 1432, made by L. Golombek, 'Some Representations of Architecture in the Istanbul Albums', in *Between China and Iran. Paintings from four Istanbul Albums*, (eds.) E J Grube, E Sims, a colloquy held 23-36 June 1980 (Colloquies on Art and Archaeology in Asia No. 10): 131, fig. 435.

²⁵ On Solomon (with Constantine and Justinian) as a precursor of Sulaiman see S Yerasimos, *La Fondation de Constantinople et de Sainte-Sophie dans les traditions turques*, Paris 1990.

²⁶ See especially the symbolic appropriation of Persepolis and Pasargadae sites by the Atabegs and the Timurids as an interesting parallel, shown by A S Melikian-Chirvani, 'Le Royaume de Salomon. Les inscriptions persanes des sites achéménides', in *Le Monde Iranien et l'Islam*, 1, 1971: 1-41. See also the new reading of some miniatures of the much studied Topkapi Sarayı Library ms. H 2153 by C Haase, 'On the attribution of some paintings in H 2153 to the time of Timur', *Islamic Art* 1 1981: 50-5, especially p. 53, in which the author suggests a new iconographic interpretation of Solomon's representation based on the sources' comparison between Solomon and Timur.

one of the more significant reasons that brought Sulaiman the Magnificent to undertake such ambitious reconstruction work can be seen in his intention to associate his new role with that of Caesar (*qaisar*), thus postulating a continuation of the Roman-Byzantine empire. The roots of this Ottoman-Roman association are already clearly evident during the time of Bayazid I;²⁷ however, it was in the period of Sulaiman that this identification became fully manifest. Sulaiman's building efforts should be seen as intimately linked to this ideological stand.²⁸ In fact such activities are Western-oriented and appear also to be linked to the Ottoman-Safavid rivalry within the Islamic scenario.²⁹

It is interesting to note, however, that in the second half of the 15th century, Pope Sixtus IV, who had in 1472-3 proclaimed a crusade against the Turks, in building the Sistine Chapel proceeded to postulate openly his own identification with Solomon. In fact a great deal of effort was expended in building the chapel in order to follow the measurements of Solomon's Temple described in the Biblical text.³⁰

This can also explain a reaction against the association of the Qubbat al-Sakhra with the Temple of Solomon that appears to have been present in the Western cultural milieu even before Sulaiman's restorations. Carpaccio in his *San Giorgio che uccide il Drago nella città di Selene* (1502-7), to be found in the Scuola Dalmata dei SS Giorgio e Trifone in Venice, presents a building which both F G de la Tourette (1924: 139-42) and R Pallucchini (1961) have identified with the Dome of the Rock. Carpaccio was most likely inspired by some contemporary wood engravings, such as those present in Bernhard of Breydenbach's work, *Peregrinationes in terram sanctam*,

published by E Reeuwich in 1486.³¹ One of them clearly shows the inscription *Templum Salomonis* on the building representing the Qubbat al-Sakhra.

An interesting *contrappunto* to this phenomenon can be seen in the practice of the *damnatio memoriae* with reference to the Holy Sepulchre which was activated by the Ottomans. A Iacobini points to a possible removal, for which the Ottomans were responsible, of a miniature representing this Christian building, from the Octateuch Gr. 8 in the Topkapi Sarayı Library.³² Moreover the appropriation of Christian ideas has been underlined by R Milstein, who has noted the relationship between the representation of Ottoman Jerusalem and the 'Heavenly Jerusalem' which was present in the Christian tradition (Milstein 1994).

Against the backdrop of these considerations, it is not an unreasonable hypothesis to consider the restoration work promoted by Sulaiman as an answer to contemporary Western efforts to revive traditions associated with the city of Jerusalem, and in particular those associated with the figure of Solomon. From this perspective, these efforts were, however, to find new channels which proposed a new concept of the city and of its religious role. The new exigencies could not be satisfied by the iconographical apparatus furnished by the *mi'rajnama* literature, and it is within this new context that popular elements percolated in the corresponding Ottoman iconographical tradition.

²⁷ For the appropriation of the title of *qaisar* and the attribution of that of *tekefur* by the last Byzantine emperors, see M Bernardini, 'Un 'ambasceria del Takvur di Costantinopoli alla corte di Tamerlano: riflessioni sul "Cesare" di Rum nelle fonti timuridi', in *Bisanzio e l'Occidente: arte, archeologia, storia. Studi in onore di Fernanda de' Maffei*, Roma 1996: 297-304; see also the very interesting consideration concerning the Aq-Qoyunlu and the Ottomans, in A M Piemontese, 'La représentation de Uzun Hasan sur scène à Rome (2 mars 1473)', *Turcica* 21-3 1991: 191-203.

²⁸ See G Necipoğlu, 'Süleyman the Magnificent and the Representation of Power in the Context of Ottoman-Hapsburg-Papal Rivalry', *The Art Bulletin* 71 3 1989: 401-27; see also Yerasimos 1990.

²⁹ See also 'Jerusalem in Ottoman-Mughal relations' in N R Farooqi, *Mughal-Ottoman Relations*, Delhi 1989: 195 n. 75, and 211.

³⁰ See E Battisti, 'Il significato simbolico della Cappella Sistina', *Commentari* 8 1957: 96-104, especially 102-4. During the second half of the 15th century the role played by the pope's court in connection with the growth of Ottoman power must be underlined. In particular it is important to consider the help furnished to Uzun Hasan, the Aq-Qoyunlu leader, who also assumed a sort of role as a defender of Christianity, see Piemontese 1991.

³¹ Bernhard von Breydenbach, *Die Reise ins Heilige Land, ein Reisebericht aus dem Jahre 1485*, (ed.) E Geck, Wiesbaden 1961. Compare also Fra Francesco Suriano, *Treatise on the Holy Land*, eds. T Bellorini and E Hoade, Jerusalem 1949: 41-50; see also F Bardon, *La peinture narrative de Carpaccio dans le cycle de Ste Ursule*, Venice 1985: 60-1, in which the representation of the Holy Sepulchre church in Carpaccio's painting is discussed. In the same period in a Florentine context different 'representations' of the Holy Sepulchre appear. This phenomenon seems to have influenced two Florentine aedicules, the first built by Alberti for the Holy Sepulchre in the Rucellai Chapel, and the second by Brunelleschi in San Lorenzo, see C Seymour Jr., *The Sculpture of Verrocchio*, London 1971: 55 figs. 125-6. Recently A Gentili, *Le storie di Carpaccio. Venezia, i Turchi, gli Ebrei*, Venice 1996: 54, has described the building as the '*Tempio di Salomone/Cupola della Rocca sensibilmente virato in battistero cristiano*'.

³² A Iacobini, 'La "Lettera di Aristeia": un prologo illustrato al ciclo degli ottateuchi mediobizantini', *Arte Medievale* 7, 1 1993: 85-6; the Ottomans seem in fact to give new vitality to the relative positions of the two holy edifices, which had been pointed out by al-Muqaddasi as early as the 10th century. That historian had held the view that the Dome of the Rock was built to furnish a valid alternative to the Church of the Holy Sepulchre. See Muhammad ibn Ahmad al-Muqaddasi, *Ahsan al-Ta'asim fi ma'rifat al-aqalim*, M J de Goeje (ed.) *Bibliotheca Geographorum Arabicorum* 3, Leiden 1906: 159; see also A Elad, 'Why did 'Abd al-Malik build the Dome of the Rock? a re-examination of the Muslim sources', in *Bayt al-Maqdis. 'Abd al-Malik's Jerusalem*, 1 1992: 33-58; J van Ess, 'Abd al-Malik and the Dome of the Rock. An analysis of some texts', *ibid*: 89-103.

A basic prototype followed in this process was indeed the iconographical models relating to Mecca and Medina. This latter tradition was attested not only by illustrations contained in manuscripts, but also by ceramics, carpets and stonework. In fact one of the earliest representations of the Ka'ba is a work in stone dating to a period between 486-98/1096-1104 housed in the Iraqi Museum of Baghdad (Strika 1976). Prior to the 16th century, however, such iconographic exempla are rare, although scrolls relating to the *hajj* were widely used, as pointed out by al-Harawi in the *Kitab al-Ziyarat* of the 12th century.³³

On the basis of such traditions the Ottomans proceeded to assimilate the iconography relating to the Haram to that of Mecca and Medina.³⁴ Such a process is clearly evident in a *Hajj Vekaletnamesi* dated 951/1544-5, in the Topkapı Sarayı Library (H1812: col. pl. I).³⁵ In it, those characteristics that were subsequently to play a dominant role are already clearly delineated. In the first place, the depiction of the Ka'ba sanctuary becomes the prevailing architectural iconographic model, with particular attention paid to relevant didactic information. Secondly, a pronounced schematism in the topographic treatment prevails, following the pattern already present in Byzantine tradition, in the same way as in representations of

Byzantine cities (Strika 1976; Krautheimer 1942). This iconographic heritage relating to the Haram was to remain unchanged for several centuries.³⁶ In fact, apart from new stylistic exigencies, the tradition hardly demonstrates any innovative features over a period of several centuries.³⁷

The Ottoman iconographic tradition pertaining to Jerusalem was however influenced by a third important factor. During the Ottoman period, as pointed out above, popular writing concerning the life of the Prophet assumed a particular relevance. Such works became the fountainhead for significant representations which have been the subject of various studies.³⁸ Popular perception of the Prophet constituted a core element of such literary religious manifestations; however, given the apotropaism present in these works,³⁹ orthodoxy often rejected their religious validity. Nevertheless, from their beginnings, such texts incorporated a rich corpus of symbolic and popular images relating to the performance of the *ziyarat* of the Haram sanctuary. As pointed out above, the same Dajjani lamented the popular excesses pertaining to the cult of the Haram. In fact he stressed that 'Story-tellers are a plague' (Perlmann 1973: 263), a comment which appears to echo the opposition to such popular religious sentiment and probably to Shi'ite religious representations. But this form of popular religiosity has undoubtedly had a profound influence on the elaboration of Islamic hagiographical iconography, a fact which has been brilliantly demonstrated by M V Fontana in a recent work (1994).

The influence of such popular perceptions is

³³ In Milstein 1994: 62-9, these sources are investigated. See al-Harawi 1957. We must signal here the existence of a pre-Ottoman pilgrimage scroll which is illustrated with representations of Mecca and Medina found in the Türk ve İslam Eserleri Müzesi: no. T.4104 dated 608/1285. This scroll is mentioned by Z Tanındı, 'İslam resminde kutsal kent ve yöre tasvirleri', in *Orhan Saik Gökay Armağanı* 2: 409-10 no. 12 (*Journal of Turkish Studies* 7 1983); Z Tanındı, 'Resimli bir Hac Vekaletnamesi', *Sanat Dünyamız* 9 28, 1983: 2-6; see also D Sourdel, J Sourdel-Thomine, 'A propos des documents de la grande Mosquée de Damas conservés à Istanbul. Résultats de la seconde enquête', *Revue des Études Islamiques* 33 1965: 73-85.

³⁴ For Meccan and Medinan iconographies compare R Ettinghausen, 'Die bildliche Darstellung der Ka'ba im islamischen Kulturkreis', *Zeitschrift der Deutschen Morgenländischen Gesellschaft* 12 3-4 1933: 175-90; K Erdmann, 'Ka'bah-Fliesen', *Ars Orientalis* 3 1959: 192-7; E Esin, *al-Qubbah al-Turkiyyah* 1966: 306-9; S Dilaver, 'Osmanlı sanatında Kâbe tasvirli bir fresk', *Belleten* 34 1970: 255-7; Z Tanındı, 'Resimli bir Hac Vekaletnamesi', *Sanat Dünyamız* 9/28 1983: 2-6; Z Tanındı, 'İslam resimde kutsal kent ve yöre tasvirleri', *Orhan Saik Gökay Armağanı*, eds. A T Kut, G Kut, *Journal of Turkish Studies* 7 1983: 407-37; H el-Basha, 'Ottoman Pictures of the Mosque of the Prophet in Madina as historical and documentary Sources', *Islamic Art* 3 1989: 227-33.

³⁵ See E Esin, 'Un manuscrit illustré représentant les sanctuaires de la Mecque et Médine et le Dôme du Mi'raj à l'époque des sultans turcs Sélim et Süleyman 1er (H.982-74/1516-66)', *Revue d'Histoire Maghrébine* 31-2 1983: 409-10 nr. 12; *Süleyman the Magnificent*, (eds.) J M Rogers, R M Ward, London 1988: 100-1, nr. 36; *Soliman le Magnifique*, (ed.) M. Bernus Taylor, Paris 1990: 129; Milstein 1994: 63.

³⁶ Milstein 1994: 63 n.4 presents different examples of this iconographical subject: ms. Supp. Pers. 1514, f.42a, Bibliothèque Nationale, Paris; ms. Türk 463, f.95r, Chester Beatty Library (Kütahya 1798); ms. Türk 464, in the same Library (1861-76). See also the examples quoted by Tanındı 1983, figs. 8, 17, 19, which are, in order, a copy of the *Şarh-i Sajarat al-İman*, *Kurra al-Uyun*, in Topkapı Sarayı Library, A.3547, f.86r, dated 1540-5; and in the same Library the *Nabzat al-Manasik*, H 116, plans 1 and 2 (19th century).

³⁷ It is particularly the case in the introduction of Western conventions of the representation of perspective between the 18th and the 19th centuries, as in ms. H 116 of the Topkapı Sarayı, quoted by Tanındı 1983, fig. 19, in which Western taste is clearly apparent. On the westernised representations of Mecca and Medina see also G Renda, *Batıllaşma Döneminde Türk Resim Sanatı* 1700-1850, Ankara 1977: 73-6.

³⁸ E J Grube, 'The Siyar-i Nabi of the Spencer Collection in the New York Public Library', in *Atti del Secondo Congresso internazionale di Arte Turca, Venezia* 26-29 settembre 1963, Naples 1965: 149-76; C Garret Fisher, *The Pictorial Cycle of the Siyer-i Nabi: A late 16th-century Manuscript of the Life of Muhammad*, University of Michigan (thesis), 1981; *idem*, 'A Reconstruction of the Pictorial Cycle of the Siyar-i Nabi of Murat III', *Ars Orientalis* 14 1984: 75-94; Z Tanındı, *Siyer-i Nebi, İslam tasvir sanatında Hz. Muhammad'ın hayatı*, İstanbul 1984; J M Rogers, R Ward 1988: 239 n. 17; A Gallotta, 'Un trittico ottomano con hilye-i serif del Museo Nazionale d'Arte Orientale di Roma', in *Arte Orientale in Italia* 3 Rome 1973: 25-59.

³⁹ On the origins of this aspect see the recent introduction by I Zilio-Grandi to *Qaḍi 'Iyād, I miracoli del Profeta. Dallo Şifā' bi-Ta'rīf huquq al-Mustafā*, Turin 1995: IX-XXXI.

clearly evident in the manuscript Vat. Turco 125 in the Vatican Library. The work, although a late production, appears to preserve in its four illustrations an 'archaic' iconographic structure, lacking any sign of the Western influence already mentioned. The manuscript is a mystical treatise, the *Nur-i vahhaj li tahsil al-ilaj* (1164/1751), in both verse and prose, written by Musa Efendi, who is better known as Amani. The manuscript was written and illuminated by the copyist Mustafa Kashif (*müzehhib*) in 1253/1857.⁴⁰ In the manuscript, there is a miniature depicting the Haram (f. 26r: col. pl. II), in which some of the peculiarities mentioned above are evident. One of the other miniatures of great interest is one which deals with the recurring theme—from the western Islamic lands to India—of the Prophet's sandal⁴¹ (col. pl. III). The illustration presents a two-dimensional depiction of a sandal with a horizontal lace. On the upper part, three discs are arranged in a triangular form, creating a motif similar to the so-called *cintamani*, which is often found in Ottoman clothing. In the middle appears an ornamental kufic inscription stating '*jimjime al-nabi*' (the sandal of the Prophet).

The cult associated with the veneration of the footprint of the Prophet had in fact become widespread in the centuries following the Ottoman conquest of Jerusalem. The rock on which it was believed that the footprint was impressed was placed in a shrine where, during the period of the reign of Sultan Ahmad I (1609), it was kept under an iron grille inlaid with silver. The iconography of the sandal appears in miniatures dating to an earlier period,⁴² such as in a miniature of a *manasik al-hajj* manuscript of the 18th century in the Jerusalem National and University Library (Yah. ms. Ar. 1117, fol. 41r: col. pl. IV). In this miniature, the two sandals of the Prophet are shown in the folio opposite to the miniature of the Haram (Milstein 1994). This iconographic motif is also to be found in other cities where the cult had a large following. This is the case of Damascus where the Prophet's sandals are represented in a ceramic panel in the Darwishiyya Mosque dating to 982/1574-5 (col. pl. V).⁴³ Hasan has given a detailed list of the recurring examples of this subject, such as that found in Masjid al-Qadam in Damascus, another in the Library of the Oratorium of Sitt

Ruqaiya in the same city, two examples to be found in Cairo, one in the Atar al-Nabi Mosque, and the other in the Qa'itbai mausoleum. Furthermore she points to an example in 'Abd al-Hamid I's mausoleum, and another from the Ayyub al-Ansari mausoleum, currently kept in the Topkapı (Hasan 1993: 335-6).

This motif made its appearance quite early in an Iranian context. This is attested by a Safavid *falnama* attributed to Aqa Mirak, produced in Tabriz and dating to 1550, and at present in the Pozzi Collection of the Musée d'Art et d'Histoire of Geneva (no. 1971-107/35: col. pl. VI).⁴⁴ Though presenting a treatment that is stylistically different from Ottoman examples, the miniature shows the iconographic characteristics which were to prove highly successful in Ottoman art. In another miniature found in the same manuscript, an architectural context is depicted for a dervish scene; it has been erroneously interpreted as a Meccan setting (col. pl. VII).⁴⁵ However, not only the octagonal domed building of the Geneva miniature, but also, far more importantly, its location near an iconographic representation of the Prophet's footprints leads us to think it is yet another depiction of the Qubbat al-Sakhra.

The thesis put forward by Hasan (1993), according to which the iconographic representation of the Prophet's sandals/footprint is to be associated with Hindu and Buddhist models, appears to constitute a possible syncretistic tendency limited to the Indian area.⁴⁶ On the other hand, within the context of Jerusalem, the possible influence of Christian models (themselves the product of classical traditions) appears more likely. From this perspective there are several reasons that bring us to postulate the influence of the Quo Vadis footprint model. In her seminal work, M Guarducci (1942-3) traced the different aspects of the classical iconographic heritage which influenced the development of the Christian footprint typology, as exemplified by the footprint found in the Roman Quo Vadis chapel (col. pl. VIII), a copy of the 'original' preserved in the church of San Sebastiano in Rome. In this work the author presented a detailed exposition of the popularity of this theme within several different religious traditions. She went on to delineate a framework of the complex motivations at the root of this

⁴⁰ See E Rossi, *Elenco dei manoscritti Turchi della Biblioteca Vaticana. Vaticani-Barberiniani-Borgiani-Rossiani-Chigiani*, Città del Vaticano 1953: 105-6. The miniatures are reproduced in A M Piemontese, *La Comunicazione nella Storia. Lo sviluppo del pensiero e le forme del comunicare. Medioevo-Islam*, Turin 1992: 287, 290, 304-5; see also my recent communication 'Vat. Turco 125 elyazması', 9th International Congress of Turkish Art, 23-27 September 1991, I Ankara 1995: 365-8.

⁴⁵ A Schimmel in *Treasures of Islam*, 1985: 99; concerning Majnun and the Ka'ba see for example one Timurid miniature (1442) in the British Museum (Add. 25900, f 114v) from a *Khamisa* of Nizami; the *Falnama* genre is certainly linked with Jerusalem as attested by Milstein 1994: 68-9, and as demonstrated also by ms. Supp. Turc 242, of the Bibliothèque Nationale, Paris.

⁴⁶ Hasan 1993. Recently Hasan's work has been refuted by A M Quagliotti in *Buddha padas. An essay on the representation of the footprints of the Buddha with a descriptive catalogue of the Indian specimens from the 2nd century BC to the 4th century AD*, Kama Kura 1998: 166, note 21.

Pl. 9.1. *Zübdet üt-tevarih* of Luqman, 16th century, Topkapı Sarayı Library H.1321, f.46.

iconographic subject. It is interesting to note the stress she placed on the ancient Egyptian tradition, which used the motif to show a symbolic depiction of the passage to the next world (Guarducci 1942-3: 338-9). Following the author's intuitive observations, one is brought to hypothesise the survival of this ancient belief in the Islamic world. Such a likelihood finds corroboration in the footprint (or sandal) associated with the *mi'raj* theme, itself a form of journey to the next world.

Moreover, the Ottomans were fully acquainted with Christian iconography. This fact is evidenced by a miniature in the *Zübdet üt-tevarih* of Luqman, an Ottoman writer of the 16th century, in the Topkapı Sarayı Library (H.1321, 991/1586: fol. 46, pl. 1).⁴⁷ In this miniature Christ is depicted being lifted to the sky so as to escape the fury of the Jews.⁴⁸ In the lower part of the

miniature, what is presumably the place of departure for flight is marked by the representation of Jesus' sandals. This model is indeed analogous to the examples of the Prophet's sandals quoted above. Further evidence of a possible Christian influence on the development of this iconographic model is furnished by the sandals of the miniature of the Vat. Turco 125 manuscript (col. pl. III). The inscription that accompanies the miniature—*'jimjime al-nabi'*—although a terminology used to denote the Prophet's sandals,⁴⁹ also brings to mind a connection with Golgotha, given the association of the term *'jimjime* with a skull.⁵⁰ This latter association is substantially confirmed by the Christian traditions concerning the theme of Jesus' crucifixion above Adam's skull.

Another miniature in the Vat. Turco 125 manuscript illustrates Solomon's 'Library' (*Kitabkhane*, f. 20r: col. pl. IX), which is represented as a rectangular labyrinth. In the middle of the labyrinth, there is a stylised triangular staircase formed by seven steps leading to a red rectangle, which symbolises Solomon's throne. In spite of the original subject of the 'Library' appearing as a *unicum* in Islamic literature, the association of Solomon's Temple with a labyrinth is certainly not new. This theme had been present in numerous Christian drawings and miniatures, such as the drawing of the Cod. Marc. Gr. Z 299 (f. 102v), or in the drawing (f. 107v) of the Cod. Marc. Gr. Z 598 (=909), both in the Marciana Library of Venice. With regard to the first Venetian manuscript, this contains the earliest reference to Solomon as a builder of labyrinths (11th century—Kern 1981: 163-4).

text tells the story of how the Jews wanting to execute Jesus, selected a man named Feltiyanus among themselves for this mission but because God made him look exactly like Jesus, he was executed instead. Jesus Christ, on the other hand, ascended to heaven.' The identity of Feltiyanus is uncertain. Stchoukine identified him with Judas. The same identity also appears in other sources (Asyū?, Qat'yatus, Titanus) like those listed encyclopaedically by Khvandamir, *Habib al-siyar*, (ed.) M Dabirsiyaqi I, Tehran 1362/1983: 147. See also the comments made by Milstein (1994: 65) about the Aqsa Mosque as the cradle of Jesus and the church of Ascension on Mount of Olives in relation to the above-mentioned ms. H.1812 in the Topkapı Sarayı Library.

⁴⁹ *Yeni Tarama Sözlüğü*, Ankara 1983: 46: 'Tabani paçavradan ve koncu çorap gibi ip ile örülerek yapılan bir çeşit ayyakkabgi'. The chapter of the Vat. Turco 125 is entitled '*na'l al-Nabi*'.

⁵⁰ This link could be derived from an etymology of the word *jumjume*, 'skull', which is connected with Jesus Christ in Islamic tradition, especially in Persian and Turkish hagiographical literature. See, for example, the *Jumjumenam* of Farid al-Din 'Attar, in H Ritter, 'Philologia XIV. Fariduddin 'Attar II', *Oriens* 11 1951: 21; M Cumbur, 'Cimcime Sultan destanı', *Türk Folkloru Araştırmaları Yıllığı* 1976: 39-54; F A Tansel, 'Cümcüme Sultan. Translations of the Fourteenth-Century Kipchak Turkic Story', *Archivum Ottomanicum* 2 1970: 252-69; Ja S Achmetgaleeva, *Issledovanie Tyurkoyazychnogo pamyatnika 'Kisekbaş kitabı*, Moscow 1979.

⁴⁷ See I Stchoukine, *La peinture turque d'après les manuscrits illustrés. Ière partie, Sulayman I à 'Osman II 1520-1622*, Paris 1966: 74 LV. The author mistakenly identified the title (*Silsilenâme*) because of a false notification on the binding of the codex. G Renda, 'Topkapı Sarayı müzesindeki H. 1321 no.lu Silsilenam'e'nin minyatürleri—The Miniatures of Silsilenam No.1321 in the Topkapı Sarayı Museum Library', *Sanat Tarihi Yıllığı* 5 1972-3: 487-8, gave the new, correct identification of the literary work found in this manuscript.

⁴⁸ An episode mentioned in Islamic historiography relating to Jesus. G Renda 1972-3: 487 summarises it as follows: 'The

Apart from the above-mentioned Vat. Turco 125 miniature, there is no reference in the Islamic tradition to Solomon as a builder of labyrinths, even though the labyrinth theme is often present, and the topographical treatment of the city of Constantinople was viewed by Qazvini as a labyrinth (Kern 1981: 156). On the other hand, al-Biruni represented some Indian cities as labyrinths in map form (Bausani 1984). It is thus possible to trace the model which inspired the miniature of the Vat. Turco 125 to non-Islamic sources. A possible candidate may indeed be the iconography of Jericho, a city which, like other ancient cities, was represented as surrounded by seven walls. This does not exclude the influence of other representations which are not linked to the labyrinth theme.⁵¹ This is the case of the depiction of Solomon's Temple found in the Codex Amiatinus: the work, belonging to the 7th century and at present kept in the Laurenziana Library in Florence, offers the earliest representation of the Tabernacle area.⁵² It is probable that this kind of representation may have influenced the artist of the Vat. Turco 125.

Moreover, the location of the throne above the Temple, clearly specified by a didactic marginal gloss, can be found in other miniatures. This is the case with the two full-page miniatures included in the *Süleymanname* of Sharaf al-Din Musa patronized by Bayazid II (1481-1512), presently in the Chester Beatty Library (ms. Turk. 406).⁵³ The two miniatures represent Solomon seated on his throne, placed at the summit of his palace. Below, different scenes are represented in regular strips in which different kinds of courtesans and demons are represented (f. 1v). It should be noted that this iconographical solution has been traced to Western models, like the one represented in Torcello (Grube 1990).

The last miniature present in the Vat. Turco 125 (f. 45r: col. pl. X) represents a *Mundus Imaginalis*. This

illustration can be connected with those recognised by Milstein as a reference to a cosmic element. The tradition has different later manifestations, as for example the one in München, Bayerische Staatsbibliothek (cod. Arab. 461, fols. 45r, 88r),⁵⁴ or another produced in the 18th century,⁵⁵ now in a private collection in Michigan. In the Vat. Turco 125 miniature, the eschatological connections appear strictly linked with the conventional Haram al-Sharif iconography. In fact those references are implicit in the building itself (Rosen-Ayalon 1989: 46-69), and their worth during the Ottoman Period is characterised by the didactic tendency typical of the dynasty, especially in the activity of illustrating manuscripts.

The miniature is tripartite, and represents, in the upper part, the *jannat al-mawa* (Paradise) with the celestial lotus on the left and the *'arsh al-'azim* (the Throne of the Heavens) in the middle. This is a clear reference to the *mi'raj* tradition, according to which Muhammad had touched this celestial piece of furniture with his sandal. Between this upper part and the scene below, there appears a dividing band representing the *wasit a'raf*, a sort of purgatory which divides the Muslim Paradise from Hell. Below, the true way (*sirat al-mustaqim*) is depicted, which believers have to follow in order to enter Paradise. One chain of light (*silsila-yi nur*) joins the two scenes traversing the *wasit a'raf*. This element is clearly linked with the specifically Ottoman perception of the Dome of the Rock, even if the symbol of the chain appears before this period.⁵⁶ On the right side of this part of the miniature, there appears a *minbar* on which a pentagonal standard reproduces the *fatiha* and the *shahada*, as attested in other, less elaborate manuscripts. Below the seven itineraries are the *minbaran al-haqq* (the Pulpits of Truth), by which access to the eternal world is granted. These appear at the upper level of the earthly world, which is represented in the lowest part of the miniature. All around the folio, the inscription *la makan* is repeated to show, as in the *mi'raj* tradition, the void dividing this 'Day of Judgment' area from the rest.

⁵¹ Kern 1981: 165 fig. 199; *ibid.*: 171-82. On Jericho see considerations by Milstein 1994. Here the author made further comments on ms. H 1812 Topkapi Sarayı mentioned above: 'Other names were added arbitrarily, such as the tomb of Moses, thought to be found not far from Jericho, in an architectural complex named Abi Musa.'

Chapter 10

ASPECTS OF THE *SIJILLS* OF THE SHARI'A COURT IN JERUSALEM

Khadr Salameh

I. Introduction

The city of Jerusalem occupied an important religious position for Muslims even before the beginning of the wider spread of Islam. An early divine connection between Muslims and the city is represented in the event of the *Isra'*, the night journey of the Prophet Muhammad from Mecca to Jerusalem, and the *Mi'raj*, his ascension from the Haram al-Sharif to the highest heavens, as recorded in the Qur'an.¹ Jerusalem was also the first *qibla* direction towards which Muslims prayed² and so Jerusalem rates as the third of the Noble Sanctuaries after Mecca and Medina in its sanctity for Muslims. This connection is strengthened by the *hadith* reports that go back to the Prophet which are recorded in the 'Merits of Jerusalem' literature.³ Throughout the history of the city this religious connection has been reflected architecturally and economically as well as in other ways. The connection is represented by the edifices contained within its walls, whether they be the Umayyad monuments as represented by the Masjid al-

Aqsa or the Dome of the Rock, the Ayyubid and Mamluk buildings, or the Ottoman constructions both inside and outside the walls.

The Ottoman empire, the last of the caliphates, ruled Jerusalem for a period of four hundred years. During that period Jerusalem was affected by Ottoman culture in a variety of ways and to varying degrees. Throughout the period of their rule in Palestine the interest of the Ottomans concentrated on Jerusalem in general, and on the Haram al-Sharif in particular.⁴ Here we will confine ourselves to three examples of the Ottoman interest in the city: (1) the works of Sultan Sulaiman al-Qanuni; (2) the renovations undertaken by Sultan Mahmud II; and (3) the Ottoman Qur'ans in the Islamic Museum.

1. The works of Sultan Sulaiman al-Qanuni

From the beginning of their rule the Haram al-Sharif—including the Aqsa Mosque, the Dome of the Rock and the various other related monuments—received the lion's share of Ottoman attention. This concern first manifested itself in concrete form in the reign of Sultan Sulaiman al-Qanuni (926-74/1520-66). He undertook many important projects

¹ 'Glory be to Him who carried His servant by night, from the Sacred Mosque to the Furthest Mosque, the precincts of which We have blessed, that We might show of Our signs, surely He is All-Hearing, All-Seeing,' Sura 17: *The Night Journey*.

² The historians record that Bait al-Maqdis remained the *qibla* for a period of some sixteen to seventeen months, when the direction was changed towards Mecca in the middle of Sha'ban AH2. See Maqrizi n.d: 59.

³ See al-'Asali 1981, where forty-nine manuscripts are listed which deal with the Merits of Jerusalem; most of these remain in manuscript, although sixteen have been lost.

⁴ This term refers to the south-eastern part of the Old City of Jerusalem. The word 'al-Aqsa' literally means 'the most distant' and the mosque located to the south of the area is also known as the Aqsa Mosque. When the term is used in this study, it means the mosque itself, while the whole area is identified by the term 'al-Haram al-Sharif'. The size of the whole area is a little over 14 hectares.

in Jerusalem, of which three will be briefly mentioned here. The first consisted of covering the upper part of the octagon of the Dome of the Rock and its drum with glazed tiles in place of the existing mosaics, as well as renovating the windows and drum, and the renewal of the windows of the Aqsa Mosque (Stephan 1980: 73-6; Meinecke 1988: 3). During Sulaiman's reign, the walls of the Dome of the Chain located to the east of the Dome of the Rock were also covered with glazed tiles; and the Kas, the place of ritual ablution located between the Dome of the Rock and the Aqsa Mosque, was renovated. Sulaiman also concerned himself with the restoration of the Citadel at the Jaffa Gate. Evliya Çelebi records that the person in charge of this restoration work in Jerusalem was the *mi'mari* Qoja (Khwaja) Sinan (Stephan 1980: 75).

It is reported that the reason for Sultan Sulaiman's concern for Jerusalem was the result of a vision in which he saw the Prophet Muhammad, who ordered him to take care of the holy places. Sulaiman consequently sent 1,000 purses (*kis*—1 *kis* equalled 500 *ghirsh*) to renovate the buildings of Jerusalem and to decorate the Dome of the Rock (Stephan 1980: 73-6). It is odd that there is no mention of Qoja Sinan in the *sijills* that I have examined; the inference seems to be that Sinan did not in fact have any connection with the restorations that took place in Jerusalem during the reign of Sultan Sulaiman.

Concern for the daily life of the inhabitants during the period of this sultan is demonstrated by the solution which he arranged for the problem of the city's water supply. Throughout its history Jerusalem has depended on two sources for water. The first is the collection of rainwater; there is hardly a single house to be found in the city without its own cistern, while in the Haram al-Sharif alone there are twenty-seven reservoirs of varying sizes. The second source is water transported to the city from outside the urban boundaries. The Ottomans were concerned with preserving the aqueduct that brought water to the city, and appointed workmen and guards to ensure that it reached Jerusalem safely. In order to distribute the water, public fountains (*sabils*) were established. In Jerusalem today there are eleven fountains, six of which bear the name of Sultan Sulaiman al-Qanuni. Of these, four are inside the Old City, one is in the northern part of the Haram al-Sharif, and the sixth is outside the city walls, south of the Bab al-Khalil (Jaffa Gate). They all date back to the first half of 943/1537. The other five fountains date to later Ottoman times—three are inside the Haram and the other two are in the Old City (Rosen-Ayalon 1989; Meinecke 1988; Salama 1986: 91-106; al-'Asali 1992: 250; Najm 1983: 332-41).

From the start of their reign it was a priority of the Ottoman authorities to find a solution to the problem of water supply within Jerusalem. On Sunday 1 Jumada II 936/31 January 1530 a document records that the

aqueduct to supply the public fountains reached Jerusalem (New Series Sijill 1a: 241); its supervisor was Hajj 'Ali ibn Khawan (New Series Sijill 1a: 331). Three years later, on 9 Shawwal 939/3 May 1533, Ahmad ibn Qansuh al-Sharkasi was appointed to the post of supervisor at a daily wage of 4 'uthmanis over the 'Arub aqueduct to Jerusalem (Sijill 3: 86).

The restoration and renovation of the city walls also date to the time of Sultan Sulaiman, and again show his concern for the security of the city. The supervisor of this great project was Muhammad Çelebi al-Naqqash (Cohen 1989c: 467-72). At the end of the project, a complaint was lodged with the *daftardar* against Muhammad al-Naqqash, apparently accusing him of negligence in the construction of the walls. From the complaint we learn that at this time the work was in its final stages, and that it had then lasted four years. It appears that the complaint arose from the alleged collapse of certain equipment and building materials during the final stages of construction in the western section of the wall (Sijill 14: 196). Darwish, one of the city-wall master-builders from Aleppo, had been accused of lodging this complaint against al-Naqqash but when Darwish was brought to court, he denied the accusation with the words 'I was with him for four years and I never saw anything objectionable about him, so how at the end of the work can I write a complaint against him?' (Sijill 14: 28; Cohen 1989c: 33). From the records in the *sijills*, it is possible to follow the stages of the wall construction and discover the names of the architects and where they came from, as well as those of the porters and clerks. This is particularly the case since working on the wall became a way of describing the worker who was labelled, for example, 'the porter of the wall' (Sijill 12: 122) or 'the clerk of the wall' (Sijill 12: 110). In the same way, it is possible to learn the various sources of the construction materials—the stones and mortar and their different types. It appears that the Citadel was constructed early on and that its walls were inspected under the supervision of three master builders (*mi'mar*) (Sijill 1: 400). In a later period there are records (Sijill 2: 6) of the payment of the sum of 4,330 'uthmanis from the official in charge of the construction (*al-mishadd*) to the clerk responsible for the restoration (*bi-rasm al-'amara*).⁵

⁵ It appears that the operations connected with the major projects like the city walls, the Takiya Khassaki Sultan and the renovations on the Haram had special *sijills*. The documents that have come down to us in the records of the Shari'a court are related to adjudicated problems, or disputes, or debts on which a judge was required to take a decision. This explains the small number of documents relating to the major projects whose patron was the sultan. For example, we know that the building of the city wall reached the Slaughterhouse Quarter of Jerusalem on 19 Muharram 946/6 June 1539 because a jar full of old coins was found and the matter was brought to the *qadi* for a ruling on what to do with it.

2. Restorations of Sultan Mahmud II

During the time of Sultan Mahmud II (1808–39), a major renovation of the Haram al-Sharif was carried out. Detailed accounts of this work from start to finish are recorded in two *daftar*s (documents) in the Islamic Museum (Islamic Museum documents 926, 927 pl, 10.1). The first consists of 32 pages, 44cm by 16cm in size, and covers the period between 18 Sha'ban 1232/3 July 1817 to 9 Muharram 1234/8 November 1818. It is entitled 'The *Daftar* of the Expenses of the Workshop of the Haram al-Sharif by the hand of its clerk Mustafa 'Ali Efendi'. It contains the names and prices of the raw materials that were used in the renovation, and details of their sources, whether local or imported. Some of the materials were brought by sea to the port of Jaffa and from there were transported overland to Jerusalem. The glazed tiles were manufactured locally in a Jerusalem factory, most probably located to the east of the Haram al-Sharif. The document also provides the names of the workers and artists and their salaries. The total sum spent on the workshop, as recorded in the *daftar*, was 213,377 *ghirsh*. From that sum about 7,000 *ghirsh* were spent on the Haram al-Ibrahimi in Hebron. The document also provides information on the sources of the finance for the renovation. On page 26 (pl. 10.1) there is 'the record from the treasury of the governor (*wali al-ni'am*) for the expenses of the building of the Haram'. Most of the sums were transferred from Acre in a series of more than thirty payments. Recorded before each payment is the name of the person who brought the money and the date of its arrival. We also learn from the document when work on the tiles began, the names of the workers and their salaries. Four skilled workers in lead, all Turks, were brought from Istanbul. The wages of the master were 1.5 *para* for each Egyptian *oka* (*uqqa*—the equivalent modern weight is 1.282 kg; Hinz 1955: 19) of lead that was cast. A daily salary of five *ghirsh* was paid to him for roofing over the ceiling. Also recorded are the names of the painters and the workers in marble and stone (both *nahhat* and *marmarji*), whom we know to have come from Syria. The names included those of ten masters and two journeymen (*sanir*), seven of whom were Christian. They arrived in Jerusalem on 3 Muharram 1233/13 November 1817 and continued their work until 27 Rajab 1233/2 June 1818—that is, for a period of nearly seven months.

The second *daftar* is the same size and completes the first. Twelve pages survive, with two pages lost from the middle. The total expenses of the workshop had totalled 374,433 *ghirsh* when work stopped on 15 Shawwal 1234/7 August 1819. At the end of each document we find the amounts of the payments and the dates, who paid them, the amount of money that each artisan received, his name, the date of the start of his work, his wage, whether daily or monthly, and the amount of *qusurmil* (see below) that he

used, which was brought from the baths of Jerusalem. 4,435 *qafiz* of *qusurmil* were purchased from four baths in Jerusalem.

From this detailed document it becomes clear that this particular restoration was one of the largest renovation projects that took place during the entire Ottoman period. It lasted more than two years and also included the city of Hebron. In the Islamic Museum some of the tiles from these works are preserved. These were removed during a later restoration of the Dome of the Rock. A number of them bear the names of the artists and the date of the restoration (pl. 10.2).

3. The Ottoman Qur'ans in the Islamic Museum

There have survived into our own times many copies of the complete Qur'an and the *rab'as*⁶ that the sultans, rulers, wealthy individuals, and other pious people endowed to the Haram al-Sharif, the Aqsa Mosque, the Dome of the Rock and the schools (*madrasas*) of Jerusalem. The Islamic Museum holds remnants of such Qur'ans and *rab'as* endowed to the holy places dating from throughout the Islamic period; they were brought to the Islamic Museum when it was founded in 1922. About half of them date to the Ottoman period. The existence of these Qur'ans is due to the income of the pious endowments that paid for Qur'an readers, whether inside or outside Palestine. The bath of Amasya was endowed for the upkeep of the Dome of the Rock (Sijill 7: 121) and the *rab'a* had associated with it an inspector (*mutawalli*), an administrator (*nazir*), a servant, an attendance clerk, and thirty readers.⁷ More than that number of people benefitted materially from each *rab'a*. The amount of the monetary yield varied according to the importance of the endower and his position and the amount of the income from the endowment. From an examination of the copies of the Qur'an and reading the documents connected with them in the *sijills*, it seems clear that all of the Ottoman sultans endowed one or more *rab'as* for the Haram al-Sharif. Four *rab'as* in the Islamic

⁶ *Rab'a* is a term used for one of the thirty parts of the Holy Qur'an, which was divided in order to make it easier to distribute the text among the appointed readers. Such a donation was a recognised act of charity for pious donors.

⁷ See the *waqf* document of Uwais Beg ibn Hamza, the ruler of the *liwa'* of Gaza, Jerusalem, Karak and Ramla, who established as an endowment three pieces of land covered with trees located in the region of al-Baq'a in Jerusalem (known as Tell Abyut today), and a public bath in Gaza. The *waqf* was for twenty reciters of the Qur'an in the Dome of the Rock. They recited the scriptures inside the south door of the Sakhra, and thus procured the merit of the recitation for the founder of the *waqf*, for his deceased brother Muhammad Pasha, and for his parents, as well as for the Prophet and other prophets and saints (Sijill 12: 592–4).

Museum were endowed by Sultan Sulaiman al-Qanuni, and one by Sultan Murad III—his is the only Ottoman *rab'a* that is in its original Qur'an box. All of the parts of this *rab'a*, the script, and the cover have the same decoration. At the beginning of the first part is written its endowment document, which stipulates that every day thirty men should read from it after the afternoon prayer. The date of the endowment is 1001/1593. Also in the collection there is a copy of the Qur'an in the name of Sultan Bayazid, the son of Sulaiman al-Qanuni;⁸ the date of his endowment is 964/1556 (col. pl. XI). The Qur'an was to be read in the Dome of the Rock. The style of its decoration and the division of the text show that it is the copy that matches the *rab'a* of Sultan Murad.

Not only men, but also women endowed copies of the Qur'an. A Lady Bilqis endowed a *rab'a* for the Haram in 1000/1591, of which five parts (*juz'*) have survived. Another woman by the name of Salihya, the wife of Mustafa al-Baituni from the village of Salfit, endowed a copy of the Qur'an to the Haram al-Sharif in 1238/1822.

These few examples give an idea of the Ottoman concerns for Jerusalem. Dozens of others could be mentioned, both within and outside the walls of the city. It is true that the Ottoman buildings lack the artistic flavour, richness and splendour of the Mamluk buildings, but it is also true that the Mamluk buildings would not have survived if the Ottomans had not been concerned with renovating them and restoring to their original state the parts which had been destroyed or damaged.

II. The *sijills* of the Shari'a court

The following section presents two aspects of the *sijills* of the Shari'a court in Jerusalem: first, the *sijills* themselves, their number, their locations, and their types; many articles have been written on those dating to the Ottoman period (for example, Manna' 1986: 351-62; Mandaville 1975: 517-24 and 1966: 311-19; Shaw 1960: 1-12; Lewis 1951: 141-55). It attempts to investigate the *sijills* as closely as possible and is based on the available information. The documents form three groups: (1) the original series *sijills*; (2) a new series of 150 *sijills*; and (3) a number of *sijills* in

the Department of Islamic Heritage. Secondly, the content of the *sijills* is discussed. This section attempts to understand the way of life of the general public in Jerusalem of the period.

With these objectives in mind, the first thirteen *sijills* of the Ottoman period were studied, covering the period from 7 Sha'ban 935/16 April 1529 to 947/1540. The study will be concentrated on the city of Jerusalem, but naturally that limitation cannot be strictly adhered to and it will be enlarged on a number of occasions in order to provide an idea, however limited, of the relationship between the city and countryside. This period and later periods are compared, especially on the basis of contrasts between the original series and the new series *sijills*, in order to give an idea of life in Jerusalem throughout the whole period of Ottoman rule. In this way the aim of this section is to give an overview of the topics included in the *sijills* as a whole.

The *sijills* of the Shari'a courts in Damascus and Jordan (Rafeq 1966/1970; Bakhit PhD thesis [unpublished] 1972) have been used as a basic source of information in a number of studies, while the *sijills* of the Shari'a court in Jerusalem⁹ have also been used either as a secondary or a primary source, in many cases for narrow topics. 'Arif al-'Arif was the first scholar to make partial use of the *sijills* in his book (1961), while more recently Amnon Cohen has become renowned over the past thirty years for his use of the *sijills* as a basic source in his studies.¹⁰ Mahmud 'Atallah also used the *sijills* in his book on guilds in the 17th century (1991).

In spite of all these studies based on the *sijills* of the Shari'a Court, the *sijills* are—and will continue to be—a fundamental source for anyone wanting to write about Ottoman Jerusalem in particular (as well as Palestine in general), whether for social, economic, architectural, cultural, or administrative topics. In the following study the three groups of *sijills* of the Shari'a Court in Jerusalem will be presented, together with details of their locations.

1. The original *Sijills*

There are 415 known *sijills* of the Jerusalem Shari'a Court¹¹ that cover the Ottoman period, divided according

⁸ Bayazid, the second son of Sultan Sulaiman al-Qanuni, endowed this copy of the Qur'an when he was *amir* in 964/1556. Bayazid fell into dispute with his father which led to his dismissal from the city of Konya where he had been ruler. Fearing for his life, Bayazid gathered an army of 20,000 men, but he was defeated. He fled to Persia but the Shah handed him over to Sultan Sulaiman and he was killed, together with his five children, in September 1561. The copy of the Qur'an refers to him as 'sultan', and this seems to have been added later by one of his supporters. For more information, see Farid 1981: 247-8; Clot 1991: 250-4.

⁹ Muhammad Adnan al-Bakhit, working in Jordan, is the pioneer in the indexing and publishing of the *sijills* in Syria-Palestine. He has used them as a basic source for a number of studies, both as the author and as a supervisor. He has published the indices for a number of *sijills* (1984, 1991).

¹⁰ Amnon Cohen has written a number of books and many articles in English, Hebrew and French based on the *sijills* of the Shari'a court in Jerusalem. For a partial list of these publications, see Cohen 1994: 10, n. 7.

to centuries, as follows:

16th century	81
17th century	119
18th century	81
19th century	114
20th century	20
Total	415

Of these *sijills*, twenty-four are in Ottoman Turkish, fourteen of which date to the 16th century and ten to the 17th century. They consist of *firman*s and orders (Heyd 1960; Cohen 1976). The first of these is no. 9, with 78 pages that contain *firman*s dating to the period 933-49/1527-42. The majority of its documents date to 947 and 948. The second *sijill* is number 11 with 163 pages. The first 73 pages are documents listing inheritances. The remaining pages of the *sijill* are *firman*s dating to 1002/1593, with the exception of pages 95-102, which are connected with the endowments of Sultan Sulaiman al-Qanuni and the names of the beneficiaries. All the other *sijills* have at least one or more documents written in Ottoman Turkish.

For a number of years a group of clerks from the Department of the Chief Qadi in Jerusalem have been summarising the Court *sijills*. Their project consists of the continuous numbering of the documents of each *sijill*,¹² beginning with the first; it includes a summary of the topic of each document in a line or two, recording the name of the person connected with the document, the name of the *qadi* and the date of the document. In spite of the importance of this task and the efforts that have been expended on it, there has been no classification of the topics, with the result that it remains necessary to go back to the *sijills*. This has to be done according to the sequential ordering in the original records. As a consequence, the end product is a summary of the original document. Their value is in the time saved for the researcher who can refer to them to determine the documents that he or she needs. From there he or she can go to the *sijills* themselves, providing permission is granted. To examine this summary in the office of the court, located in Salah al-Din Street in Jerusalem, requires the permission of the Mufti of Jerusalem.¹³ A copy of these summaries is located in the Department of the Chief Qadi in 'Amman, Jordan. It is

only rarely permitted to examine the original *sijills*, but permission to see the summaries can be obtained with less difficulty.

The Ottoman *sijills* have been photographed on microfilm¹⁴ more than once, and the material fills sixty-three 35mm films.

The originals were written in a number of scribal hands and as a consequence the handwriting varies between bad and good according to the individual writer (pl. 10.4). Sometimes a document consisting of a small number of lines can require hours of concentration before a reader with an excellent command of Arabic can copy and understand it. The length of time it takes to read a given document is related to a certain degree to the extent of the reader's knowledge of Arabic. The language of the *sijills* is closer to a colloquial than a literary Arabic. The records do not use commas, full-stops, or paragraphs and are written in a special language that reflects the spirit of the age. Sometimes they are difficult even for someone who knows Arabic well, especially at the beginning; but by degrees the eye and mind become accustomed to their form. Use of a microfilm reader and the prohibition against examining the original *sijills* add to the difficulty, especially since a large part of the documents of the first Ottoman century were written in a poor *naskhi* script, while the closer the *sijills* come to the modern period the easier the language becomes to read.¹⁵

The number of documents on a single page varies according to the length or brevity of the document, which in turn depends on its subject. Some of the documents need a page or more if they are endowments, or the inventories of the estates of a merchant or wealthy person. The number of pages in each *sijill* also varies, especially in the *sijills* of the 16th century, in which the number of pages can reach as high as one thousand. The dimensions of each *sijill* are around 30cm by 20cm. The documents were recorded according to their temporal sequence. No blank spaces are left on the pages, either between the documents or in the margins. Each double page is filled up completely with writing over all four sides. If there is a space left without writing, which rarely happens, the word '*battal*' (void) is written a number of times along the empty space. It appears that this was done to guard against forgery. Each document is distinguished from the others by a title,

¹¹ For example, see the following, based on the *sijills*: Doumani 1986; Manna' 1986; Cohen 1976; Mandaville 1966.

¹² The supervisor of the team was the late Imam Shaikh As'ad, who had long experience in reading the *sijills*. At the end of 1995, the number of indexed *sijills* was 160. Sijill 1, for example, contains 1,859 documents, while Sijill 2 contains 1,691 documents and there are 3,388 documents in Sijill 3.

¹³ The *mufti* who grants permission to examine the *sijills* is Qadi 'Abd al-Qadir 'Abidin, who has his office in the Nahawiyya Madrasa in the Haram al-Sharif. A personal interview is necessary to obtain permission.

¹⁴ Copies of the films are located in a number of different places. Within Palestine, a copy is lodged in the Department of the Chief Qadi, another is in the Department of Heritage in Abu Dis, and a third in the Najah University in Nablus. More than one copy is located in the University of Jordan in Amman.

¹⁵ The names of four scribes recur in the first *sijill*: Ahmad al-Hammam, who has the best hand; Muhammad ibn Muhammad ibn 'Imran al-Hanafi; Badr al-Din ibn Rabi' al-Hanafi; and Khalil al-Hanafi, who has the worst hand of all.

written in red ink in some of the early *sijills*, such as ‘The Sijill (Document) of the Shaikh of Islam’, ‘The Sijill of the Account of Muhammad ibn Zuraiq’, ‘The Sijill of the Shaikh of the Maghariba’, ‘The Sijill of the Hammam al-‘Ain for Ibn al-‘Ajan’, ‘Sijill of the Pricing’, and so on, but such titles disappear in the later documents. Usually each document is sealed with the Hijri date, most often spelled out. Then come the names of all the parties to the case, written along the line, followed by the name of the scribe, or the word ‘its writer’ without a name, followed by the names of the witnesses and that of the *qadi*.

The beginning of each document differs depending on the topic. In general the topic can be understood by reading the first two lines. Examples of the start of a document are: ‘The price of good flour from the mill stabilised ...’, ‘Muhammad ibn Muhammad alleged ...’, ‘The renter, our lord ...’, ‘The allegiance of the patrol remained ...’, ‘Before our lord the Efendi ...’, ‘Was purchased ...’, ‘The woman testified against her ...’, ‘The legal recognition for the master ... about what he spent on reconstructing the *khan*’, ‘The husband ...’, ‘The price of grapes stabilised ...’ etc. These general references appear scattered throughout the documents.

Naturally Palestinian society was affected by the Ottoman Turkish language and this is reflected in the *sijills*, where we find many Turkish phrases, even in the early records. The frequency of such words increases in the later *sijills*. Most of these phrases occur in the documents relating to inventories of estates, such as the words for clothes or their description, such as *kuhna* (old), *besht* (a coat made from black goats’ wool), *dara’a* (coat), *qatarmiz* (a very large glass bottle or vase used by apothecaries or confectioners as a show-vase), *tartur* (hat), *saraquh*, *baidak*, and *nahbaq silk*.

A final point connected with the original *sijills* concerns the repairs that took place in the 1930s, when they were sent to the Islamic Orphanage so that their bindings could be repaired. As a result of this work, which entailed the pages being unbound and then re-sewn, some of the pages of the *sijills* became displaced. These loose pages were gathered together at the beginning of Sijill 135 of the new series. It contains the following:

- 4 pages from Sijill 1
- 36 pages from Sijill 192
- 44 pages from Sijill 152
- 16 pages from Sijill 221

2. The New Series of Sijills

In the Shari’a court, in addition to the original *sijills* already described, there are 150 *sijills* called the ‘New Series Sijills’ in order to distinguish them from the first group. Divided

according to century they comprise:

16th century	1 <i>sijill</i>
18th century	10 <i>sijills</i>
19th century	107 <i>sijills</i>
20th century	32 <i>sijills</i>
Total	<u>150 <i>sijills</i></u>

Their content is the same as that of the original series. In general they contain records of marriages, divorces, alimony, guardianship, inventories of estates, buying, selling and trading, prices of commodities, construction, documents related to the villages of Jerusalem with regard to the purchase of land, and documents related to murders. About half of the 140 pages of Sijill 34 are documents related to villages. These *sijills* contain many documents about the *dhimmis* (Jews and Christians). The number of documents connected with them increases when the purchase and sale of land—and occasionally its endowment—is involved, especially after the promulgation of the Tanzimat reforms in the Ottoman empire in the middle of the 19th century. The majority of the endowments in these *sijills* are family endowments, in contrast to the original 16th-century *sijills*, most of which were charitable endowments. This indicates the general triumph of personal interest. Perhaps it also demonstrates the difficult economic situation that compelled people to endow parts (*qirats*) of their property to their children.

The number of pages in these *sijills* varies; most of them range between 150–200 pages. They measure around 30cm by 20cm, with the exception of three *sijills* of an elongated format which measure 30cm by 10cm. They are better organised in the presentation of material, so that a number of these *sijills* have only one document recorded on each page, especially those of the 19th century. At the beginning of each *sijill* there is usually a confirmatory document containing the name of the *qadi* and the clerk. For example, ‘This page was prepared to ascertain the events that occurred in the time of ... Muhammad Efendi, the *qadi* at that time in the city of Jerusalem along with what his deputy ‘Abd Allah ibn ‘Umar added, beginning at the end of Rabi’ II 1122/24 September 1710’ (New Series Sijill 2: 1). There are many indications specifying when the deputy *qadi* held his session: ‘On Monday, 1 Muharram 1151/21 April 1738 ‘Abd al-Wahhab Efendi al-Shihabi held session in the Shari’a court of Jerusalem, legally deputising for Muhammad Efendi, the Qadi of Jerusalem’ (New Series Sijill 8: 34).

The style of writing of the documents in these *sijills* is less difficult to deal with than the documents of the 16th century. Writing continued without the use of punctuation between sentences and also without diacritics and *hamzas*.

Often the date of the document is repeated at the beginning. The documents begin, for example, as follows: 'There was present on that date ...', 'Bakir Agha was present, the representative ...', 'He alleged ...', 'The rental continued ...', 'The wife purchased ...', 'The *khwaja* (merchant) purchased ...', 'Based on the legal investigation the court sent an official authorised by the *qadi* concerning the following ...'

Five are drafts of documents before they were officially recorded in the *sijill*. They consist of papers 15cm by 10cm in size, pasted onto empty *sijills* so that one page contains more than one of these draft papers. There is no apparent order and it is difficult to utilise them. They comprise the following:

Sijill 60, 1305-6/1887-8	559 pages
Sijill 132, 1322-5/1904-7	1,117 pages
Sijill 133, 1317-19/1899-1901	840 pages
Sijill 135, 1333-6/1914-17	625 pages
Sijill 136, 1331-4/1912-15	559 pages

The years listed are the ones recorded in the beginning and end of the *sijills*. There may be missing years in between or other years that fall outside that range. To complete the characterisation of this collection, we include the dates and lengths of some of the New Series Sijills, and examine three of them—Sijills nos. 1a, 11 and 192.

Sijill 18 covers the 20-day period from 10 Rabi' I 1286/20 June 1869	33 pages
Sijill 19 1286-95/1869-78	204 pages
Sijill 29 1288-9/1871-2	133 pages
Sijill 31 (1) 1289-95/1872-8	92 pages
Sijill 59 (1) 1304-29/1886-1911	148 pages
Sijill 95 1315-16/1897-8	229 pages

a. Sijill 1a

This is the oldest of the Ottoman *sijills* of the Shari'a court in Jerusalem. It consists of 350 pages, measures 21cm by 21cm and covers a period of fifteen months from 7 Sha'ban 935-18 Shawwal 936/16 April 1529-15 June 1530. The following list gives the flavour of its contents:

6 endowment documents
3 documents in Ottoman Turkish
23 documents connected with Christians
26 documents connected with Jews
12 documents of restoration to buildings
168 documents dealing with villages

The village-related documents show the importance of the economic and social relations between the village and the city. The villages were the providers of

vegetables, fruits, grain and meat for the city and many of the villages were endowed for the benefit of the Haram al-Sharif or for the Ibrahimi Mosque in Hebron, whether in whole or in part, or they were *timars*.

From the documents about building, we know that in Jerusalem in the period of this *sijill* there were thirteen builders (*mi'mar*), eight of whom were from the city of Aleppo; one was Christian, another was from Hebron, another from Ramla, and two were head masons/chief architects (*mi'mar bashi*)—Ibrahim ibn Ma'tuq al-Halabi and Husain ibn Nammar. This large number of chief architects demonstrates the amount of building activity in the city and the attention of the state in supervising the construction, renovation and inspection of buildings—especially those that were endowments—to determine the renovations that were needed.¹⁶

b. Sijill 11

This is dated 21 Ramadan-1 Dhu'l-Qa'da 1256/16 November-25 December 1840. Despite the small number of its pages—42—it is one of the most important *sijills* because it records the transitional period immediately following the withdrawal of the Egyptians (Mamluks), when order in Palestine was restored under the umbrella of the Ottoman state, and it includes the appointments and dismissals in the state bureaucracy in Jerusalem, Jaffa, Hebron, Bethlehem and the Jerusalem hills, and the award of allowances of bread from the hospice of Khassaki Sultan for the clients of the state. The judge signed his decrees with the following text: 'Muhammad Hamdi, the Qadi in Jerusalem and presently the Qa'im maqam of the Wali of Sidon', while in some of his appointments he indicated that he was deputising for the Wali of Sidon: 'And according to our deputyship coming from Muhammad 'Izzat Pasha, the Governor of Sidon and presently the Ser 'Askar'. The term 'and temporarily of Egypt' is added to the previous terms in some of the documents. A few examples from this *sijill* are:

—Appointment of Husni Agha Butbaq as an officer of the cavalry of the treasury and the enrolment of 70 cavalymen with a monthly salary of 150 *ghirsh* (Sijill 11: 3).

—A decree to Muhammad Agha the Mutasallim of Jaffa appointing the Khwaja 'Abd al-Nur Kalakuti to the position of secretary and the provision of the

¹⁶ The *qadis* who are mentioned in this *sijill* are Burhan al-Din al-Khazraji, Shams al-Din ibn 'Imran, Sa'd al-Din al-Muhandis, Shams al-Din al-Faqusi, and Ghars al-Din al-Dairi, while the post of Chief Qadi was filled by Sharaf al-Din Musa ibn al-Dairi al-Hanafi and Sa'd al-Din Muhammad ibn al-'Alam al-Maliki.

general employees of the treasury of Jaffa, Ramla and Ludd with a monthly salary of 800 *ghirsh asadi* in the place of Nasr Allah al-Qibtī al-Maltī because 'he favoured the faction of the Egyptian military forces' (Sijill 11: 3).

—The appointment of Muhammad Agha al-Qarrafi Buzuk Bashi in Jerusalem as officer over 500 cavalymen with a monthly salary of 2,500 *ghirsh asadi*, a ration of bread and fodder for his horse, while the salary of the cavalymen was 110 *ghirsh asadi* (Sijill 11: 6).

—The appointment of the Shaikh 'Abd al-Qadir al-Kiswani to a third of the district of the Jerusalem hills to protect travellers and repair roads (Sijill 11: 20).

—The appointment of 'Abd al-Latif ibn 'Abd al-Wahhab as inspector (*nazir*) of a third of the district of the Jerusalem hills (Sijill 11: 20).

—The appointment of Sulaiman al-Talhami as *shaikh* of the European sect in Bethlehem with three assistants, and the appointment of Ya'qub al-Ja'ar as *shaikh* of the Rum (Greek Orthodox) sect, also in Bethlehem (Sijill 11: 28).

—The appointment of Abu 'l-Hasan Efendi as chief doctor and surgeon for the Ottoman troops in Jerusalem with a monthly salary of 300 *ghirsh asadi* (Sijill 11: 34).

c. Sijill 192

This collection is the result of the rebinding of the *sijills* in the 1930s as mentioned earlier, when the covers of the *sijills* were completely replaced with new ones. The interior sections of the old covers contain valuable information and observations on such matters as natural events like snow, earthquakes and disease in Jerusalem; appointments or dismissals of employees and judges; important visitors who came to Jerusalem or travelled from it to Istanbul, Cairo, or on the Hajj; the date of death of important people, judges and women and their burial places, as well as information about gifts or endowments that were presented to the Haram al-Sharif—mats, carpets, lamps, copies of the Qur'an or *rab'as*—and their storage places; the names of the officials responsible for them; who presented them; and the dates of the Islamic, Jewish and Christian holidays. Examples of such information have been selected to give the reader a general idea about this unusual *sijill*.

i. Natural events

A plague occurred in Jerusalem on 1 Jumada I 1028/16 April 1619 which 'took children and was heart-breaking. It continued in Jerusalem and has not lifted up to the present day, 16 Shawwal of the same year/26 September 1619'.

ii. Islamic, Jewish and Christian Holidays

—Permission [granted] to the Jews to enter the public baths on condition that they have a special place for bathing separated from the Muslims. Date 17 Dhu'l-Hijja 1056/24 January 1647.

—Pentecost on Wednesday 5 Dhu'l-Hijja 977/11 May 1570.

—Passover on Thursday 14 Rajab 967/10 April 1560.

—The holiday of the Eastern Christian sects and their entrance into the Church of the Holy Sepulchre on Sunday, 21 Rajab 968/6 April 1561.

—The visitation of Musa (Moses) on 9 Rajab 967/5 April 1560.

—The visitation of Musa on 13 Rajab 968/30 March 1561.

—The visitation of Musa on 15 Rajab 969/21 March 1562.

iii. Arrival of visitors in Jerusalem

—The arrival of Farrukh Beg in Jerusalem on Monday 25 Rabi' II 964/25 February 1557 after the noon prayer.

—The arrival of the ruler of Damascus (*malik al-umara*) Ridwan Beg in Jerusalem on Thursday 15 Ramadan 968/29 May 1561.

—The departure of Ridwan Beg to Ramla and then to Damascus on 29 Shawwal 968/12 July 1561.

—The arrival of Ahmad Beg, commander of the Lajjun *liwa*, on Monday 5 Jumada II 969/9 February 1562 and his departure to Egypt on Thursday 29 Muharram 970/28 September 1562.

iv. Deaths of *qadis* and news of other important personalities

—The Shaikh Abu 'l-'Aun al-Dairi died on Monday 25 Rabi' II 965/14 December 1558 after the noon prayer.

—Abu 'l-Fath ibn Fityan died on Monday 25 Rabi' II 965 after the death of the Shaikh Abu 'l-'Aun.

—The Qadi Abu 'l-Thana' ibn al-Duwaik died on Saturday 28 Shawwal 956/19 November 1549.

—The death of the Qadi Shams al-Din ibn Rabi' on 2 Rabi' I 967/2 December 1559.

—The death of al-Shihabi Ahmad in the city of Ramla on 11 Rabi' II 967/10 January 1560. He was brought to the city of Jerusalem and was placed for the night in the al-Adhamiyya and was buried next to his father near the Gate of Mercy on Sunday.

—Bairam Beg departed to Cairo on 13 Rabi' I 965/2 January 1558.

—The late Bairam Beg passed away to the mercy of God, may He be exalted, on 9 Rabi' I 970/6 November 1562.

—The death of the Shaikh Ahmad al-Dajani on Thursday the 24th of the same month; and he was buried on Friday, 25 Jumada I 969/30 January 1562 in the cemetery of Ma'mun Allah near the courtyard of the Shaikh Abu 'Abd Allah Muhammad al-Quraishi.

—The late Khatun, daughter of Muslih al-Din Efendi died

in the daytime on Tuesday 11 Dhu'l-Hijja 977/17 May 1570. She was buried near the Bab al-Rahma in the mausoleum of Ahmad Beg, the provincial secretary, at noon.

—The news of the death of the late Rustam Beg, the minister, on 7 Dhu'l-Hijja 968/19 August 1561.

—The news of the death of the late ... Shaikh Mahmud al-Baluni, the Shaf'i Mufti in Aleppo, who died in Egypt on the Hajj at the beginning of Dhu'l-Hijja 1007/25 June 1599.

—The dismissal of Khusrau Efendi on 6 Rajab 1015/7 November 1606, who departed in health and safety to Turkey by way of Egypt on the 12th of the same month.

—The Qadi Sharaf al-Din al-'Asali was dismissed from the (post of) assistant magistrate (*al-niyaba*) in Jerusalem on Monday, 8 Muharram 978/12 June 1570.

—The Shaikh Abu 'l-Sa'ud al-Ghazi and the pilgrims arrived in Jerusalem on 3 Rabi' I 982/23 June 1574.

—Muhammad Beg al-Tafaji, appointed to renovate the Dome of the Rock, left Jerusalem for al-Rum after completing the renovation on 8 Ramadan 996/31 July 1588.

—The killing of Abu Saifain, the former commander of the district of Jerusalem, in the land of the *'ajam* (non-Arabs) on 2 Rajab (...).

—The revenue of the endowment of Nasr al-Din son of the legal scholar Muhammad ibn 'Umar, known as Abu Dabus, for the year 1015/1606.

—In the presence of the commander-in-chief Muhammad Bashi residing in the city of Jerusalem were brought those in the prison of the citadel, who had been imprisoned in the time of the commander Muhammad Beg, the former *muhafiz* of the city of Jerusalem. They were Thabit ibn 'Uthman, one of the *shaikhs* of Dair al-Shaikh; he was found to have been unjustly imprisoned and he was released. The next ... and seven people were brought from the prison of Jerusalem known as the political (*siyasa*) prison and he recorded their names and released them on 10 Jumada I 1031/23 March 1622.

v. The Sessions of the court and the council, held in various places on the Haram al-Sharif

—The session of the court in the Mosque of the Hanbalis (today the location of the Library of the Aqsa Mosque) on 8 Ramadan 968/22 May 1561.

—The session of the court in the Qubbat Musa on 15 Ramadan 979/30 January 1572. The session of the council in the Qubbat al-Silsila for the complaint against the servants of the commander of the district of Jerusalem, Ahmad Beg, on 24 Rabi' II 991/17 May 1583.

vi. Gifts for the Haram al-Sharif and the names of Qur'an readers and their salaries.

—The names of those allowed to recite parts of the *rab'a* of

the Sultan Selim Khan for 1008/1599, of whom there were thirty-two named. Among them was the man who distributed the parts and the recorder of those attending, who gave each individual twelve gold pieces annually. Also mentioned is the *rab'a* endowed by the sultan's mother, with thirty readers, each with an annual salary of 9 gold *sultanis*.

—A woman, Sa'adat al-Mar'ashiyya, endowed two bound collections of books to the library of the Dome of the Rock for the use of students. She handed over the books to the Shaikh Muhammad al-Khalili, the superintendent of the books, on 12 Muharram 1015/19 May 1606.

—On 2 Sha'ban 1018/31 October 1609, 1,345 lamps (*qandil*) were delivered to the storeroom of al-Aqsa and up to the date of 8 Ramadan of the same year (i.e., one month and six days) a total of 680 were used.

From other records we know the number of lamps used to illuminate the mosques of the Haram al-Sharif. The Dome of the Rock was lit by three hundred and twenty-one lamps and its doors by fifteen. The Aqsa Mosque was lit by two hundred and thirty-five lamps and it had fifteen at its door. The Mosque of the Magharibis was lit by eighty-nine lamps, and the Mosque of the Hanbalis by eighteen. The Mosque of the Women (located between the Aqsa Mosque to the east and the Islamic Museum on the west) was used as a storeroom. The record of the inventory of its contents, taken in the presence of Muhammad Agha, the inspector of the Two Sanctuaries, and Murtada Efendi al-Sharif, the head of the doorkeepers, is repeatedly mentioned.

—At the beginning of 1029/1619, the gift of a candlestick weighing 390 *dirhams* and a censer of bronze with seven domes is recorded, donated to the Dome of the Rock by the Hajja Fatima, the daughter of the commander Junbalat.

—Eight lamps were given to the graves of the prophets in the Ibrahimi Mosque in Hebron by the Khatun, the daughter of the *amir* Sulaiman, who was the grandson of al-Malik al-Mu'ayyid, in 1015/1606.

—During the day of 14 Rajab 1073/22 February 1663, the spring waters (*'uyun*) reached the city of Jerusalem from al-Raji' pool.

—On 25 Rajab 1015/26 November 1606, it was announced in the markets that the value of each *ghirsh* was 30 *qit'a misri* and the gold *dinar* was worth 45 *qit'a*.

3. The sijills of the Department of Islamic Heritage¹⁷

The *sijill* listing bequests is lodged in the Department of Islamic Heritage. It has one hundred and twenty pages

¹⁷ The *sijill*, which is referred to here as the Heritage Sijill, is located in the Department of Heritage in Abu Dis, 3km south of Jerusalem. The number of the file is 29/5/1/1, 2/945.

dating from the end of Dhu'l-Hijja 939 to 14 Safar 945/21 July 1533 to 12 July 1538. The largest bequest recorded in this *sijill* is that of the deceased Hajj Khalil ibn Zainat al-Ghazzi and totalled 76,826 *qit'a* (Heritage Sijill 21-22). From details of his bequest we know that the deceased was a cloth merchant in Jerusalem.

Three years later it appears that a dispute over the bequest was renewed, because the inventory of the inheritance connected with al-Ghazzi is repeated in Sijill 10: 76-8. In this document the bequest is recorded as totalling 86,986 *'uthmanis*, of which 14,000 *'uthmanis* represents the interest on the principal, declared in this document to be 320 *'uthmanis*. The sum includes debts owed by forty people—merchants, *qadis* and others from Jerusalem—and debts on credit. The name of each debtor is recorded, together with the amount of his debt and the date on which it fell due.

In addition to this *sijill*, there are in the Department six volumes of drafts of the *sijills* of the Shari'a court in Jerusalem of the same type as those described above.

III. Currency

Before we turn to the economic situation in Jerusalem, it is necessary to examine the currency that was in use in the period under discussion (935-48/1528-41), as well as to cite examples of the gold and silver coins that were in use in the later period, especially in the 19th century. I will mention the weights and measures recorded within our period, and also provide at the end a table of special numerals used by the scribes of the Shari'a court to record the prices of food commodities, houses, inheritance portions, rental of property, prices of building materials, and everything else connected with quantities. Work on this table was done after perusing the *sijills* and comparing the numerals with each other. It appears that each law court had its own special language for numerals. Those recorded in the *sijills* of the Shari'a court in Jerusalem are almost completely different from those recorded in Elker's study (1953) on the numerals known by the term *siyaqat*.

The system of currency at the end of the Mamluk period had reached a state of collapse due to its steady depreciation; it was so debased that merchants had reverted to a system of barter. The last Mamluk sultan, Qansuh al-Ghuri, minted a new copper *fil* in Safar 907/August 1501 but it lost a third of its value in commercial exchanges. After five months, he again minted a coin known as 'new' to distinguish it from the first, older, one (al-Shafi'i 1980: 110). As the Mamluk state approached its end, the copper *fil* was sold by the *ratl* (al-Mubayyid 1989: 217) because the percentage of copper represented nine-tenths of the *fil*, with silver making up the remaining part. This led to a rise in the price of gold

(Ali 1986: 229). In their financial transactions, the inhabitants of Bilad al-Sham continued to use the Mamluk coins, which consisted of silver *dirhams*, copper *fil*s, and gold *dinars*, alongside the Ottoman currency (Lutfi 1985: 286). The Ottomans cancelled the use of Mamluk coins as a means of lowering the value of the Ottoman coinage by half, which in turn harmed the interests of the populace (Rafeq 1993: 64). The Ottomans minted new coins and distributed them to the *sanjaqs* by means of decrees from the governors. On 13 Safar 938/26 September 1531, a document in the *sijills* of the Shari'a court of Jerusalem records the arrival of new copper *fil*s for distribution to the Muslim, Christian, and Jewish inhabitants. Because of this document's importance, we reproduce it here in full:

The reason that led to the writing of this document was the occasion when Mahmud the Janissary and his associates Hajj Hasan ibn Hajj 'Izz al-Din and Hajj Muhammad ibn Hajj 'Ali, the master treasurer in the mint, delivered the decree of our lord the Pasha in Damascus concerning the new coins (*fulus*) that they brought to distribute in Safad, Nablus, Jerusalem, and elsewhere. They gathered the populace of Jerusalem so that they could hear and obey. It was decided that the aforementioned copper *fil*s would be exchanged in the markets of Jerusalem at the rate of 5,000 *'uthmanis*. The *muhtasibs* Muhammad ibn al-Mujarad and Taj al-Din al-Sukari received the aforementioned coins legally in order to exchange them legally in the markets of Jerusalem ... written on 3 Safar 938/16 September 1531 (Sijill 1: 403).

It is clear that the name of the *'uthmani* coin mentioned in the documents is the *akçe*, a term never used in the first fourteen *sijills* that I examined. The *'uthmani* is a local term that the Jerusalem residents applied to the *akçe* because it was issued by the Ottomans. In the next document, dated 1 Ramadan 941/6 March 1535 another quantity of the new copper *fil*s is reported to have arrived in Jerusalem. The portion (*hissa*) for the Jews for exchanging the new copper *fil*s was 2,900 *'uthmanis*, for the Muslims 4,000 *'uthmanis*, and for the Christians 2,000 *'uthmanis*, on the basis that every twenty *fil*s equalled one *'uthmani*, and forty *fil*s equalled one piece (*qit'a*) (Sijill 4: 612). The *'uthmani* was equal to 2.5 silver *halabis*, and each silver *halabi* equalled 8 new copper *fil*s. Numerous documents warn against using 'black' *fil*s (*al-fulus al-sud*); if it became apparent that someone was using black *fil*s, he had to pay a fine of 1,000 *'uthmanis* to the *amir* of the *sanjaq* (Sijill 4: 617). The new *fil*s were known by a variety of terms describing their characteristics. Once they were

termed 'pure red *fil*s' (Sijill 5: 69) and another time 'red *fil*s free of black *fil*s' (Sijill 5: 278). The price of these *fil*s dropped within a short time. Only two days after the previous document, another document was issued to the effect that every *halabi dirham* equalled 16 new red copper *fil*s—in other words, its price had dropped by half (Sijill 4: 617). At the end of Rabi' I 944/5 September 1537, the value of the new *fil*s dropped again and every 24 bought one *halabi dirham*, while the *fil*s bought iron and copper at three *dirhams* for an *uqiya* (Sijill 6: 642). After a year, exchanging the coins for copper and lead was no longer allowed because of the harm it caused to the public (Sijill 10: 360).

The silver coins recorded during our period according to the value in terms of the silver *halabi* were:

- (1) The *sulaimaniyya*, also called the 'shaved piece', which was rarely used. The value of each one was 5 silver *halabis* and equalled two 'uthmanis.
- (2) The 'uthmaniyya, also known as the 'uthmani silver coin. It equalled 2.5 silver *halabis*. It was the principal silver coin and was used most often in leasing endowed land and property. As mentioned earlier, it seems to be the coin known elsewhere as the *akçe*.
- (3) The silver *halabi* coin, also known as the *dirham*. Most commercial transactions and pricing of goods used this coin.
- (4) The new *fil*s, which was introduced at the beginning of the Ottoman period to take the place of the copper, lead and black *fil*s. At the beginning, the value of every eight *fil*s equalled one *halabi dirham*. The exchange rate thereafter quickly dropped until one *halabi dirham* equalled 24 *fil*s.

In the 18th century, three types of silver currency are mentioned in the New Series Sijills: *al-zulta*, which equalled 30 silver pieces (New Series Sijill 9b: 51); *al-misriyya*, which equalled one silver piece (New Series Sijill 9b: 54); and the *ghirsh al-asadi*, which equalled 40 *misriyya*.

On 4 Safar 1254/29 April 1838, a document was issued which priced six types of silver coins that were exchanged in that period in terms of the *ghirsh* and the *para* (New Series Sijill 6: 31).

Name of silver coin	Equivalent in <i>ghirsh</i>	Equivalent in <i>para</i>
Old <i>bashlak</i>	16	22
Old <i>buzli</i>	11	23
Old <i>iklikt</i>	0	39
New <i>bashlak</i>	2	24
<i>Timshlik</i>	3	1
Old <i>sali riyal</i>	13	28

In Dhu'l-Hijja 1288/February 1872, the value of the *bashlak* reached 5.25 *ghirsh* (New Series Sijill 29: 33).

Many types of gold coins were used in the Ottoman empire and their values varied according to the quantity of gold in them, and also according to the current value of the silver coins. We will present two tables, the first from the original *sijills* and the second from the New Series Sijills which detail the types and prices of the gold coins in the two periods. Their values are presented in the first table according to the piece, the 'uthmani and the *halabi dirham*, and in the second table according to the *ghirsh*.

The following gold coins are recorded in the estate of the merchant Khalil al-Ghazzawi, which was divided on 12 Rabi' II 942/10 October 1535 (Heritage Sijill 21).

Name of Gold Piece	Equivalent in <i>Qit'a</i>	Equivalent in 'Uthmani	Equivalent in Silver <i>Halabi</i>
<i>Halabi</i>	22	44	110
<i>Sultani</i>	38	76	190
<i>Selimi</i>	25	50	125
<i>Shami</i>	26	52	130
<i>Zahiri</i>	34	68	170
<i>Ghuri</i>	28	56	140
<i>Qa'itba'iyyi</i>	35	70	175
<i>Qubrusi</i>	40	80	200

Three centuries later, another document (New Series Sijill 6: 31) records the names and varieties of sixteen types of gold and their prices according to the *ghirsh* and *para*, 'on the announcement of necessary transactions, its prices among the population for buying and selling on the types of gold':

Name of gold piece	Equivalent in <i>Ghirsh</i>	Equivalent in <i>Para</i>
Old <i>Mahmudiyya</i>	60	23
New <i>Mahmudiyya</i>	50	33
Old <i>Mahmudiyya Funduqli</i>	43	10
Old <i>Salim Funduqli</i>	36	22
New <i>Funduqli</i>	34	9
<i>Islambuli Salimi Mahbub</i>	25	13
Old <i>Mustafawi Misri Mahbub</i>	24	1
New <i>Mahmudi Misri Mahbub</i>	20	24
Old 'Adli	17	16
New 'Adli	15	28
Old <i>Mahmudi Zarifa</i>	3	3
New <i>Zarifa</i>	2	28
Old <i>Islambuli Khairi</i>	20	5
New <i>Islambuli Khairi</i>	17	10
Old <i>Yusufo</i>	174	4
New <i>Yusufo</i>	173	11

'This is what was issued by the order of al-

Hukumdari. Anyone who violates this, and gives an increase or decrease in these types, will be punished. 4 Safar 1254/28 April 1838.'

IV. Weights and measures

The weights and measures, too, varied from city to city and region to region. Various grains were used for measures, and the units of weight varied as well. The *ratl* was the main unit of weight and was divided into smaller units, such as half-*ratl*, two *uqiyas*, *uqiya*, and half-*uqiya*. I have found nothing to indicate that the kilogram was known or used in our thirteen-year period. From the *ratl* is derived the *qintar*, which was 100 times the weight of the *ratl*. Thus in the Ottoman period in Jerusalem the *qintar* equalled 250 kilograms, based on the weight of the Jerusalem *ratl* at 800 *dirhams*. The *qintar* was used for weighing large quantities of seeds, rice and flour, just as the quantities of oil that were sent to the soap factories were measured by the *qintar*, as was the buying and selling of soap in large quantities for export. The monasteries bought grapes by the *qintar*, apparently for the purpose of producing wine (Sijill 10: 21).

The *mann* unit of measure is mentioned once in terms of the Egyptian *ratl*, where 137.75 Egyptian *ratls* of saffron equal 55 *mann* (Sijill 13: 448). Thus the *mann* equalled 2.5 Egyptian *ratls*. The term *himl* (load) was used to indicate what an animal could carry. Its quantity varied according to the type of animal. A camel-load of soap was as much as 125 Jerusalem *ratls* (Sijill 6: 621), i.e., 312.5 kilograms. In another document (Sijill 1: 99) a camel-load of soap is recorded as something different: 'all the load of the soap with a weight of 131.5 *ratls* according to the Jerusalem weight.' It is clear that the weight of a load of the same commodity was not fixed even in relation to the load of an animal such as a camel. A load of wheat of 14.25 *mudd* is mentioned (Sijill 4: 186). *Qusurmil* and mortar were also sold by the load. A measurement called a *farda* of rice with a weight of 55 *ratls* is mentioned (Sijill 7: 20), while the weight of a *farda* of silk was 65 Damascus *ratls* (Heritage Sijill 40) and a *farda* of soap was 63 *ratls* (Sijill 7: 11). Various commodities were measured by the *mudd*, such as wheat, barley, semolina, and sesame. 'Abbasid, Egyptian, Ramli, and Jerusalem *mudds* are mentioned, showing that the size of these measures varied from one city to the next. The size of a *mudd* can be determined on the basis of the information in a document (New Series Sijill 1a, 2) in which the sale of a number of *ghararas* and *mudds* of wheat for eight people is recorded. The size of a *gharara* was 72 *mudd* and the weight of the Jerusalem *gharara* was 613.5 *ratls* (Hinz 1970: 64). Thus the size of a *mudd* was about 8.5 *ratls*.

Two units of length are recorded. The first is called the 'work cubit' (*dira' al-'amal*), used for measuring the

surface of a hall in the Bab al-Nazir (Sijill 11: 128). It appears to be the architectural cubit, which was 79.8cm long (Hinz 1955: 86). The second term is a cubit for measuring cloth. One refers notes '45cm *Hurmuzi* cubits long according to the Jerusalem cubit (*dira' Hurmuzi bi dira' Qudsi*)' (New Series Sijill 1a: 191).

V. Economic aspects

The markets and *khans* were the central sites for internal and external trade in Jerusalem. The number of markets corresponded directly to the economic situation—that is, a large number of markets indicates that the economic situation was good for internal and external trade, and *vice versa*. A number of markets in Ottoman Jerusalem became well known (Cohen 1990: 131). Their names were derived from the type of goods sold in them, just as in other Palestinian cities (al-Hanbali 1973: 50). Some markets of Jerusalem were concentrated in the main streets, which still exist today. The first such street extends southward from Bab al-'Amud (Damascus Gate) in the north of the city, where it branches into two roughly parallel streets, al-Wad (Valley) Street to the east, which was then called the Wadi al-Tawahin (Valley of the Mills), and Khan al-Zait (Oil Market) Street to the west, which still has the same name, until they intersect at two different points with the other main street. This begins at the Bab al-Khalil (Jaffa Gate) in the west of the city and extends eastward until it reaches the Bab al-Silsila (Chain Gate), one of the gates of the Haram al-Sharif. In the Ottoman period this thoroughfare was called David Street (as it is today). Each street was divided into a number of markets, and each part was named after the type of goods sold in it.

The markets of Jerusalem mentioned in the *sijills* in the Ottoman period (Cohen 1978: 5-12) are: the Bashura Market, the Market of the Traders, the Silk Market, the Dukhaniyya Market, the Oil Market, the Market of the Cooks, the Market of the Spice Merchants, the Thread Market, the Pottery Market, the Wickerwork (*qashashiyyin*) Market (whose goods continue to be sold in the same place within our own period), the Cotton Market, and the Large Market. Smaller markets are also mentioned, such as the *suwaiqa*¹⁸ of Bab Hitta, and the *suwaiqa* of Bab al-Qattanin (Gate of the Cotton-Merchants).

Some of the markets were already in existence in the Mamluk period, and continued with the same function and bore the same names into the Ottoman period. Among

¹⁸ The word *suwaiqa* is a diminutive form of *sug* and was, it seems, used for markets specific to certain quarters that were smaller than the main *sugs*.

these is the Market of the Cotton Merchants,¹⁹ also identified in the documents as the Cotton Market and the Market of the Gate of the Cotton Merchants. The market contained two *khans*, two public baths, and thirty-two shops. It was an endowment for the Tankiziyya Madrasa²⁰ and the Aqsa Mosque. The market formed an economic unit in the Mamluk and Ottoman periods. Some of its shops were rented for a variety of functions. It appears that the market in its entirety did not specialise exclusively in the sale of cotton, at least in the Ottoman period. One of the shops was rented as a tailor's shop (Sijill 4: 189) and another as a residence (Sijill 5: 90).

Some names are recorded in the *sijills* that did not exist in the Mamluk period, such as Bashura Market and Thread Market, just as some of the markets in the Mamluk period are no longer recorded in the Ottoman period, or had changed their names, such as the Market of Knowledge, the Market of the Metal Polishers, or the Market of the Cloth Merchants (Lutfi 1985: 283).

Many types of products, both those made locally and imported, were sold in the markets. It is possible to identify the types, names, and sources of these from the documents concerning prices which were recorded in the special ledger kept in the Shari'a court. The pricing of goods took place in the presence of a group of merchants, each according to his speciality, and the *shaikh* of the professions, as well as the *muhtasib*, one of the chief assistants of the *qadi* (see section on the *Muhtasib*). The documents have similar patterns in pricing the goods, such as 'consideration of the prices of the listed goods according to what was fixed in the presence of the *muhtasib* and a group from the markets of Jerusalem, in silver *dirhams* (*qit'a halabiyya*)—*mawi* bread ...' (Sijill 3: 19). The goods are listed and their prices follow immediately. The pricing was determined using the *ratl* as the unit of weight, unless otherwise specified. If the date of the pricing is not mentioned at the beginning of the document, it comes at the end. The prices of the currencies exchanged in the market are repeated at the end of this type of document in the majority of cases—'consideration of the prices that are mentioned in it according to how its price was determined before the Hanafi Qadi of Jerusalem, Muhammad al-'Uthmani ... and the price of the red *fihs* was stable at 16 for a Halabi *dirham* and that the *maqtu'a* coins, the copper

coins, and the iron coins were abrogated on the date of 18 Jumada I 938/28 December 1531' (Sijill 2: 25). Because the demand for food increased during the month of Ramadan and the prices rose—whether as a result of the increased demand or because of the cupidity of the merchants—an increase is noticeable in the number of pricing documents. Likewise the *qadi* instructed the sellers to provide food in the market: 'The price of good bread was stable for each *ratl* ... and each miller, baker, and butcher was required to provide the city with commodities from today until the third of Shawwal of the same year 19 Ramadan 937/6 May 1531' (Sijill 2: 264).

The source of each item can also be discovered from the pricing documents. The sources of the imported items are also mentioned in these documents. For example, among the commodities sold by the spice merchants, 'Egyptian iron' is listed, and among the types of fruit 'Gazan', 'Syrian' and 'local' apricots are specified, as are 'Gazan' apples, and 'Syrian' pears. The documents of inventories of estates also inform us about the source of clothes and household items, such as 'Ottoman' *tartur* (head cover), 'Frankish' knife, 'blue Yemeni' blanket, 'Rumi' mattress, 'Rumi' carpet and so on. These terms appear throughout the *sijills*.

The names of all the types of goods exchanged in Jerusalem are recorded in the documents. To mention but a few: various kinds of meat, soap, sweets and bread, sesame oil, sesame paste, dairy products, nuts (almonds, walnuts, hazelnuts, pistachios), watermelon, cotton, various kinds of fruits, fish, oil, grain, skins, and spices.

A few examples follow, limited to such basic commodities as olive oil, sesame oil and sesame paste, bread and its associated mills and bakeries, and meat.

Nutritional aspects

a. Olive oil

The olive tree is one of the most ubiquitous fruit trees in Palestine. There are two types. The term '*rumi*' is used to describe the trees that were planted a long time ago—the description is intended to denote that the trees date from the Roman period. The 'Islamic' type is more recent than the '*rumi*'. The season for harvesting olives in Palestine is the end of October and the beginning of November. The quantity produced depends on natural as well as human factors. It is common that olive trees will produce well one year, but less well the following year. The olives were used after pressing and the oil was used as a food for the local inhabitants, a practice that continues today. There is not a single household that does not still today buy an annual supply of this food. The oil was transported and stored in pottery jars, and pure oil with no *zibar* (the dark sediment of the oil) was used for food. When the oil was less pure

¹⁹ The name refers to the sale of cotton, just as the 'Gate of the Cotton Merchants', one of the western gates of the Haram al-Sharif, was so named because of its connection with the market. Sultan al-Malik al-Nasr Muhammad ibn Qala'un renovated the market in 737/1336, which supports Mujir al-Din's statement that the market predates the 8th/14th century. See Burgoyne 1987: 273–98.

²⁰ A *madrasa* and *khanqah* located to the east of the beginning of Bab al-Silsila Street, founded by the then-Governor of Syria, Tankiz al-Nasiri (died 740/1339); for details see Burgoyne 1987: 223; al-'Asali 1981: 118.

(*turbid*), it was used to make the soap for which Jerusalem and Nablus were famous in the Ottoman period, as well as being used for lighting in homes and places of worship.

The villages in the area of Jerusalem, especially the villages of Bani Zaid, were famous for growing olives.²¹ The crop was given as security to the traders of Jerusalem, or to the owners of soap factories before the season (New Series Sijill 19). The supply of oil resulted in the establishment of soap factories, a number of which were well known in the inner Zion Quarter, located north-west of the city, and in the area of the Damascus Gate. The soap factories were known by the names of their owners, whether they were the founders or later purchasers. Three soap factories are mentioned in the thirteen-year period covered by this study, all located in the Zion Quarter: the Jabariyya and the Mansuriyya (which later merged into one factory), and the slaughterhouse factory, bordering them on the north.²² Abu 'l-Nasr Muhammad ibn Burhan al-Din Ibrahim Sharwin bought a *qirat* of the Mansuriyya soap factory for 1,000 *dirhams* (Sijill 4: 78) and a woman, Asil, sold him a *qirat* of the two factories. Later he became an owner of 5% *qirats* and the same woman also sold him $\frac{1}{8}$ *qirat* of the ruined northern soap factory. In total he possessed 6% *qirats* for which he paid the price of 1,350 *dirhams* (Sijill 5: 78). This Ibn Sharwin was the owner of a soap factory located at the Damascus Gate which is mentioned twice as the boundary of a press (Sijill 10: 49, 59). He manufactured soap and traded in it, both buying and selling. One of the documents (Sijill 2: 169) records that he undertook to produce a *nassja* of soap for one of the *qadis* and its cost was listed as the following:

The price of 16 <i>qintars</i> of oil—	12,672 'uthmanis
The rental of a cook and the cost of plaster, water, fuel, producers and scales—	1,269 'uthmanis
The price of 14 <i>qintars</i> of <i>qali</i> (alkaline) oil to cook the <i>nassja</i> —	1,162 'uthmanis
Total	15,103 'uthmanis

The *nassja* of soap was sold for 45,000 *dirhams*. Ibn Sharwin himself bought a quarter of it. By a simple calculation we find that the *qadi* earned a profit of 7,245.5

dirhams from the production of the soap and that the price of a *qintar* of alkaline was 83 'uthmanis. The price of a *qintar* of the oil from which the soap was made was 792 'uthmanis. The prices of oil varied both according to its type and to supply and demand, as well as according to the olive season. A *qintar* of oil was sold for the production of soap for a total of 580 'uthmanis (Sijill 7: 479) and the inspector of the Haram al-Sharif sold the impure residue of the oil for lighting. The profit in the waste product weighing 14 *qintars* was 5,880 'uthmanis at a price of 420 'uthmanis for each *qintar* (Sijill 7:188). Another document from a later period specifies 'the price of a *qintar* of oil destined for the soap factories' as 400 'uthmanis; this was testified 'in the presence of the merchants in Jerusalem, the people who bring the oil, the Qadi Shihab al-Din Ahmad, the *faqih al-zait*, and the master Khalil ibn 'Alyan, the measurer of the oil' (Sijill 12: 69).

The price of soap varied according to its type. A *ratl* of dry soap sold for 27 *dirhams* and fresh soap sold for 24 *dirhams* (Sijill 2: 85). A woman sold eight loads of very dry soap weighing 10 *qintars*, using the Jerusalem weight, for 10,200 'uthmanis (Sijill 6: 621). Part of the soap produced was for local consumption and the remainder was exported, especially to Egypt. The overland route from Jerusalem to Gaza and then on to Egypt was well known, and the port of Jaffa was also used to export soap. In spite of the costs of transporting a load of soap to Cairo overland, surprisingly it cost twice as much to transport it by sea and, because of its reliability, the overland route became increasingly common, as is indicated by the rise in the price of soap in Cairo. But, despite the high costs, the expansion of the Egyptian market and the increase in demand continued without interruption (Cohen 1989b: 88). One document records that the Qadi 'Abd al-Nabi ibn Jama'a al-Kanani handed over to Musa al-Salti nineteen loads of soap to sell in Cairo (Sijill 12: 244).

On 25 Rajab 1215/11 December 1800, a document records the number of *tabkhas* produced in the three soap factories in Jerusalem for the years 1213/1798 and 1215/1800. These were the factory of 'Abd al-Ghani Çelebi al-Sabbagh, who produced 65 *tabkhas*, of which he sold fifteen in the city; the factory of Shaikh 'Ali al-Qutb, who produced 91 *tabkhas*, of which he sold sixteen in Jerusalem; and the factory of Sulaiman Qutaina, who produced 15 *tabkhas* (Sijill 10: 276). The size of a *tabkha* may have equalled a *nassja*, as a price comparison would indicate, and it equalled 2,000 *ratls* (al-'Arif 1961: 346). The document demonstrates that the local market in two years consumed 46 *tabkhas*, or 276,000 kilograms of soap. This large amount of soap shows the importance of cleanliness to the citizens and may also indicate an improvement in the economic situation, with perhaps the consequence of an increase in the size of the population. The export in two years of 125 *tabkhas* of soap, equalling

²¹ The twenty-three villages of the Bani Zaid are located in the hills north of Jerusalem and cover an area of 360 sq.km. They are famous for the extensive cultivation of olive trees and the production of olive oil there at present exceeds 3,000 tons annually. In the Ottoman period the Bani Zaid villages were administered as one of the *nahiyas* of Jerusalem. See Ahmad 1992.

²² Amnon Cohen mentions the names of seventeen soap factories in Jerusalem in the 16th century. For more information on these, their dates and their role in the 16th-century economic life of Palestine see Cohen 1989b: 106.

750 tons, generated a revenue of 5 million *dirhams* at a price of 20 *dirhams* for one *ratl*. The small number of soap factories is notable in this late period, as are the names of the factory owners, who were members of Jerusalem families that still continue today. It is clear that most of the soap was exported to Egypt and that the Egyptian market also absorbed the bulk of the soap production of Palestine as a whole. Raymond commented that the Palestinian sector in Cairo controlled almost the entire market in soap (Raymond 1990: 186). Anyone could rent a soap factory for a specified number of days. Yahya al-Dairi rented a medium kettle for making soap in the Mansuriyya factory as well as the other necessary furnishings, buckets and the like, for a period of twenty days in order to produce soap privately for his own use. He paid a rent of 4 gold *qit'a qubrusi* for the period (Sijill 12: 400).

The *sijills* refer to two of the *badds* (the place where the oil was pressed in the open air), the first outside the Lions' Gate, rented for ten months for 1,000 *dirhams* (Sijill 5: 195), and the other in the Mashariqa Quarter, from which six *qirat* were sold for 1,500 *qit'a halabi* (Sijill 6: 290).

b. Sesame oil and paste

The prices of this commodity were volatile. This can easily be deduced in relation to the two products obtained from pressed sesame oil. Perhaps their prices changed because of the small number of presses in Jerusalem, in addition to the greed of the traders, which has been commented on throughout the ages. In Dhu'l-Qa'da 936/June 1530, a jar of sesame oil (*sirj*) sold for 65 *dirhams*, and a jar of sesame paste (*tahina*) for 48 *dirhams* (Sijill 1: 25). Two years later a jar of *sirj* sold for 150 *dirhams*, and a jar of *tahina* for 100 *dirhams* (Sijill 2: 145). That is, the price of *sirj* rose more than 130 percent and during the following years up to 948/1541, the price of these two products rose and fell dozens of times. They were sold from the press by the jar (weighing some 5 *ratls*) and by the *ratl* and *uqiya*, as well as being sold retail in the market. Naturally the price in the market was higher than the price at the press. The following is an example of the documents concerning these two commodities: 'The price of *sirj* from the press was stable at 2.5 for each *uqiya* and in the market at 2.75, calculating 30 for each *ratl* from the press and 33 in the market, while a jar of *tahina* was 100 from the press and 2 in the market for each *uqiya* on the aforementioned date' (Sijill 12: 372—21 Rabi' I 947/26 July 1540). The *sirj* and *tahina* were priced almost cyclically whether in individual documents or in lists of general prices. This shows the degree of importance that this food commodity had for the people of Jerusalem as well as the extent of consumption and the manipulation of prices to gain quick profits.

Four presses (*ma'saras*) are mentioned in Jerusalem. A press consisted of an oven to cook the sesame, a stone for grinding the seed, a cellar for storage, basins, a cistern for water, and a roller (perhaps to turn over the sesame). The press was known by the name of the street in which it was located, in contrast to the soap factories which were known by the names of their owners. One of these presses was located in Damascus Gate Street and was owned by the master Hasan ibn al-Fuqa'i, known as Ibn al-Asfar. His three sons, his two daughters and his wife inherited the press from him. The sale of the shares of this press is recorded in six documents because of a dispute among the heirs. The sale price of the press reached 2,200 *'uthmanis* and it was bought by Badr al-Din Muhsin ibn 'Ali who was known as 'Ibn al-Masri the merchant in Jerusalem' (Sijills 2: 410; 6: 277; 10: 47, 49, 69). A second press is mentioned in the Aulad al-'Alam Quarter; the master Hasan, son of the master Muhammad ibn Zuraiq, bought half of it from the master 'Ali ibn Muhammad ibn Hasan ibn al-Dahina for a price of 2,200 *'uthmanis* (Sijill 6: 405). This means that the price of that particular press was twice that of the one at Bab al-'Amud—perhaps because of its larger size, or because of the type of equipment, or even its location. The rental for half of the third press located in David Street, and known as the press of Ibn al-Hisni, for one year was two *dirhams* a day (Sijill 10: 109). The fourth press was located in the Abu Shama Lane; Saniyya bint Nasir al-Din al-Samasami al-Dabbagh, the wife of Barakat Muhammad al-Khalili, ceded half of it to her four sons (Sijill 12: 421).

On 2 Ramadan 1125/22 September 1713, there were eight sellers of *sirj* in Jerusalem and the *qadi* ordered them to supply the market with adequate amounts of the commodity; each merchant brought his jar to the market, according to the custom (New Series Sijill 2: 286). On 13 Safar 1205/22 October 1790 a new order from the *qadi* to the presses is recorded, instructing them to supply the city with *sirj*, and he assigned each one of them a day on which to sell the product (New Series Sijill 9b: 532). There were five presses in September 1719—two were in the Jewish Quarter, another two were in the Christian Quarter, and the fifth was at the Damascus Gate. Hajj Musa ibn Mahmud Qatana, who owned one of the presses in the Jewish Quarter, was appointed *shaikh* over the presses (New Series Sijill 4: 173). It seems that the press at the Damascus Gate was in ruins; it was rented for a period of ten years for a price of 200 *ghirsh* and half of the rent was spent on its renovation (New Series Sijill 4: 5). It was a *waqf* for the Ribat al-Mansuri. A document of 13 Ramadan 1182/21 January 1769 records that its operators contracted to sell to the inhabitants of Jerusalem—Muslims, Christians, and Jews—one *uqiya* of oil for 2.5 *misriyyas* (New Series Sijill 9b: 45).

c. Bread

Bread was of course a basic commodity for the daily sustenance of the inhabitants of Jerusalem. The daily diet of many poor families is limited even today to bread and pressed olives or olive oil. The grain was grown in the countryside and, regardless of who owned the land, it was the peasant farmer who grew the crops. A part of the harvest was stored to provide his yearly needs and the seed-corn for the following year, while the remainder was sold. A variety of documents refer to the prices of wheat using a number of measures, among them *qintar*, *makuk*, and *mudd*. Each town had its own *mudd* measure with an individual name—for example, ‘the Egyptian ‘Abbasi’, and the ‘Jerusalem *mudd*’. A *makuk* of wheat was sold for 450 ‘*uthmanis* to the inhabitants of Jerusalem (Muslims, Christians, and Jews) (Sijill 7: 262) while 1,500 *mudd* of wheat using the Ramla measure sold for 15,000 ‘*uthmanis* (Sijill 10: 66), and 500 *mudd* of wheat, using the Jerusalem measure, sold for 4,000 ‘*uthmanis* (Sijill 10: 75). The prices for a *mudd* of barley varied between 9 *halabiyya* (Sijill 5: 1) and 12 *halabiyya* (Sijill 10: 586). A pricing document on 20 Jamada II 937/8 February 1531 records that ‘Shaikh Bakir, the *muhtasib*, attended the legal council of Jerusalem, and Nasir Elias from the Millers’ Market in Jerusalem accompanied him and together they priced flour and good *simid* at 8 *dirhams* for each *ratl*; of *mawi* bread flour six *dirhams*; and *simid* bread flour 6.5 *dirhams*’ (Sijill 1: 92). In general the prices of *simid* are mentioned more often in the *sijills* than the price of flour. Occasionally the pricing was done separately, in addition to their being listed in the general pricing documents. The prices of *simid* fluctuated over short periods of time, indicating changes in demand for this commodity. Two months after the previous date, the price dropped to 5 *dirhams* for a *ratl*. On 18 Rabi’ I 938/30 October 1531 its price returned to 6.5 *dirhams*, and at the end of the month the price of 10 *ratls* of *simid* from the mill became 70 *dirhams* (Sijill 1: 481). Two months later the price for each ten *ratls* rose to 85 *dirhams* (Sijill 2: 25). Some of the documents indicate that grain was sold in places other than the ones designated, which led to those who lost out as a result to complain to the *qadi*, grumbling that some people were going to sellers outside the city walls and buying grain from them without it being measured in the designated location, ‘and so one of the handlers of the commodity was brought to the grain lot (*‘arasat al-ghilal*)²³ and it was measured in the lot, as happened usually; and when it became clear that one of the people had hidden some grain and did not declare it to the masters of the

grain lot, he was guilty of a crime. For every load two pieces of Sulaimani silver were necessary without an increase on that. Thus the two pieces (of silver) were collected and none of his goods were taken, neither wheat nor anything else ... 3 Jumada II 945/27 October 1538’ (Sijill 10: 131). The grain was normally measured in the ‘*arasat al-ghilal*. In 947/1540, the weighing of the grain was undertaken by the master Hamidain and his sons and Muzaffar ibn Arghun, a task which included ‘the measurement of wheat, barley and various types of grain and anything else that enters the ‘*arasat al-ghilal* in Jerusalem and other markets within the city ... for a sum of 8,000 ‘*uthmanis*. The sum of money was to be paid to the ruler of the Sanjaq of Jerusalem by the *kikhya*’ (Sijill 12: 160). It appears that the problem of selling grain outside the designated area continued throughout the Ottoman period. On 3 Muharram 1181/31 May 1767 a document records the names of the people permitted to buy and sell grain in the bazaar, while carriers were prohibited from selling grain. The *qadi* ordered the shop-owners next to the bazaar to close their shops in the morning and to open them in the afternoon, after the grain stores in the bazaar had closed. He further imposed the condition on the shops outside the bazaar that they were to be restricted to the sale of barley and corn only as grain varieties. He likewise instructed the shops that sold grain at the Bab Hitta not to sell barley and corn. If they wanted to continue selling those grains, they would have to come to the bazaar (New Series Sijill 19: 538). It is clear from some documents that the tradesmen did not comply with the laws of their professions. On 15 Jumada II 1182/27 October 1768, the *qadi* issued a document instructing the millers not to sell *simid* or flour and to restrict their work to milling for a rent, and that the sale of those two commodities were restricted to the owners of *tawabins* (the name given to the place where flour and *simid* were sold) (New Series Sijill 9b: 27). At the beginning of Ramadan 1196/10 August 1782, the six members of the millers’ group pledged not to sell *simid* in their mills or to work in the *tawabins* (New Series Sijill 9b: 265).

d. Meat

If we turn to animal products, we find that their prices remained stable over this period of thirteen years. The lowest price for a *ratl* of mutton, the most expensive kind of meat, was 11 *dirhams*, while once the price reached 16 *dirhams*, the highest recorded in the period. The lowest priced meat was beef and buffalo. The price for a *ratl* of *qa’ud* meat (a young camel) is once recorded as 10 *dirhams* (Sijill 10: 494). A *fatr* camel (one whose incisors have grown) reached 4,000 *dirhams* (Sijill 13: 444). The price of fat was continuously among the highest paid for meat. Meat was sometimes sold deboned according to demand. Naturally its price was higher than that of meat sold with bones. All Muslims consumed a great deal of meat during

²³ The term ‘*arasa* means literally an ‘open space’ or ‘any space without buildings’. Most probably in the Ottoman period it was in the Khan al-Sultan, located at the top end of the Bab al-Silsila market. See Cohen 1989: 106; al-Munajjid 1980: 497.

the 'Id al-Fitr and 'Id al-Adha, while the upper classes used it daily. Every day the house of the *qadi* was provided with two *ratls* of meat, for example (Sijill 1: 78). Occasionally meat was sold to Jews at a rate of an extra *dirham* per *ratl* above the price charged to Muslims (Sijill 8: 59), probably because the sheep were slaughtered by Jews which entailed greater expenditure to conform to Jewish dietary laws. Meat was sold to the Arabs for two *dirhams* above the price charged to the Janissaries (Sijill 3: 203). I did not find anything to indicate that meat was sold to Christians at a price higher than that for Muslims. The sheep were raised in the countryside, and either belonged to the peasants or to the city's sheep merchants. Three hundred and ninety-four head of Dan sheep were sold for 14,000 *'uthmanis* (Sijill 10: 1950); they were butchered in the slaughterhouse located in the Jewish quarter (Cohen 1989b: 35). On 19 Sha'ban 1126/30 August 1714 there were a total of fourteen butchers' shops. One of them was in the Large Market, and a second was in the Market of the Cotton Merchants. The location of the other shops is not specified. The meat merchants were instructed to sell a *ratl* of meat for 14 *qit'a misriyya*. The *qadi* imposed the condition that they were under obligation to retain that price from the date of the document until after the 'Id (New Series Sijill 3: 271). Ten years later the number of butchers' shops had risen to sixteen. Five were in the Large Market, two in the Vegetable Market, another four in the New Market, and one was in each of the Grain Market, the Bab al-'Amud, the Cotton Merchants' Gate, and the Bab Hitta, while the location of the last one is not recorded (New Series Sijill 5: 1). By 16 Jumada II 1136/12 March 1724 there were fifteen butchers in Jerusalem (New Series Sijill 5: 213), while on the first of Dhu'l-Qa'da 1193/10 November 1779 seventeen butchers pledged to provide the city with meat, and that no one else would butcher animals, for the sake of order. Hajj 'Uthman, the butcher, was appointed the *qassabbashi* over them (New Series Sijill 9b: 241).

e. Luxury items: spices, sweets, nuts and others

Numerous documents in the *sijills* of the Shari'a court in Jerusalem relate to luxury products. The commodities for which the *muhtasib* had the right to regulate prices included wax, ammonia, iron oxide, henna and sugar (Sijill 10: 69). There were three types of sugar, and the prices were very high. An *uqiya* of white sugar sold for 8 *dirhams* and of refined sugar for 11 *dirhams*, and of *banat* (perhaps to be read *nabat*, 'plant') sugar for 14 *dirhams* (Sijill 3: 122). A *ratl* of wax was sold for 110 *dirhams* (Sijill 4: 602). The highest prices per *uqiya* for this commodity during the thirteen years of our period are the following: white sugar—15 *dirhams*; *banat* sugar—20 *dirhams*; henna—1.5 *dirhams*; wax—10 *dirhams*; a *ratl* of *misri* and *halabi* iron—34 *dirhams* (Sijill 13: 382); and ammonia—22 *dirhams* per

uqiya (Sijill 10: 70). The high prices fetched by these commodities show that the use of perfume was confined to the women of the upper classes of Jerusalem society, while the lower-class women restricted themselves to henna because it was comparatively cheap. It is assumed that luxury items were imported from Egypt and Syria although this is not directly indicated in the *sijills*.

One document (Sijill 13: 448) dated 17 Rabi' II 948/10 August 1541 is connected specifically with spices. The document was originally recorded in the Maliki Islamic law court in Cairo, and was then recorded again in the Shari'a court in Jerusalem. It deals with the sale of saffron by Muhammad Çelebi al-Naqqash to Ibrahim the Jew, known as Castro.²⁴

Various kinds of sweets are mentioned in the *sijills*, and without exception their prices were higher than those of other food items. Some of the sweets known in Jerusalem today go back to that period, such as *kunafa* and *qata'if*. The prices of these items tended to rise or fall according to the holidays, during which the supply and demand for sweets increased, or according to price manipulation of the basic commodities from which they were made. They were priced by the *ratl*. Among the sweets that are recorded are *al-mushshabak* (an Arabic pancake)—25 *dirhams*; *al-'aja'yin* (paste)—15 *dirhams*; *shami halwa* (a Damascus sweetmeat made of sesame seed meal)—33 *dirhams*; local *halwa*—28 *dirhams*; 'good' stuffed nuts—20 *dirhams*; sesame paste and sesame cakes and chick peas—8 *dirhams*; *qaraqish* (a kind of crisp biscuit)—16 *dirhams*; *maltut* (a paste mixed with oil and sugar)—12 *dirhams*; shredded *kunafa*—3.5 *dirhams*; *kunafa* on a tray—3.5 *dirhams* (see for example Sijills 5: 432; 7: 219, 329). The nuts were priced as part of the main price lists, without a separate document recording the details. A *ratl* of hazelnuts—60 *dirhams*; pistachios—60 *dirhams*; almond kernels—48 *dirhams*; walnut kernels—24 *dirhams* (Sijill 3: 19). A year later the prices had risen more than 50 percent; almonds with their shells—25 *dirhams*; almond kernels—65 *dirhams*; hazelnuts—90 *dirhams*; pistachios—90 *dirhams*; walnut kernels—73 *dirhams* (Sijill 5: 397).

The prices of all commodities were recorded in the registers, whether they were imported or produced locally. They were listed in the files in the presence of the *muhtasib* and a group of the merchants. Occasionally the prices of some goods were reviewed, on the basis of complaints made either by the traders or the citizens of Jerusalem. As

²⁴ It seems that there were economic relations between the Jew, Ibrahim Castro, and Muhammad Çelebi al-Naqqash, who was in charge of building the city walls of Jerusalem. Muhammad Çelebi al-Naqqash borrowed 10,000 *'uthmanis* from Castro when he went to Cairo to meet the architects in connection with the walls (Sijill 12: 360). Kastruwa (Castro) did not have any direct connection with the construction of the walls, as Cohen makes clear in his article (1989c: 467-77).

a consequence the prices of certain commodities fluctuated. The *muhtasib* and his men supervised the market and the sale of some luxury commodities, like oil and wax. The presence of the *muhtasib* or one of his men was required in order to adhere to the price agreed at the time of sale, or to collect the specified fees on the commodity being sold. The Officer of the Oil complained to the Qadi Shihab al-Din Ahmad al-Faqusi that he 'had been harmed because the oil is brought to the place of Bab al-'Amud and the merchants of Bab al-'Amud weigh it among themselves without him being present' (Sijill 10: 194). 'Abu Bakr al-Ja'ba' admitted that he had weighed wax without the knowledge of the *muhtasib* Hajj Muhammad ibn Zuraiq ... and the judgment was that he was required to pay the fine for the crime on the basis that he did not acknowledge the *muhtasib* and went against the decree ...' (Sijill 5: 147). Those who violated the agreed prices were brought before the judge and penalties were imposed. Warnings about violation of the fixed prices are repeated and exaggerated to such an extent that it would appear to us that they were merely intended as deterrents. In most of the pricing documents the phrase 'Everyone who exceeds the price will pay the *sanjaq* 2,000 and this in the presence of the traders' is repeated (Sijill 5: 333). Similarly the traders were warned against buying goods without going to the weighing area, because by not weighing they avoided payment of the weighing fee: 'The prices of the goods remained stable in the markets of Jerusalem, rice, etc., then the merchants came to the court and testified against themselves that all those who purchased goods without weighing them must be fined 100 *'uthmanis*' (Sijill 5: 75). On certain occasions, the pricing took place after the commodity had been presented to the court, especially in connection with a major commodity like bread. Then its pricing took place based on the inspection, for example: 'After the wheat was made, a sample was milled and brought to the law council. That was done and honesty in its sale was ascertained. For *simid* and flour were sold for 4 *halabi dirhams* for a *ratl*, and good *kimaj* for 4 *dirhams*, and good *tabun* bread for 3 *dirhams* ...' (Sijill 6: 650). On 28 Safar 948/22 June 1541 a document was brought by one of the group of Hasan Beg, the ruler of the *liwa*' of Jerusalem and Hebron; it ordered the Court to examine the weights of the traders in Jerusalem and Hebron—Muslims, *dhimmis*, and others—in the presence of the representative, according to the religious and secular laws (Sijill 12: 293). The weights were supervised and measured against the weights kept in the court, for example: 'The half *uqiya* of Musa the Jew was measured, and found to be slightly low ... then the *ratl* of Ibn Faris al-Tanur' was measured and found to be low by a quarter *uqiya*' (Sijill 6: 712). The chief unit of measure in selling was the *ratl* and on 23 Dhu'l-Hajja 944/23 May 1538 a price document records at the end that 'the Jerusalem *ratl*

weighed 800 *dirhams*' (Sijill 8: 118). This weight today equals 2.5 kilograms (translation of Hinz, 1970: 32). The *ratl* was divided into 12 *uqiyas* and thus the weight of an *uqiya* was 208 grams.

Many documents record that the *muhtasib* brought someone or other to the court because he sold higher than the set price, which indicates that the markets were regulated. This is most often observed in connection with the peasants who brought their produce from the villages and sold the goods in the markets. For example, the *muhtasib* seized a *ratl* of grapes sold for a *dirham* above the fixed price (Sijill 8: 351), and he arrested another person who sold yoghurt above its price (Sijill 2: 59).

The supervision was not limited to prices and weights, but also extended to quality control. It was required that anyone who did not do his work well should replace it, as in the following example: 'Hajj Ahmad ibn Bahr al-Duhn the *muhtasib* seized from Ghars al-Din Jabir bread baked on pebbles in the oven—the barley flour was altered in colour, black, and dried up, and it became clear that it was necessary from that day onwards for Ghars al-Din to change his guild' (Sijill 6: 565).

The Muhtasib

The office of *muhtasib* (inspector)²⁵ was considered one of the three most important positions in any Ottoman city (together with the *qadi* and *subashi*). In Jerusalem too the *muhtasib* had an important social and economic position and played an essential role connected with the markets in the city. For example, he supervised prices and weights, and fixed the prices of goods, combatted fraud and kept the roads open. He was considered to be an assistant to the *qadi* in the city and his work included ruling on cases connected with trade and industry (Gibb and Bowen 1970: 219). The office of *muhtasib* was farmed out for the highest price. Its income went to the ruler of the *liwa*' of Jerusalem. His deputy in the city, the *subashi*, was responsible for collecting income for his master, the ruler. He also had a role in paying the income of the office of *muhtasib* (Sijill 10: 406). In the Ottoman period, the *muhtasib* was one of the merchants; in particular, there were many who were members of the meat sellers' guild (Cohen 1989: 12). The first *muhtasib* recorded in the *sijills* is Taj al-Din Ahmad al-Sukari on 9 Sha'ban 935/17 April 1529 (New Series Sijill

²⁵ The *hisba* is an old post which, according to some scholars, predates Islam. Its origins in the Islamic period date from the end of the 8th century AD. It had two meanings; the first is a religious sense—to enjoin what is right and forbid what is wrong; and the second is a civil sense which resembles to a certain extent that of 'municipal council' today. Twenty manuscripts concerning the *hisba* from various Islamic periods have survived. See Essid 1995: 123–51; 'Ali 1911: 537–54; 610–18.

1a: 5). More than one person could share the office, which included that of Master of the Market of the Traders. The bazaar *bashi* assisted the *muhtasib*, who rented out some of these positions to others, thereby making a profit. In Ramadan 937/May 1531 the *hisba* (market inspection) was granted to al-Nasiri Muhammad ibn 'Ala' al-Din ibn al-Mujarrad, known as Shaikh Bakir, for the sum of 2,800 'uthmanis a month; he shared the position with one Muhammad ibn al-Aqra' (Sijill 1: 286). The *hisba* was limited to a small number of names; the price of grant farming in 945/1538 reached 5,020 'uthmanis a month (Sijill 10: 246). Two years later the cost had jumped to 7,200 'uthmanis a month (Sijill 12: 321), that is 240 'uthmanis a day. With this level of daily grant farming, it was possible to rent an oven and mill for a year. In order to give an idea of the size of the sum, it should be seen as representing the wage of a worker at the time for a period of 120 days. To give a clearer indication of the speculation involved in taking on the position and to understand the role of the *muhtasib*, the following example gives an idea of the extent of his income over a sixteen day period: 'After the master Ahmad ibn Zuraiq and his companion master, Yusuf ibn Miran ibn Suaidan, settled into the *hisba* in Jerusalem as replacements for Hajj Shihab al-Din Ahmad al-Halabi, when it became free of the direction of Hajj Ahmad al-Halabi—from the income of the *hisba* for sixteen days, 200 *halabi* coins and 30 *qubrusi* coins.' Hajj Ahmad also had to provide them with an additional sum of 300 new series 'uthmanis (Sijill 10: 250).

The grant farming of the *hisba* did not include weighing oil (which entailed a sum of 16,000 'uthmanis a year), nor guarding the gates of Jerusalem, the grant farming of which reached 11,000 'uthmanis a year. Both of these were under the control of Khadr Darsan al-Rumi (Sijill 1: 217). Also not included in the agreement was the grant farming of the grain store, the cost of which reached 8,000 'uthmanis a year (Sijill 12: 160). The *muhtasib* did not impose fees on the shops of the Perfumers' Market, nor on the goods that entered into the weighing areas of Jerusalem, because the fees of those goods were allocated to the Dome of the Rock. He also received no fees from loads of wheat or honey, nor from loads of garlic and onions that came into the city from outside Jerusalem (Sijill 13: 381).

The following document makes clear the extent of the fees that the *muhtasib* was able to levy weekly on the shops, mills, ovens, and cooks, and the level of the fee on the loads that were brought in for sale in the markets of Jerusalem. 'Copy of the law copied without addition or deletion concerning the amount of market-supervision fees in Jerusalem with the exception of the Spice Merchants' market:

For every shop each week	1 'uthmani
From the millers each week	2 'uthmanis

—From each bakery oven each week	2 'uthmanis
—From the cooks each week	2 'uthmanis

—The *muhtasib* is to receive nothing for honey or *mann* (a kind of sweetmeat). As for what [else] enters the scales, the weigher takes 2 'uthmanis for the Dome of the Rock.

—Grape syrup prepared in Jerusalem, if sold in the market, has no [tax] on it, and when it is weighed nothing is due to the *muhtasib*.

—Rice. For every Jerusalem *qintar*, a Jerusalem *ratl*. For everyone who brings a camel-load of rice from outside Jerusalem, a *ratl* of rice.

—For a camel load of flour, a *ratl* of flour.

—Loads of wheat carry no dues to the *muhtasib*.

—The sellers of grapes until their season is completely finished, each week 2 'uthmanis.

—A load of yellow melons, a melon; and if someone buys a yellow melon and sells it in the market, he must pay 1 'uthmani.

—For each load of eggplant, 2 'uthmanis.

—A green melon carries no dues.

—Garlic and onions, if brought from outside Jerusalem, carry no dues.

—Every load of apples brought from Syria, and pears: for every four boxes, two *ratls*.

—Every camel-load of *sumaq*, a *ratl* and for every load of dough, a *ratl*.

—For every camel-load of pomegranate seeds, a *ratl* and for every horse-load, half a *ratl*.

—For every camel-load of caraway seeds, 6 'uthmanis and for every horse- or donkey-load, 4 'uthmanis.

—For every camel-load of buffalo- or cattle-cheese, a *ratl*.

—And for every camel-load of flax, 20 'uthmanis.

—For every 30 *ratls* of fruit—apricots, figs, etc., a *ratl*.

—For every head of buffalo, cattle and camel if they are slaughtered, a *ratl* of meat.

—If the *muhtasib* buys something, he is not entitled to a discount and if he imposes that on the people with excess, then that is a violation of Ottoman law.'

This copy of the law was issued by Ja'far Beg, the provincial secretary, in the middle of the month of Rabi' I 948/June 1541 (Sijill 13: 381). If we add to these figures the amount that the *muhtasib* received from trade and supervising goods and prices as a result of his knowledge of the requirements of the market, it can be well understood why the *muhtasibs* came to number among the rich men of Jerusalem. It is noticeable from the documents of the *sijills* that these men had a finger in every pie—they were involved in all deals and trade relations in every area of economic

life connected with buying, selling and renting, whether in the daily necessities of life, or in property, or in offices.

One of the duties of the *muhtasib* was to inspect the roads to see that they remained safe and open. The *muhtasib*, Muhammad ibn Riziq, requested that the *subashi* investigate the *dir' al-tariq* (the supporting wall which gave protection on both sides of a road) of the public road in Harat al-Haidira quarter. The investigation and measurement of the road took place in the presence of the master architect, Muhammad ibn Ghanim ibn Nammar, and a group of other witnesses (Sijill 15: 552).

Four names recur most frequently in the office of market inspection over the thirteen year period:

- Taj al-Din ibn Ahmad al-Sukari (Cohen 1989b: 12 and following)
- al-Nasiri Muhammad ibn 'Ala' al-Din ibn al-Mujarrad, known as Shaikh Bakir
- Ahmad ibn Bahr al-Dahn
- Ahmad ibn Badr al-Din ibn Zuraiq

The names of two people are recorded in the position of bazaar *bashi*: Ibrahim ibn 'Ali al-Halabi and Yahya al-Halabi.

Public and private buildings

a. Khans

The *khans* were one of the basic necessities for trade in the cities of the medieval period because they were the main location for any buying and selling undertaken by traders. The name varied according to the time and place. In Syria, Iraq and Palestine they are referred to as a *khan*, while in Egypt in the Ottoman period they were called *wakala* and in North Africa *funduq* (Raymond 1990: 185). All *khans* were basically alike in their architectural form—a building, perhaps a square or an approximation to one, with a courtyard in its centre, normally open to the air but occasionally closed (especially in regions with a high rainfall). This was ringed by storerooms and shops for the merchandise. Above there was a top floor with small rooms used as sleeping quarters. The size of the *khans* varied according to the founder. In the *sijills*, four *khans* are mentioned: Khan Bab al-'Amud, the Khan of the Melons, the Khan al-Fakhriyya and the Khan al-Quttain. It seems that either they were not highly active or that the names had been taken from earlier *khans* which had become landmarks for the areas in which they were located. Many documents are connected with the six functioning *khans* in the city. The first is the Khan of the Wakala, known in the Mamluk period as the Khan of the Sultan (Burgoyne 1987: 479) reflecting the name of its founder. It was not used in the Ottoman period as a *khan*, but was rather a place for selling goods, fruits and vegetables. From this function in

the Ottoman period, it became known as the Khan of the Wakala and Dar of the Vegetables. It appears that part of it was used for measuring grain. The highest annual rent paid for the *khan* is recorded at 14,000 'uthmanis, paid to the Haram al-Sharif, for it formed part of its *waqf* (Sijill 8: 239). The most famous of the *khans* in the Ottoman period in Jerusalem was the Khan of the Cotton Merchants. It is referred to in the documents under several names, such as the Khan of the Market of the Cotton Merchants, the Khan of Cotton, the Khan of the Cotton Merchants' Gate; and the Khan of Tankiz, a name derived from that of its founder, the Amir Tankiz, the governor of Syria (Burgoyne 1987: 280). The *khan* was a *waqf* for the Madrasa al-Tankiziyya and a tenth of its income was a *waqf* for a group of 'the Egyptians'. Hajj Qasim ibn Ahmad and 'Ali ibn Abi al-Naja rented the *khan* in Shawwal 937/June 1531 for a sum of 3,200 'uthmanis for a year.

In Sha'ban 944/January 1538, Hajj Ahmad al-Sa'bi rented the *khan* for a year and ten months at a cost of 11,000 'uthmanis; in addition to the rent 'he donated the work of the keys and locks and removing the garbage and renovation with the exception of any necessary rebuilding' (Sijill 7: 250). That means that the rent of the *khan* rose more than three times in a period of less than seven years. This increase demonstrates the improvement in the economic situation in the city. Of the fourteen documents in the *sijills* examined concerning this *khan*, seven are connected with the lessee, Ahmad al-Sa'bi. Another *khan* mentioned in the Cotton Merchants' Market is al-Ghadiriyya Khan. The *sijills* record that it was located below the Gate of the Cotton Merchants, and once it is described as 'on the street of the Gate of the Cotton Merchants'. Its boundaries are not specified in the ten documents connected with its rental, but rather are limited to the phrase 'its location is well-known and does not need to be specified ... and from the total rented, all the six north and south shops' (Sijill 1: 107). It was located north of the Khan of the Cotton Merchants with the Cotton Merchants' market located between them. The *khan* was a *waqf* for the Madrasa al-Ghadiriyya (Burgoyne 1987: 526). The tax collector or trustee of the *waqf* undertook its lease. Its rent was very small in comparison with the rent of the Khan of the Cotton Merchants opposite it. In the nine documents that are connected with it, the average annual rent ranged between 500 to 700 'uthmanis (Sijill 2: 48; 3: 182). On 29 Jumada I 980/7 October 1572 a document records the rental of the *khan* by the tax collector of the *waqfs* of Madrasa al-Ghadiriyya. The document does not specify the boundaries, but limits itself to the statement that the *khan* was so well-known that it was unnecessary to do so. Its rental for a year and a half was 18 gold *sultani* and 21 pieces. 90 pieces of the rent money were spent on lighting the *madrasa* for the period of rental, and another 90 *qir'a* were spent on restoring the *khan* and its shops, and

illuminating its door (Sijill 55: 208). These three *khans* still exist today, although their function is now different.

A limited number of documents refer to three other *khans* in Jerusalem which no longer exist. We do not know when they stopped functioning as *khans*, or when their architectural remains disappeared. The first was named the Khan Daraj al-'Ain (Khan of the Steps of the Spring). Two documents are connected with its purchase by 'Hajj Qasim ibn Na'ib al-Nazar, (who) bought 20 *qirats* of it for a sum of 1,400 *'uthmanis*. This *khan* is known to have been founded by the Qadi Fakhr al-Din ibn Nasiba al-Khazraji.²⁶ The south boundary reaches the Hammam Tankiz. On the east is the house of Ibn Abu Sharif, and on the north is the furnace room of the aforementioned bath, and on the west is the street and in it is the door. The same is the account from the four shops located next to the entrance of the *khan*' (Sijill 1: 283). About four years later Hajj Qasim bought two *qirats* of the *khan* from the Qadi Abu al-Sa'ud, the son of the founder (Sijill 4: 440). The location can be identified at the end of al-Wad Street. A second *khan* was located near the Khan of the Wakala or Khan of the Sultan at the top of David Street (Chain Street); it was known as the Khan al-Fahm (charcoal) and was a *waqf* for the Haram al-Sharif. Two neighbouring shops were rented at the same time as the *khan* at an annual rent of 720 *'uthmanis* (Sijill 13: 250, 280-1). A single document mentions the third *khan*, which was called the Khan Wad al-Tawahiya. It was a *waqf* for 'Ala' al-Din al-Basir and was rented with a shop connected to it for a year for the nominal sum of 600 *halabi*. The delineation of this *khan* is not recorded either; the document merely states that 'its location is well known and does not need mentioning or delineating' (Sijill 12: 149). A document dated 15 Dhu'l-Hijja 946/22 April 1540 is connected with Khan al-Zabib in Damascus, including the *khan* itself, two lower levels, four shops, two seats, two storerooms, and an open-air courtyard. It was a *waqf* for the Haram al-Ibrahimi in Hebron. Al-Zaini Mahmud al-Yasaji rented it for the two

waqfs in his capacity as deputy for Muhammad Çelebi, the inspector of the Two Harams. The rent was 24,000 *'uthmanis*, to be paid in four instalments (Sijill 12: 78).

The *sijills* record the rental of a number of stables, which appear more frequently in the record of the rental or sale of houses, for animals were the sole means of transport in the Ottoman period; providing a sound place for them was a necessity. The lease of stables that are recorded individually was rare. One exception to this rule was a stable in the Magharibi Quarter which was rented for three years for 300 *halabi* pieces (Sijill 13: 397). Another stable located at the bottom of al-Maulawiyya steps was rented for two years for 90 *'uthmanis* (Sijill 1: 259).

b. Ribats

Al-rubut (singular *ribat*, EI² VIII: 493) denotes the places where *sufi* ascetics stayed, similar to a *khanqah* and *zawiya*. Most of the documents in the *sijills* concerned with *rubut* are connected with the Ribat al-Mansuri.²⁷ In order to lodge there the ascetics required the agreement of the *qadi* (Burgoyne 1987: 119). If there are frequent documents in the *sijills* about a specific place, it means that not only was it prosperous and endowed with numerous *waqfs*, but that, as a consequence, there were constant conflicts over its tenancies and its *waqfs*. There is no doubt that the *waqfs* of this *ribat* were both numerous and widely distributed throughout various sites in Palestine—in Gaza, Akko (Acre), Jerusalem, and a third of the revenue of seven villages. The *ribat* was leased by Sinan Çelebi ibn 'Ilyas al-Balik Basha for 20,000 *'uthmanis* for the year 941/1534 (Sijill 4: 627, 634) from the commissioner of the *waqf*, the Imam of the Aqsa Mosque, Badr al-Din Muhammad ibn Jama'a al-Kanani al-Shafi'i, and the supervisor of the *waqf*, the Qadi Sa'd al-Din ibn Sharaf al-Maliki. The names of two tax collectors of the *ribat* are recorded as Qarqamash ibn Qasim and Hajj Muhammad al-Faduli (Sijill 4: 534). As might be expected, from time to time there was a disagreement about the *ribat* between a number of the residents (*mujawir*). In Jumada II 942/December 1535, there were twenty-two residents and each had been assessed to receive 12 *'uthmanis* from the previous month of Jumada I (Sijill 5: 332). The lessee of the *ribat*, Sinan, had disbursed that amount for each resident and, after two years, his brother and representative paid 32 *'uthmanis* to each of the poor men residing in the *ribat* for two months, at a time when fifteen people were living there (Sijill 7: 148). These sums were the equivalent of the expenditure

²⁶ The Qadi Fakhr al-Din Nusaiba al-Khazraji lived in the second half of the 15th century. The only clues about him are recorded in Mujir al-Din al-Hanbali. We know that he took on two-fifths of the teaching position in the Mu'azzamiyya Madrasa, and acted as a substitute for the inspector of the Haram when he travelled to Egypt. Fakhr al-Din Nusaiba al-Khazraji also supervised the restoration of the Sultaniyya Madrasa, built by the Sultan Qa'itba'i. His life in Jerusalem was made uneasy by his relations with the ruling Mamluk sultans and he was summoned to Cairo on a number of occasions, the last being in Sha'ban 895/July 1490. On that occasion he was banished from Cairo for two years, but later was forgiven, at which point he returned to Cairo, where he remained. It is possible to date the construction of the *khan* to the end of the 10th/16th century. See al-Hanbali 1973: 242 and following.

²⁷ It is located to the left outside the Bab al-Nazir. Al-Malik al-Mansur Qala'un al-Salihi set it up as a *waqf* in 681/1282. For details, see al-Hanbali 1973: 43, 79, 89; al-'Asali 1981: 317; Burgoyne 1987: 129.

on bread and other basic essentials by the poor living in the *ribat*. The income of the residents in the *ribat* varied according to their number and to the level of income each year that accrued from the *waqfs* endowed for the *ribat*. Sinan, the lessee of the *ribat*, had cancelled the rent in Ramadan 945/February 1539 as a result of the loss of two villages of his rent of the *waqfs* of the *khan* (Sijill 10: 364). Determining what each resident in the *ribat* was to receive was subject to negotiation. The poor occupants of the cells wanted the inspector to pay out of the *waqf* a monthly sum of 12 *'uthmanis* for each cell and, moreover, wanted it to be done in the presence of the *qadi* and the residents (Sijill 10: 133). The *qadi* took no decision without consulting the beneficiaries or the people involved in the dispute. The inspector and the trustee of the *ribat* proposed to the *qadi* that they build a *khaif* (a shady place similar to an harbour) for the poor of the *ribat*. At this point the *qadi* requested the residents of the *ribat* to assemble so that he could consult them as to their wishes; they rejected the proposal. Each said 'the *dirhams* are a benefit for us and better than the *khaif* in many respects, for part of the (money) allows us to buy bread, oil, and salt, and to go to the bath house, and so on' (Sijill 13: 190). The monthly allowance for the poor of the *ribat* was not paid regularly; in consequence the residents (*mujawirs*) of the Ribat al-Mansuri complained to the trustee in 941/1534 that they had not received what was owing to them for two months (Sijill 4: 626). The *waqfs* made over the income of a tenth of the olive groves in Gaza (Sijill 1: 163).

The second *ribat* to be included here which featured in the *sijills* is the Ribat of 'Ala' al-Din al-Basir, which was located across the street from the Ribat al-Mansuri. One of the documents indicates that each of the eleven poor who resided in the assembly room (the hall) received 5 *dirhams* for the month of Jumada I, and that each of the seventeen residents living in the cells, whose names were recorded in the document, received 30 *dirhams*. The rental of the doorman was 35 *dirhams*. The sums which were distributed to those who resided in the *ribat* came from the rent of the Hammam 'Ala' al-Din, which was endowed as *waqf* for the *ribat* (Sijill 10: 246).

We learn from one of the documents that the Ribat al-Jawali, located in the Ghawanima Quarter, was already in a dilapidated state in the early 16th century. At the beginning of Dhu'l-Hijja 943/10 May 1537, it was given to 'Ali al-Khaluti to turn into a small vegetable garden and to plant trees, after witnesses had reported that the building was in ruins (Sijill 6: 482).

It appears that *zawiyas* did not play a prominent role during the Ottoman period, for there are only limited references to them and they do not seem to have functioned effectively as housing for the indigent in the period under discussion. The documents examined concerning the *zawiyas* show that they were frequently

converted into private houses and were then rented out. The Zawiya al-Mawardiyya (located at the far end of al-Sitt or Takiyya Khassaki Sultan Street) was rented for two years for 1,000 *'uthmanis* (Sijill 5: 301). Al-Zawiya al-Muhammadiyya (located opposite al-Mawardiyya) was rented for four years for 720 *'uthmanis* at the end of Ramadan 947/28 January 1541 (Sijill 12: 697). It is not surprising that the *zawiyas* did not continue in their original function, for we learn that the income of the Zawiya Shaikh Ya'qub came to a total of 590 *halabi* silver pieces for nine months (Sijill 3: 143), and that the poor residents of the Zawiya al-Maltaniyya went to the *qadi* to demand a sum of 90 *halabi* silver pieces from the tenant of the *zawiya's* *waqf* (Sijill 5: 288). One document indicates that the Zawiya al-Badriyya, together with the mausoleum of Shaikh al-Qarami opposite it, were let for a period of six years at an annual rent of only 150 *dirhams*, on condition that the rent money was spent on restoring the property (Sijill 13: 567). The revenue of the Zawiya Shaikh 'Abd Allah was 900 *dirhams* for a three-year period that ended in 935/1528; the sum covered the rent for an oven, a *hikr* (a long-term lease of *waqf* property) and soap factory (New Series Sijill 1: 46). It seems that the Zawiya al-Adhamiyya was the only property that retained its primary function of housing the poor, although this is not specified. This may be deduced from a dispute that arose between its trustees and the trustee of the Zawiya al-Shaikh Haidar over an oven and a shop, which each one of them claimed were the property of their own *waqf* (Sijill 12: 138). Another document connected with the Zawiya al-Adhamiyya claimed that included in its *waqf* was part of the income of the Manjakiyya Madrasa at a rate of 460 *'uthmanis* for the year 948/1541 (Sijill 13: 611). The document does not record the total annual income of the *madrasa* and consequently we cannot determine what portion of the *madrasa's* income this sum represented.

Most of the *zawiyas* date back to the Mamluk period. The only foundation that took up its function again in the Ottoman period was the Zawiya al-Yunusiyya, which Bairam Jawish endowed with 150 *qubrusi* gold pieces on the condition that a third was spent on the renovations required by the *zawiya*, and that the remaining 100 *dinars* were used to build rooms for the poor residents. He also set himself up as inspector of the *zawiya* during his lifetime and specified that the *dazdar* of the Citadel should follow him in the position (Sijill 12: 264). Part of the *zawiya* was used for teaching children the Qur'an. Bairam also covenanted that the teacher, Asya ibn Habib, should not take a salary from the children, and set aside for him a daily wage of two *'uthmanis* (Sijill 12: 464).

c. Public baths

One of the aspects of daily life at the beginning of the

Ottoman period in Jerusalem that is clearly noticeable is the presence of public baths. The names of seven baths are recorded in the *sijills*; all of them date back to the Mamluk period and continued in use under the Ottomans. Four of these baths are in the vicinity of the Haram al-Sharif. Their presence here in locations so close to the Haram is related to the Islamic rite of religious ablution. Most of the documents about baths in the *sijills* are connected with the Hammam al-'Ain and the Hammam of 'Ala' al-Din al-Basir. The cost of bathing was moderately high in comparison to the general level of income, which leads us to conclude that the use of the baths was perhaps restricted to a visit once a month by those with a limited income. The following document shows clearly the extent of the cost of the bath and bathing (*istihmam*) for every man and woman. It seems the cost was divided into two parts: one fee to enter the bathhouse and for the services, and another for the actual bathing. The recording of the document took place in the presence of the masters of the baths—"The fee for the bath is fixed at a *dirham* for a man and two *dirhams* (with henna) for a woman, and bathing for her at a *dirham*, and bathing for a man at half a *dirham*. Anyone who takes more than that must pay the ruler of the *sanjaq* eight '*uthmanis* and will receive 100 strokes of the cane' (Sijill 7: 211). Most of the names that recur in reference to the rental of the baths are those of three individuals—'Ali ibn al-Tayyibi al-Hammami is mentioned ten times; while 'Ala' al-Din ibn Abu 'l-Naja and 'Abd Allah al-Nasrani shared more than once in the rental of a bath. The Hammam al-'Ain, referred to occasionally in the documents as the Hammam Tankiz, is located on the southwest side of the Market of the Cotton Merchants. It was established as *waqf* by the Amir Tankiz for the benefit of his Madrasa al-Tankiziyya (Burgoyne 1987: 287). Half of its rental was paid to the Haram al-Sharif in exchange for the provision of water from the Haram for the bath. On 27 Shawwal 943/7 April 1537, a complaint was presented from the *mutawalli* of the Madrasa al-Tankiziyya against the *waqf* of the Haram in connection with the claim by the Haram that it should take a portion of the income from the bath. After the *qadi* had investigated the stipulations of the founder of the *waqf*, he ruled that the bath was endowed for the *madrasa* only (Sijill 7: 471). The bath was leased yearly, but its rent was paid daily. The lessee had a great tussle with the beneficiaries. In one *sijill* there are eleven documents recorded that deal with its rent, which started at 160 *dirhams* a day and went up as high as 195 *dirhams* (Sijill 8: 288). This was the highest daily rent paid for a bath building in the period of our study. It appears that this rise in the rent of the bath was the result of the building's proximity to the Haram al-Sharif and because it was next to the Khan Tankiz. It appears that the most prominent merchants of the city were the main users of Hammam al-'Ain. Most probably there was an interior passageway

between the two establishments to make the bath easily accessible. Dung was used as fuel to heat the water (Sijill 4: 235). As a result of the many improvements that the tenants of the bath undertook, especially work on the copper cauldrons, and because these improvements were deducted from the rent, the *qadi* appointed a tinsmith to patch the remains of the copper cauldrons in the bath at a yearly fee of one gold *qubrusi* (Sijill 12: 76).

The second bath building frequently recorded in the *sijills* is the Hammam 'Ala' al-Din al-Basir, which was on Marziban Street, near the Zawiya al-Qirami. It was *waqf* for the Ribat of 'Ala' al-Din which was adjacent to the bath. Its supervisor was the *imam* of the Dome of the Rock, Shaikh Abu 'l-Fath ibn Fityan and Sharaf al-Din Musa al-Dairi al-Hanafi. It was rented either by them or by the *qadi*, and the business included agreements that were arranged between the supervisor and the employees of the court for the sake of profit. This is clear from two sequential documents. The first records that 'Ali ibn Mahmud, the chief clerk of the Shari'a court, hired the Hammam 'Ala' al-Din on 16 Rajab 938/23 February 1532 for 2,400 '*uthmanis* (Sijill 2: 59). Following this, two days later, the supervisor of the *waqf*, Abu 'l-Fath ibn Fityan, leased it to the Chief Clerk of the Court. From the next document, it appears that Shaikh Abu 'l-Fath ibn Fityan, the *imam* of the Dome of the Rock, in turn leased it to 'Ali ibn Mahmud al-Rumi, chief clerk of the court of Jerusalem '... and that is all of the endowed bath by 'Ala al-Din al-Basir ... for the period starting on that same date and ending at the end of the same year for a rent for the entire period of 2,220 '*uthmanis*, the rent to be paid at the end of each day ... 18 Rajab 938/25 February 1532' (Sijill 2: 60). The highest annual rent paid for the bath was 15,500 *dirhams*, rented by Kamal al-Fityani and 'Abd Allah al-Suriani al-Nasrani (the Syriac Christian) (Sijill 10: 257). The bath was leased without water for a sum of 7,200 *dirhams* annually (Sijill 8: 137). The income of the bath for the eight months in 941/1534-5 was 7,125 *dirhams*. Part of the sum, 4,540 *dirhams*, was spent by the trustee on the indigent residents of the *ribat*; the price of bread for those staying in the *ribat* at the time was 850 *dirhams*, oil 150 *dirhams*, rope and water jugs 35 *dirhams*, renovation of the bath 300 *dirhams*, and *qusurmil* for the renovations 600 *dirhams* (Sijill 5: 88).

One document is connected with the Hammam al-Shifa' (Burgoyne 1987: 282), which is also called the 'Hammam of Ablution'. It was rented for a period of thirteen months and twenty-two days for a daily rent of 16 *dirhams*. The rent for the eleven months was paid to the endowment, and the remainder was specified to pay for the filling, cleaning and servicing of the ablution pool and water jugs for those ritually cleansing themselves (Sijill 2: 141). The bath is located on the south side at the beginning of the Market of the Cotton Merchants. On 6 Ramadan

1136/28 May 1724, the bath of the Gate of the Cotton Merchants (the Hammam al-Shifa'), a *waqf* of the Dome of the Rock, was rented for one year for 11 *ghirsh* for the entire period. The lessor was the *mutawalli* of the *waqfs* of the Dome of the Rock and the head of the Ashraf, Muhibb al-Din Efendi. The daily rate was 11 *misriyya*, five of which were for water jugs for the ritual purification, while the remaining six were for the *waqf* (New Series Sijill 4: 141).

A bath is recorded by the name of Hammam Daraj al-'Ain (Sijill 10: 91, 127, 130; 12: 217), but the boundaries of the bath are not mentioned. The first time it is recorded in the *sijills* is on 21 Jumada II 945/14 November 1538, when it was rented for three *dirhams* a day. The highest daily rent paid for it was 15 *dirhams*, which was low compared to the other baths. To judge from the name of the bath, it seems that it must have been located next to the Khan of the Steps of the Spring mentioned earlier. The lessor of the bath mentioned in all of the relevant documents was Khudawardi, deputising for the group of Shaikh 'Ali al-Khaluti.

In the eastern part of the city, next to the Bab al-Asbat (St Stephen's or Lion's Gate), inside the city walls, was the Hammam al-Asbat, also known by the name of the Bath of Our Lady Mary. It was a *waqf* for the Salahiyya *madrassa*, located to the west of the bath. The first time it is recorded was on 23 Rabi' I 945/19 August 1538, when it was leased for 10 *dirhams* daily without water (Sijill 8: 398). Over three years later it was rented for 40 '*uthmanis*' (100 *dirhams*) daily (Sijill 13: 559).

Five documents are related to the rental of the Bath of the Patriarchs, located in the Christian Quarter. It was one of the *waqfs* of the Khanqah al-Salahiyya, and its rent ranged between 38 and 70 *dirhams* daily. Around 10-20 percent of the rent was paid to the *sufis* (Sijills 6: 179; 10: 259).

The last bath mentioned in the *sijills* of our period is the bath of Bab al-'Amud. One document records its lease, then at a daily rent of 20 *dirhams* with the provision of water. Two *dirhams* were *tashrif* (discounted) and the rest was for the *waqf* (Sijill 4: 549). Another two baths were mentioned adjacent to houses—the bath of the Jewish quarter (Sijill 8: 88) and the Bath of the Syrians in Bab al-'Amud (Sijill 2: 8).

d. Tanneries, dye-works and other establishments

The term *madbagha* ('tannery') is applied to the place where hides are tanned, while the term *masbagha* ('dye-works') denotes the place where cloth is dyed. The documents of the *sijills* do not however differentiate between the two terms. The term *madbagha* is also used for dye-works, and both terms are used indiscriminantly to refer to the same place. Three dye-works are mentioned in Jerusalem. One, located near Bab al-Khalil (Jaffa Gate), was originally an oven that was later turned into a

masbagha. It was rented for a period of ten years for 3,500 *halabi* silver coins on 18 Rabi' II 937/8 December 1530 (Sijill 1: 159). A disagreement arose over the ownership of the *masbagha* between the trustee of the *waqf* of the Karimiyya Madrasa, who claimed that the *masbagha* was part of the *waqfs* of the *madrassa*, and Muzaffar Ibrahim ibn Arghun, who claimed that it formed part of his *waqfs*. After investigating the *waqf* documents of each side, the *qadi* ruled that the *masbagha* was indeed a *waqf* for Muzaffar (Sijill 5: 63). But in the next document it is recorded as a *madbagha* endowed to the Karimiyya (Sijill 5: 99).

The second *masbagha* was in the Jewish Quarter and it was a family (*dhurri*) *waqf*, of which Amina, the daughter of the deceased 'Ali al-Karimi, sold six *qirats* for 852 '*uthmanis*' (Sijill 6: 361). By a simple calculation we thus learn that the whole price of the *masbagha* was 3,408 '*uthmanis*' (8,520 *halabi* silver coins).

The third building was perhaps a *madbagha*, rather than a *masbagha*, and was a *waqf* for the Salahiyya Bimaristan. The documents that refer to this *madbagha* do not specify its location. The highest annual rent paid for it on 4 Muharram 945/2 June 1538, after numerous increases, was 2,100 *dirhams*, paid monthly. Its tenant or lessee was Shihab al-Din ibn Suraisir, who is described as a trader of goods (Sijill 8: 153). Two years later a document records the demand by the inspector of the *waqf* that the same tenant pay a rent for the premises in excess of 1,200 *dirhams*. The tenant Ibn Suraisir had taken a partner for a third of the *madbagha* for 425 *dirhams* (Sijill 12: 171). The lowest annual rent paid for it was 750 *dirhams* (Sijill 7: 41). It seems that this tenant was not concerned with the disposal of rubbish, and for that reason a document was issued obliging Ibn Suraisir to remove detritus from the works (Sijill 12: 177).

It is noticeable that the location of the *masbaghas* was on the outskirts of the city because of the obnoxious odour and garbage that they created, just as their small number can perhaps be seen as due to the limited amount of water in Jerusalem, the difficulty of the work and its low economic return. The number of people who worked in the industry was eleven, two of them being identified as *usta* or expert (Sijill 13: 265).

A single pottery workshop is recorded, located in the Street of the Cotton Merchants, which was a *waqf* for 'Ala' al-Din al-Basir. Its rent was a nominal 20 *dirhams* a year (Sijill 2: 279). The price of a piece of pottery rose over a short period of time, which would indicate the widespread use of pottery instead of ceramic in mosques for ritual ablution before prayer (*wudu*'), and for everyday domestic use. In addition, it might point to a shortage in the number of pottery factories. In Jumada I 1128/May 1716, the *qadi* instructed the potters to sell five water jugs for a single piece, and a large cup for a piece. He also required them to make the cups large enough to allow each to hold a *ratl* of yoghurt to be sold for half a piece. The cups

were to be made wide enough to contain half a *ratl* of milk, with four cupfuls sold for a piece (New Series Sijill 3: 269). Three years later the price of pottery had risen by 50 percent. A large jug now sold for 1.5 pieces, the medium size for a piece, and the small size for 3 new coins; three water jars were a piece. There were five potters and their *shaikh* was named as Salah al-Ramlawi (New Series Sijill 4: 173).

A single *marabba*²⁸ is mentioned, located in the Bani Murra Quarter near the *zawiyya* of Shaykh 'Ali ibn Abi al-Wafa'. Half of it and a quarter of the house next door were sold for 1,200 *dirhams* (Sijill 1: 422).

e. Mills and ovens

Twelve mills are mentioned in the *sijills* of this period. Most of them were *waqfs* endowed for the *madrasas* or for the *dhimmis*. It is noteworthy that half of the mills that are mentioned were rented from Muhammad and his brother Abu 'l-Naja, the sons of the master 'Ali ibn Shuqruf the miller. The mills were located in different parts of the city. Two mills were at the Bab al-'Amud, while two others were in the Christian Quarter, one a *waqf* for the Georgians, and the other a *waqf* for the Khanqah Salahiyya. Three were in the Jewish Quarter; one was a *waqf* for the Jewish Karaites, rented for 40 '*uthmanis* a month (Sijill 5: 16). The mills were rented at a daily, monthly, or yearly rate. The rents were low, the lowest paid for a mill being the *waqf* of the North Africans (Magharibis) located in their quarter, which was leased for 90 *dirhams* a month (Sijill 1: 134) at a time when the highest rent was paid for a mill in the Bab al-'Amud district, which reached 250 *dirhams* a month (Sijill 4: 237). Half of a mill and its equipment was sold for 1,200 *dirhams* (Sijill 1: 25). The prices of flour were low in comparison with other food commodities. This was due to the fact that the government did not levy tax on flour (Cohen 1989: 98). Most of the twelve ovens recorded in our period were *waqfs* for the Muslims and *dhimmis*, and for the *madrasas* and *zawiyyas*. Their rental was lower than for the mills. The rental of the oven in the North African quarter and that of the Tashtimuriyya Madrasa was at a rate of one *dirham* per day for each. The highest rental was 5 *dirhams* paid daily for the Adhamiyya oven (Sijill 5: 181). The oven of the Tawashiyya *waqf*, which was in need of renovation, was rented for a period of twenty years for 400 '*uthmanis*: 'the tenant is allowed to sublease in order to spend from that income what is necessary to renovate the oven of the tenant' (Sijill 4: 241). The ovens were rented by a variety of people. An Egyptian lessee is mentioned, as is another from

Salt in Transjordan. There is no record of the rental of a number of ovens by a single individual—probably because of the limited economic return from the ovens.

Various types of bread were offered for sale in the markets²⁹—among them *kimaj*, *ta'bun* bread, *simid*, *marwi* bread, 'good' bread, and *kashkar*. *Sammuni* bread was made for the Citadel and a *ratl* sold for 4½ *dirhams* (Sijill 6: 9). The price of a *ratl* of bread varied between 3-7 *dirhams* (Cohen 1989b Appendix 3: 146). The oven operators were required to bake 430 *ratls* of flour each day to produce the various types of bread (Sijill 1: 469). In one of the documents, the names of the oven operators in Jerusalem are recorded, and at the end it is stated 'and the *sammuni* bread is cancelled' (Sijill 10: 530)—that is, bread prepared for the Citadel was prohibited. The weight of ten loaves was a *ratl* and 1.5 *uqiya* (Sijill 1: 194).

The last food item to be mentioned here is rice. A *farda* of rice weighing 55 *ratls* was sold for 660 *qit'as halabiyya* (Sijill 7: 20)—that is, the price of a *ratl* was 12 *dirhams*. In a later period 77 *ratls* of rice according to the Jerusalem measure were sold for 720 *dirhams* (Sijill 8: 28)—in other words, the price of a *ratl* was less than 9.5 *dirhams*. The price of a *ratl* of rice from the market varied between 8-13 *dirhams*, and once reached as high as 18 *dirhams* (Sijill 5: 267). We learn from one of the documents that this commodity was subject to hoarding, just like other goods. At the beginning of Dhu'l-Hijja 945/20 April 1539, a document records 'Attending the law court of Jerusalem were the merchants ... [the names of nine merchants are listed]. They and their fellow merchants in Jerusalem were charged that each of them had rice and did not bring it out to sell to the Muslims at a price of God, and they were fined 1,000 '*uthmanis* each for the *sanjaq* of Jerusalem according to what was testified against them, and after the announcement of this news to those who hear it—and if he does not sell—he will have no-one to blame but himself ...' (Sijill 10: 543).

f. Shops

In Jerusalem in the second half of the 17th century there were a total of 2,045 shops, as recorded by Evliya Çelebi (al-'Asali 1992: 250). 'Arif al-'Arif (1961: 348) included the information that the number of shops in Jerusalem in 1876 was 1,320, which represented a sixth of the 6,606 shops in Damascus in 1871 (Raymond 1985: 173). The shops consisted of rectangular spaces bordering one another, bounded by the street on two sides with their doors opening on to it. One characteristic of the 16th century was the presence of a bench in front of each shop. This was raised between 3-4 feet above the level of the

²⁸ A *marabba* acts as a fruit-press where the fruit is cooked, with sugar added to preserve it. The juice is called *rubb* (compôt). It was made from grapes, sesame or dates. A *ratl* of *rubb* sold for five *dirhams*, a *rubb* of sesame for four *dirhams*, and the price for pure, sweet, peeled *rubb* was 7.5 *dirhams*.

²⁹ For detailed information on flour and bread in 16th-century Jerusalem, including a table of prices, see Cohen 1989c: 476-77.

street, and extended from the floor of the shop to outside its door to form a seat for the shop owner and his customers (Raymond 1985: 179). Such benches are referred to in some documents because they were part of the rented property, as in the following case: 'Our lord the Maliki Shaikh Safi' al-Din Muhammad ibn Khalifa legally leased what is currently part of his entitlement and under his control to our lord Taqi al-Din Abu Bakr, son of the late Hajj Muhammad al-'Abanusi, who leased it from him with his own money for himself alone without anyone else, consisting of all the shop located in Jerusalem in the Market of the Cooks on the south side and all of the bench situated at the door of the house on the east side' (Sijill 4: 176). In 1863 the local authorities in Jerusalem prohibited the erection of new benches in front of the shops and ordered the removal of the old ones (al-'Arif 1961: 347).

I examined 120 documents dealing with shops, most of which were the property of the Islamic Auqaf. 78 shops were endowed to the Haram al-Sharif; 2 other shops were endowed to the Haram al-Ibrahimi in Hebron, and 15 were private endowments, which gives some indication of the proportion of shops controlled by the Auqaf. If we add the other property that they owned as endowments for *madrasas*, houses and land etc., we begin to realise that part of the history of Jerusalem is the history of its endowments. Because most of these shops were endowed, their transfer between merchants took place by lease rather than by purchase. Most of the time, if they were leased, the boundaries of the shops that specified the neighbouring properties were not recorded. This is in contrast to the shops that were sold, for usually here the boundaries are recorded in detail. In the sample that I examined, three shops were sold, one with its contents, the boundaries of which were not recorded: 'Hajj Zain al-Din Muhammad ibn 'Izz al-Din ibn Khalil al-'Anabusi bought from Muhammad ibn Abi al-Khair ibn Shawar what was currently in his possession and it was transferred to him by legal sale ... namely all the shop in Jerusalem near the arch of the Hammam al-'Ala' al-Din ... the location of which is so well-known that it is unnecessary to describe and delineate it, and its contents of rice, butter, onions, cheese, glass jars, copper cups, mixing bowls, covers, and carpets hung above the shelves and on hooks, and beads ... for a sum of 5,750 silver *halabis*' (Sijill 1: 37). A shop in the Zara'ina quarter was sold for 2,200 silver *halabis*; the document specified that the shop was vaulted with stone and mortar. That means that there must have been some others that did not have stone roofs, although I did not find any indication of such shops in the documents that I examined. A cistern belonged to this shop, and was included in the sale (Sijill 3: 240). The third shop was sold for 800 silver *halabis*, which was paid in daily instalments of two 'uthmanis (5 silver *halabis*) (Sijill 10: 458). The goods of one shop in the large market were sold for 20 gold *qubrusis* (Sijill 8: 299).

The highest rent paid was 900 silver *halabis* per month for a shop in the large market endowed to the Masjid al-Aqsa (Sijill 13: 399). The level of rents in the Market of the Cooks followed in second place; one shop was leased for a year for 1,800 silver *halabis* (Sijill 8: 304). Another shop in the same market was leased for 1,080 silver *halabis* a year (Sijill 12: 404). The third level of rent was for the shops of the Market of the Cotton Merchants, where a shop endowed to 'Ala' al-Din al-Basir was leased for one year for 70 silver *halabis* (Sijill 4: 496). The average annual rent for the shops in the area of Bab al-Qattanin was 520 silver *halabis*. The shops with the lowest rent were in the area of Jaffa Gate and David Street. The lowest rent paid for a shop on David Street inside the Haush al-'Azam, endowed to the Tashtimuriyya Madrasa, was one 'uthmani a month (2½ *halabis*) (Sijill 4: 185). A shop in the same street was leased for 600 silver *halabis* for a period of thirty years (Sijill 12: 261). The majority of leased shops were located in the area of the Bab al-Qattanin, which does not include the thirty-two shops of the Market of the Cotton Merchants. Next in number are the shops of the Jewish quarter. The documents connected with the shops include the names of the lessor and lessee, the location of the shop and the period of the lease, its cost, the dates of the start and end of the lease, and whether the shop was endowed or not. In general the location of the shop determined the cost of the lease. But, even in the large markets, the shops were leased for low prices. It was common for the lessee to sub-lease the shop rented to him to a third party. In the documents that I inspected, a significant number of shops were used as domestic houses (Sijill 4: 141).

g. Houses

In the *sijills* that I studied 36 *haras* (quarters or neighbourhoods) are mentioned. Some of them are named after the city gates, while others are related to ethnicity, such as the Bani Haritha and Bani 'Ayyash. Others are named after the village or city that the inhabitants came from, such as the al-Tur quarter, derived from Jabal al-Tur, south of Jerusalem. Occasionally a quarter is known by more than one name, such as the Jewish quarter which was also known as the Quarter of the Readers, the Zion Quarter, or the Slaughterhouse Quarter. Perhaps these last three names were for smaller parts of the larger Jewish quarter. In the documents the old name of a neighbourhood is recorded for additional clarity, such as 'the Bani Murra Quarter, which was known as the Zara'ina Quarter' (Sijill 12: 59). Other housing groups are mentioned; their names are based on place or geographical location, which apparently refer to smaller numbers of inhabitants than the quarters themselves, such as Qanatir Khudair, 'Aqabat al-Sitt, and Daraj al-Battikh. Both the Jews and Christians had quarters bearing their names, although the inhabitants did not belong exclusively to these two religious groups.

It appears that the number of quarters in Jerusalem did not change over a period of 400 years. There were thirty-nine quarters in Jerusalem in the 13th and 14th centuries (Little 1984), and the names of fourteen of them continued into the early Ottoman period. The number of quarters did not change in the 15th century (al-Hanbali 1973), and twenty-one quarters continued to carry the same names. Twelve of them, indeed, continued with the same name over a period of 300 years.

The names of the quarters mentioned are: Aulad al-'Alam, Bab Hutta, Bab al-Khalil, Bab al-'Amud, Bab al-Ghawanima, Bab al-Qattanin, Bab al-Nazir, Bani Haritha, Bani Zaid, Bani Sa'd, Bani 'Ayyash, Bani Murra, al-Tabana, al-Jilariya, Hammam 'Ala' al-Din, al-Hayadira, al-Khawalida, al-Rahba, al-Risha, al-Sharaf, al-Saltiyin, Sihyun, al-Turiyya, al-Duwiyya, al-Qara'in, al-Ghawanima, 'Aqabat al-Sudan, 'Aqabat al-Zahiriyya, Qanatir Khudair, al-Qawasima, al-Maradiwa, al-Maslakh, al-Mashariqa, al-Maghariba, and finally, al-Yahud.

Various lanes (*zuqaqs*) and streets (*khatts*) were distributed throughout these quarters. The names of nine streets are recorded from the west of Jaffa Gate descending to the east. We do not know where they intersected David Street, which continued to the east as far as Bab al-Silsila (one of the western gates to the Haram al-Sharif). Two of the western Haram gates carried the names of streets: Bab al-Nazir Street and Bab al-Qattanin Street. Marziban Street begins across from the last street on the west, ascending westwards and, from the Lu'lu'iyya Madrasa, turns at the corner located to the north where it continues until beyond the Maqam of Shaikh Muhammad al-Qirami. Bab al-'Amud Street runs from the north, dividing into two below the plaza south of the gate, from which it takes its name. The western divide meets the Khan al-Zait which continued perhaps to the intersection of the west and east streets already mentioned. The east street that branches off Bab al-'Amud Street was known as Wad al-Tawahin Street. Marah al-Sayyida Street is mentioned once, located to the north of the Haram al-Sharif, beginning from Bab al-Asbat. I was unable to determine the end of that street, although one can assume that it continued until it met Wad al-Tawahin Street (at the third station of the Via Dolorosa). Once Zuqaq al-Fustuqa is described as a street. Numerous side streets branch off these main thoroughfares, which are called *zuqaq* or *darb*. The names of eighteen *zuqaqs* are recorded in the *sijills* that I examined. A *zuqaq* was normally named after a famous person who was resident there, such as Zuqaq al-'Ajluni (Sijill 7: 46) or Zuqaq Ibn al-Tarubi (Sijill 10: 574). As a consequence the names of the *zuqaqs* would change with time. They could also be named for the commodity that was sold there, such as Zuqaq al-Labn (Sijill 12: 218), or for a famous landmark, such as Zuqaq Bir al-Sultan (Sijill 8: 245). A *zuqaq* could be either a thoroughfare or a dead end. An alley smaller

than a *zuqaq* seems to have been identified as a *majaz mustatraq* ('a much-frequented passage').

The documents connected with houses give us much useful information. From them we learn the names of the buyer and seller, how its owner came to get possession, whether by purchase or by inheritance, whether it was a family or charitable *waqf*, the location of the house, the name of the street or alley, the names of the neighbours, on at least three sides, and the owners of those houses, the size of the house in terms of number of rooms, floors and facilities, as well as the names of the witnesses and the judge. As a result of all the detailed information that these documents provide, and the scattered information in other documents, a complete and in-depth study would enable us to determine the prevalent type of architecture in the city, and to know approximately the number of houses in a quarter, street, or alley.

I examined 228 documents concerning houses; 120 were connected with leases, while 108 related to sales, including courtyards and single rooms. A cistern for collecting rainwater is mentioned for 84 houses. A well for storage of olive oil is mentioned once, while 32 houses contained a stable and 42 had an open-air courtyard. About half of the houses had an upper floor, meaning that the inhabitants depended upon vertical expansion to provide for additional space. Some houses are described as including an upper level, a lower level and a storey. It would appear clear from the documents that the mention of a 'storey' (*tabaq*) meant one or more rooms on the roof, i.e., a third floor. 23 houses have such a third storey, and if they are added to the houses with two storeys, the number of multi-storeyed houses exceeds 60 percent of the housing units. For example, 'The master so-and-so bought all of the house in Jerusalem in the al-Sharaf quarter ... containing an upper and lower level and a storey on top ('ulu' wa sufl wa tabaq bi-l-'ulu'), residences and facilities' (Sijill 4: 51). The proportion of derelict houses was high and references to them appear in 16 percent of all the documents. The houses could be derelict either wholly or in part. Usually they would be purchased by a builder in order to re-use the stone in construction or renovation of other buildings. Two builders, Ahmad ibn Salim al-Khuraishi and Husain ibn Nafi' al-Halabi, bought 16 *qirats* of a mostly derelict house near Herod's Gate for 120 'uthmanis (Sijill 5: 381). A derelict house could be leased long-term on condition that its rent be spent on renovating it. The rent could be nominal, as in the following example: 'Shihab al-Din, son of the late Nasir al-Din Muhammad Sabt al-Dairi, leased ... for Hamza ibn 'Abd Allah al-Rumi all of the ruined and derelict house, any income from which has stopped, in Jerusalem located at the high point of the 'Aqabat al-Sitt, including rooms, an open-air courtyard, a cistern and legal rights in itself and its entirety ... for a period of 30 years ... for a rent each year of 28 'uthmanis. The lessor permits the

lessee to spend all of the previously mentioned rent on what the leased house needs for renovation (identified) by legal witnesses' (Sijill 4: 69).

There are fifty houses identified as family or charitable *waqfs*. In general their rent was less than the rental of private houses. All of the known houses in the *waqf* of the Salahiyya Khanqah and hospital were leased to *rumis* (Turks). 75 units were joint property, which meant that they were inherited and divided among the heirs. 22 houses had latrines (baths). The documents mention 17 houses that had kitchens, and 25 that had an *iwan* (a square or elongated room with walls on three sides (Amin 1990: 17).

The term *ghurfa* for 'room' is not attested in the documents; rather the term '*bait*' is used. A house could contain more than one room, just as a storey could contain more than a single room, as in the following example, 'So-and-so bought all of the house in Jerusalem located in the Bab Hitta quarter, including a lower level—which contained an open-air courtyard, two rooms (*bait*s), and a stable—and an upper level, which contained an open-air courtyard and three rooms, and a cistern, and the legal rights' (Sijill 4: 195). The sale or lease of portions of a house could occur. In general, various factors played a part in determining the price of purchase or lease, among which location was perhaps the most important, such as the distance from the Haram al-Sharif, the city centre or the markets. The size of the house and the facilities it contained, such as a stable, a cistern to collect the winter rain, latrine, or kitchen, and the architectural condition of the house, were other factors affecting the purchase or lease cost. Nonetheless, a highly-priced house can be found next to one with a lower price. The highest purchase price paid was for a house located in the Bab al-Nazir, sold by Muhammad ibn Muhammad al-Jauhari for 7000 '*uthmanis*. It consisted of a lower level with a stable, a storage area for straw, an *iwan*, *rakb khana* (a place for keeping the horses' equipment, located near the stable or below the seat or sitting place) (Amin 1990: 56), and a small sitting place, while the upper level contained a large hall with three *iwans* and a cistern. It was purchased by Muhammad Çelebi al-Zaini Mustafa al-Yaziji, the deputy of the ruler of the district of Jerusalem, Gaza, Karak, Hebron and Ramla, Uwais Beg (Sijill 2: 235). 6 *qirats* of a house located in the Bab al-'Amud neighbourhood, consisting of an upper and lower floor, residences, and a cistern, were sold for 650 *halabis*. The lower floor contained an open-air courtyard paved with dark tiles, space for the storage of straw, a cistern and latrine, while the upper floor contained an open-air courtyard, three rooms, one of which was derelict, and a latrine (Sijill 5: 327). At the Jaffa Gate the wife of the head of the Fodder Market bought 12 *qirats* of a house containing a number of rooms, one large room, kitchen, cistern, latrine, and stable, all for 750 *halabis*. The prices of houses located in quarters in outlying

areas of the city were lower than their equivalents inside the city, such as Zion Gate, Jaffa Gate, and Herod's Gate. The lessee had the right to sublease the house he leased, expressed in the contract, 'for the lessee to benefit from that as tenant and sub-lessor' (Sijill 7: 88, 461). Houses changed hands by sale or lease between the two sexes without distinction, as between the adherents of the three religions, regardless of whether the house was a charitable or personal *waqf* or private property. In spite of the presence of a quarter for the Jews and another for the Christians, the Muslims bought and rented houses in these quarters and lived side by side with their non-Muslim neighbours. An expansion of residence by Christians or Jews outside their own quarters has not been observed.

The city contained a significant number of vegetable gardens, sometimes called *marja* or *hauta*. 36 gardens are mentioned in the documents that I examined. A variety of trees is mentioned as well, either in the gardens or around the houses, among them fig, bitter orange, mulberry, pomegranate, and apple.

Ten *haushs* are recorded. The term *haush* (courtyard) is used for an open space surrounded by rooms, whose doors open onto it. The number of rooms varies from *haush* to *haush*. The *haush* could contain a water cistern, a stable, or store-room and could consist of one or two storeys. Usually members of one family or relatives lived in it. The largest *haush* mentioned in the *sijills* that I examined was located in the Jewish quarter, bordering the slaughterhouse. It was a *waqf* for the Mansuri Ribat. The deputy of the *waqf*, the Maliki *imam* in the Haram al-Sharif, leased it to the head of the Jewish community, Ya'qub ibn Hakim, for a period of thirty years. The *haush* consisted of an upper storey supported by a vault, an open-air courtyard, a lower level containing eight rooms, some of which were derelict, two store-rooms, and a cistern. The rent for the period was 1,000 '*uthmanis* and was spent on renovating the property (Sijill 13: 397). The prices of the *haush* varied; the highest was the Haush al-Khanaqa located in the Wad al-Tawahin street near the little market of Bab al-Qattanin, endowed for the Zawiya al-Adhamiyya. The trustee of the *waqf* obtained a document from the *qadi* to sell it and buy another property to endow in its place. Bairam Jawish bought it for 40.5 gold *qubrusis* (Sijill 13: 522). The lowest price paid was for a *haush* located on Marah al-Sayyida street and consisted of a lower level of rooms, the number of which is not specified, a cistern, facilities, and half a cave; it was sold for 380 *halabis* (Sijill 1: 128). It can be clearly seen that most of the *haushs* were derelict. This would seem to indicate that they were neglected by the residents, who preferred to live in independent houses, rather than in compounds, and for that reason they did not take care of the property. The prices of *haushes* were low in comparison with other houses. It seems that in our period their role as housing compounds had diminished.

h. Restoration

The Mamluk buildings that had been constructed in Jerusalem continued in use in the Ottoman period, but their architectural state called for extensive repair and rebuilding. This work is recorded at remarkable length and detail in the documents of the *sijills* of the Shari'a court. The restorations included all of the Mamluk buildings in Jerusalem without exception—the *madrasas*, *khans*, *hammams*, *bait*s, etc. Part of the income of the *waqfs* was set aside for renovations. The documents distinguish between the various terms. *'Amara* (restoration/rebuilding/new building), means the renewal of a wall or its rebuilding. This is the more general and larger term. The other term *tarmim* (repair/maintenance), which is a part of restoration, meant repair to the mortar, both inside and out, and the repair of doors, among other things, as in the following example: 'Legal recognition of what the Khwaja Badr al-Din ibn Ghars al-Din Khalil, one of the leading merchants in Jerusalem, who leased the shops and soap factory in Jewish Quarter street in the legal manner from the one who had the authority to do so from before the date permitted to him in expenditure before the lease from the period starting in 939 and ending in 941/1532-34. That is what he spent on repairing (*tarmim*) the doors of the shops and what he also spent on restoring the soap factory and shops and repairing the interior and exterior of the soap factory in the period mentioned above' (Sijill 6: 94-5).

In the Mamluk period in Cairo there was an office called the Diwan al-'Ama'ir with responsibility for building affairs (Hanna 1984: 2). There is no indication in the Shari'a court documents of such an office in Jerusalem in the Ottoman period. It seems clear that the office was replaced by the *diwan* of the *qadi* who granted permission for restoration, after a request had been presented by the trustee (if the property was a *waqf*), or from the lessee or owner of the property (if it was a joint property—*milk sha'i*). Restoration of a leased building required the agreement of the owner of the property, but the owner did not need permission to undertake his own restoration work. For that reason we do not find any reference to the restoration of private houses in the *sijills*. The permission of the court was needed in order to receive reimbursement for payments on rebuilding or repairs. The property of Jews and Christians was an exception, for they needed permission from the *qadi*, whether the property was private or an endowment. That was in order to assure the return of the property to the state in which it had been before the repairs took place. Yuwasif ibn Manuli the monk went to the *qadi* of the court—and reported that his house, located in the Bani Murra quarter near the Khanqah Salahiyya—was in need of repairs. He asked for an inspection and a permit to restore it. After the inquiry (*kashf*), the witnesses reported to the *qadi* that the house was indeed in need of repair and the *qadi* therefore permitted him to restore and

repair it to its former state, without any addition or diminution (Sijill 3: 207). The *qadi* himself sometimes headed the committee of enquiry into a property, accompanied by master builders (*mu'allim al-mi'mariyyas*) from Jerusalem and other witnesses. The *qadi* could delegate the enquiry to another person. The inclusion of a builder in the enquiry was essential to determine the extent of damage and the sums needed for the restoration. In addition the committee usually included people described as 'experienced' (*ahl al-khibra*) to help the builder in his evaluation.

The names of forty-six builders (*mi'maris*) occur in the period of our study. Husain, the son of the late master 'Ali ibn Nammar, was the master builder in Jerusalem for a long time. He is described sometimes as the 'Master of the Sultan'. He inherited his position from his father, as is clear from his father's name. Three *mi'maris* from the same family are recorded. Eleven *mi'maris* were connected with the city of Aleppo, in addition to three others originally from outside Jerusalem, from Damascus, Antioch, and Syria. Eight of the Aleppo *mi'maris* were in Jerusalem between April 1529 and July 1530. We do not know the date of their arrival in Jerusalem or the length of time they resided in the city, or the projects on which they worked. Only one is mentioned after that period, which leads us to conclude either that their contract to undertake or to supervise architectural projects in Jerusalem came to an end, or that they came to Jerusalem specifically because of the many employment opportunities there. The names of thirty out of a total of thirty-eight *mi'maris* (79 percent) recorded after the departure of those from Aleppo show that they were locals. No Egyptian *mi'mari* is recorded in the period of this study, although a document (Sijill 12: 360) dated 18 Rabi' I 942/15 September 1535 records that Bairam Jawish went to Egypt to bring back master builders (see the list of names of builders below).

Nothing in the *sijills* that I examined indicates the level of wage received by a *mi'mari* who undertook an official enquiry. The documents related to restoration that were presented to the *qadi* were witnessed by one or more builders who supervised the work. The term 'builder' (*mi'mari*) was applied to a master of a particular building skill, such as the man who applied the mortar (*qassir*), or pointing (*kahil*), or the 'constructor' (*banna'*) of walls. The salary of *mi'maris* ranged between 25 and 30 silver *halabis* a day. 10 *'uthmanis* were paid as a daily wage for a master renovator and likewise to a master of mortaring and pointing (Sijill 1: 399). The salary of the master Mahmud, the son of the Qadi of Salt, was 210 silver *halabis* for eight days of work, which was also the salary of the master Ghanim ibn Nammar for spreading *qusurmil*, gap-filling and sealing (*sirara wa taghliqa*) (Sijill 10: 130). The sum of 60 silver *halabis* was the daily wage for the master stone mason (*nahat*) in the soap factory of Ibn Abi Sharif in the

Jewish quarter, at a time when 1,000 silver *halabis* were paid to the master of copper casting in the same soap factory (Sijill 13: 268). The wage of an artisan (*sani'*) was half the wage of the *mi'mari*, while the wage of a labourer ranged between 8-10 *halabis* (Sijill 4: 35). It was one of the conditions of employment that the employer provide food (*ma'una*) for all the workers in addition to their wage. Thus we find, in all of the documents concerning restoration work, the price of *ma'una* quoted. There follow recorded examples of the prices of construction supplies and the salaries of workers in silver *halabis*.

Materials	Price in <i>dirham halabi</i>
Door for a storeroom	35
Door hinges (<i>mufassala</i>)	5
For each 100 stones of hard <i>qashim</i>	30
For each 100 stones of soft <i>nari</i> stone, dressed	60
For each 100 stones of <i>nari</i> paving for ceiling	15
Lock (<i>zarfi</i>)	11
Lock for a door (<i>sukkara</i>)	10
Iron door for mausoleum	150
Load of <i>nari</i> stone	6

Worker	Wages in <i>dirham halabi</i>
Carpenter	20-30
Artisan (<i>sani'</i>)	12.5
Hoeman (<i>mujarifi</i>)	10
<i>Jabbal</i> (work with <i>turiyya</i> , hoe)	10
<i>Jabish</i> (work with rubble stone)	10
<i>Mu'allim sirara</i> (skilled in use of small stones between courses)	25
Sievelman (<i>gharapi'li</i>)	8-10
Plasterer (<i>saqqal</i>)	5
Water-carrier	7-12
Unskilled workman (<i>fa'il</i>)	5-8

Mortar (*shid*)

Two materials in particular were used in construction work: mortar (*shid*) and *qusurmil*, while sand was also used, but to a lesser extent. In one of the documents, it is recorded that a basket (*zanbil*) of slaked lime (which was also known as *shid*) as well as high quality lime was submitted to the court by the supervisor of the restoration of the Haram al-Sharif, for the purpose of setting the price, at a time when the cost of it was estimated by a specialist at a rate of 8 *uthmanis* per *qintar* (Sijill 1: 399). The mortar was brought from the villages surrounding Jerusalem; the names of Bait Hanina, Bait Jala, Lifta, Bait Fajjar, and Burqa are all recorded. The mortar was sold both by the *qintar* and by the load. It seems from the price recorded that a donkey load (*al-himl*) was about half of a *qintar*. The

place where mortar was worked was called a *latun*. The price of a *qintar* collected from the *latun* of the village of Burqa was 25 *halabis*, while its price in Jerusalem once reached as high as 55 *halabis* (Sijill 13: 58), presumably because of the cost of transportation. The prices of this commodity were not stable. At the beginning of our period a *qintar* sold for 40 *halabis* (New Series Sijill 1a: 43), while in a later period a *qintar* sold for 72 *halabis* (Sijill 10: 65). The lowest price recorded for a load was 10 *halabis* (New Series Sijill 1a: 87), but later it reached 15 *halabis* (Sijill 7: 139). On 2 Rabi' II 947/6 August 1540 a document records an agreement between the representative supervising the restoration of the walls, Muhammad al-Naqqash and six people from Bait Hanina, Bait Fajjar and Jerusalem, to transport mortar for the walls of Jerusalem on forty camels. They pledged to do this for five months and that the price of a camel-load would be 20 silver *halabis*, on condition that all the camels would be available for work (Sijill 12: 400). The mortar was used as a binding material in the construction of walls (for restoration) and was as strong as the cement used today.

Qusurmil

The basic source of *qusurmil* was from baths. It was an ashy by-product (*ramad*) from burning the wood used to heat the water, and it was sold by the load. The lessee of the Hammam Tankiz sold 408 loads of *qusurmil* for the renovation of the Khan Tankiz for 4,100 silver *halabis* and in addition paid the transport costs of one *halabi* for each load (Sijill 6: 354). In a later period, 200 loads of *qusurmil* from the same bath were sold for 1,500 *halabis* (Sijill 12: 829). The lowest price recorded in the period for a load of *qusurmil* was 4 *halabis* (Sijill 10: 81). *Qusurmil* was used for mortaring walls; the operation was termed 'to apply (*darab*) the *qusurmil*'. The material was first sifted and then kneaded (*jabala*), giving the name of the artisan—*jabbal*. Other materials had to be added to the *qusurmil* to render it serviceable. After preparation, the master craftsman first applied the substance to the walls and later smoothed it over (Sijill 4: 35). *Qusurmil* was also used to seal roofs of rooms. It seems that it was applied with some sort of tool. The master who undertook this task was called 'the pounder (*daqqaq*) of the *qusurmil*'. The daily wage of the 'master' and the 'pounder' of *qusurmil* ranged between 25-30 silver *halabis*. Wells too were lined with *qusurmil* in order to render them water-proof. That task was termed *samal* (Sijill 3: 323).

Sand was purchased from a pottery workshop. Of the three types of building material, it was the one mentioned most infrequently and was the least expensive. Six loads of pottery sand were sold for 18 silver *halabis* (Sijill 2: 238). All three materials were sold at higher prices to soap factories. Other materials were used in

construction, but less often, such as red earth (*turab ahmar*), chalk (*huwar*), and brick dust (*humra*) (see the appendix of the document of the inspection of the Khan of Charcoal and the *wakala*, and the assessment of the costs of repairs).

The names of the builders in Jerusalem between April 1529 and September 1542

(The names followed by an asterisk* are those of builders mentioned in the first Sijill of the New Series):

Ibrahim ibn al-Qara'i
 Ibrahim ibn Ma'tuq al-Halabi (*mu'allim al-mi'mariyya*)*
 Ibrahim ibn Hajj Yusuf al-Halabi *
 Abu Bakr al-Mashtub, the builder of walls
 Abu 'l-Jaud ibn Da'na al-Khalili *
 Ahmad ibn Khalil al-Shukhais
 Ahmad al-Hamidi
 Ahmad ibn Salim al-Khuraishi
 Ahmad ibn Sharaf al-Din Musa, the son of the *qadi* of Salt
 Ahmad ibn Muhammad al-Sa'di al-Jarkasi (from Circassia)
 Ahmad ibn al-Najjar
 Hajj Isma'il
 Jirjis ibn Yuhanna al-Nasrani
 Hasan ibn Ibrahim al-Dimashqi, the builder of the walls of Jerusalem
 Hasan al-Khalili
 Husain, the son of the late master 'Ali ibn Nammar (*mu'allim al-mi'mariyya*)
 Husain ibn Mahmud al-Rumi
 Husain ibn Nafi' al-Halabi *
 Khatab
 Al-Hakim ibn al-Hasan
 Darwish, the master builder in Aleppo and of the walls of Jerusalem
 Rajab ibn Yahya al-Antaki
 'Abd al-Rahman al-Tawil
 'Abd Allah ibn Nammar
 'Ala' al-Din ibn Abi 'l-Naja al-Husari
 'Ali ibn Ramadan al-Halabi *
 'Ali ibn Nafi' al-Halabi *
 'Ali ibn Wishah
 Ghanim ibn Ahmad ibn Nammar *
 Ghanim ibn 'Abd al-Rahman ibn Jibrain
 Fath al-Din al-Sani'
 Majd al-Din ibn al-Bajali
 Muhammad ibn Ibrahim Abi Fak'ash
 Muhammad ibn Akhi Khatab
 Muhammad ibn al-Hamawi al-Shami
 Muhammad ibn Shaikh al-Bahr

Muhammad ibn Hajj Muhammad ibn 'Uwais al-Ramli *
 Hajj Muhammad ibn Mansur al-Halabi *
 Muhammad ibn Nafi' al-Halabi *
 Mahmud ibn Sharaf al-Din Musa, the son of the Qadi of Salt
 Mahmud ibn 'Abd al-Rahman al-Halabi *
 Hajj Mahmud ibn 'Abd Allah al-Halabi
 Musallih al-Din ibn 'Abd Allah al-Rumi al-Qanawati, the builder of the walls
 Musa ibn al-Sayyid Abi 'l-Khair
 Nammar, son of the master Ahmad ibn Nammar
 Yahya ibn Salim al-Ramli

VI. Social aspects

a. Inheritance

Documents of inheritance and the apportionment of legacies are scattered throughout the *sijills* in Jerusalem, like the other documents. I found only one *sijill* in the Department of Islamic Heritage devoted to this type of document, in addition to 73 pages in Sijill 11. It seems that an attempt by the court to keep special *sijills* for matters connected with inheritance did not continue.

Under the heading of inheritance we will discuss two types of documents. First, those known as 'wills' (*wasaya*), i.e., when the individual recorded what he possessed while still alive, whether near to death or with a terminal illness, in the presence of certain witnesses, relatives and a scribe from the court. I found 70 wills, of which 41 are by women and the rest by men. The documents start as in the following example: 'On the date of 3 Shawwal 947/31 January 1541, Amina, the daughter of Hajj Muhammad al-Dimashqi, living in the Zawiya of our Lord Shaikh Muhammad al-Qirami, testified in sound mind and possession of her faculties, although unwell in body, that what she possessed on the above date were a blue shirt, a blue kerchief ...' (Sijill 11: 71). The registration included everything without exception, even small details. The document informs us about the work of the testator/testatrix and the place of residence, the type of work, whether they were from Jerusalem or elsewhere, whether rich or poor, married or divorced, and with how many wives (if a man) or children they had. It appears that the wills were registered because of pressure from the heirs to ensure against loss of any part of the possessions after death, or else due to the fear of the person making the will that disputes that might occur among the heirs, especially if the person were wealthy. The motivation for registering the wills of women or men who were resident in public institutions or had neighbours of good conscience was a fear that either the institution or the neighbour—or indeed anyone—would be accused of taking possessions from the

estate, and to make sure that the inheritance reached the beneficiaries, whether the heirs or the public treasury. In this last case the person responsible for the public treasury prepared the recording of the will. In one will it is recorded that a person from Nablus, who was a resident in the Jewish quarter, ‘did not have a claim on any person either of the Muslims or of the Jewish sect, and that in the presence of Hajj Ahmad ibn Firi, the spokesman for the public treasury in Jerusalem ...’ (Sijill 13: 205). The will sometimes records the manner of dividing the portion of the bequest that a Muslim was permitted to distribute according to Islamic law.

The second type of document connected with inheritance concerns those produced after the death of the individual, when all of the movable or unmovable property owned by the deceased, as well as their debts, were recorded. Most often such a document begins as in the following examples: ‘Settlement of the estate of Fatima bint Muhyi al-Din’ (Sijill 1: 258); or ‘The estate of the late Salim’ (Sijill 6: 369), or ‘Settlement of the sales of the estate of Fatima al-Rumi’ (Sijill 11: 6). The funerary rites began immediately after death; these are referred to as ‘the exit’ (*kharija*) in the *sijills*, a term that refers to the preparations and actions that must take place before the deceased can be taken from their residence. The preparations include the purchase of a shroud, if the deceased had not bought one during their lifetime, cotton and thread, the purchase of the items required for washing the body, payment for digging the grave and for the pall bearers. Washing the body of the deceased required written permission (a permit—*waraqa*) from the Shari’a court and from the *subashi*, whether it took place in the house in which the person had died or in the designated place next to the east door of al-Aqsa Mosque (Sijill 2: 74). On 12 Safar 940/2 September 1533 a document records a warning to the washers ‘that they should not perform the washing of deceased Muslims without a paper from the Shari’a court and a paper from the *subashi* in the city, and when they perform the washing of deceased Muslims in the countryside or in the city without a paper, they are required to pay 100 ‘*uthmanis* to the ruler of the city of Jerusalem’ (Sijill 3: 232). On 10 Muharram 944/19 June 1537, Shaikh Ahmad al-Nasiri became the *shaikh* and spokesman for those who performed the washing of the dead. At that time he again requested them not to wash the dead without his knowledge and a paper from the Shari’a court (Sijill 6: 537).

The cost of the ‘exit’ is the first charge on the testated inheritance of the deceased, if there was a will. If the deceased was intestate, the ‘exit’ charge was borne by the estate. The first legal right connected with the deceased after death was the preparation for burial. That took precedence over payment of any debt, which included the balance of the dowry of a wife (al-‘Abadi 1975, 2: 181). A Muslim is entitled according to Islamic law to bequeath

only a third of his property away from his heirs, while the remainder must be divided among them. The determination and recording of the estate took place in the presence of the heirs and a scribe from the court. Then the estate was sold at auction or passed down by inheritance. For example, the value of the estate of Mustafa al-Shawish was 951 ‘*uthmanis*, of which 128 ‘*uthmanis* were spent on the ‘exit’. Alms, ‘merit’ (*thawab*) and the fees for witnesses and for the division of the estate came to 90 ‘*uthmanis*—that is, the total expenses were 218 ‘*uthmanis*, which represented 23 percent of the total estate. The remainder was placed as a security with the spokesman for absentee property and the public treasury until such time as Mustafa’s wife and two daughters, who were then in Damascus, arrived (Sijill 4: 123). From the will, sums of money were disbursed according to the specifications of the deceased. One text records ‘Fee for fulfilling the prayer’ (*isqat*) (Sijill 11: 28). That means that the deceased had missed some of the obligatory prayers during his life and that he set aside part of his estate to fulfil these missing obligations. Occasionally the fulfilment of prayer and fasting were repeated, as in a document connected with the estate of Mustafa al-Rumi, who left the sum of 400 ‘*uthmanis* for that specific purpose (Sijill 1: 305). Most of the documents that mention the fulfilment of prayer and fasting concern Turks. The inheritance was recorded in court. The fee paid for this was always 25 *halabis* (Sijill 1: 34). The fee for division of the property varied from one estate to the next, and in one document reached 3 percent of the whole estate (Sijill 2: 8). The total estate of Asil al-Misriyya was 4,471 *dirhams*, from which the following sums were spent for her ‘exit’ (Sijill 2: 229):

Funerary costs	Fee in <i>dirhams</i>
Digging the grave	20
Washing	15
Rental of the <i>dakka</i> (the long table on which the deceased was washed)	5
Shroud	230
Merit (<i>thawab</i>)	20
Cotton	15
Water	5
Fee for the register of the Court	25
Fulfilment of prayer (<i>isqat</i>)	100
Semolina, with the fee for bread (for preparing food)	90
Syrup and sesame oil (for preparing food)	45
Tray of meatballs (for preparing food)	65
Bread (<i>ruqaqs</i>) (for preparing food)	8
Extras (unspecified expenses)	5
Fee for woman servant during life of deceased	50
Fee for the <i>efendi</i> (<i>qadi</i>) (Sijill 2: 232)	100
Total	<i>dirhams</i> 798

The *qadi qassam* performed the division among the debtors of the civilian estates. In the case of the estate of military personnel, the task was undertaken by a *qassam 'askari*. The public treasury benefitted from those individuals who did not have heirs, in which case the *subashi* sold the estate and deposited the value of the items after the deduction of expenses (Sijill 1: 319). A dispute arose between the *subashi* and the Magharibis, represented by their *shaikh*, Ahmad al-Masmudi, about the estates of deceased North Africans who had no heirs. The Magharibi *shaikh* presented to the ruler of the *sanjaq* old decrees indicating that the colony of the Magharibis were entitled to inherit the estates of those of their community who died without heirs, and this was duly confirmed by the ruler (Sijill 7: 41).

Some documents record wills and inheritance connected with Christians in Jerusalem. They all concern poor members of the communities; 'Murad ibn Turus the Christian, a monk resident in the Armenian Monastery on the outskirts of the city, testified that all he possessed was the shabby clothes on his back and that he was one of the destitute Christians who possessed no money' (Sijill 7: 17). Another inheritance document records 'Settlement of the estate of the deceased 'Abd al-Masih the Ethiopian, whose legal heir is the public treasury and whose estate consists of a robe and blue mantle' (Sijill 4: 229).

Among the general documents of inheritance concerning men, 24 documents are connected with Muslims who were not residents of Jerusalem. They were of various nationalities including Indian, North African, Egyptian, Syrian, Yemeni and Turkish, these last forming the largest group. 12 people in the sample are referred to as being *hajji*, which means that their original presence in Jerusalem was to fulfil a religious obligation, and for one reason or another they had stayed there. At the same time the title *hajji* is used to describe only one resident of Jerusalem in the rest of the 33 inheritance documents. 29 documents concern women who were not from Jerusalem, three of whom are identified as *hajja*. One was a Turk from Asia Minor and two were from Aleppo. The largest group of women, fourteen in all, was Turkish.

The inheritance documents give us valuable information about the types of clothes worn by both sexes, as well as the type or origins of household equipment. As an example, one poor widow possessed 'the Egyptian clothes on her back consisting of an old shirt, an old large white outer garment and a skullcap on her head' (Sijill 7: 137). Various types of furniture were found in the houses, such as a Rumi carpet, a carpet of noble manufacture, a blue Yemeni blanket, a yellow Indian blanket, an Aleppo blanket covering, a silk seat, a yellow seat-cloth, a pair of chairs, a wooden bed, a red bed, a Hurmuzi pillow, a pair of cotton side cushions, a blue and pink Hurmuzi mosquito net, a black bath robe. This type of document also provides

us with the names of utensils used by different professions, such as are recorded in the estate of Nasir al-Din ibn al-Jamus al-Zaradkash (who manufactured iron chain-mail). Among his tools are listed files, hammers, pincers, and steel awls (Heritage Sijill 52). The types of tools used in book binding are also recorded; these include a file, chart compass, knife blades, iron burnisher, pliers, seven iron engraving hammers, and a binding tool (Heritage Sijill 35). Inheritance documents for a manufacturer of bows and arrows, a farrier, a tailor and others have also been located.

b. Marriage

The documents concerning marriage inform us about the organisation of social life in Ottoman Jerusalem and give us a clear picture of family life, the level of dowries and the rights of women during our period, in addition to the role of women generally in society and the proportion of non-Jerusalemites resident in the city.

I examined 155 marriage documents; of these, 13 concerned minors, 30 virgins of legal marriageable age (who were occasionally termed 'adolescent virgins', *bikr murahaqa*), 55 divorcees or widows (*thayyib*). 36 relate to divorces and 21 concern cases of divorce at the instance of the wife (*mukhala'a*) (meaning that it was the woman who sought the divorce before renouncing her rights). The study of this sample shows that in the 16th century the Jerusalem family was not overly cohesive. The rate of divorce was as high as 23 percent, but if we include the cases of divorce at the instance of the wife, the level increases to 36 percent. However, it should be kept in mind that a portion of divorces (*mukhala'a*) at the request of the wife ended with the wife returning to her husband. The marriage contracts were recorded in the Shari'a court in order to protect the rights of the wife with regard to both the advanced dowry (*mu'ajjal*) and the delayed dowry (*mu'ajjal*) and are the most important confirmation in the case of marriage. The court charged a fee for marriage contracts. I did not find anything that indicated the level of the fee, although one document records that the amount of income from an unspecified number of marriage fees for a period of ten months was 627 'uthmanis (Sijill 13: 127).

Dowries are divided into two types. The advanced dowry is paid to the legal guardian of a girl in order to prepare her for marriage and ordinarily is half of the full dowry. The second part is delayed, and is paid to her upon the death of her husband or on divorce. In addition to the dowry, the cost of a yearly set of clothes (*kiswa*) was often paid to the wife. The highest price for a set of clothes recorded in a contract which was paid to a virgin who was a minor was 750 *dirhams* (Sijill 8: 9).

The guardian (*wali*) of a girl who was a minor (whether her father, brother, or uncle) had the right to arrange her marriage after obtaining her approval, if he

considered it to be in her best interests. As a result this type of marriage was frequently based on the interests and monetary benefit of the minor girl's guardian rather than on her own. The average dowry of a minor was 4,500 *dirhams*, while the lowest amount paid was 1,250 *dirhams* for a minor who was an Indian, and the highest amount was the 10,000 *dirhams* that Farhat al-Sibahi paid (Sijill 13: 114). He, as we know from an earlier document, married a daughter of Sinan al-Sibahi, a virgin, for a dowry of 5,800 *'uthmanis* (Sijill 7: 169). The document in this case identifies the girl's guardian: 'and her father married her to him for that (dowry) by his authority of guardianship' (Sijill 7: 223). Occasionally the marriage of a minor was handled fraudulently for financial gain. One document (Sijill 12: 430) records a marriage in which Khalil al-Jafali married his minor son as though he were of legal age to the woman Sitt al-Hana, who had been divorced by Hajj 'Umar al-Halabi, for a dowry of 100 *'uthmanis*. In a record on the same document, the wife requests the husband's father to divorce her from his son and he agreed. The *qadi* ruled that no waiting period (*'idda*) applied because the husband had not reached puberty. The wife returned to her divorced husband immediately with a proper contract and a new dowry.

The dowry of a virgin was higher than the dowry of a minor. The highest dowry of 60,000 *'uthmanis* (150,000 *dirhams*) paid for a virgin of legal age was exceptional. Half was paid and from the remaining 30,000 *'uthmanis* her guardian (her father, who was the previous inspector of the Two Harams), deducted 20,000 *'uthmanis* for Muhammad Subashi ibn Hamza, the bridegroom. The remaining 10,000 *'uthmanis* remained as a delayed dowry for the bride (Sijill 2: 79). One of the conditions for the validity of the marriage contract was the agreement and wishes of the girl herself. It was customary for two witnesses to witness that the girl agreed to the marriage and that she delegated her father or guardian to arrange it so that the contract could be concluded. The smallest dowry paid to a virgin of legal age was 4,000 *dirhams* (Sijill 3: 61). The average dowry for this type of marriage was 7,000 *dirhams*, excluding the exceptionally high dowry mentioned earlier.

A variety of documents record the marriage of foreign Muslim men and women, both Arabs and non-Arabs—Egyptians, North Africans, Indians, and Rumis (Turks). The largest group of marriage contracts recorded was for people from the city of Karak in southern Jordan. We notice that most of the marriages of these non-local Muslims were either to a divorced woman or a freed slave, with three exceptional cases in which people from North Africa, Malta and Karak married minors. The lowest amount for a freed slave was a delayed dowry of 200 *dirhams* paid by Hasan al-Khaluti (Sijill 1: 173). Mahmud al-Malti married a divorced woman for an advanced dowry of 150 *dirhams* and a delayed dowry of 100 *dirhams* (Sijill

1: 406). Murad al-Rumi married a divorced Egyptian woman for an advanced dowry of 100 *dirhams* (Sijill 2: 175). Naturally the social and economic position of the husband and wife determined the size of the dowry. The *qadi* 'Izz al-Din Muhammad al-Thayyib married Fatima al-Khazraji for a dowry of 10,000 *dirhams*, 6,000 in advance and the remainder delayed (Sijill 5: 54) and the Amir Bayazid al-Dhikri married a widow for a dowry of 9,500 *dirhams*, 4,500 of them in advance (Sijill 13: 59). It seems that many of the professions of the strangers were of a low status, such as doorman, press operator, maker of donkey saddles, seller of pickled vegetables, or porter. Once the occupation of an Egyptian woman was recorded as a lady's maid from al-Jiza (Sijill 10: 21).

Occasionally the woman came to the court to present her complaints herself or through her representative. One woman complained of her husband that although he had married her fourteen months earlier, she was still a virgin, and so she sought a divorce. The husband requested a delay of three more months before he would be able to live with her (Sijill 10: 109). The woman had the freedom to impose some conditions in the marriage contract. One woman of Damascene origin made a return to her husband conditional on the promise that he no longer beat her without reason, or marry another wife, or prevent her from travelling to visit her family (Sijill 10: 53). One wife imposed the condition in the contract that her husband would divorce her if he did either of two things: (1) marry another wife, either personally or through his agent, or cheat her by having an affair with a slave girl in the city of the contract (i.e., Jerusalem), or by having an affair during his travels and bringing the girl back with him to Jerusalem or its vicinity, in which case it was imposed upon him legally that she would be divorced; and (2) if he took her from the house in which they were to reside, located near the house of her father in the Sharaf quarter (Sijill 7: 96). The repetition in the conditions of marriage that the husband should not marry another woman indicates that the practice of polygamy was common in Jerusalem.

In the case of divorce, the husband was required to support the wife (*nafaqa*) until her waiting period (*'idda*) was over. The amount of support was higher if the wife had children by the husband. The level of support paid by Hasan the Janissary in the Citadel of Hebron was 2.5 *dirhams* per day (Sijill 7: 18). In one case, the *qadi* ordered 3 *'uthmanis* (7.5 *dirhams*) per day to be provided as support for two children and their pregnant mother (Sijill 7: 152). Taj al-Din ibn Ahmad al-Sukari brought a case to the court because of an excessive increase in the level of daily support to 5 *'uthmanis* and an excessive yearly clothing allowance of 600 *'uthmanis*. It seems that the amount was imposed on Taj al-Din in the marriage contract for his wife, the daughter of the chief *qadi*, 'Izz al-Din 'Abd al-'Aziz

Muhammad ibn al-Dairi. The *qadi* decided upon a rate of 3 'uthmanis per day for both support and clothing (Sijill 7: 259). Some documents record the amount of support that a family needed each month, and it seems that this was the result of the failure of the husband to fulfil his responsibilities to support his family, which led to the wife or her family being forced to raise the case in court, demanding that the husband be required to support his family. The husband, Ahmad ibn Hujij, was required to provide his wife and two children with the wherewithal for the following items every month: 3 *mudds* of milled flour, 2 *ratls* of oil, 3 *ratls* of lentils, syrup, chick peas, 1 *mudd* of beans, 5 cakes of soap, 2 *ratls* of rice and 5 *uqiyas* of clarified butter; every two months he was to supply 10 *dirhams* for bathing, every 10 days and 1 *ratl* of meat (Sijill 7: 252). In another document the husband laid upon himself to provide his wife each month with 1 *mudd* of sifted flour, 3 *uqiyas* of oil, 3 *uqiyas* of sesame oil, 1 *ratl* of syrup, 0.5 *ratl* of cheese and each week 5 *dirhams* with which to buy meat (Sijill 12: 51).

Male and female slaves were an integral part of Jerusalem society, even if they were limited to the upper classes. The colour, price and religion of slave girls are recorded and a distinguishing mark, if any, for a male slave. If a slave-girl or a male slave was set free, they were identified in the official contracts according to whoever had freed them, as for example: 'The husband Mubarak ibn 'Abd Allah, the freed slave of Yusuf Sinan known as the "Egyptian" and the wife Najiya of legal age (*bint 'Abd Allah*), the freed slave girl of Jabir ibn Jabr one of the *shaikhs* of the trade' (Sijill 10: 190). The trade in slaves was a characteristic of the age. A black Muslim slave girl called Hilwa was sold for 2,600 *dirhams* (Sijill 2: 24). Taj al-Din ibn Ahmad al-Sukari bought a white Muslim slave girl named Mahrana for his wife Sitt al-Qudat for 5,000 'uthmanis. She exchanged part of the price for a 'red' slave girl for 1,600 'uthmanis and a black male slave for 2,000 'uthmanis (Sijill 7: 7). In a later period Sitt al-Qudat sold the same slave girl, Mahrana, for 50 *afluri* gold pieces (4,000 'uthmanis) (Sijill 7: 268). An adolescent black Ethiopian slave called Yaqut was brought to court and among his distinguishing marks was a tribal mark (*wasm*) between his eyes (*mashhut*), while the top of his right ear was cleft. He was sold for 4,500 *dirhams* (Sijill 8: 391).

c. Professions

The concept of professional employment as understood today did not apply in the Ottoman period. The documents in the *sijills* of the Shari'a court do not distinguish between work in a trade or guild (such as butchery, which we would today term 'non-professional'), and a profession with a fixed salary, such as that of a teacher or a doorman. All of

the posts are equally termed 'professions' in the *sijills*. The professions that are mentioned in the documents can in general be divided into two types: (1) private professions, and (2) professions in the Haram al-Sharif and the *madrasas*.

i. Private posts

These were supervised by the *subashi* and his assistants, while other professions were the concern of the *kikhiya* (deputy ruler of a *liwa*), including those of patrol ('*asas*) and guard (*ghafar*), prison staff, court ushers (*mudhir*), care of absentee properties (*mal al-ghiyab*), lost property (*mal mafqud*) and appointment of the *shaikhs* of the quarters. Because most of the fees for these professions went to the ruler of the *sanjaq* of Jerusalem, a single person often filled more than one post. These fees are known in the *sijills* under the term 'fees of the province' ('*awwa'id al-wilaya*), i.e., the province of Jerusalem. Muhammad ibn Mahmud, known as Abu Shanaq, leased (*tadaman*) the posts of supervisor of patrol (*al-'asasiya*), absentee property (*mal al-ghiyab*), the treasury (*bait al-mal*), lost property (*mal mafqud*) and tax (*aywa*), all for a yearly sum of 10,000 'uthmanis (Sijill 5: 187). Once the post of patrol was leased separately for a monthly fee of 450 'uthmanis (Sijill 3: 56). Four years later the price of the patrol increased to 1,100 'uthmanis (Sijill 6: 363). It seems that this particular profession was not popular with the people. We infer this from one document in which one of the members of a patrol testified on his own behalf that he would not work in the patrol and would not enter the house of the *subashi* from that day on (Sijill 7: 231). There was more than one prison in Jerusalem. The highest amount (*tadmin*) paid for the Prison of the Deputy (*niyaba*) reached 400 'uthmanis monthly (Sijill 8: 359). It is possible that prisoners paid a fine instead of being incarcerated in the prison; so far no firm evidence has been found in the *sijills*. Another prison of unspecified location but part of the endowments of the Salahiyya Bimaristan had a monthly rent of 100 *dirhams* (Sijill 12: 294). A document of renovation records in passing that the Jaliqiyya Madrasa was used as a prison for anyone who had legal charges proven against him (Sijill 5: 137). Likewise there is a reference to the Prison of the Subashi. We do not know if there were more than these four prisons in Jerusalem.

The post (*wazifa*) of guarding and accompanying (*ghafar*) the travellers and the goods which were coming to Jerusalem amounted to 13,386 'uthmanis for a period of twenty months (Sijill 13: 122). The post did not include responsibility for loads of wheat, barley, cotton, or raisins nor for guarding or accompanying Jewish and Christian travellers. This probably means that they were under the protection of a different person. One document lists six people who undertook the profession of court usher

(*mudhir*), their representative being Hajj Mas'ud (Sijill 3: 112). This profession, like the others, could be sub-let. The *kikhiya* in the Citadel leased from Hajj Ahmad ibn 'Abd Allah his profession of court usher for a period of two years in exchange for 4,300 'uthmanis (Sijill 10: 146). The *kikhiya* then in turn sub-let the post for a year at a daily rate of 10 'uthmanis (Sijill 10: 238). This means that the *kikhiya* made a profit over the period of two years of 3,000 'uthmanis, if we assume that the rent remained without any increase at a level of 10 'uthmanis per day.

Included as part of the post of *kikhiya* was the appointment of the *shaikhs* of the various quarters of Jerusalem. Yahya al-Sharif appointed a *shaikh* for the neighbourhood of Bab Hutta in the place of the two previous *shaikhs*, 'Ali ibn Hashish and Shuman (Sijill 4: 606). In the subsequent period, Husain ibn al-Hajar was appointed in his place (Sijill 7: 241). A group of the residents of the Bab al-'Amud quarter requested that Khalil al-Salti be appointed *shaikh* of their quarter (Sijill 10: 587). The tasks of the *shaikh* of a quarter included keeping the area secure, keeping in touch with its residents and solving any problem that might arise. The *shaikh* represented governmental authority within the quarter, and there is no indication that he either claimed or was entitled to receive a fee for any action he undertook on behalf of the residents of his quarter.

Among the market professions was that of the broker (*al-dalal*), who brokered or sold goods. Most of the duties of a broker formed part of those of the *muhtasib* and were rented along with that post. Occasionally the profession was called 'calling the goods' (*al-tasaih 'ala al-bata'*); the term was applied to the broker of the slave market, and the market of the merchants, the property market, and the donkey and cattle markets (Sijill 6: 684). Other brokerage posts that are mentioned are the broker of cloth in the wickerwork (*al-qashashin*) market, which means that cloth must have also been sold there (Sijill 12: 72), and broker of the thread market (Sijill 12: 470).

ii. Posts in the Haram al-Sharif and *madrasas*

The professions involved in the *madrasas* and the Haram al-Sharif—the ones most frequently recorded in the *sijills*—include the posts of administrator, *shaikh* of a *madrasa*, trustee, teacher, tax collector, doorman, lighter, janitor, water carrier, and reader of parts of the Qur'an in the *madrasas* and the Haram. The *madrasas* are referred to in the *sijills* when the documents relating to the posts are recorded or when the buildings underwent reconstruction, or rental of their endowments. The *sijills* provide us with detailed information about the *madrasas*, and in particular about the posts which provided an important source of income for a large portion of the reciters and scribes in the Ottoman period with which we are concerned. Reciting the

Qur'an in the Fanariyya Madrasa was restricted to Turks, to the exclusion of Arabs, and an edict from the *qadi 'askar* was issued to that effect (Sijill 6: 386). All of the Mamluk *madrasas* continued to be active in the Ottoman period and had students, teachers, and other employees. Each *madrasa* formed its own economic unit with its own endowments and staff. The income of the *madrasa* was provided by its endowments and as a consequence the income varied according to the property with which each had been endowed. We will limit ourself to a few examples. In 943/1536 the income from the endowments of the Arghuniyya Madrasa was 10,000 'uthmanis. Of that sum, 600 'uthmanis were paid out for the *shaikh* and for tuition. The *madrasa* had twelve Qur'an reciters, each of whom received 32 'uthmanis a month (Sijill 6: 379). The highest salaries in the *madrasas* were received by the trustee, the administrator, the *shaikh* of the *madrasa* and the tax collector. The salaries of the main employees varied. The *qadi* Burhan al-Din ibn Nusaiba al Khazraji, the administrator of the Arghuniyya Madrasa, received the fixed sum of 2,500 'uthmanis for the year 941/1534, and the *qadi* Abu 'l-Ma'ali Muhammad ibn al-Dair, the *madrasa's* trustee, received 2,900 'uthmanis for the same year. The tax collector received 700 'uthmanis, while the beneficiaries received 1,600 'uthmanis and the fee for court registration was 100 'uthmanis (Sijill 6: 403). In the following period, Ahmad ibn Abi 'l-Lutf presented a licence (*bara'a*) testifying that he was the administrator of the Arghuniyya Madrasa at a daily wage of 8 'uthmanis. He received 1,800 'uthmanis during his first period of work (Sijill 1: 73). The former trustee and *shaikh* of the Taziyya Madrasa and his brother, the former administrator of the *madrasa*, brought a claim to the new administrator, demanding from him their agreed salary for each of their positions for 947/1540 at a rate of 3,600 'uthmanis for the first and 2,160 'uthmanis for the second. A dispute arose among the beneficiaries of the Tankiziyya Madrasa over their salaries, and the *qadi* duly ruled that renovating the *madrasa* took priority over payment of their salaries (Sijill 12: 529).

Renting the *madrasas* for residential use started at the beginning of the Ottoman period. The *qadi* granted permission to Muqaddim ibn Mustafa al-Taimari to live in the Yusufiyya Madrasa in exchange for renovation of the mosque, furnishing and lighting it, holding prayers there, and instruction of the children (Sijill 12: 132). Likewise the Mawardiyya Madrasa was inhabited. Its tenant, Sinan al-Sughnaji, undertook its renovation for a sum of 2,000 'uthmanis (Sijill 5: 309) and Bairam Jawish spent 1,600 'uthmanis on the renovation of its dome, according to the testimony of the architect of the walls, Musallih al-Din ibn 'Abd Allah (Sijill 7: 435).

The posts were inherited just like private property, and their sale, in exchange for a sum of money, the amount

of which was sometimes specified, was recognised. Hajj Ibrahim was appointed to recite a part of the Qur'an from the copy endowed by Sultan Sulaiman each day after morning prayer in the Dome of the Rock for the benefit of the sultan's deceased father, Sultan Selim. The *qadi* appointed Hajj Ibrahim and allowed him to find a substitute whenever it was necessary (Sijill 12: 293). Two brothers gave up the post of 'reciters in any place', for which a house in the Wadi al-Tawahin had been endowed, in exchange for 8 *sultani* gold pieces (Sijill 12: 155). Another individual left a similar position in exchange for 1,300 *'uthmanis* (Sijill 7: 108). Sometimes the amount was not specified and it seems that the agreement was reached privately, although the transaction was registered in court to protect the rights of the buyer. Even the profession of janissary was rented. 'Ali ibn 'Abd Allah resigned the post of janissary in the Citadel, the daily salary of which was 6 *'uthmanis*, in favour of Yusuf ibn 'Abd Allah al-Rumi. The sum that he received in exchange for demitting the position is not recorded (Sijill 12: 350).

Many documents are connected with reciters (*qari's*) of parts of the Qur'an in the Haram al-Sharif. A portion of these documents are connected with disputes over licences giving the right to recite. Most of the copies of the Qur'an were endowed to the Dome of the Rock—those endowed to al-Aqsa Mosque do not make up even a tenth of the total. That is rather strange, but it seems that in the opinion of the endowers the sanctity of the Rock exceeded that of al-Aqsa Mosque. All of the endowed copies of the Qur'an had many readers, sometimes as many as thirty-three individuals. The time and place of reciting a part was specified, together with the amount that each reciter was to receive. The *rab'a* of the Qur'an donated by Sultan Sulaiman was to be recited in the Dome of the Rock each day after the morning prayer. The reciter had the right to arrange for a substitute if necessary, as recorded in one document (Sijill 5: 242). There were thirty readers of parts of the Qur'an endowed by the *ustadar* of Syria in 872/1467, to be read in the Dome of the Rock after the morning prayer, at a cost of 500 *dirhams*, while 450 *dirhams* were spent for those who recited the *Sahih* of al-Bukhari in the Haram al-Sharif in the months of Rajab, Sha'ban and Ramadan each year (Sijill 12: 704). A number of documents are connected with the *rab'a* donated by Ibn Qirman, which dated back to the Mamluk period and which was recited in the Dome of the Rock. The annual amount that each reciter received from that copy was 120 pieces (600 *dirhams*) (Sijill 1: 754). As an example of the disputes over the licences to recite, one case was presented before the *qadi* over the right to recite from the *rab'a* of Sultan Sulaiman. On this occasion, the *qadi* ruled in favour of the man who held the licence with the older date (Sijill 7: 327). Occasionally the *qadi* appointed a new reciter in place of one who had died.

Posts in the *madrasas* and the Haram al-Sharif included those of lighter (*shi'ala*) (the man who lit the oil lamps), carpet spreader (*firasha*) (the man who laid out the mats and carpets), sweeper (*kinasa*—cleaner), caller to prayer (*al-mu'adhdhin*) and—the most important one of all—the inspector. Next in importance was the *imam* and the preacher of the Haram al-Sharif. These last were all positions of high social and professional status. One document records that the income received up to 934/1527 by a preacher in al-Aqsa mosque, the Shaikh Burhan al-Din ibn Jama'a, was 900 old *dirhams*, which at the time of the *sijill* entry had a value of 48 *sultanis* a year (Sijill 13: 84).

On many occasions an individual, especially if he was a *qadi*, took on more than one position and in more than one *madrasa*, irrespective of the type of post. If there was no doorman or sweeper, he arranged for someone else to be a substitute or appointed one of his sons to undertake the work involved in the position. We will mention as an example the posts held by the *qadi* Sa'd al-Din ibn al-Muhandis. He worked in at least five *madrasas* and was one of the beneficiaries of the endowment of the Ashrafiyya Madrasa (Sijill 6: 353). He also had a licence to act as a *shaikh* and water carrier in the Salahiyya Madrasa and, in a later period, he became its inspector (Sijill 10: 142, 279). He and two of his sons are also recorded among the beneficiaries of the endowments of the Fanariyya Madrasa, and they duly received their grant of 27 *sultani* gold dinars (Sijill 6: 335). Sa'd al-Din was also a *shaikh* of the Jauhariyya Khanqah for a yearly salary of 1,800 *dirhams* (Sijill 12, 579). His position in the Ghadiriyya Madrasa was as *imam*, doorkeeper and reciter. A dispute arose between the *qadi* and the tax collector of the Ghadiriyya Madrasa over financial matters. The tax collector (*jabi*) was arrested because of the revenue of the *madrasa*. He said that Qadi Sa'd al-Din ibn al-Muhandis had taken 10,200 *'uthmanis* from the revenue of the *madrasa* and the court asked the *qadi* to return that amount to the tax collector. Qadi Sa'd al-Din had only to present a memo from 'Ali Beg, the *daftardar*, about taking the money from the tax collector and place the money in the citadel until a decree was issued about what should be done with the amount later (Sijill 4: 181, 347). From a later document we know that the struggle for the positions in the Ghadiriyya Madrasa did not stop there. A document was recorded in the presence of the inspector of the *madrasa* in which ten holders of positions in the Haram al-Sharif and elsewhere testified that Qadi Sa'd al-Din ibn al-Muhandis and his sons had held their positions from a period before the Ottoman conquest (Sijill 4: 512).

Conclusion

I have attempted in this chapter to focus on a number of *sijills* of the Islamic law court from the Ottoman period. In

addition to the 415 *sijills* already known to researchers, I have referred to 151 previously unknown documents. No one can attest that the 566 Ottoman *sijills* now known is the final total, because new examples may be found in the future. But this statistical aspect is only a small part of the chapter. The rest concentrates on presenting a general idea about some of the contents of these documents over a limited period of time: 1528-40. For example, I have examined information from the *sijills* relating to buildings—such as soap factories, olive presses, and ovens—and public buildings like baths and *khans*, as well as shops and houses. The chapter also touches upon social aspects, such as marriage, divorce and inheritance.

The study reveals that in general during the Ottoman period Jerusalem, with its buildings, customs, religious endowments and economic system, was a continuation of the Mamluk city—at least in the first half of the 16th century, even if its administration had begun to proceed according to Ottoman law. The religious legal school of the state became Hanafi in place of Shafi'i, as it had been under the Mamluks. There is little doubt that new endowments in the Ottoman period were characterised by their small size, which was a result of the smallness of their economic bases. The exceptions are institutions like the *takiyya* and the baths of the Khassaki Sultan on the Via Dolorosa, which were converted into an Armenian church in the late Ottoman period. The focus of Ottoman attention was the Haram al-Sharif. This is demonstrated by the amount of their building operations, the number of their employees and the gifts of Qur'anic manuscripts, lamps and other items. In spite of this attention, not a small part of the income of the Haram came from endowments which dated back to the Mamluk period. It is clear that the establishment of large endowments in Jerusalem ended with the Ottoman conquest.

One difficult feature of the *sijills* of the Shari'a court is that the information they provide often requires recourse to more than one document. In other words, in many cases it is necessary to study the *sijills* as a group rather than as individual documents. For example, we find information about building operations in documents unconnected with building. The documents complement each other. To clarify the point, the following example is offered.

On 19 Muharram 946/6 June 1539 a document was recorded which was connected with the discovery of a pottery vessel containing money unearthed during the excavation of the foundations for the city wall near the slaughterhouse in the Jewish Quarter. The *qadi* had sent the master builder Husain ibn Nammar to investigate. The vessel had been broken open in his presence and before other witnesses. Old coins had been found inside, and the vessel had been resealed and placed in the Citadel (Sijill 12: 92). About two years later, on 26 Dhu'l-Hijja 947/23

April 1541, workmen found four other bronze coins while digging the foundations of the city wall near the Citadel, and the matter was again brought before the court (Sijill 13: 114). Those two documents are important because they indicate that the construction of the city wall, from the area of David's Gate (Zion Gate) up to the south end of the Citadel covering a distance of some 600m, took twenty-two months to complete—that is, half the time that it took for the construction of the city wall as a whole. This takes into consideration the fact that documents were often not registered in the *sijills* immediately after an event, and could take some time. It is also clear that the construction of the city wall from the foundations up was restricted to certain sections only, whereas in other parts the wall was only repaired with the addition of some courses of stonework to the older surviving construction.

In this chapter it has not been possible, because of shortage of space, to cover all the topics recorded in the *sijills*; but some of the *lacunae* will be itemised in this paragraph. There is a good deal of information recorded in the documents about charitable and inherited endowments—how they were exchanged for other property, or rented, what had been endowed during the Mamluk or Ottoman period, especially with regard to the *waqfs* of the Haram al-Sharif, and the gifts sent from various parts of the Islamic world. Information about the *madrasas* and their endowments is also missing, as is data on their employees, beneficiaries, and residents—whether students, *sufis* or the impecunious. The *sijills* also contain a good deal of information on Jews and Christians—their lives, institutions, economic and social relationships with Muslims, pilgrims and the places they visited, and the taxes they paid. We find information about the libraries of Jerusalem, both private and public, and about endowed copies of the Qur'an, as well as data on the city's water supply, its channels, employees and expenses. We also find indirect information on the number of inhabitants of the city, for example from an order issued by the Sanjak Beg of Jerusalem (Cohen 1978: 39), which reads as follows:

The important people of the quarters are to be brought to the Court, and the places are to be investigated in the presence of the Subashi of Jerusalem. The Subashi came to the Court, then they summoned the inhabitants of the Bab Hutta neighbourhood and ten people were then recorded, for whom Hajj Ibrahim ibn Jabr stood surety, and they were ... (Sijill 15: 536)

One person stood surety for every ten people from a quarter, and the *shaikh* of a quarter stood surety for all the inhabitants of that quarter. That arrangement seems to have developed for the sake of public security in the city;

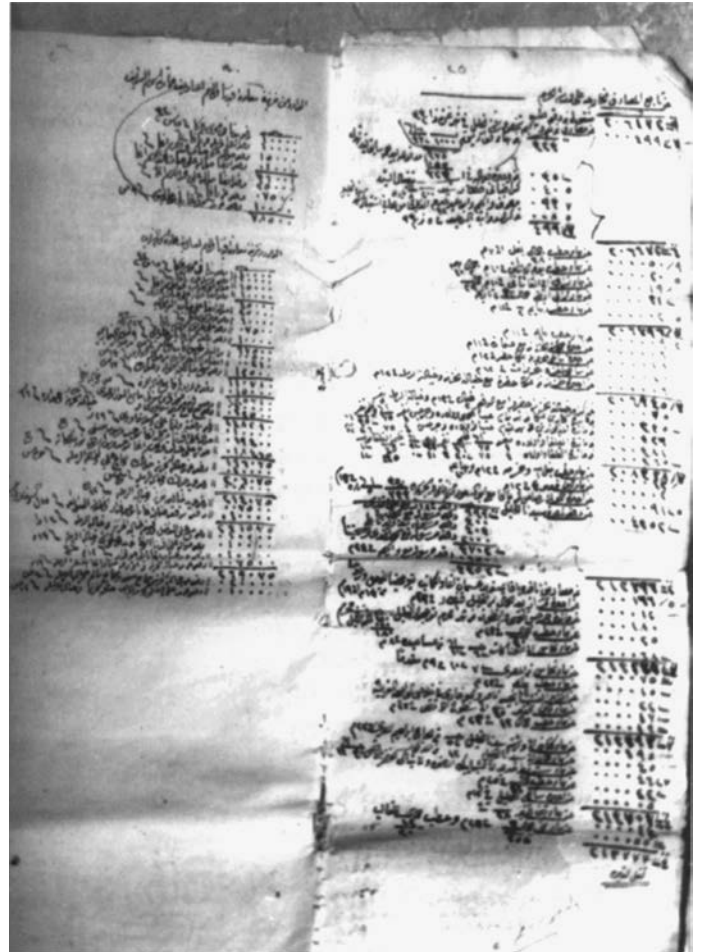

this way it was possible to know who was resident in each quarter, who had moved into it recently and who had left, as a means of protecting the morals and safety of all the residents. The documents usually started as follows: 'the names of the inhabitants of the Bab al-Qattanin, *shaikh* of the Quarter 'Abd al-Mun'am, House of ibn Su'd, [House of] Khalili Muhammad al-Mahruq, [House of] Kamal al-Hammami ...' (Sijill 10: 216). It is recorded at the end of this document that if it was discovered that one of the guarantors was a criminal, a prisoner or an adulterous woman, the wife of the person standing surety (i.e., the *shaikh* of the quarter's spouse) would be divorced and the *shaikh* would pay 10,000 'uthmanis to the *amir* of Jerusalem (Sijill 12: 441-59).

These documents allow a decision to be taken on the approximate number of inhabitants of Jerusalem at the time the document is recorded, if the number of households is multiplied by a factor of six. Based on the census that took place in December 1538 (Sijill 10: 170), the population of Jerusalem was 4,344, of whom 400 were Jews and 335 were Christians. From another document dated 1553, it is learned that the number of Jewish households paying taxes was 89; this gives a figure of 534 inhabitants. At that time there were a greater number of Christians—97 households or 582 people (Sijill 27: 54). By 1572 the number of Jews had increased to 110 households, or 690 people (Sijill 55: 207). Even though these statistics do not provide precise numbers, they do give an approximate idea about the size of the overall population of the city at a specific time.

The *sijills* also contain a good deal of information about the life stories of a large section of the population—their trades and work, the various stages of their lives, how some families prospered while others declined. Perhaps surprisingly, the documents also provide information on homosexuals (Sijill 10: 596). Among other diverse topics recorded in the *sijills* there is information on a rubbish dump located near the Khawalida neighbourhood (which had been an endowment since the Mamluk period—Sijill 10: 270), on cemeteries, on a furnace for producing glass

(Sijill 10: 266), and on the exchange of property through sale and purchase.

In conclusion, I hope that a project can be undertaken to index these *sijills* in a scholarly manner so that more information is available in a properly documented way about this region that is of such concern to so many peoples of the world.

Pl. 10.1 Document relating to the restorations (1232-1234/1816-1818) on Haram al-Sharif by order of Sultan Mahmud II (Islamic Museum of al-Aqsa document no. 926/927: 25-26)

APPENDIX 10.1

See pl. 10.5.

A document of restorations connected with the Khan al-Wakala, the Khan of Charcoal, and the ablution fountain of the Haram al-Sharif taken from Sijill 13: 194

In the presence of our lord and master, the Chief Qadi Salih ibn al-Qudwa al-Zaini, the master of Jerusalem and Hebron, there attended the master Muhammad son of the master Khalil ibn 'Alayan, the lessee of the Khan al-Wakala, and Hajj Ibrahim known as al-Fashkha al-Shuwaiki, the lessee of the Khan of Charcoal in Jerusalem, both part of the endowment of the al-Aqsa Mosque, and who complained about the two *khan*s mentioned above because they were derelict, and that any income from them had ceased because of the ruins. At that our lord brought Muhammad Çelebi ibn al-Dazdar, the inspector of the two noble sanctuaries, and mentioned to the *qadi* referred to above what the two lessees had reported, and they agreed to go to the two places mentioned above to see what restorations were necessary. At that the *qadi* went in the company of the deputy inspector of the Haram al-Sharif, Hamza Çelebi Yaziji of the noble endowment; Chief Qadi Sa'di Muhammad son of al-Muhandis al-Hanafi; Shaikh Abu 'l-Diya' Musa al-Dairi al-Hanafi, the Imam of the Dome of the Rock, Qadi Shams al-Din ibn al-Masri, the Director of the Noble Waqf; the trader Sa'd al-Din ibn Rabi'; the *shaikh* of the masters of the merchants in Jerusalem; Qasim the son of the assistant inspector of the Haram of Jerusalem, and other Muslims; and the Master Badr al-Din Husain ibn Nammar, the master architect in Jerusalem, in order to assess what the two places mentioned above needed by way of necessary restoration. The master Husain the architect assessed in the presence of our masters mentioned above the cost of what the Khan al-Wakala needed, especially the price of mortar and stones, the wages of the masters and workmen, the price of *qusurmil*, panels for the storerooms, nails and food, etc. at 9,500 *'uthmanis*.

In detail:

The lower supporting part of the arches in the northern arcade—160.

The construction of the north wall from the side of the derelict mosque—500.

The assessment of the vaults of the two derelict cells above the *khan* on the west side—400.

The construction of the wall close to the two houses of al-'Amidi—80.

The repairs of the north large arcade—300.

The repairs of the latrines in the *khan*—300.

The transportation of the plaster for the repair of the east wall—1,400, including the price of the stone and the restoration of the south wall above the *khan*.

The repair of the derelict mosque and the storerooms—500.

The price of 70 *qintars* of mortar at the rate of repairing the side mentioned above—1,500.

The price of 500 loads of *qusurmil* and the wages of the plasterer of the *qusurmil*, the gap-filler and the sealer—1,250 *'uthmanis*.

Assessment of the doors at the rate of the storerooms for the *khan* with 40 doors—1,060 *'uthmanis*.

The repair of the two cisterns in the *khan* and removal of the rubbish—250 [*'uthmanis*].

The assessment for the *khan* of Charcoal mentioned above totalled 3,750 *'uthmanis* according to the specifications:

The rate of restoration of the upper and lower storerooms—800.

The assessment of the repair of the latrines—300.

The price of *qusurmil*—750.

The wages of the plasterer of the *qusurmil*—500.

The cost of 20 *qintars* of mortar—500.

The cost of ten doors according to the rate of the storerooms—400.

The assessment of the wall shared by the *khan* and Qadi Sa'd al-Din al-'Alam—500.

After the completion of that, the *qadi* and our lords mentioned above and the master Husain the architect mentioned above went to the ablution fountain of the noble Aqsa Mosque and inspected the circular column and the repairs that it needed—the cost of the plaster of the *qusurmil* and construction of the rooms of the latrine—and the master Husain assessed the cost of these repairs at 7,000 *'uthmanis* according to the specifications:

For repairs to the columns and roofing of the two vaults and latrines—3,000.

The plaster of the *qusurmil*, gap-filling and sealing for all the roofs and surfaces of the reservoir.

The construction of the windows for the latrines and removing the rubbish, etc.—1,000 *'uthmanis*.

The grand total of what was assessed on the site specified above for the assessment of the master mentioned above was 20,250 *'uthmanis*.

At that the Qadi mentioned above permitted the Inspector of the two Harams mentioned above to authorise the expenditure of the amount specified above for the repair of the sites mentioned above from the funds of the above-mentioned endowment. And that after that the beneficiaries of the noble endowment came before him and witnessed that the repairs were necessary and that the repair was good and to the benefit of the endowment and of the beneficiaries of the endowment. Legal permission was granted by the inspector of the Two Harams and legal acceptance by the legal means took place in Muharram 948/27 April 1541. The witnesses at the time of its writing: Our lord, the most learned Shaikh Sharaf al-Din al-Dairi, Shaikh Shams al-Din al-Rumi, Shaikh Fakhr al-Din al-Ghanimi, Shaikh Ahmad ibn al-Junaidi, Rajab, the interpreter, 'Ali the trustee and other Muslims.

Pl. 10.2 Tiles, some dated 1233/1817, manufactured in Jerusalem from the restorations of Sultan Mahmud II (Islamic Museum of al-Aqsa collection)

Pl. 10.3 An example of the poor script encountered in the Jerusalem *sijills* (Sijill 1A: 299-300).

Chapter 11

THE *WAQFS* OF THE TRADITIONAL FAMILIES OF JERUSALEM DURING THE OTTOMAN PERIOD

Mohammad 'Ali 'Alami

The history of the traditional Muslim families of Jerusalem after the Crusades appears to be inseparable from the history of the Sunni religious establishment. This intimate association can be discerned in the numerous works of bibliographers and historians of the Ayyubid and Mamluk eras. The Shari'a Court documents of Jerusalem and the private family papers of the Ottoman period confirm this relationship and illustrate how, throughout, members of the traditional families formed the backbone of the local Sunni institutions. This phenomenon was not unique to Jerusalem; it occurred elsewhere in Palestine, in Hebron and Ramla for example, as well as in towns as diverse as Damascus, San'a' and Fez. Indeed, the association appears to have been prevalent throughout the geographical and historical domain of Sunni Islam.

The prerequisite of continuity for these families was a sufficient degree of stability in the home town and to some extent in the region as a whole. In this respect, Muslim urban society in Palestine enjoyed a varied history on either side of the historical divide marked by the Crusades. With the advent of the Crusades, however, the entire Muslim urban society was dismantled by a combination of mass slaughter, expulsion and migration. The only scanty Muslim presence permitted appears to have been confined to beneficial elements such as passing traders, who were subjected to taxation, and to officials enlisted to serve the Crusader kingdoms—tax collectors, plantation overseers in neighbouring villages, low-ranking administrators and menial workers. These were employed out of necessity to alleviate the almost perennial manpower shortages of these kingdoms. The Muslim society they formed must have been that of a subservient minority

largely preoccupied with survival in a hostile environment.¹ Family mythology apart, the researcher into the history of the traditional families of later eras can hardly find any viable historical evidence that links these families to ancestors who inhabited Crusader towns. The traditional families of Jerusalem and other Palestinian towns seem to have been entirely recreated in the post-Crusader period.

The available records, however, indicate a different attitude among the Crusader rulers towards the rural population. Entire Muslim villages survived in the Jabal Nablus and Galilee regions. Little is known of the fate of other villages in the south. The Crusader kingdoms appear to have relied to a considerable extent on the Muslim villages for food production to supply their walled towns

¹ Studies appear to indicate that, faced with severe shortages of manpower, the Crusaders concentrated their human resources within walled towns such as Jerusalem, Acre and Tyre. It is extremely unlikely that they would have permitted Muslims who were of no benefit to them to dwell within these strongholds. Even those few Muslims in Tyre who had been allowed to return after the initial conquest, as recorded by Ibn al-Qalanisi and quoted subsequently by Ibn Taghri Birdi in his account of the year AH 496, must have been small in number. The eyewitness accounts of Ibn Jubair (n.d.) and his astute observations of life in rural Muslim villages are widely quoted. Prawer (1963; Ben-Ami 1969: 153) estimates that there were some 1,200 agricultural villages in the Holy Land, whose population amounted to some 250,000, the overwhelming majority of them being Muslim. The entire Frankish population concentrated in the cities has been estimated at 100,000-120,000, with the numbers in Jerusalem at 20,000. For further reading see Ibn Taghri Birdi 1963, Ibn Jubair n.d., Runciman 1951, Aharon 1969, Prawer 1963, Mayer 1984.

and armies. Villages were apparently required to pay taxation in the form of specified amounts of agricultural produce, regardless of the decline in the rural population as a result of desertion or migration. Nevertheless, the Muslim village community was otherwise largely left to its own devices with some measure of religious freedom. This is evidenced by the way that the Sunni Hanbali school flourished during the Crusader period in the Jabal Nablus area.² It is noteworthy that the ancestors of several town families resident in Ayyubid and later eras, including those of Damascus, Jerusalem and Nablus, can be traced to villages within this area that came under Crusader rule. These included the Shafi'i Banu Ghanim family, which originated from the village of Burin near Nablus (Mujir al-Din 1973, 2: 146); and the Hanbali Ja'fari family (better known by the names 'Hanbali' and 'Hashim' in contemporary Nablus), which originated from the neighbouring village of Jama'il (contemporary Jama'in). This village also produced the Banu Qudama and Aulad ibn Abi 'Umar, who fled Crusader rule to settle in al-Dair at the foot of the Qasyun mountain in Damascus. These families were instrumental in the revival of the Hanbali *madhhab* in Damascus. The Hanafi Aulad al-Dairi family of Mamluk Jerusalem (the contemporary Khalidi family) probably originated from neighbouring Dair Istiya, south of Nablus.³

With the advent of the Ayyubids, Sunni Islam was vigorously and intensively re-established by Salah al-Din as the state creed with the prime objective of eradicating Fatimid Shi'ite institutions. The *sunna* was also an effective medium used by the Ayyubids and early Mamluks to concentrate opinion and strengthen morale in order to combat the Christian Crusades. The Ayyubids favoured the Shafi'i creed and elevated it to the position of the senior school of the *sunna*. The Bahri Sultan Baibars, the effective founder of the Mamluk state, went further when he formally institutionalised the four Sunni creeds and assigned an official order of seniority: Shafi'i, Hanafi, Maliki and Hanbali respectively. This institutionalisation

was first applied to Egypt and was later extended elsewhere, including Jerusalem. This had the effect of a proliferation of religious posts that were paid, as each creed was assigned its own *qadi*, *mufti*, *imam*, scholars and so forth.⁴ The championship of the *sunna* was viewed by all Mamluk sultans as highly beneficial in offsetting the awareness that they had been born non-Muslim and only later converted to the faith. As distinct from the Shi'ite Safavid state to the east and the predominantly Shafi'i Mamluks to the south, the Ottomans of Asia Minor strongly upheld the Hanafi creed. It needs to be emphasised, however, that the Ottoman attitude towards the three other Sunni creeds was generally tolerant—at worst it was indifferent, but never oppressive. The Ottomans maintained this attitude during their rule of Greater Syria and Egypt after they brought about the fall of the Mamluks at Marj Dabiq in 922/1516.

The form in which the *sunna* was re-established and consolidated by the Ayyubids and Mamluks and later maintained by the Ottomans was such that it remained dependent on the state. It certainly was neither centralised nor profoundly hierarchic, as was the Christian church in medieval Europe. In essence, it was composed of institutions identifiable by function: the Shari'a courts, control and administration of *waqfs*, servicing of mosques, religious schools, sufi *zawiyas*, and so forth, with provision for some educational and health services. These involved not only spiritual functions but also financial and administrative management of these institutions and their related *waqfs*. All major appointments were made by the state and as such were used to extend control and influence. It is thus hardly surprising that the Sunni Muslim state rarely witnessed a coherent challenge of substance to its authority by the nascent Sunni establishment. On the contrary, whenever the Muslim state was strong and stable, the Sunni establishment and its institutions were in turn vibrant and effective.

² Some insight into the life of the three Hanbali families of Banu Qudama, Ja'fari and Aulad ibn Abi 'Umar in the village of Jama'il during the period of Crusader rule is given by Ibn Tulun (1980: 67-76) who described their flight to Damascus. Further information may be obtained from relevant biographies of Hanbali scholars, e.g. Ibn Rajab (1953), who begins his Book 2 with an account of al-Hafiz 'Abd al-Ghani al-Ja'fari, who died in 600 AH. Al-Ja'fari was a renowned *hadith* scholar, who was born in Jama'il during the Crusader period. The book gives an account of the numerous descendants of the three families cited.

³ Mujir al-Din (1973, 2: 221), in his account of Qadi al-Qudat Muhammad ibn 'Abd Allah ibn Sa'd ibn 'Abd Allah ibn Muslih al-Dairi al-Khalidi, states that al-Khalidi was born in al-Dair near Nablus in about 750 A.H. It is likely that Mujir al-Din meant Dair Istiya.

⁴ Ibn Taghri Birdi (1963 Book 7, account of year AH 658) states that this tradition was adopted in AH 663 and evolved out of protest against the presiding *qadi*, Qadi al-Qudat al-Shafi'i, who was overworked. Ibn Taghri Birdi also noted that Hanafi *qadis* were common in Egypt during the period of Fatimid rule. Al-Maqrizi, however, in his account of the year AH 663 states that the chief *qadis* (*qadi al-qudat*) for each of the Hanafi, Maliki and Hanbali *madhhabs* were appointed three years earlier, in AH 660. Mujir al-Din (1973: 87) states that this tradition was extended to Syria in AH 664. He adds that the first Hanafi and Hanbali *qadis* were appointed to Jerusalem in AH 784, followed by the appointment of a Maliki judge in AH 802. He notes that all *qadis* were appointed to Jerusalem from Damascus until the year AH 800. Thereafter the appointments were made from Cairo. Mujir al-Din (1973: 32) explains that the four *madhhabs* each had their own *imam* to conduct prayers and in addition each was traditionally allocated a different location in the main mosques of Jerusalem and Hebron.

The financial base for maintaining Sunni institutions, particularly in Jerusalem and Hebron, was largely laid early in the post-Crusader era. By 690/1291 (the final fall of Acre) all Palestine had been recaptured. Scores of villages, plantations, groves and valuable urban property passed into the hands of the conquering sultans. The majority of these were made into *waqfs* to finance the various mosques, schools, *zawiyas* and so forth. The three main mosques in Jerusalem and Hebron were privileged with huge *waqfs* which included revenues from nearly a score of villages. Major institutions such as the Ayyubid Salahiyya Shafi'i *madrasa*, the Sufi Khanqah al-Salahiyya, the Salahiyya *maristan* (hospital), and the Nabi Musa shrine (near Jericho) were particularly well endowed. The Bahri and Burji Mamluk periods also witnessed the foundation of a multitude of *waqfs*, mainly for the benefit of newly-founded religious schools. However, despite the long reign of the Ottomans, the major public *waqfs* of their era were relatively few in number and included those of the Khassaki Sultan (also known as the 'Imarat al-Amira), Nabi Da'ud on Mount Zion, and the As'adiyya Zawiya on the Mount of Olives.

The fact that Sunni institutions were financed by revenues from specific *waqfs* contributed significantly to their long-term stability and continuity. Generally, the Ottomans, Mamluks and Ayyubids exercised genuine respect for the integrity and survival of their own Sunni *waqfs* in Jerusalem, as well as those of their Sunni predecessors. This is in sharp contrast to the deliberately detrimental treatment meted out by the Ayyubids towards the Shi'ite Fatimid *waqfs* in Egypt. Furthermore, throughout the period of the Ayyubids and the Mamluks and most of the time under Ottoman rule, the majority of *waqfs* did not suffer from any deliberate attempt to lay hands on wealthy endowments by means of the misuse of *shari'a* rules governing the transfer of *waqf* property and assets. The *fiqh* of *waqf* allows, under certain strictly defined circumstances, for the exchange of *waqf* property with non-*waqf* assets, for example by way of the rules governing *badal* and/or *istibdal*. Elsewhere, however, numerous cases of misuse of these rules were recorded. In Mamluk Egypt, for example, the widespread collusion of the official Ustadar Jamal al-Din (752/812) with hastily appointed *qadis* helped to sanction the exchange of huge and rich *waqf* assets for the personal benefit of the then-reigning Sultan al-Nasir Faraj.⁵ A few centuries later, in order to be able to implement his land reforms, the Ottoman Sultan Muhammad 'Ali Pasha also resorted to unprecedented methods to bring vast *waqf* lands under his own control.

In effect, each Sunni institution and its related *waqfs* was a single administrative and financial entity, initially managed in many (if not the majority of) cases by a renowned scholar or illustrious religious personality. This management was usually—but not exclusively—granted to descendants of the original administrator by way of a sultan's decree emanating from the seat of political authority (Cairo or Istanbul), following a petition by the individual(s) concerned and occasionally backed by the local Sunni leaders of the town. The decree was given the seal of approval, as a mere formality, by the local *qadi*, who authorised its registry in the Shari'a Court Register. The manner in which the management was passed on to descendants was in most, if not all, cases such that the male offspring of a deceased official would acquire all the responsibilities and privileges of the vacant office. This procedure had over the years tended to empower the family concerned and to associate it with a particular Sunni institution. The association was very beneficial to these families; in addition to the prestige, the related religious and administrative posts provided paid and secure jobs and in most cases free (or very cheap) secure accommodation. As will be elaborated below, the long-term control of these *waqfs* by the traditional families enabled many of them to acquire benefits such as long-term leases of valuable *waqf* assets. In time some of these leases were transformed into private assets or brought under the control of private *waqfs*. It is worth noting that during most of the Ottoman rule, particular major public *waqfs* came directly under the close supervision of state officials. These included those of the Aqsa and Hebron mosques as well as of the Khassaki Sultan. Other less significant public *waqfs* were usually left to the supervision of local religious officials. Family and private *waqfs* were rarely interfered with and their supervision was left to descendants and beneficiaries in accordance with the *waqf* conditions and the discretion of the *qadi*.

The Ayyubid, Mamluk and Ottoman periods saw the establishment of some five dozen religious schools in Jerusalem. Mujir al-Din (1973, 2: 33-49) gives a good account of those founded during the Ayyubid and Mamluk eras. His record indicates that at least a dozen religious schools were established by the Ayyubids, some three dozen by the Bahri Mamluks, and about another dozen schools by the Burji Mamluks. Admittedly these schools and their related *waqfs* varied in size, prestige and wealth, but nevertheless their number clearly indicates the tremendous interest that the Bahri Mamluks had in Jerusalem and demonstrates their financial support for these Sunni institutions. It is thus hardly surprising that many of the city's illustrious traditional families rose to eminence during the Mamluk era. These include the Shafi'i Kinani Banu Jama'a, who originated from Hama in Syria (the contemporary Khatib and Afifi families), the Hanafi

⁵ Al-Maqrizi gives many examples of the expropriation of *waqf* assets during the Mamluk period; see for example his account of certain quarters and houses in Cairo (1973, 2: 49-55).

Aulad al-Dairi (the Khalidi family), the Shafi'i Aulad Abi'l-Lutf al-Haskafi, who originated from Hisn Kaifa in modern Kurdistan (the contemporary Jaralla family), the Hanafi (later Maliki) Aulad al-'Alam who probably came from Hisn Akkar near Tripoli (today's al-'Alami family who, contrary to widely-held views, do not appear to have Moroccan origins), Aulad Nusaibeh al-Khazraji (now known simply as the Nusaibeh family), the Shafi'i Aulad Qadi al-Salt (today's Imam al-Hussaini), Aulad Abi'l-Wafa (the Hussaini family), Aulad Abi Rabi' (the 'Asali family), Ibn Abi Sharif (the Kamal family), Nashashibi, Banu Ghudaia (the contemporary families of Yunis Hussaini, Judih, Bazbazat), al-Sa'di al-Maliki (the Hijazi, Muna and so forth), Aulad al-Hamidi (probably today's Ansari) and Ibn Fityan (the Fityani). An explanatory note relating to the development of some family names is given in the footnote.⁶ With the exception of the 'Alamis, all available records indicate that the founding ancestor of each of the families named above was either a renowned scholar, a *qadi*

or a recognised religious personality or official. Atypically, the ancestor of the 'Alamis, the Hanafi Amir Musa ibn Sulaiman ibn al-'Alam, was governor of Jerusalem from 793-95/1391-93 (Mujir al-Din 1973: 164-5). But his descendant Nasr al-Din, who died in 877/1474, abandoned his administrative posts to join the religious establishment as a Hanafi deputy *qadi*.⁷

The opening few decades of Ottoman rule brought more families into eminence. It needs to be emphasised that many of these probably lived in, or were associated with, Jerusalem prior to the Ottoman conquest. The most notable of these are the Dajanis (descendants of the regionally famous *sufi*, Ahmad Dajani, of Nabi Da'ud fame, who died in 969/1562⁸), Ja'uni, and Aulad Nammar (who specialised as architects and surveyors to *waqf* institutions⁹). Soon afterwards other families became well established: Aulad al-Ma'arri (the Uwaida), Daqaq, Qutub (descendants of the prolific *sufi* author al-Qutub al-

⁶ *Family names.* The name forms of the traditional families, and the way that they developed, follow an identifiable pattern. During the Ayyubid and Mamluk periods, the form Aulad was used predominantly, for instance Aulad al-'Alam, Aulad al-Dairi, Aulad Abi'l-Lutf and so on. A few families took the older form of Banu, which was used by older families, for example Banu Ghanim, Banu Jama'a, Banu Qudama and so on. The Sunni *madhhab* of each family was invariably added, and this was noted to be the case even prior to the decision by Sultan Baibars to assign its own officials to each *madhhab*. During the Ayyubid and Mamluk periods, two titles were always added to the first name. The first was 'father of' (*abu*) and each was identified with a specific first name—for example every Muhammad was entitled Abu 'Abd Allah, Ibrahim was always Abu Ishaq, Sulaiman was always Abu Rabi' and 'Ali was always Abu'l-Hasan. The second title took the form of the attribute al-Din (the faith), which was again specific to each first name. Thus each Muhammad would be entitled Kamal al-Din (or Shams al-Din, or Nasr al-Din), each Ibrahim Burhan al-Din, each Sulaiman 'Alam al-Din, each 'Ali 'Ala' al-Din, and each Yusuf either Jamal al-Din or Salah al-Din. Ibn Taghri Birdi (in his account of the year AH 416) noted that the origin of these titles dated back to the early decades of the 5th century Hijri. It is most probable that the custom proliferated with the influx of large numbers of non-Arabs bearing Turcoman names, which occurred during the Saljuq migration eastwards at that time. It seems likely that this habit, with its emphasis on first names, provided a convenient Islamic cover for non-Arab second names. The habit was adopted rapidly by the indigenous population. It is almost certain that family names, such as al-'Alami, Shihabi and Kamal find their origins in the title forms by which their ancestors were addressed—for example, 'Alam al-Din Sulaiman, Shihab al-Din Ahmad, and Kamal al-Din Muhammad respectively.

At the beginning of the Ottoman rule, several developments in the form of names of the traditional families took place. The first was the gradual abandonment of the title relating to the Sunni *madhhab* of each family, including those of the Hanafi *madhhab*. By the end of the 11th century Hijri, all but a few families had abandoned this centuries-old tradition. The exceptions were some non-Hanafi families such as the Shafi'i Imam and Jaralla. Another development in the

form of names was the addition of the final letter *ya'*. Each name was thereby simplified by reducing it to a single word—thus Aulad al-Dairi al-Khalidi al-Hanafi became simply al-Dairi, and, subsequently, al-Khalidi; Aulad al-'Alam al-Maliki became al-'Alami. The fact that the official (and predominant) language of the seat of power (Istanbul) was non-Arab may explain the significant simplification of the family names which had previously been in use for some five centuries.

Early in the 12th century Hijri, and in an effort to confirm their link to or association with the Ashraf, some families changed their names completely. Thus, no less than three unrelated families adopted the name al-Hussaini—the Aulad Abi'l-Wafa became 'Abd al-Latif al-Hussaini; a branch of the Ghudaya's became Yunus al-Hussaini, and, later, the Aulad Qadi al-Salt became al-Imam al-Hussaini. Aulad al-Dairi abandoned their traditional name altogether, to become al-Khalidi in order to emphasise their claim to an association with the Sahabi Khalid ibn al-Walid. During the same period, the 'Alamis—without a change to their name—began to associate themselves with the 'Alamis of Fez, a well-established member of the Ashraf in Morocco who claimed descent from al-Hasan ibn 'Ali ibn Abi Talib through their ancestor, the *sufi* ibn Mashish who had been killed in 622 AH (al-Zarakli 1980 IV: 9). An example of this 'Alami line of descent can be found in al-Mihibi (n.d I: 218). However, al-Murtada al-Zubaidi made a clear distinction between the 'Alamis of Morocco and those of Jerusalem (Murtada al-Zubaidi 1966 VIII: 408).

⁷ Mujir al-Din (1973: 231), in his section on the Hanafi *qadis* of Jerusalem, states that Nasr al-Din ibn al-'Alam was the nephew of Qadi al-Qudat Sa'd al-Din al-Dairi. He hinted that the uncle encouraged Nasr al-Din to make the change, and to join the religious establishment.

⁸ Najm al-Din al-Ghazi (1979, 3: 120) provides the earliest account of Ahmad Dajani. It suggests that, together with Ibn Maimun and Ibn Araq, they were the most illustrious *sufis* of the region in the 10th century Hijri. It is probable that the name Dajani is a reference to the village Janiya, close to Ramalla, north of Jerusalem, which later evolved into Dajaniya.

⁹ The Shari'a Court Records (Ab 935 AH: 196, 329 amongst others) have references to a certain Hasan ibn Nammar as an architect/builder in Jerusalem.

Khalili), Qadamani, Aulad Zuhaiman/‘Abd al-Latif, Turjuman, Qutaina, Tirhi, Wahbah, Hujaij, and so forth. The Shihabis and Abu Su‘d, descendants of renowned Syrian families, established themselves as part of the Jerusalem upper religious society early in the 3rd century of Ottoman rule. Ibn Hubaish, who probably came from Acre late in the 12th century Hijri (the contemporary Budairi), joined the establishment soon afterwards. The smaller families of Darwish, Murad and Hallaq (all of Ottoman origin) settled in Jerusalem during the same period.

This list is not intended to be a complete account of the traditional families of Jerusalem. Although extensive, nevertheless it does not account for families belonging to the Maghribi community, nor the descendants of very active Ayyubid, Mamluk and Ottoman families—for example, the Banu Ghanim (Ayyubid), Denkiz, Arghun (who may be the contemporary Rajabi), Tunbugha (perhaps the contemporary al-Saifi), all of whom were Mamluk families.

In their capacity as scholars, officials and administrators, the Muslim traditional families of post-Crusader Jerusalem represented a good example of consistent beneficiaries of public *waqfs*. Use of public and private *waqfs*, however, predates these families and can be traced back to the 1st century Hijri. Essentially, *waqf* has been an instrument for directing the benefits of an estate (property, plantation, books, etc.) to serve the purposes specified by the institutor, that is the *waqif*, who was the previous owner of the estate.¹⁰ In accordance with the Hanafi *madhhab* as practised in Ottoman Jerusalem, the *waqf* process irrevocably removed the right of ownership of *waqf* items from the institutor. Once *waqf* is ruled by the *qadi* as being valid and irrevocable (*sahih wa lazim*—the two rulings according to the practice of the Hanafi *madhhab* are inseparable), its stated purposes and

conditions as specified by the *waqif* carry the authority and protection of the *shari‘a* from the moment of inception and, more significantly, extend after the death of the *waqif*. This has proved to be one of the very limited means available to Muslims to control the benefits (but not ownership) of their wealth after death. Muslims are, however, permitted to assign up to a third of their estate to specific beneficiaries after their death by way of a declaration or will (*wasiya*) drawn up during their lifetime. In the absence of a *wasiya* or *waqf*, the estate is subjected to strict and well-defined laws of inheritance as stated in the Holy Qur‘an, elaborated by the Tradition of the Prophet, and explained in depth by what scholars have termed the ‘science of *fara‘id*’.

The Holy Qur‘an has no direct or specific ruling on *waqf* and the reported *hadith* (Tradition) of the Prophet Muhammad, claiming that he instituted a *waqf* of his own, lacks reliability and has never been substantiated. One such claim was made by al-Waqidi with respect to seven gardens in Madina (Gill and Kramers 1974: 624-28 and Abu Zahra 1391/1971: 4). However, though famous as a historian, al-Waqidi cannot be regarded as an *imam* of *hadith*. Moreover, his claim is not included in the collections of the Grand Imams of Tradition, such as al-Bukhari and Muslim. As with many major issues of *al-shari‘a*, the *waqf* rulings were formalised around the 3rd Hijri century when the opinions of the great men of *ijtihad*, including the founders of the four main Sunni creeds, were formulated. Generally, there has been a good measure of agreement amongst Shi‘ite and Sunni scholars regarding the function, general purposes and many of the major rules of *waqf*. Significant differences did, however, occur on some specific issues. These differences, which were not so much between Sunni and Shi‘ite scholars but within the *sunna* itself, reflect the subtle yet profound methods and approaches to *ijtihad* adopted by each of the four Grand Imams.¹¹ Major differences

¹⁰ The origins and rulings of *waqf* have been the subject of study by numerous authors and scholars. The concise treatment in the *Shorter Encyclopaedia of Islam* (Heffening 1974: 624-28) provides a good introduction for non-Arabic readers. Specialised books, which have since become classics, on the subject appeared as early as the 3rd century Hijri—for example, Ahmad ibn ‘Umar al-Khassaf, who died in 261/875, *Ahkam al-Auqaf*, and Ibrahim ibn Musa (853-933/1449-1516), *al-Tarabils*, which has been extensively used by followers of the Hanafi *madhhab*. Modern books on the history of *waqf* in Jerusalem include Shaikh Muhammad As‘ad al-Imam al-Hussaini (who was for a long time until he retired *qadi* of the Shari‘a Court in Jerusalem), *Al manhal al-safi fi‘l waqf wa ahkamah* 1402/1982. One of the best modern treatments of *waqf*, its *fiqh* and arguments for and against reform rules in Egypt, Syria and Lebanon is al-Imam ibn Ahmad Abu Zahra, *Muhadarat fi‘l-waqf*, 1391/1971. This last book has been relied upon extensively to highlight the various differences in *waqf* rulings amongst the four main *Sunna madhhabs*.

¹¹ The Grand Imams of *ijtihad* in Sunni Islam were numerous and spanned many centuries. Although the *imams* of the four main *madhhabs* of the *sunna* are the ones most frequently quoted, others, who were no less original or outstanding in their thoughts, had a significant impact on the development of *sunna*. Examples of these are ‘Ali ibn Isma‘il al-Ash‘ari, founder of the Ash‘ari *madhhab* (260-324/874-936), ‘Ali ibn Ahmad ibn Sa‘d ibn Hazm, one of the great *imams* of the Dhahiriyya *madhhab* (384-456/994-728), Ahmad ibn ‘Abd al-Halim ibn Taimiyya (661-728/1263-1328), who, although he followed the Hanbali *madhhab*, was nevertheless a most influential and original *imam* of *ijtihad*. The four Grand Imams, generally regarded as the cornerstones of Sunni Islam, are: (a) Abu Hanifa (al-Nu‘man ibn Thabit) 80-150/699-767, born and died in Kufa; (b) Malik (Malik ibn Anas ibn Malik) 93-179/712-95, born and died in Madina; (c) al-Shafi‘i (Muhammad ibn Idris ibn al-‘Abbas) 150-204/767-820, born in Gaza and died in Egypt; and (d) Ibn Hanbal (Ahmad ibn Muhammad ibn Hanbal) 164-241/780-855, born and died in Baghdad.

within the same creed also occurred, the most relevant of which were the contradictory opinions held by Abu Hanifa and his two disciples, Abu Yusuf and Abu 'l-Hasan al-Shaibani,¹² on the issue of the *lazim* of the *waqf*—its irrevocable nature. Then again differences occurred between Abu Yusuf and Abu'l-Hasan on the issue of instituting a *waqf* based on shared property, and also the self-assignment of the *waqif* as beneficiary. Yet in practice the final arbiter on opinions relating to *fiqh* of *waqf* was, as a mere formality, the *qadi*. During the Hanafi Ottoman rule (and very likely in previous eras as well), the *waqif* was not much concerned with matters of *fiqh* or the differences of opinion of the various *imams* as long as his prime objectives were achieved. These were that the *waqf* and its conditions as specified by the *waqif* were ruled as valid and irrevocable. Invariably, all investigated *waqfs* were found to be ruled as such by the *qadi*, and approved by the *mufti* and scholars.

Muslim scholars are in agreement that *waqf* is defined as a continuous form of charity directed for the benefit of everlasting and deserving causes, the Arabic definition being *al-waqf sadaqatun jariya 'ala jihat bir la tanqata*. Whereas the Holy Qur'an identifies many recipients worthy of charity (for example Sura 9: 60 'Repentance', *al-Taubah*), the *fiqh* of *waqf* gives full freedom of choice of recipients, provided they are in perpetual and deserving need of charity. To assign oneself exclusively, or a specified person or a descendant, as sole recipient is not considered valid as the requirement of each person would be terminated by death, or by the termination of the family, in the case of descendants. Even to name exclusively a specified mosque or religious school is not sufficient, as the physical existence of these might be discontinued by demolition. On the other hand, naming the poor is considered valid, as it has been assumed that they will always be present until 'God inherits the earth and everything on it.'

The rules of *fiqh* do not specify whether all recipients are simultaneously entitled to the benefits of *waqf*. Accordingly, the overwhelming majority of public and private *waqfs* are assigned a sequential order of entitlement, subject to the conditions laid down by the *waqif*. Again, as the relevant rules are unclear on whether each element of the sequence of beneficiaries ought to constitute in itself (or themselves) an everlasting recipient worthy of charity, the actual practice of *waqf* was designed only to ensure that the final recipient of the sequence be so. This very subtle

difference was astutely exploited by both public and private *waqfs*, resulting in tremendously significant consequences. Thus, in the great majority of *waqfs*, the sequence of beneficiaries consisted of one or more of the following elements: (1) the *waqif* during his lifetime; (2) all, or some, of his descendants or those of relatives or of a specified person; (3) the local mosque, religious school, *zawiya* etc.; (4) the poor. As explained earlier, the fourth element was always included to maintain validity. By mere convention, whenever the second element was included, the *waqf* was said to be 'private', otherwise it was said to be 'public'. It is of paramount importance to emphasise that the *fiqh* of *waqf* does not recognise this distinction and all relevant *shari'a* rules and regulations are equally applicable to both.

All known *waqfs* instituted in Jerusalem during Ottoman rule were registered within the town's Shari'a Court Records. The registration took the form of a transcribed copy of the original document made in the handwriting of the presiding court clerk. The registration in the great majority of cases took place very soon after the ruling by the *qadi* on the validity of the *waqf*. The original document was usually kept by the *waqif*. It carried the signature and stamp of the presiding *qadi* and usually the written and stamped approval of the *mufti* and, occasionally, those of senior religious scholars in the city. An example of an original *waqf* document (these are now scarce) is shown in pl. 11.1. Pl. 11.2 shows the corresponding court record of the same al-'Alami *waqf* dated 1136/1724.¹³ A copy of an earlier court record showing a much earlier *waqf*¹⁴ is shown in pl. 11.3. The court records also include the registration of a few *waqfs* of previous periods (less than fifty in number), and an equally low number of *waqfs* instituted in other towns during the Ottoman era.¹⁵

To date, there is no complete and reliable index to the Ottoman court procedures of the Jerusalem records. The earliest record (no. 1) dates to 936/1530. The author has examined and copied parts of a bound record entitled *Ab* with 350 pages, which dates to the previous year, 935/1529. Although some *waqfs* were identified there on pages 49, 72 and 189, record *Ab* was not investigated because of the difficulty in deciphering the script. The author has also examined and copied three other bound records, which carry no number. These include entries which date to the period 1126-28AH, 1128-31AH and

¹² The two Hanafi *imams*, Abu Yusuf and Abu'l-Hasan, are usually referred to as al-Sahiban. The former was Ya'qub ibn Ibrahim ibn Habib al-Ansari, born in Kufa and died in Baghdad, 113-182/731-798; the latter was Muhammad ibn al-Hasan ibn Farqad, 131-189/748-804, who was born in the vicinity of Damascus and died in Rayy.

¹³ Jerusalem Shari'a Court (hereafter JSC) Record 218: 346, dated 1136/1724. *Waqif* Amina Ibnat Yahya, wife of Mustafa ibn Abi 'l-Wafa 'Alami.

¹⁴ JSC Record 16: 276, dated 951/1545. *Waqif* Sutaia Ibnat Ibrahim ibn al-'Alam.

¹⁵ For example, JSC Record 105: 757, dated 987/1579. *Waqif* Fakhr al-Din ibn 'Uthman ibn Sa'd al-Din ibn al-'Alam. This *waqf* was instituted in Damascus and re-registered in Jerusalem.

1135-38AH. None of these unnumbered records were found to contain transcriptions of *waqf* deeds. There are four hundred and fifteen numbered Ottoman records, which fill some 125,000 pages, with an average of four entries per page. Nevertheless, an index of Ottoman *waqfs* does exist in the form of a hand-written notebook compiled probably around AD 1919 by a court clerk, probably to be identified as Shaikh Ya'qub Afifi. This very valuable index lists the names of the institutors of *waqfs* and the relevant record and page numbers together with the date for each record and the name of the *qadi* who was presiding, presumably at the beginning of the period covered by the record. A copy of a page of this index is presented in pl. 11.4. The index covers all the Ottoman records which are numbered, with the last entry made by the *shaikh* in record 416 dated 1338/1919. The index has proved to be highly accurate, for it is still in current use in the Shari'a Court of East Jerusalem. Its reliability was ascertained by the author when more than 300 traditional family *waqfs* were investigated and copies retrieved from the court. The index has the added use of identifying a few multiple re-registrations of the same *waqf*, as well as incomplete copies of a few others. It also distinguishes between *waqfs* instituted by the *waqif* during his lifetime from those very few which were confirmed by the *qadi* and registered after death. Although this index was relied upon to identify *waqf* record and page numbers, the data relating to this study is based on a collection of some 300 *waqf* deeds retrieved in copy form, classified and entered on a computer.

Table 11.1 lists all known *waqfs* registered in Jerusalem during the Ottoman era. The data were extracted from the index described earlier. These *waqfs* have been classified to account for those instituted by each of the following social groups—traditional families, other Muslims, Christians, and Jews. *Waqfs* of non-Muslims were instituted in accordance with Sunni *shari'a* law in a manner identical to that employed for all other Muslim *waqfs*. The data presented in Table 11.1 unmistakably indicates that the instrument of *waqf* was extensively and consistently used by the traditional families, other Muslims, and Christians throughout the Ottoman period. The table also indicates that, prior to 1290/1873, there were few Jewish *waqfs*. This may partly be explained by the fact that the Jewish community in Jerusalem was small. However, and commensurate with the resurgence of modern Zionism, *waqf* as an instrument for confirming property rights, outright ownership or right of use, was much utilised by the migrating Jews who settled in Palestine after AD 1870. This use of *waqf* suddenly ceased with the start of the British Mandate in Palestine, which would suggest that other, more convenient, avenues for securing Jewish property rights were then made available by the new secular authority. The frequency of *waqfs* made by the Christian community, on the other hand, remained fairly consistent

throughout Ottoman rule, with a noticeable increase observed after 1250/1834. Again, as with the Jewish community, Christian *waqfs* ceased after the end of Ottoman rule in Palestine.

Table 11.1 indicates that the traditional families were persistent users of the instrument of *waqf* throughout the Ottoman period. It is noticeable that this usage declined significantly between 1280AH and 1320AH, which is in sharp contrast to the high frequency observed for the preceding century. A breakdown of *waqfs* of the traditional families is presented in Table 11.2, which is based on data relating to 306 *waqf* deeds involving some thirty-one traditional families established in Jerusalem for two or more centuries under Ottoman rule.

The above table lists both public and private *waqfs* for each family. It is clear that the instrument of *waqf* was not equally utilised by all thirty-one families. One family alone accounts for some 17 percent of the total, while the top six families account for 49 percent of the listed *waqfs*, and the top twelve families account for nearly 75 percent. It is significant that of the top six families, at least four were well established during the preceding Mamluk era. But this should be viewed with caution; although some 55 percent of the 306 *waqfs* belong to such pre-Ottoman families, some (for example the Khatib/Afifi, Ghudaia, Nashashibi and Nusaibeh families) have relatively few instituted during this period. It is therefore prudent not to assume that older families necessarily have more *waqfs*.

The act of instituting a *waqf* implies the *a priori* ownership of property. It follows that families and those members with a large number of *waqfs* must have been relatively wealthy. In an effort to study the source of this wealth, six families with large numbers of *waqfs* were investigated and the results are presented in tabular form. Table 11.3 indicates that of 142 *waqfs*, 124 were instituted by males, of which 33 were made by six individuals. All six were recorded as having held notable religious posts: *qadi*, *mufti*, chief court clerk, etc. Most male *waqifs* held religious posts or *tauliya* of a known and well-endowed public *waqf*. The 'Alamis held the *tauliya* of the *sufi* Khanqah, the Salahiyya *maristan*, the Hamra *madrasa* (located half-way down the Christian Quarter Road and mentioned by Mujir al-Din), and the Zawiya As'adiyya. The 'Alamis were also much associated with posts of *qadi* (or deputy) of the Shari'a Court, particularly in the first century of Ottoman rule. The Jaralla family were associated with the *tauliya* of the Salahiyya *madrasa* from the 8th century Hijri, as well as the important post of *mufti*. The Salahiyya *madrasa* was the Church of St Anne during the Crusader period, and was then transformed into the famous Shafi'i *madrasa* by Salah al-Din who endowed it with much revenue from different *waqfs*. In the 13th century Hijri, the school once more returned to being a church. The Hussainis associated themselves with the Afdaliyya School, the presidency of al-

* Denotes the family as having been already well established in pre-Ottoman Jerusalem

Ashraf and, following the demise of the Jarallas (probably through the loss of many of their male members through illness),¹⁶ the post of *mufti*. The Khalidis were very closely associated with the posts of *qadi* (or deputy) and chief court clerk of the Shari'a Court. The Imams, as their name implies, were associated with the imamate of al-Aqsa Mosque, and also held the *tauliya* of the Aminiyya School and were closely associated with the Tashtimuriyya *zawiya*. The Nammari, on the other hand, were the official architects/surveyors/builders (*mi'mari bashi*) to public *waqfs* for most of the Ottoman period. Very few examples of non-religious professions could be deduced from the study of the *waqf* deeds of the families mentioned above. The most notable were the Haduta and Su'di branches of the 'Alami family who were involved in making soap, milling flour and plantation management. Some 'Asali *waqfs* were described as traders.

The above appears to suggest that, apart from a few exceptions (which would include the Khatib/Afifi and Ghudayya), those families with the closest continuous ties to important religious institutions and/or prominent posts tended over the long period of Ottoman rule to be the most frequent institutors of family *waqfs*. Apparently, the continuous benefits to these families that arose out of this relationship enabled many members to accrue a significant measure of wealth which they subsequently transformed into *waqf*. It is also significant that for some families a good proportion of the *waqf* elements (in this case property) was located in the vicinity of the institution that was being looked after by the relevant family. The best example of this is the 'Alami *waqfs* and the fact that many of their elements were concentrated in the Christian Quarter—that is, in the immediate vicinity of the Khanqah Salahiyya and the Hamra *madrassa*. Another example is the location of some Jaralla private *waqfs* near the Salahiyya *madrassa*. A third example is the identification of several items of Imam *waqfs* in the vicinity of the Tashtimuriyya *zawiya*.

An examination of some 300 family *waqf* deeds unmistakably indicates that the majority were based on items declared by the *waqif* to be his own. Nevertheless, a significant number of items, including major proportions of certain categories (for example plantations) were not so categorised. In many cases these were explicitly declared to belong to earlier *waqfs* and leased to the *waqif*. In the case of plantations, the item of *waqf* was referred to as *al-ghiras*, that is the planted trees, vines and so forth. In the case of property built on land that did not belong to the *waqif*, the instituted *waqf* referred to whatever was built on or added to the leased property.¹⁷ The close association of these families with previously instituted major public and private *waqfs* undoubtedly favoured their members in obtaining such long-term leases. This phenomenon merits closer attention and study as one of the avenues through which the assets of earlier Jerusalem *waqfs* were diverted. It needs to be emphasised that these avenues, which include long-term leases which had expired but were still maintained by their lessee, were used by Christians, Muslims and Jews alike.

The position of *fiqh* regarding the issue described above was not ambivalent. Early *imams* ruled that outright ownership of a property was deemed essential for the validation of a *waqf*. The Shafi'is, Hanbalis and Hanafis argued elegantly that as the process of *waqf* of an item implicitly removes the right of ownership of a property from the *waqif*, he or she cannot legally transform into *waqf* items which they do not own in the first place. Even in cases of shared ownership, those *imams* who sanctioned the process insisted that the *waqif* own the share to be made into *waqf*. Nevertheless, *waqfs* of the traditional families included numerous examples of non-owned items transformed by the *waqif* into *waqf*. The extreme case is two

¹⁶ Hasan ibn 'Abd al-Latif al-Hussaini 1985, a biographical account of Muhammad Zain al-Arab al-Lutfi, shows on p.214 how in a short span of a few weeks no less than twelve male members of the family died through illness.

¹⁷ JSC Record 403: 283, dated 1098/1687. *Waqif* Abu'l-Wafa ibn 'Abd al-Samad al-'Alami, who leased parts of the Hamra' *madrassa* and made buildings added to the school into *waqf*.

¹⁹ JSC Record 322: 235. *Waqif* Mustafa ibn Khalil al-Khalidi.

Khalidi *waqfs* (dated 1213/1799¹⁸ and 1255/1839¹⁹) in which the two *waqifs* explicitly described all the items of their *waqfs* as not being owned by them but leased to them long-term. Similarly, an earlier Khalidi *waqf* (952/1545²⁰) described most of its items—plantations in the vicinity of Jerusalem—as being long-term leases and, remarkably, stated that the original owners were the subjects of much earlier Ayyubid and Mamluk *waqfs*. Yet other examples (for example Khalidi 1255/1839, see note 19, and Hussaini 1249/1834²¹) show the *waqif* transforming into *waqf* leases of items previously made into *waqf* by ancestors of the same family. Many additional examples of non-owned items were noted in *waqfs* of other families. Some are listed below:

The very fact that the traditional families

succeeded in the process described above reflects a significant measure of their power in their city. Other groups (Christians and Jews) followed suit during their period of increased influence, as was the case in the last century of Ottoman rule in Jerusalem. The process also gives credence to the general observation that considerations of some matters of *fiqh* were not always paramount to the *waqif*, the presiding *qadi* or indeed what was then the central seat of Sunni power, Istanbul. Yet it is also true, as will be discussed below, that the Hanafi Ottomans were very strict on some matters of form with respect to the process of rendering a *waqf* valid and irrevocable.

An unexpected finding of this study has been the very considerable role of partially owned property in *waqfs* instituted by the traditional families of Jerusalem. Of the total number of plantations (103), town houses (215) and shops (224) made into *waqfs* by the 6 families listed above, some 66 percent, 71 percent and 85 percent respectively were only partially owned by the *waqif* prior to the *waqf*. This indicates a considerable degree of fragmentation of property ownership in Ottoman Jerusalem. The *waqf* process could not but aggravate this fragmentation, as it was technically difficult for any outsider to buy *waqf* shares in the hope of consolidating the whole. Extreme, yet not uncommon, cases were encountered: two ‘Alami *waqfs* (1132/1908³⁵ and 1333/1915³⁶), in which less than a handful of the one thousand shares of total ownership of several Jerusalem shops were made into *waqf*. Again, the early *imams* of *fiqh* were not unanimous on this issue of shared ownership. The Malikis argued against it and, more significantly, the Grand Hanafi Imam Abu’l-Hasan Shaibani, whose opinions were much respected by the Hanafi Ottomans, was not in favour of this form of *waqf*. Nevertheless, the Hanafi *qadis* of Ottoman Jerusalem accepted the process and ruled it as valid.

The popularity of *waqf* amongst members of the traditional families must have been related to the success of this instrument in achieving certain purposes of the *waqif*. One advantage was outlined earlier—the confirmation of rights of use of property obtained through long-term leases and passing these rights to future beneficiaries named by the *waqif*. Another major purpose was the considerable freedom practiced by the *waqif* in guiding—and even defining—the benefits of his or her estate after death, without loss of control during their lifetime. An examination of 112 private *waqf* deeds of the 6 families indicates that in a hundred cases the *waqif* assigned himself during his lifetime as the sole beneficiary as well as the sole

controller (*mutawalli*) of the *waqf* in question. This confirms the clear impression that transforming property from private ownership into *waqf* did not necessarily jeopardise the control or influence of the *waqif*. Of the thirty public *waqfs* instituted by the same six families, the *waqif* assigned himself (or herself) as sole beneficiary and controller during his lifetime in only three cases. This reflects an ambivalent attitude towards the two types of *waqf* by these families; it seems as if private *waqfs* were instituted by the *waqif* for his (or her) own private purposes, while public *waqfs* appear to have had the more general charitable purposes originally outlined by *fiqh*. This may be further elaborated by investigating the controller (*mutawalli*) assigned by the *waqif* in each of the private and public *waqfs* of these families. It has been found that in the case of public *waqfs*, the *waqif* included *mutawallis* from outside his (or her) family, or in addition to his (or her) own descendants. In the case of private *waqfs*, the *waqif* usually assigned a member of his or her own family, and in most cases male descendants of male members. This finding confirms the observation made earlier about the distinct attitude towards each type of *waqf*.

Of the 112 private *waqfs* of the 6 traditional families under discussion, seventeen were instituted by females. Of these only five *waqfs* (29 percent) allowed male and female descendants of both males and females to benefit. Twenty-three private *waqfs* instituted by males, out of a total of ninety-five (24 percent), did allow such a distribution of benefits. However, in nearly all the other male- and female-instituted private *waqfs*, benefits were directed solely to the descendants of male descendants: that is, the male and female children of the *waqif* would benefit first, followed by only the descendants of their male descendants, *ad infinitum*. This deprivation of the descendants of females was found to be the case in nearly 75 percent of all private *waqfs* regardless of the gender of the *waqif*. Several extreme cases were noted whereby the male *waqif* of a private *waqf* directed the benefits of his *waqf* to the future male descendants of his own males, even though it was admitted that the *waqif* had no males of his own at the time of the institution of the *waqf*, but God willing, one or more would be forthcoming—for example, Imam 1328/1910,³⁷ Hussaini 1214/1799,³⁸ Khalidi 1216/1802,³⁹ ‘Alami 1069/1658.⁴⁰

Prejudicial attitudes towards the female gender were not, however, confined to the offspring of females of

male descendants. They also encompassed the female spouse. In the great majority of male-instituted private *waqfs*, hardly any benefits were assigned to the wife of the *waqif*. At best the wife (and unmarried daughters of male descendants) were merely granted the benefit of living in *waqf* houses. Even this privilege was conditional and was withdrawn whenever the widow (or unmarried daughters) chose to marry. The *shari‘a* most certainly does not rule against the remarriage of a widow. On the contrary, the *sunna* encouraged them to do so. In contrast a widow (and unmarried daughters) would fare much better if the estate of the *waqif* were not made into *waqf* but distributed in accordance with Muslim laws of inheritance. In normal cases, the widow would be entitled to one-eighth of the estate of her deceased husband.

It must be emphasised that not all male-instituted *waqfs* were biased against females and their descendants. Some, although only a minority, granted them benefits almost identical to those to which they would have been entitled if *shari‘a* rules of inheritance were applied—for example, Budairi 1205/1790,⁴¹ Jaralla 1076/1666,⁴² Khalidi 1245/1829,⁴³ ‘Alami 960/1553.⁴⁴ However, all but two Nammari *waqfs* (1139/1727⁴⁵ and 1329/1911⁴⁶) were heavily biased in favour of descendants of males. It is interesting to note the effect that this attitude had on old family trees kept by the traditional families. The great majority of these did not include female descendants, the names of wives, or the names of male descendants with no male offspring. This observation suggests that family trees were largely maintained for the purposes of distributing *waqf* benefits. In this way, only those entitled to a share would be included in a family tree, with females only included (as in the case of the Budairi tree) where this would be applicable. Unfortunately, wives’ names were found to be absent from all the trees investigated by the author, who studied a score of them relating to Jerusalem families.

This attitude towards females was to some extent a reflection of the male-dominated Muslim society of Ottoman Jerusalem. The relevant rules and opinions of the early Grand Imams were, however, very clear on this issue. Any condition laid down by the *waqif* which had the disguised purpose of circumventing *shari‘a* laws, including

those governing inheritance, was not valid. Some *imams* went further and ruled that the entire *waqf* in such cases was null and void. The responsibility for ensuring the observance of *shari'a* laws rested with the presiding *qadi*. In practice, the *waqf* deeds investigated here indicate a very lenient attitude which was compliant with the wishes of the *waqif*. This may be illustrated with respect to one aspect of Hanafi *fiqh*. The Grand Imam Abu Hanifa granted that, as in a *wasiya* (will), the *waqif* was freely allowed to direct benefits of a *waqf* involving up to a third of his wealth. It follows that it was the responsibility of the would-be Hanafi *waqif* to make a declaration as to the extent of his estate to ensure that no more than a third was committed to the *waqf*. The author has ascertained that not a single *waqf* deed has been found to contain such an explicit account of the full extent of the estate of the *waqif*. It has also been noted that no request or command to this effect, explicit or implicit, was made by the presiding *qadi*.

Between 922/1522 and c. 1025/1615, *waqfs* were generally instituted in a form that would be acceptable to the *madhhab* of the presiding *qadi*, in a similar way as those prevailing in the Ayyubid and Mamluk periods—for example, Maliki *qadi* on Maliki 'Alami *waqif* 960/1533,⁴⁷ Shafi'i *qadi* on Hanafi Khalidi 954/1547.⁴⁸ After this period all the *qadis* appointed in Jerusalem were Hanafis. More significantly, all *waqfs*, regardless of the *madhhab* of the institutor, took a particular Hanafi form, which may cause confusion to the casual reader unless some explanation is given. It was noticed, for example, that a Jaralla *waqif*, who was *mufti* of the Shafi'is in Jerusalem and who had instituted his *waqf* in the earlier form (1031/1622),⁴⁹ had to reinstitute the same *waqf* again in the new form the following year (1032/1623).⁵⁰

The Imam Abu Hanifa ruled that *waqf* was not irrevocable except in three cases—(i) that of a mosque or well-recognised public utility (for example, a cemetery); (ii) *waqfs* produced in the form of a *wasiya* (will); and (iii) where, following an argument which involved diverse opinions of *fiqh*, the presiding *qadi* ruled irrevocably in favour of the general benefit of Muslims. All *waqfs* dating after 1025/1622 were invariably found to be ruled valid and irrevocable only in line with the third case. The technique for achieving this was noted to be the same in all *waqf* deeds. After instituting his *waqf* in the presence of a *qadi*, the *waqif* would hand over his or her relevant *waqf* deeds to a temporary *mutawalli* (administrator). The *waqif* would then rescind his *waqf* and feign to quarrel with his *mutawalli*

amidst an exchange of diverse arguments of *fiqh*. When both appealed to the presiding *qadi* for a ruling, the judge would intervene and invariably side with those arguments of the *mutawalli* in favour of the validity and irrevocability of the *waqf*. The *qadi* usually then dismissed the *mutawalli* and assigned the *waqif* in his place. It is worth pointing out that in order to declare a *waqf* by the *waqif*, the presence of the *qadi* was unnecessary according to most schools of all the *madhhabs*. The *qadi*'s presence was, however, necessary in the case of a ruling on a dispute, even a feigned one, thus ensuring the subsequent validity and irrevocability of the *waqf*.

In line with their scholarly origins and religious posts, the traditional families of Jerusalem maintained private libraries of varying sizes. The number of *waqfs* instituted by the six families investigated can be quoted in evidence; these involved manuscripts, books, notebooks and even astronomical tools. Nine *waqfs* were identified. Another *waqf* (Khalidi 1322/1904)⁵¹ assigned its benefits solely for the upkeep of the renowned Khalidi Library at the Bab al-Silsila. Undoubtedly the *waqf* of the *mufti*/scholar Hasan ibn 'Abd al-Latif (Hussaini 1201/1787)⁵² contained the largest number and most varied titles. A part of this *waqf* is shown in pl. 11.5. The Jarallas had four *waqfs* of books, which included religious, linguistic and other titles, instituted within the short span of thirty-two years (995–1028/1587–1619).⁵³ This reflected the scholarly pursuits of the *waqifs* commensurate with the post of *mufti* held by this family until the early 12th century Hijri. Interestingly, an 'Alami *waqf* (1116/1698)⁵⁴ included in addition to books a number of astronomical instruments and equipment to measure time.

This study is largely based on the *waqfs* of six families. A reading of a hundred *waqf* deeds of other Jerusalem families nevertheless indicates that the findings described here are both representative and significant. Generally, members of the traditional families tended to use *waqf* as a tool primarily for private as opposed to public and strictly charitable purposes. It is clear that the control of the *waqf* wealth during their lifetime was not jeopardised by the process. On the contrary, this tool was used to

extend control after death and beyond the parameters normally allowed by *shari'a* rules, as for example when diverting benefits away from descendants of females. Significantly, *waqf* was also used to pass on to the beneficiaries' rights of use of property not necessarily owned by the *waqif*. Throughout this investigation

no indication has been found that would suggest that *waqf* was used by the traditional families as a method of protection against state interference or expropriation. On the whole, the families had little reason to fear their main benefactor, the Ottoman state.

Chapter 12

ARCHITECTS IN JERUSALEM IN THE 10TH-11TH/16TH-17TH CENTURIES: THE DOCUMENTARY EVIDENCE

Mahmud Atallah

The powers of the *qadi*, known throughout both the 16th and 17th centuries as a 'legal judge' (*al-hakim al-shar'i*) and 'follower of the noble rule in Jerusalem' (*khalifat al-hukm al-sharif bi'l-Quds*) (Atallah 1988: 15-17; Atallah 1991: 1/5-7), were comprehensive, covering different functions within the city during the period of Ottoman rule. Architects and activities related to the profession also came under his jurisdiction (Gibb 1957 I, II: 121-33; Wensinck 1976: 248-9; Raymond 1985: 216; Kaldy Nagy 1990: 4, 375; Majer 1992: 237-8).

1. Architectural Organisation

Architects in Jerusalem in the 16th and 17th centuries were organised in groups which consisted of *mi'mar bashi*, architects, craftsmen and workers.

Mi'mar bashi

The term is Turkish and consists of two parts. The first, *mi'mar*, is derived from Arabic; the second, *bashi*, is Turkish, meaning head or chief. The term therefore denotes the chief architect (Redhouse 1987: 1914; Steuerwald 1985: 641; see also Rafeq 1976: 151; Rafeq 1981 4/31; Halacoglu 1992: 5/119-20). It is the most prevalent one for this office in documents dealing with architects during the period. Sometimes the term *mu'allim al-mi'mariyya* is used (see for example 3/2: 105; 12/3: 502; 13/1: 2; 14/1: 538; 18/1: 253); *ra'is al-mi'mariyya* also

appears (91/2: 79; 94/1: 91; 155/1: 92; 156/1: 4-5; 160/1: 72; 188/2: 67). The term *kabir* (senior) *al-mi'mariyya* was also sometimes used (see for example 96/2: 238; 118/1: 106; 118/1: 342). Occasionally the documents refer to him as *min ru'asa' al-mi'mariyya* (147/1: 380) (of the chief architects) and *ahad ru'asa' al-mi'mariyya* (one of the chief architects) (150/1: 111; 161/2: 391) and *min kibar al-mi'mariyya* or *min kubra' al-mi'mariyya* (of the senior architects) (see for example 98/1: 93; 124/1: 60; 146/1: 542). All these terms and expressions carried the same meaning, and they were used to refer to the official in charge of the architects.

Apparently the appointment of the *mi'mar bashi* would be made in Jerusalem by the *qadi*, as had been the case with other professions (Atallah 1988), and sometimes by the hand of the sultan, in accordance with sultanal decree (*bi mujabi amrin sharifin sultani*). In the latter case, the *qadi* was in charge of implementing the 'noble decrees' (*al-awamir al-sharifa*). On 6 Rabi' I 1112/21 August 1700 *fakhr aqranihi* (of his peers) Muhammad Çelebi al-Nammari, acting on behalf of his son Hibat Allah Çelebi, showed the *qadi* Sharif Efendi a handwritten copy of a noble decree (*suratu khattin sharifin sultani*) dated 4 Sha'ban 1111/25 January 1700, which stated that *al-sadaqat al-sultaniyya wa'l-'awatif al-khaqaniyya* had conferred the office *mi'mar bashiyya* upon his son, to assume authority over *sayyiduna* Khalil al-Rahman's *waqf*, over al-Sakhra and al-Aqsa in Jerusalem, and over all *auqaf* there. Muhammad Çelebi asked the *qadi* to act in accordance with the sultan's decree which he then did (200/1: 64). The document in question, which goes back to 15 Muharram 973/12 August 1565, shows that the post

was shared. Both masters, Muhammad ibn Ramadan and Mahmud ibn Husain ibn Nammar, agreed to share the chairmanship of architects in partnership between them without one of them being privileged over the other. The document also stipulated that each of them would earn a salary (*‘alufa*) according to what he had been assigned in accordance with the *bara’a* (official licence) and *tadkira* (permission). In the case of surveying (inspecting) an estate or other location, they would go together to examine it and submit a report. In the case of one failing to go, the other would assume his position. The *qadi* approved the agreement at the time (48/4: 168; on *bara’a* see Brunschwig 1986 1: 1026-7; on *tadkira* see Carra de Vaux 1934 4: 644).

In this way the *mi‘mar bashi* was in direct touch with the *qadi* and acted as the link between the *qadi* and the architects in matters concerning the architecture of the city.

The authority of the *mi‘mar bashi* following his assignment by the *qadi* was as the leading official in charge of running the different aspects of architectural work, including assessment, renovation, construction, certifying drainage works, contributing to solving any dispute that had arisen between architects and employers, and also any dispute involving architecture that had arisen between members of the public. These aspects of his post are detailed below.

The first reference to the *mi‘mar bashi* found in the Jerusalem Shari‘a Court records and documents is on 15 Dhu‘l-Qa‘da 938/19 June 1532. The chairmanship of architects during the 16th and 17th centuries was virtually the preserve of the Nammar (or al-Nammari) family (see Appendix 12.1); there were only four incumbents of the post who did not belong to the family. This is clear from a survey of the *mi‘mariyya* chiefs identified in the sources over the period. They were:

1. Master Badr al-Din Husain ibn ‘Ali ibn Nammar. Documents describe him as ‘Master *mi‘mariyya*’ (1/4: 143; 2/4: 144; 18/1: 621; 17/4: 58), ‘Sultanal Master’ (17/1: 334), *mi‘mar* (architect) (18/1: 519; 33/4: 415), *mi‘mar bashi* (24/3: 307; 37/3: 646), *ra’is al-mi‘mariyya* (46/1: 78). These references date from Mustaha ‘l-Rabi‘ II 937/22 November 1530 and 23 Jumada II 972/26 January 1565.

2. Al-Sharif Musa ibn al-Sharif Abi ‘l-Khair. His name is cited in a document dating 17 Dhu‘l-Qa‘da 947/15 March 1541. He is termed ‘master of the architects’ (13/1: 51).

3. Master Muhammad ibn Ramadan. Documents cite him as *mi‘mar bashi* (33/1: 30) and ‘*mi‘mar* of the Jerusalem Citadel’ (33/3: 56; 35/1: 102; on Qal‘at al-Quds, see al-‘Ulaimi 1973 2: 55; Najm 1983: 128-9). These date from Awasiit Dhu‘l-Hijja 963/20 October 1556 to Awa’il Safar 977/16 July 1569 (33/1: 20; 52/1: 40).

4. Master Mahmud ibn Husain ibn Nammar. The relevant documents describe him as *mi‘mar bashi*, particularly between 3 Jumada I 964/4 March 1557 and Awakhir Jumada I 1005/19 January 1597 (33/4: 259; 78/1: 544).

5. Al-Ustad Ahmad ibn Yahya. The document is dated 18 Dhu‘l-Qa‘da 985/27 January 1578, and refers to him as *mi‘mar bashi* (58/4: 40).

6. Al-Usta ‘Abd al-Muhsin ibn Mahmud ibn Nammar. In the documents he is described as *mi‘mar bashi* (78/2: 136; 83/1: 89; 123/1: 73-4), *ra’is al-mi‘mariyya* (90/1: 191; 101/1: 243), and *kabir al-mi‘mariyya* (90/1: 294; 118/1: 342). He is also given titles of nobility such as *fakhr al-aqran* (94/1: 86), ‘*ain al-amathil*’ (96/3: 120), *fakhr al-mi‘mariyya* (95/1: 71), *fakhr al-aqran wa ‘ain dunya al-zaman* (101/1: 312), *fakhr aqranih ‘ain abna’ al-zaman* (102/2: 426), *fakhr al-a‘yan* (121/1: 139), and *fakhr al-aqran wa ‘ain al-a‘yan* (122/1: 47-8). From titles like these it is possible to see the very real status enjoyed by the chief architect. The titles rendered him equal to the senior notables of Jerusalem at the time, and in particular equal in status to the governor-commissioner of the city (135/1: 262).

‘Abd al-Muhsin held the chairmanship of the *mi‘mariyya* between 20 Jumada II 996/17 May 1588 and 12 Rajab 1045/22 December 1635 (67/2: 210; 125/1: 47). In addition to the chairmanship of the *mi‘mariyya*, he was also given the job of ‘reconstruction and renovation’ of al-Aqsa Mosque. In Awasiit Jumada II 1004/15 February 1596, Master ‘Abd al-Muhsin was granted permission by Qadi Shuja‘ al-Din Efendi to build a *khalwa* (cell) on the esplanade of al-Sakhra to the south to use as a storeroom for tools. He was given permission after the *qadi* had been convinced that it would not harm al-Aqsa (77/2: 243).

7. Master Karim al-Din ibn Mahmud ibn Nammar. In the documents he is called *mi‘mar bashi* (86/5: 137), *ra’is al-mi‘mariyya* (91/2: 79), and *min kibar al-mi‘mariyya* and cited among those who had experience and expertise in buildings and their assessment (98/1: 93). The documents refer to him as *fakhr al-mi‘mariyya* (95/1: 71). He held the chairmanship of the architects between 27 Dhu‘l-Qa‘da 1014/5 April 1606 and 9 Jumada I 1038/4 January 1629 (86/5: 37; 115/1: 179). On 20 Safar 1027/16 February 1618, Qadi ‘Abd Allah Efendi decided to allocate two-thirds of the job of servicing the *qanat al-sabil* (drinking-fountain canal) to Karim al-Din and his brother Hasan (see below). The water of the *qanat* was to flow into Jerusalem from *birak al-Marji‘* (the Pools of Solomon—for *birak al-Marji‘* see al-‘Ulaimi 1973 2: 59; al-‘Arif 1961: 438). Their joint salary amounted to two-thirds of a *ghirara* of wheat (for *ghirara* see Hinz 1970: 37-8; Ashtor 1991: 118)—48

mudd and its equivalent value in Jerusalem (for *mudd* and its equivalent value in Jerusalem, see Hinz 1970: 45-6; Atallah 1988: 56 n. 147; Ashtor 1991: 118). They were to share the salary equally and were appointed in place of Mansur walad Makhluḥ al-Talhami al-Nasrani (100/2: 125).

8. Master Hasan ibn Mahmud ibn Nammar held the chairmanship of the architects between Monday, 3 Ramadan 1015/2 January 1607 and 10 Rabi' I 1057/15 April 1647 (87/2: 73; 139/1: 301). The relevant documents cite him as *mi'mar bashi* (87/2: 73). In the same documents he is called *fakhr al-aqran* (104/2: 228) and *fakhr al-mi'mariyya* (118/1: 284). When on 4 Dhu'l-Qa'da 1055/22 December 1645 there was a difference of opinion over the post of *mi'mar bashiyya* between Hasan and Master Khalil ibn 'Ali ibn Nammar, Hasan showed the *bara'a sultaniyya* which granted him the post in question provided it was associated with the *tauliyya* post over the *qanat al-sabil* endowed by Sultan Sulaiman (reigned 1520-66). Master Khalil retaliated by producing a *bara'a sharifa sultaniyya* dated later than that of al-Ustad Hasan confirming him in the job. Hasan then showed the 'sultanal ordinary' dated 24 Muharram 1055/22 March 1645 addressed to him. The decree also declared that if anyone should present a *bara'a sharifa* with regard to the *qanat*, it would not be valid (138/4: 32-3). On Ghurraṭ Dhu'l-Qa'da 1056/9 December 1646, Hasan took on a part-time post in charge of the *qanat al-sabil waqf* on a daily basis for 5 *qit'a shamiyya* and a *ghirara* of wheat every year and a half in the place of Shaikh 'Ali ibn al-Shaikh Jar Allah ibn Abi 'l-Luṭf—*mufti al-sada al-hanafiyya*—as he had retired (139/4: 86; for *qit'a shamiyya* see Atallah 1988: 41 n. 82; Cohen 1989: 116).

9. Ustad Mustafa ibn al-Mu'allim 'Abd al-Muhsin. He ran the *mi'mariyya* between Ghurraṭ Rajab 1031/12 May 1622 and 20 Rabi' I 1052/18 June 1642 (105/1: 267; 132/1: 381). The relevant documents cite him as *mi'mar bashi* (105/1: 267), *kabir al-mi'mariyya* (118/1: 106), *min kubara' al-mi'mariyya* (124/1: 60) He is also referred to by the titles *fakhr al-aqran* (117/1: 123), and *fakhr al-aqran wa zain al-khillain* (117/1: 298).

According to the *bara'a* dated 2 Jumada II 1040/6 January 1631, Ustad Mustafa on 3 Dhu'l-Hijja 1040/3 July 1631 assumed the post of 'appointing the one in charge of *qanat waqf*, the water from which would flow to Jerusalem, and a *mi'mar bashi* over the *qanat* and pools for a salary of 6 *qit'a misriyya* daily and a *ghirara* of wheat annually (118/2: 116; for *qit'a misriyya* see Atallah 1988: 41 n. 82; Cohen 1989: 116).

10. Master Khalil ibn 'Ali ibn Nammar. He assumed the leadership of the *mi'mariyya* between 6 Ramadan 1047/22

January 1638 and 16 Muharram 1061/9 January 1651 (126/2: 557; 145/1: 91). The documents in question cite him as *mi'mar bashi* (126/2: 557). He also enjoyed the titles of *fakhr al-aqran* (126/1: 561), *fakhr al-mi'mariyya* (127/1: 484), *fakhr al-a'yan* (127/2: 550) and *fakhr al-aqran* (128/1: 62).

11. Ustad Fakhr al-Din ibn Khalil ibn Nammar. He took up the *mi'mariyya* chairmanship between 22 Dhu'l-Qa'da 1052/11 February 1643 and 15 Rabi' I 1078/4 September 1667 (133/1: 276, 168/1: 99). In the documents he is referred to as *mi'mar bashi* (133/1: 277), and *ahad ru'asa' al-mi'mariyya* (150/1: 111). He also had the title *fakhr al-aqran* (134/1: 595).

12. Master 'Umar ibn Hasan ibn Nammar. He was the chief architect between 17 Rabi' I 1055/13 May 1645 and 26 Rabi' I 1093/4 April 1682 (135/1: 144; 185/1: 22-3). Between 5 Ramadan 1090/10 October 1679 and 26 Rabi' I 1093/4 April 1682, 'Umar was deputy *wakil* of his son, Hibat Allah, in the *mi'mariyya* chairmanship. In the documents, he is referred to as *mi'mar bashi* (135/1: 441), *ra'is al-mi'mariyya* (156/1: 4-5), and *mi'mar* of al-Aqsa (181/1: 316). He had the title *fakhr al-mi'mariyya* (160/2: 170). On the basis of a *bara'a* dated 10 Rabi' II 1048/21 August 1638, Qadi Mahmud Efendi appointed him to a part-time post 'to share out water' in the *maqsam* (water exchange) located near the Bab al-Silsila (see Najm 1983: 337) for a salary of two and a half 'uthmani daily (127/1: 486).

13. Master Mahmud ibn al-Hajj Hasan ibn Nammar. He held the *mi'mariyya* chairmanship between 16 Shawwal 1056/25 November 1646 and Rajab 1078/December 1667. In the documents he is referred to as *mi'mar bashi* (139/1: 63), and *ra'is al-mi'mariyya* (156/1: 4-5).

14. Ustad 'Ali ibn al-Hajj Karim al-Din ibn Nammar (or Nammari). He was chief architect between 14 Ramadan 1059/21 September 1649 and 23 Safar 1105/24: October 1693 (142/2: 41; 195/1: 57). He is also referred to as *mi'mar bashi* (142/2: 41), *ra'is al-mi'mariyya* (155/1: 92), *mi'mar* al-Aqsa (183/1: 225-6), and *ra'is al-mi'mariyya bi'l-Sakhra* (188/2: 67). He also had the title of *fakhr al-mi'mariyya* (161/3: 20). On 20 Dhu'l-Hijja 1061/4 December 1651, 'Ali took over the *qanat al-sabil waqf* in partnership with Hajj Mahmud ibn Nammar and Master 'Umar ibn Nammar. The three of them would audit the returns and the expenditure of the *qanat* endowment according to the *qanat's* requirements. They would receive a salary of 10 *qit'a misriyya* and a *ghirara* of wheat to be divided among them (164/1: 64).

15. Ahmad Khalifa *mi'mar bashi*. He held the

chairmanship of *al-mi'mariyya* between Awasit Sha'ban 1080/8 January 1670 and 7 Muharram 1088/12 March 1677 (171/1: 255; 173/1: 230; 174/1: 10; 177/1: 169; 178/1: 7; 179/1: 89).

16. Hibat Allah Çelebi. He held the *mi'mariyya* chairmanship between 15 Dhu'l-Qa'da 1090/18 December 1679 and 23 Safar 1105/24 October 1693 (181/1: 316; 195/1: 57). The documents refer to him as *mi'mar bashi* (181/1: 316) and *ra'is al-mi'mariyya* (188/2: 67). The documents also give him the title *qudwat al-a'yan* (181/1: 316).

17. 'Abd al-Karim Çelebi *mi'mar bashi*. He held the *mi'mariyya* chairmanship between Awakhir Dhu'l-Qa'da 1109/9 June 1698 and Awasit Jumada I 1112/28 October 1700 (198/3: 239-41; 200/1: 140).

From the entries listed above, it can be seen that in addition to the titles already discussed, the chief architect also took the title *mu'allim*, or *usta*, or *ustad* as in other crafts (Atallah 1988), as well as the title of 'noble', as in the case of Sharif Musa ibn Abi 'l-Khair. The principle of a 'professional dynasty' is clear in the Nammar or al-Nammari family, where the title passed from father to son and so on (Gibb 1951 I: 292; see Appendix 1).

Finally I would like to point to another speciality to which the documents refer. This is the licence of the chief architect. The licence, which would be granted after obtaining permission from the *qadi*, would be awarded so that he could run his own business and look after his personal interests. When Master Muhammad ibn al-Hajj Ramadan al-Mi'mar wanted to travel to Hebron on 22 Jumada I 965/22 March 1558 in order to complete *al-'amara al-sultaniyya al-sharifa* there, he requested permission from the *qadi* which was duly granted. His deputy, Isma'il ibn Khadr al-Yeniçeri in the Jerusalem Citadel, took over in his absence the job of collecting the *auqaf* of the *qanat al-sabil* that would supply Jerusalem with water (36/2: 27). The same thing happened with Master 'Abd al-Muhsin ibn al-Mu'allim Mahmud ibn Nammar, also *mi'mar bashi*. He asked permission from Qadi Mahmud Efendi on 9 Rabi' II 990/3 May 1582 to travel to Egypt to complete some personal business. He was asked to appoint a deputy to run the renovation of Hammam al-Sultan and the water-channel supplying Jerusalem during the period of his absence. Permission was granted (61/4: 173; on the Hammam al-Sultan see Atallah 1988: 224 n. 1840).

Architects

The architects were of *mu'allim* or *ustad* rank. The relevant

documents refer to them as *al-mi'mariyyun* (18/1: 253; 25/1: 204; 1: 205; for the term *mi'mari* see al-Qasimi 1960 I: 51-2; II: 458; for *ustad* or *mu'allim* see Rafeq 1976: 152). They are also called *al-mi'mariyya* (58/4: 40; 165/1: 48), and *muhandisun* (engineers) (18/1: 253; 25/1: 204; 1: 205). These architects contributed to the implementation of various construction works in Jerusalem. The documents refer to them as belonging 'to the construction profession' (*min ahl hirfat al-bina'*) (102/1: 37). Those who had previous experience and knowledge of estates and their assessment are referred to as being '*min ahl al-khibra wa'l-ma'rifa bi'l-'aqarat wa takhminiha*' (104/1: 172; 146/1: 197-8), while those who 'have experience and knowledge of surveys and their evaluation' are referred to as '*min ahl al-khibra wa'l-ma'rifa bi'l-masahat wa taqwimiha*' (105/1: 495). These architects would also resolve disputes and differences that arose among the population of the city, for they had experience in dividing houses and knew the buildings' weaknesses and the damage that they had sustained (138/1: 79; 160/1: 70). I will refer to this again below.

Apparently some architects would work in another job in addition to their profession. Al-Mu'allim Muhammad ibn al-Hajj al-Mi'mar is a case in point. He took on the job of collecting the endowments of the *qanat al-sabil* supplying Jerusalem (36/2: 27).

The total number of architects identified from the documents who were active during the 16th and 17th centuries is one hundred and twenty-eight. From the list (see Appendix 12.2), the conclusion is that the Muslim architects played a crucial role. Of the one hundred and twenty-eight, one hundred and five were Muslim while twenty-two were Christians and there was only one Jew. As already shown, the list shows that some families were particularly prominent, like that of the Nammar, eleven of whom were practising architects, and from whose ranks came the majority of the *mi'mar bashi*.

Specialist Architects

The documents of the period cite specialised groups of architects working in the following fields:

(a) Architects at the Maqam (holy place) Sayyiduna Da'ud

On 12 Muharram 991/18 February 1583, this job was assigned to the brothers 'Abd Allah and Da'ud, sons of Shaikh 'Ali Abi Huraira. They shared the job equally, with a salary amounting to 2 *'uthmanis* per day, in place of their late father (61/1: 432).

(b) Architects' and Gravediggers' Guild

Members of this guild specialised in digging and

construction in the following cemeteries: al-Rahma (near the wall to the east of the city), al-Sahira (to the north of the city, also near the wall), Ma'man Allah (to the west of the city—now known as Mamilla) and al-Yusufiyya (to the north of al-Rahma cemetery, near the Bab al-Asbat) (103/5: 17; Atallah 1991 1: 69). Some documents directed at architects contain warnings with regard to the behaviour expected of them. One reminder dated Saturday 25 Rabi' I 1029/1 March 1620 from Qadi Khalil Efendi to the architects warns against the re-use of materials. It makes clear that 'none of the architects may build a grave using old stones or old stone-slabs' (103/5: 17; Atallah 1991: 1/69). When al-Shaikh Majd al-Din al-'Alami lodged a complaint against Abi Bakr ibn Qasim al-Halabi for digging three graves and uncovering the bones of his son (123/3: 545; Atallah 1991 1: 73), al-Qadi Muhammad al-Ja'uni on Friday 11 Shawwal 1044/30 March 1635 ruled that 'he must not dig a grave unless the *shaikh* of the cemetery, Muhammad al-Huwaish, was present' and 'he must not expose the bones of the dead' (123/3: 545; Atallah 1991 1: 73).

The documents cite five guild *masha'ikh* who were appointed between 13 Rabi' I 1019/5 June 1610 and 6 Jumada II 1063/4 May 1653. These *masha'ikh* were as follows:

1. Al-Naqib Muhammad ibn Mansur al-Sulami. He was appointed *shaikh* on 13 Rabi' I 1019/5 June 1610 with authority over gravediggers and stonecutters at Ma'man Allah cemetery after he had made it clear to the *qadi* that some gravediggers and stonecutters were desecrating the graves and their occupants by illegally removing gravestones, re-inscribing them and then selling them (90/9: 438).
2. Badr al-Din ibn Sulaiman. He was appointed *shaikh* on 25 Rabi' I 1029/1 March 1620 over gravediggers and architects at al-Rahma, al-Sahira and al-Yusufiyya cemeteries (103/5: 17; Atallah 1991 1: 69).
3. 'Ali ibn Khalil ibn Nammar. He was appointed *shaikh* on 25 Rabi' I 1029/1 March 1620 to be in charge of both gravediggers and architects at Ma'man Allah cemetery (103/5: 17; Atallah 1991 1: 69).
4. Muhammad al-Huwaish. He was appointed *shaikh* on Friday, 11 Shawwal 1044/30 March 1635, to be in charge of Ma'man Allah cemetery and *nazir* (administrator) over the gravediggers (123/4: 545; Atallah 1991 1: 70).
5. Musa ibn Sa'd al-Din. He was appointed *shaikh* over the gravediggers' guild on Sunday, 6 Jumada II 1063/4 May 1653 (147/4: 329; Atallah 1991 1: 74). In the same document three other masters are identified as practising the same profession—Muhammad ibn Khalil, Muhammad al-Magharibi and Musa ibn al-Khayyat.

The documents also mention a number of Jews

who had obtained legal permission to act as gravediggers for their own dead. Ha'im Walad Hilal al-Yahudi al-Maghribi is a case in point. He obtained a permit from Qadi Hibat Allah Efendi on Monday, 26 Rabi' II 1059/9 May 1649 to dig graves for the Jewish dead in their own cemetery in the village of Silwan (for Silwan see Atallah 1988: 51 n. 121). All others were prevented from digging or interfering in the affairs of the cemetery without his prior knowledge (132/1: 83; Atallah 1991 1: 71). Two spokesmen for the Jewish community—Ha'im Abi Halaqa and Ha'im Qurra—filed a complaint on Sunday, 9 Rabi' II 1063/9 March 1653 complaining that a large number of Jews were digging graves and overcharging the people, especially the poor, widows and orphans. They requested that Qadi Abu 'l-Barakat Muhammad Sharaf al-Din Efendi al-Khalidi prevent the men involved from working in the cemetery. At the same time they demanded that Idir al-Yahudi al-Haffar be allowed to practise his profession of gravedigger for the Jewish dead because he did so without salary. Idir undertook to 'dig the graves of the dead Jews at no charge and free.' The *qadi* responded positively to their request and granted Idir permission to do his job (147/1: 167; Atallah 1991 1: 71-2). But on Akhir Shawwal 1064/12 September 1654, Yasif Walad Binyamin and Ya'qub Walad Danial received an order from the sultan (*amrin sharifin sultani*) according to which they could both pursue their profession of digging Jewish graves. The service was restricted to them and no other gravedigger would be allowed to compete with them following the order. Al-Qadi Muhammad Efendi granted them permission to practise their profession and prevented others from harassing them (150/7: 81; Atallah 1991 1: 73).

The documents also specified the cost of digging an old grave in 1063/1653. The wage was 5 *qit'a misriyya* for the cemeteries of Bab al-Rahmah, al-Yusufiyya and al-Sahira, while at Ma'man Allah the wage was 8 *qit'a misriyya*. The cost of digging a new grave was 1.33 *ghirsh* at Ma'man Allah (Mamilla) cemetery, and 1 *ghirsh* at Bab al-Rahmah, al-Yusufiyya and al-Sahira (147/4: 329; Atallah 1991 1: 74; for *ghirsh* see Atallah 1988: 42 n. 87; Cohen 1989: 115).

(c) Canal employees (*al-qanawatiyya*)

The canal employee (*qanawati*) was in charge of the construction and renovation of, and keeping clear of stones and debris, the *qanat al-sabil* supplying Jerusalem (on *al-qanawati* see al-Qasimi and al-'Azm 1960 2: 364-5). The personnel concerned with the canal consisted of the following:

1. *Mutawalli*: this was the person in charge of canal endowments in terms of securing the necessary funds for its maintenance. Sulaiman Çelebi was one of those in charge of the canal, cited in the documents on 12 Shawwal

981/4 February 1574 (56/1: 732). Because of the importance of the job, which secured the city's water supply, it was associated with the post of chief architect (see above)

2. **Didban:** (a Persian word meaning a 'supervisor', Junker and Alavi 1986: 337). This man was in charge of the water in the pools and canal. On 12 Shawwal 981/4 February 1574, Jum'a ibn Abi 'l-Fakhr and his son were cited as *didban al-ma' wa-'l-birak* (56/1: 732).

3. **Masters:** seven masters were identified by me from the documents—Ibrahim and Jum'a (135/1: 296); Mahmud al-Qanawati (56/1: 732; 84/1: 522; 135/1: 296); Muhammad ibn Mahmud al-Qanawati (135/1: 349); Muhammad al-Shami al-Qanawati (135/1: 359); Shihada and Yusuf (135/1: 296).

4. **Pool Servants:** these were in charge of inspection and cleaning work. Dhu'aib ibn Khalil and Shabib ibn 'Umar are among those cited in the documents (56/1: 732).

5. **Ajnad:** guards whose task was to guard the canal. They are cited on 5 Shawwal 1018/1 January 1610 during the reconstruction and renovation of the Middle Marji' Pool. Their wage was 330 *qit'a misriyya* (90/3: 238).

It is worth noting that the reconstruction and renovation work of the canal came under the authority of the architects. One document dated 13 Dhu'l-Qa'da 939/6 June 1533 records the expenditure of 9 *'uthmanis* of canal endowment money by Master Husain, Master of Architects, in return for the work of canal specialists and labourers on restoration of the canal (3/2: 105). *Mafkhar al-amajid* 'Ali Katkhuda spent 75 *sultani* gold coins on the wages of farmers and labourers from neighbouring villages to restore/construct the Middle Marji' Pool with the prior knowledge of al-Mu'allim Mahmud Çelebi ibn Wali and al-Mu'allim Mahmud ibn Nammar ibn al-Mu'allim Husain ibn Nammar *mi'mar bashi*, who were deputed to reconstruct the pool in question (61/1: 472). The total costs of canal renovation and construction by the date of 5 Shawwal 1018/1 January 1610 amounted to 1,710 *qit'a misriyya*. The sum was distributed as follows (90/3: 283):

labourers' wages	59 <i>qit'a</i>
<i>silal</i>	75 <i>qit'a</i>
<i>ajnad</i> (guards') wages	330 <i>qit'a</i>
donkeys	52 <i>qit'a</i>
donkey drivers	15 <i>qit'a</i> .

Architects from outside Jerusalem would sometimes participate in inspection work. For example, on 7 Dhu'l-Hijja 1047/22 April 1638, al-Mu'allim Khalil ibn 'Ali ibn Nammar *mi'mar bashi* co-operated in the inspection of the *sabil* pools with al-Mu'allim Muhammad ibn 'Ali *mi'mar bashi* al-Jami' al-Umawi (the Umayyad mosque), Ustad Nasr Allah, Ustad Mikha'il and Ustad

Ya'qub. All were experienced architects. The total cost of the pools' reconstruction amounted to 2,750 *ghirsh* (127/1: 66), while the estimated cost of canal renovation on 25 Dhu'l-Qa'da 1054/23 January 1645 was 1,090 *ghirsh asadi* (135/1: 296; for *ghirsh asadi* see Atallah 1988: 42 n.87).

The chief architects and architects co-operated in revealing any damage to the *sabil* canal both inside and outside the city. Muhammad Manakhir al-'Ijla damaged the *sabil* basin under the stairway of the Sakhra esplanade by building two walls which obstructed the *sabil*. As a result, Muhammad Basha *amir al-umara*, requested that Qadi Muhmmad ibn Amin look into the matter in Jerusalem. The *qadi* and the chief *amir* went in person to inspect the site, accompanied by al-Mu'allim 'Abd al-Muhsin *mi'mar bashi*. They discovered that the basin had been rebuilt and a wooden door added. The *qadi* ordered the demolition of the building on 19 Dhu'l-Hijja 1037/20 August 1628 (113/1: 846). In addition, the attorney of Muhammad Basha's wife, Muhammad ibn Salih al-Dajani, complained on 25 Dhu'l-Qa'da 1054/23 January 1645 about the location of a canal between the houses of Shaikh 'Umar al-Halabi and Ishaq al-Yahudi in the Jewish Quarter, on the grounds that it would affect al-Khwaja al-Duhaina soap-factory. Al-Mu'allim Khalil ibn Nammar *mi'mar bashi* and his son al-Mu'allim Fakhr al-Din, together with Muhammad al-Shami al-Qanawati, visited the site but found on inspection that the canal had no connection whatsoever with the soap-factory and, moreover, that it was an old construction. It was causing no harm whatever to the soap-factory (135/1: 359). Ahmad Katkhuda al-Basha, on 18 Rajab 1056/30 August 1646, complained about villagers who were vandalising the canal en route for Jerusalem by opening a link in order to provide water for their animals. This had resulted in a shortage of water and residents of the city had been harmed. The situation required a close on-site inspection. As a result al-Mu'allim 'Umar ibn Hasan ibn Nammar and al-Mu'allim Khalil ibn Karim al-Din ibn Nammar, together with other canal personnel, conducted their own investigations (136/2: 322).

Special Personnel

Some sites were so important that specialists were employed to supervise the architecture. These are as follows:

1. The Royal Buildings of the Noble Sultanate (al-'ama'ir al-sultaniyya al-sharifa)

The buildings were under the supervision of special employees of the sultan. These 'buildings' were in fact a castle used for defensive purposes which included housing for soldiers, governors and relatives of the sultan. The

special employees have been identified as follows:

a. *al-Amin* (Superintendent)

The legal documents mention *qudwat al-amathil* Haidar Katkhuda as secretary of the buildings of the Noble Sultanate in addition to his post as leader of the Tripoli District (*liwa' Tarablus*) and administrator of the Church of the Holy Sepulchre (*kanisat qumama*) (24/4: 69; 3: 440; on this church see also al-'Ulaimi 1973 2: 51; al-'Arif 1951: 213-39; al-'Arif 1961: 517-23; Najm 1983: 437). On 24 Ramadan 957/6 October 1550, Haidar brought stones from churches that had been destroyed in the village of Qaluniya to use in the royal buildings (24/4: 69; for Qaluniya, see Hütteroth 1977: 118). On 22 Jumada II 958/27 June 1551, Haidar was in receipt of 500 *sultani* gold coins as the return from the Holy Sepulchre for the year 958/1551; this money was to be spent on the building (24/3: 440).

b. *al-Mushidd*

Al-mushidd (for the term see al-Qalqashandi 1963 4: 77; al-Maqrizi 1956 I 1: 105 n. 2) was in charge of the reconstruction and restoration of the royal buildings. Several people are named as having held the post:

i. *Mafkhar al-amathil* Hasan Beg, who is cited at the beginning of Dhu'l-Hijja 937/16 July 1531 in connection with the receipt of 30,000 *'uthmanis* from *mafkhar al-khuddam* Biri Jawish ibn Khadr (11/1: 348).

ii. *Mafkhar al-akabir* Muhammad Beg was a *mushidd* in charge of a royal building—the Citadel of Jerusalem—on 28 Rabi' II 938/9 December 1531. He paid al-Hajj 'Ali ibn Ahmad al-Suqi a sum of money as recompense for design work on the Citadel (1/2: 6).

c. *al-Yazici*

The *yazici* was Clerk to the Royal Buildings. In Shawwal 937/June 1531 *fakhr al-muharririn* Husain al-Yazici is cited as having received a specific sum of money from Khwaja Badr al-Din ibn Mujahid ibn al-Jamus al-Ramli as the final instalment of a total of 19,500 *'uthmanis* for oil (1/2: 319). Apparently the funds were to be used on the building. Owing to the importance of the post, on 15 Dhu'l-Qa'da 937/June 1531, Husain introduced Muslih al-Din al-Yazici as deputy 'to audit the expenditure on all royal buildings' (1/2: 338). In this post, all specialist clerks were to be listed in specific places, as was the case with Shaikh 'Abd al-Qadir ibn Muhammad, deputy *nazir* of al-Aqsa Mosque. This illustrates the fact that the Noble Court bestowed a daily wage of 1 *qit'a misriyya* in line with a *bara'a sharifa* dated 6 Safar 994/27 January 1586 (69/2: 206) on him for the maintenance of the Bimaristan endowment.

d. *The Dome of the Rock and al-Aqsa Mosque*

The 'job of repairing and renovating the lead of the Rock'

was one of those related to the maintenance of the Sakhra and al-Aqsa Mosque. The post was introduced at a time when the surface lead of the two buildings was in need of repair and renovation due to heavy rain and snow on Awa'il Jumada II 1003/11 February 1595. There was a large amount of damp because of the weather. Al-Qadi Maulana Shuja' al-Din Efendi inspected the roofs and he was informed by the Jerusalem dignitaries that the damp would recur annually due to lack of inspection and supervision. They suggested that he appoint a person to renew the lead. An *'alufa* (salary) would be earmarked for him from al-Aqsa Mosque endowment. The Qadi Salih ibn Ibrahim al-Gharabili was a man of 'experience and knowledge in renovation and repair' work. But the *qadi* was not satisfied with this recommendation. He ordered al-Zaini Salih to repair and renovate a sample of the lead so that he could be sure of his expertise and knowledge. Salih renewed some parts and succeeded in stopping the damp. The *qadi* concluded that Salih was indeed a man of expertise and knowledge. He was duly appointed to the job of 'repairing and renovating the lead' with a daily wage of 1 *qit'a misriyya* at the expense of al-Aqsa *waqf* (76/1: 350).

e. *Bait al-Maqdis wall*

Mafkhar al-'umana Muhammad al-Naqqash was one of the men who assumed the post of *al-amin* with respect to the reconstruction of the walls of Jerusalem. This was on 2 Rabi' II 947/6 August 1540 (12/2: 400). Following the news, he received at the end of Ramadan 948/17 January 1542 information to the effect that al-Mu'allim Darwish al-Mi'mar in Aleppo had written a letter to *maulana* 'Ali Çelebi Efendi, *al-daftardar* of the Ottoman empire, to the effect that Muhammad Çelebi was negligent in his work of wall reconstruction despite all the potential he had in the way of masters, carriers and labourers. In the wake of this, *maulana al-efendi* Salih ibn Yanni summoned al-Mu'allim Darwish, the administrator of Jerusalem and Hebron. He asked him about the authenticity of the letter. Darwish denied its contents and said 'I have not completed, written or sent a letter against him. I have been in his company for four years. I have not noticed any carelessness, negligence or laziness' (14/3: 144). He added that Muhammad had on the contrary been active, serious, diligent and knowledgeable in his work. All these qualities he had contributed towards the completion of the reconstruction of the wall (14/3: 144; for the wall see Najm 1983: 100-1).

f. *Craftsmen*

The 16th- and 17th-century documents refer to five groups of craftsmen in industries related to reconstruction and renovation:

1. *Smiths*

Smiths contributed considerably to the completion of one

aspect of reconstruction and renovation. On 7 Shawwal 947/4 February 1541, the minaret of al-Masjid al-Sharif was stripped. It was found to be in need of reconstruction, and renovation was also required in its vicinity. Mu'allim Jum'a al-Haddad was one of those who participated in this renovation work (15/2: 114). In Awa'il Safar 977/16 July 1569, four smiths are cited on the occasion of their appointment in accordance with an *amrin sharifin sultani* (royal order) to participate in the building of *al-qal'a al-mansura* in Jerusalem. Their wages amounted to 6 *sultani* distributed as follows: Mus'ad ibn Sulaiman—2 *sultani*; Jirjis ibn Hanna—2 *sultani*; Khalaf ibn Khalil—1 *sultani*; and Muslih ibn al-Riyah—1 *sultani*. All of them were guaranteed by Mus'ad ibn Sulaiman (52/1: 20; Atallah 1988: 208-12).

2. Lead-Pourers

Lead-pourers were needed in the reconstruction and renovation of sites where lead was used in the building. The documents relating to the construction of al-Mansuriyya soap-factory show expenditure on 4 Muharram 940/26 July 1533 on al-Mu'allim 'Ubaid al-Sakkab, who had leaded the soap-factory kettle (*qidra*) (4/4: 219-20; on the term *sakkab* see Ibn Manzur 1981 3: 2045; al-Qasimi and al-'Azm 1960 2: 236-7). Two masters (*mu'alliman*), Ibrahim Walad Sadaqa al-Ghazzi and his brother Yusuf, are cited on 22 Rabi' II 1037/31 December 1627 as lead-pourers for al-Aqsa Mosque (113/1: 439).

3. Carpenters

Carpenters worked on various tasks associated with construction work of both old and new houses—doors, windows and roofs (al-Qasimi and al-'Azm 1960 2: 478-9). The documents contain information on the amount of a carpenter's wage working on four successive days in Sha'ban 941/February 1535 on the repair of the Khan al-Qattanin doors. The carpenter Muhammad al-Hindi received 411 *qit'a sulaimaniyya* (4/1: 615; on Khan al-Qattanin see Burgoyne 1987: 276), while al-Mu'allim Muhammad Abu Baksh made nine doors for the upper storeys of the same *khan* on 22 Shawwal 944/24 March 1538. He also repaired another (tenth) door (7/1: 452). On 4 Rabi' I 947/9 July 1540, the carpenter al-Mu'allim Muhammad al-Jaljuli made another four doors for the same upper storeys (12/1: 306). On 13 Rabi' I 948/7 July 1541, the carpenters Ahmad Walad Khattab and Muhammad al-Jaljuli made doors for al-Madrasa al-Tuluniyya and for private rooms (*khalawiha*) (13/2: 351; for al-Madrasa al-Tuluniyya see al-'Ulaimi 1973 2: 40; al-'Arif 1961: 251-2; Nasir 1974: 68; al-Nu'aimat 1983: 37).

With regard to carpenters' wages, a document dated 19 Jumada II 951/7 September 1544 reports that the carpenter Ahmad ibn Hattab had made three doors for the

lower storeys of Khan al-Qattanin and that for this he had received 12 silver *dirhams* (17/1: 168). In the reconstruction of Hammam al-'Ain, on 4 Jumada I 953/3 July 1546, 'Abd al-Karim and Ahmad al-Najjar received 411 *qit'a sulaimaniyya* (18/4: 163; for Hammam al-'Ain see Atallah 1988: 224). On 26 Dhu'l-Hijja 954/6 February 1548, al-Mu'allim 'Ali al-Najjar received 20 *qit'a sulaimaniyya* in payment for reconstructing al-Madrasa al-Manjakiyya (20/1: 183; for al-Manjakiyya see al-'Ulaimi 1973 2: 37; al-'Arif 1961: 248-9; Ghawanima 1982: 160; Najm 1983: 229-32; al-Nu'aimat 1983: 60-1; Burgoyne 1987: 384-8). 'Abd Allah al-Najjar received the same amount in payment for his work on the building on 4 Muharram 957/23 January 1550 (23/2: 52). Five carpenters were appointed to participate in the building of the Citadel (*al-qal'a*) al-Mansura in accordance with an *amrin sharifin sultani*. The document, dated Awa'il Safar 977/16 July 1569, specified their wages as follows: al-Usta Muslih al-Din—2 *sultani*; Khalaf ibn Muhammad—2 *sultani*; Dib ibn Sulaiman—1 *sultani*; Mahmud ibn Abi 'l-Khair—1 *sultani*; and Muhammad ibn Muslih al-Din—1 *sultani*. These carpenters were guaranteed by al-Usta Muslih al-Din (Atallah 1988: 218-21; 52/1: 40). In addition two carpenters, Hasan ibn Jamal al-Ramli and 'Umar al-Muhtadi, were appointed on 23 Jumada 'l-Akhira 988/5 August 1580 to participate in the construction of 'Uyun al-Tujjar. Each would receive 6 *qurush*; both were guaranteed by Ahmad ibn Abi Shadi (72/3: 68).

It is also worth noting that the documents dated Muharram 952/March 1545 refer to a *sabiyy al-najjar* (carpenter's apprentice) whose job was to help the carpenter in his work (17/1: 168).

4. Mu'allimu al-balat (pavement-makers)

The job included lifting stone slabs. The brothers al-Mu'allim Muhammad and al-Mu'allim Khalil, the sons of Mu'allim Ghanim ibn Nammar, accepted work in lifting slabs in the place of al-Halabi and his brother on condition that they would receive the same salary as these brothers, who were both resigning. Both brothers were guaranteed by Mamiya ibn Mustafa (31/1: 7; 33/6: 187).

5. Sani'u al-tub (brick-makers)

The brick-makers produced both fire-baked and sun-baked carmine bricks which had a brilliant red (*nisf ahmar*) and white colouration. The site of brick production was known as the *tubkhana*. The person in charge of the factory was called *al-amin 'ala 'amal al-tubkhana*. *Qudwat al-mustahfizin* Sinan Aga took on the job on 22 Rabi' II 964/22 February 1557. Sinan was also a constable (*dizdar*) of the Citadel in Jerusalem (33/1: 238). After he had concluded an agreement with *qudwat al-mustahfizin* Sinan Aga of the Qal'a, a document dated 9 Dhu'l-Qad'a 963/14 September 1556 cites Master Muhammad ibn

Muhammad ibn Turkiyya as one of the specialists of the craft. Master Muhammad would supply him with various kinds of carmine bricks. The agreement also states that Sinan Aga would pay him 10 *sultani* in return for making 1,000 red *tugla* (a Turkish term, meaning carmine or baked brick; see Redhouse 1987: 1257; Steuerwald 1985: 952; Ghalib 1988: 314). Al-Mu'allim Muhammad (mentioned above) received 12 *qubrusi* gold coins as a first payment. On 22 Rabi' II 964/22 February 1557, Sinan Aga *amin tubkhana* and *tubjiyya* explained to delegates from the Sublime Porte (*al-bab al-'ali*), who had come to Jerusalem in connection with the rebuilding of the Citadel, that part of the roof (*dargah*) of the building where the bricks would have been made had been destroyed by an earthquake (*min afatin samawiyya*—through a natural disaster). The oven where copper would have been smelted had also been destroyed (33/1: 238). On 26 Rabi' II 964/26 February 1557, Sinan Aga and al-Mu'allim Muhammad agreed that the latter would work for Sinan and supply him with red and white fire-baked bricks. In return Muhammad would receive 8 *sultanis* for 1,000 red *tugla*, 4 *sultanis* for every thousand brilliant red *tugla*, and 18 *sultanis* for 1,000 white *kerpic* boards. In the document, Muhammad acknowledged that he had received the price of the bricks he had made at the *tubkhana* (33/2: 247).

6. *al-Nahhatun* (stonemasons)

The *nahhatun* cut all kinds of stone and *qashami* (faience tiles) according to demand. One document states that a stonemason would receive 2 *ghirsh* according to an estimate for al-Madrasa al-'Uthmaniyya on 23 Ramadan 1066/15 July 1656 (151/1: 322; for al-Madrasa al-'Uthmaniyya see al-'Ulaimi 1973 2: 36; al-'Arif 1961: 254; Nasir 1974: 64-6; Ghawanima 1982: 163; Najm 1983: 284-7; Nasir 1983: 78-104; al-Nu'aimat 1983: 38-40; Burgoyne 1987: 544-54).

7. Labourers

The documents describe labourers as *fu'ul*, the plural of the word *fa'il*. The *fa'il* was the man who worked under the direction of a master or *al-sani'*, carrying mud, digging, moving stones or water, removing rubble and so on (Ibn Manzur 1981: 3459; al-Qasimi and al-'Azm 1960 2: 333; 4/1 446; 6/2 354-5; 14/1 543-4; 26/2 2; 33/1 138). The documents also supply information on the wage a labourer would receive in the period. During the four-day renovation of al-Madrasa al-Baladiyya on 16 Dhu'l-Hijja 947/13 April 1541, thirteen labourers took part. They received 52 *uthmanis*, that is 1 *uthmani* each per day (13/1: 145; for al-Madrasa al-Baladiyya see al-'Ulaimi 1973 2: 135; al-Nimr 1961: 251; Ghawanima 1982: 164; Najm 1983: 245-6; al-Nu'aimat 1983: 15-16; Burgoyne 1987: 443-55). The documents sometimes specify the name of the labourer and his wage. On 9 Muharram 960/26

December 1552, the labourers 'Abd al-Rahman al-Magharibi, Ibrahim al-Maghribi, Ibrahim al-Mu'adhdhin and Muhammad al-'Iraqi worked on the reconstruction of a house located in the al-Sharaf quarter, the property of al-Hujra al-Sharifa *waqf*. Each labourer received 6 *uthmanis*, while Mansur al-Maghribi, who worked on the same site for two days only, received 4 *uthmanis*. Ahmad al-Matari, who also worked on the site for four days, was paid 8 *uthmanis* (that is 2 *uthmanis* per day) (27/2: 413). In other documents there are references to labourers and their wage but none to the number of days worked. On Awa'il Sha'ban 959/23 July 1552, ten labourers worked on renovating the oven in the Bani 'l-Masharifi quarter, for which they received 100 *dirhams* (25/1: 544). Often the documents only specify the labourers' wages together with the wage of *al-mu'allim* (master). For inspecting and giving an estimate on al-Zawiya al-Ahmadiyya on 3 Rajab 959/25 June 1552, one document gives the wage of both labourers and masters as a total of 22 *sultanis* (31/9: 271; for al-Zawiya al-Ahmadiyya see al-'Ulaimi 1973 2: 63).

In another estimate dated Awa'il Safar 1017/17 May 1608 (88/2: 50) for Khan al-Wakala in al-Suq al-Kabir, the property of al-Sakhra and Hebron *waqf*, wages for masters, labourers, supplies and *qufaf* (baskets) amounting to 40 *ghirsh* are recorded (for Khan al-Wakala see al-'Ulaimi 1973 2: 52; Ghawanima 1982: 92-4; Najm 1983: 261-3; Nasir 1983: 312-23; Burgoyne 1987: 479-84). On the subject of accidents on site in which labourers were harmed, one document dated 10 Jumada II 954/28 July 1517 reports that Ishaq al-Nasrani had informed the *qadi* at the time that his brother, Ibrahim Nasrani al-Mi'mar, had employed a group of labourers to remove the wall on the west and south of Dair al-Habash. The name of one of the labourers was Khalil ibn al-Nasrani min Aulad al-Jamal. When he began work, soil and debris fell on him with the result that his leg was broken. When Ibrahim was questioned, he said he had employed Khalil for five days for a wage of 10 *qit'a*. When Khalil was also questioned about the accident, he made a similar report and added that he had no claim against either Ibrahim or his son or the Habash community (19/1: 214; for Dair al-Habash see al-'Arif 1951: 138 and 1961 534).

The documents also introduce other specialised groups of labourers with specific tasks:

a. *al-Mukarbilun*

The term *mukarbilun* (plural of *mukarbil*) is derived from the Arabic verb *karbala* meaning to purify or refine; it is also close to *gharbal* (Ibn Manzur 1981 5: 3848). It has come to mean sifting soil or similar substances and removing unwanted material. The documents describe the men of the profession as *karabilat al-turab* (21/1: 245) and *mukarbilu al-turab* (31/9: 27). The work of these men would precede that of the shovellers (*al-mujarifi*—see below).

Another document dated 11 Ramadan 955/14 October 1548 specifies the wages of three labourers who had worked as *karabalat al-turab* at a house in the Aulad al-‘Alam quarter; they were to receive 30 *‘uthmanis* (21/1: 254). On the other hand, one estimate set the *mukarbil*’s wage for reconstruction work at al-Zawiya al-Adhamiyya at 5 *sultanis*, a sum which also included the wages of *qufaf* and water-carrier, and took in the cost of digging the foundations (31/9: 271). The estimate of reconstruction work on Turba Baraka Khan on Khatt Da‘ud specifies the wages for *mukarbilin* at 8 *qit‘a misriyya* on 13 Rabi‘ II 1038/10 December 1628 (115/1: 116; for Turba Baraka Khan see al-‘Ulaimi 1973 2: 45; Najm 1983: 137-8; Burgoyne 1987: 109-16).

b. *al-Mujarifiyya* (shovellers)

The term *mujarifiyya*, plural of *mujarifi*, is derived from the Arabic verb *jarafa*, meaning to move something on the ground with a spade or shovel (Ibn Manzur 1981 1: 603). The term refers to the man who prepares the mud for construction work using a shovel (the same implement is widely used today, see al-Qasimi 1960 1: 93; 2: 532). The job would therefore also require the labourer to know the correct quantities of building materials in terms of the proportion of *qusurmil* which a *qintar* of cast *shid* would need (for these terms, see below). A suitable quantity of water would then be added to the mixture. All this would be mixed with the shovel for a specified time (al-Qasimi 1960 2: 415; for *qintar* see Hinz 1970: 24-7; Ashtor 1991: 117). A shoveller received 12.5 *‘uthmanis* according to a document dated 19 Jumada II 954/6 August 1547, which refers to a labourer who had worked on Zawayat al-Maghariba (19/1: 243; for Zawayat al-Maghariba see al-‘Ulaimi 1973 2: 45-6). On 11 Rabi‘ I 955/20 April 1548, Ahmad al-Mujarifi worked for five days on the reconstruction of a house in the Bab Hitta quarter for which he received 62.5 *‘uthmanis*, while on 9 Muharram 960/26 December 1552, Mansur al-Mujarifi, who worked for three days on the reconstruction of a house which was part of al-Hujra al-Sharifa *waqf* in al-Sharaf quarter, received 7.5 *‘uthmanis*; Isma‘il Sani‘ is recorded in the document as receiving the same amount (27/2: 413).

Apparently some form of emergency tax was imposed on the people from time to time. The documents refer to these taxes as *‘awarid* (accidental) (on *‘awarid* see Gibb and Bowen 1951 1: I /35; Gibb and Bowen 1957 1: II/3; Gibb 1960: 760-1; Barkan 1961 2: 13-19; Sahilioglu 1991 4: 108-9; Ipşirli 1991 4: 109). The people would pay a specific sum towards these *‘awarid*, in addition to amounts paid to masons and labourers involved in reconstruction. The *‘awarid* would be imposed by royal order (*awamir sultaniyya sharifa*). The sultanal noble order (*al-amr al-sharif al-sultani*) cited in the document regarding *‘awarid* collection in Jerusalem gives a specific amount—80

‘uthmani sahih per khana. A construction mason together with a labourer would take control of 100 *khana*s. However, Mahmud ibn Ahmad al-Khuraishi and Kamal ibn Yahliq protested against this specific order, for which they received a reprimand as punishment (66/8: 188; for the term *khana* see Atallah 1986: 81 n. 133). The inhabitants of Hebron also protested against the order on 6 Jumada II 994/25 May 1586. A group of them travelled to Jerusalem to meet the *qadi* of Jerusalem, Muhammad Efendi. They explained to him the situation of the poor people in Hebron, who, they said, were living on *al-simat al-karim* (meal flour). They added that the male inhabitants of the city could be classified as: 100 men who were servants of the prophets (*Maqamat al-Anbiya*’); 100 men who served *simat*; 100 men who were poor. Despite the *qadi*’s understanding of their situation and their inability to pay, he merely agreed to lighten their burden by imposing an *‘awarid* of only 10 *khana*s in compliance with the royal order (66/3: 196).

From the noble order received by Nablus, mentioned in a document dated 20 Jumada II 994/8 June 1586, it appears that one construction mason and labourer would be supported from 100 *khana*s. The amount of their wage was, however, not specified. This led to a dispute with the people of Nablus about the level of wages for masons and labourers due from each *khana*. The Nabulsi decided to send Ahmad ibn al-Hajj Muhammad to accompany al-Qadi Muhyi al-Din Khalifa, the royal legal deputy of Nablus (*al-na‘ib al-shar‘i bi-Nablus*), together with masons and labourers. They explained that they would pay the sum to Ahmad regardless of the amount due to the masons and labourers. Certain notables of Nablus, among them Ahmad ibn Muhammad, al-Hajj Nafi‘ ibn Muhammad al-Fidawi and al-Hajj Muhammad ibn Hasan, wanted Ahmad ibn al-Hajj Muhammad—who was to pay the masons and labourers on request—to accompany the deputy *qadi* Muhyi al-Din at whatever time he left with the *‘awarid*. Meanwhile, both Maulana Yahya Efendi al-Daftardar bi-Liwa’ al-Sham and Maulana Haidar Beg Qa’immaqam Amir al-Umara’ forwarded a reminder stipulating that if and when there were no masons and labourers, 32 *qit‘a* would be collected from each *khana*. On this basis, the Nabulsi collected the wages due (66/2: 111).

Building Materials

The documents provide accurate information on the building materials used in Jerusalem in the 16th and 17th centuries. The materials are as follows.

1. Stone

The documents make clear reference to several kinds of stone used in construction: *jabsh* (rubble) and *jabsh nari* (fire rubble) (4/4: 219-20); *‘uqadi* or *‘uqadiya* (96/3: 274;

105/1: 102; 168/1: 408); *al-ayyubi* (31/3: 63); *al-mazzi* (124/1: 316); *al-manhut* (83/2: 43; 144/1: 326); *al-salb* (83/2: 43); *al-qantari* and *al-mamillawi* (134/1: 195). The documents also refer to other components made from stone: *al-'atabats* (door-steps), *sawaqif* (lintels) (144/1: 326; 151/1: 322) and *al-zawayya* (squares) (155/1: 92) (see Appendix 12.3). Ahmad al-Khuraishi is cited as a stone-dealer on 18 Jumada II 945/12 October 1538 (10/1: 80). The documents cover the possibility of buying stone according to specification. On 3 Rabi' I 963/16 January 1556, al-Mu'allim Banul al-Istanbuli al-Rumi al-Mi'mar al-Nasrani, al-Mu'allim Khalil ibn Nammar al-Mi'mar and al-Mu'allim Yusuf ibn 'Abd al-Qadir al-Halabi agreed to prepare 100 *ayyubi* stones according to the following measurements: length 16 *qirat*, width 10 *qirat* per stone; in addition 60 *dhira'* (arms) of the same stone, the size of each to be 4 *qirat* square, for one silver piece for each stone. The document also states that the cost of transportation would be borne by the sultanate (31/3: 63).

On Akhir Dhu'l-Qa'da 993/23 November 1585, *qudwat al-tuqah wa-'l-mustahfiz* Sinan Aga of the Jerusalem Citadel and the *amin* in charge of building a wall round Wali Allah Sayyidi Abi 'Abd Allah al-Qurashi cemetery, bought 2,000 *mazzi* stones from al-Mu'allim Khalil ibn Husain ibn Nammar, Yusuf al-Halabi, Musa al-Halabi, Musa ibn 'Ubaid, Mahmud ibn Husain, Jauhar ibn 'Abd Allah, Muhammad Shuqair and Muhammad al-Qanawati. The stones had the following specifications: 500 stones to be 2/3 of a building arm (*dhira'*); 500 stones to be 14 fingers (*asabi'*) in length each; 500 stones each one to be half an arm in length; and 500 stones each to be 10 fingers in length. Their width was to be 1/3 of an arm, 9 fingers, and 10 fingers respectively. Sinan paid a total of 26 *sultani* gold coins (new gold *sulaimani*) (66/2: 621). Another document, dated Saturday 8 Rabi' II 999/3 February 1591, makes reference to the possibility of re-using stones from disused sites in other locations. Al-Shaikh Salah al-Din al-Ju'bi, *mutawalli* of Bimaristan *waqf*, asked permission from the current *qadi* to allow him to use some of the stone from a disused house for the reconstruction of Dabbur House, which belonged to the *waqf*. The *qadi* granted him permission (72/2: 354). Appendix 12.3 illustrates the types of stone, their use, their quantities and their price.

2. Rough-cast

Walls would be faced either with rough-cast (a lime and gravel mix) or tiles (Ibn Manzur 1981 4: 2374; Ghalib 1988: 239). The documents refer to the highest quality of rough-cast as *al-tayyib al-jadid al-hajar al-fahl al-salim min al-banduq wa-min 'aybin mithlihi* (2/2: 268; 33/2: 460; 39/2: 391; 96/1: 314). The documents refer to some places which specialised in the production of rough-cast; Bait Hanina (4/1: 446; Hütteroth and Abdulfattah 1977: 120); Lifta

(39/2: 391; 96/1: 314; Hütteroth and Abdulfattah 1977: 115) and Majdal Fadil (16/1: 45; Hütteroth and Abdulfattah 1977: 123). A document dated 2 Rajab 954/18 August 1517 refers to a price of 8 *qit'a* silver *sulaimaniyya* coins per *qintar* of higher quality rough-cast. Anyone who violated the set price would receive the due punishment with the knowledge of al-Mu'allim Husain ibn Nammar *mi'mar bashi* (2/2: 268). It is worth noting that rough-cast was procured through *al-salam* (forward buying). On 10 Sha'ban 964/8 June 1557, al-Qadi al-'Allama Abu 'l-'Aun al-Diri sent 10 *sultani* to al-Mu'allim Husain ibn 'Ali ibn Nammar for 55 *qintars* of high-quality rough-cast. He would deliver it in Ghurra Shawwal/28 July of the same year (33/2: 460). On 10 Ramadan 967/4 June 1560, al-Khwaja Shams al-Din Muhammad ibn al-Khwaja Jalal al-Din ibn Diklik sent 10 *sultani* gold coins to 'Imran ibn al-Harish and al-Hajj 'Ali ibn Hasan of Lifta village in payment for 50 *qintars* of higher quality rough-cast. They had to deliver that quantity after Salkh Dhu'l-Qa'da/22 August of the same year (39/2: 391). In Ghurra Rajab 1024/27 July 1615, 'Auda ibn Nammar, Ma'ali ibn Sa'd Yusuf ibn Khalil, 'Assaf ibn Saqar, Mufarrij ibn Mur'ib, Sadaqa ibn Ghabayin, Hijaz ibn Zafir and Buraq ibn Muhammad, all of Lifta, were pre-paid 113.5 *ghirsh* silver coins by *hawi al-mahamid wa'l-makarim* Sulaiman Aga, *nazir* of al-Aqsa and al-Sakhra *waqf*. He was also the *mandub* (delegate) in charge of the construction of the eastern face of al-Aqsa Mosque wall as well as the Tower of David in the Jerusalem Citadel. All this was pre-payment for 200 *qintars* of excellent rough-cast, and delivery would be secured for Ghurra Ramadan/24 September of the same year. They also undertook to offer Sulaiman 100 *qintars* in return for 17 *qit'a misriyya* per *qintar* after completion of delivery of the former quantity (96/1: 314).

Among those specialising in selling rough-cast were 'Ali ibn al-Najjar of Bait Hanina (4/1: 446), and Hanna, Nasr and Farraj, Christians of Majdal Fadil (16/1: 45). Appendix 4 illustrates the quantities of rough-cast and the prices. From the information in the appendix, the conclusion is that the *qintar* was the unit of measure in general use; in rare cases a camel-load (*himl*) was also used (Hinz 1970: 13-14). The average cost of 1 *qintar* of rough-cast was 1 *ghirsh* (see Appendix 12.4).

3. al-Qusurmil

Qusurmil was made from ash extracted from *qammim al-hammam* (al-Qasimi and al-'Azam 1960 2: 363; al-Nimr 1961 2: 109). The presence of numerous baths in Jerusalem helped to produce the material. These included Hamman al-Sultan, Hammam al-'Ain, Hammam al-Batrak, Hammam 'Ala' al-Din al-Basir, Hammam al-Asbat, Hammam al-Shifa', Hammam Da'ud, Hammam Bab al-Mutawadda, Mustaham Daraj al-'Ain (Atallah 1988: 224-5). 'Ali ibn al-Tibi was one of the people who

specialised in selling the material from Hammam Tankiz (6/2: 354-5), as were Ibn al-Fakhkhar and Ibn al-Naja (10/1: 80). The material was used—after riddling and processing at the hands of a shoveller (see above)—for covering roofs and for flooring. The documents refer to specialists in laying *qusurmīl*. Al-Mu'allim Muhammad ibn al-Karth is a case in point (6/2: 354-5). One *mu'allim* received 5 'uthmani for three days' work in laying the material in 952/1545 (17/5: 330). On 24 Ramadan 968/8 June 1561, the master's and labourers' wages for laying *qusurmīl* were estimated at 40 *qit'a misriyya* (40/2: 355). On 9 Jumada I 1038/4 January 1629 the total wages for *mu'allimin*, labourers, layers, brushes and mortar to make the *qusurmīl* amounted to 7 *ghirsh* (115/1: 179) (see Appendix 15.5).

With regard to the price of *qusurmīl*, there is a noticeable difference between summer and winter. A document dated 22 Sha'ban 955/26 September 1548 specifies the price of *quffa min al-qusurmīl al-tayyib al-salim min al-'ayb mithl al-zibil* (21/1: 210) per *quffa* (basket) for al-Mu'allim Husain ibn Nammar at 1 *qit'a halabiyya* each in summer, while in winter it was double the cost at 2 *qit'a halabiyya*. It should be noted that the price was arranged with the prior knowledge of al-Mu'allim Husain ibn Nammar and Abu 'l-Fadl ibn al-Qalqili al-Muhtasib, and the masters of the baths (*mu'allimi al-hammamat*) Musa ibn al-'Arif, Muhammad ibn Warjis, Muhammad ibn al-Sulami and Daghiri (21/1: 210; for *qit'a halabiyya* see Cohen 1989: 48-9). Appendix 5 illustrates the quantities of *qusurmīl* used and its prices. The conclusion is that the camel-load (*himl*) and basket-load (*quffa*) were the only two units of measure used for *al-qusurmīl*. (On *quffa* see al-Qasimi and al-'Azmi 1960 2: 361-2).

4. Paving stones (*al-balat*)

Stone slabs were used to cover the floor or walls of a house or to produce a smooth flat pavement (Ibn Manzur 1981 1: 344; Atallah 1988: 88). The legal documents refer to many brands of these slabs: *marji* (31/1: 7); *'uqud* (31/3: 53); *mazzi* (31/1: 110; 33/4: 259); *mahalli* (local) (40/2: 513); *ayyubi* (66/2: 62), as well as red, black and white varieties (31/1: 110; 157/1: 3373; 174/1: 10). The documents also show the processes through which the paving-stones would pass—quarrying, cutting to size and polishing with sand (31/1: 7; 31/1: 110; 43/2: 263; 174/1: 10). It seems that in this period people were skilled in processing old paving-stones and restoring them by means of veneer and repair. For example, on 7 Shawwal 954/20 November 1547, al-Mu'allim Nauba received 50 *qit'a* for two days' work in veneering and repairing the pavement of the Madrasa al-Manjakiyya (20/1: 83). The documents also refer to the process of making and selling the paving-stones by the arm measure. On 3 Rabi' I 963/6 January 1556, al-Mu'allim Banul al-Istanbuli al-Rumi al-Mi'mar al-Nasrani, al-

Mu'allim Khalil ibn Nammar and al-Mu'allim Yusuf ibn 'Abd al-Qadir al-Halabi all agreed to cut *mazzi* paving-stones for the new bath, Hammam al-Sultan. The measurements were to be: 50 arms wide, 16 *qirat* per slab; and, in addition, another 50 arms of paving stones, the measurements of which would be 1 arm by 1 arm. Hanna ibn Da'ud, Musa ibn Nasr Allah, 'Aun al-Halabi and Yusuf ibn Nabi' were also contracted to prepare 100 arms of *mazzi* tiles, with the value of each arm set at 6 *qit'a*. The cost of their transportation would be borne by the sultanate (31/3: 63; for Hammam al-Sultan see Atallah 1988: 224 n. 1840). On 1 Muharram 969/11 September 1561, the needs of al-Madrasa al-Qa'itba'iyya were estimated at 80 arms of *mahalli* (local) slabs at a value of 20 *sultani* (40/2: 513; for al-Madrasa al-Qa'itba'iyya see al-'Ulaimi 1973 2: 290, 325, 328-9; al-'Arif 1961: 255-6; Najm 1983: 306-10; Burgoyne 1987: 589-605).

At the end of Dhu'l-Qa'da 993/November 1585, Sinan Aga of the Jerusalem Citadel purchased from certain architects eight *ayyubi* frame-slabs measuring 2.5 arms in length by 1.5 arms in width at a price of 2 *sultani* gold coins of the *sulaimani* type. The slabs were to be transported by donkey or horse to Ra's Mamilla (66/2: 621). The total cost of paving Hammam al-Batrak in black, white and red stone as well as marble was more than 3,790 *qit'a misriyya* on 15 Jumada I 1033/6 March 1624 (107/1: 373; for Hammam al-Batrak see Atallah 1988: 224 n. 1837). The Dome of the Rock was in need of new paving at the end of Sha'ban 1080/22 January 1670 at an estimated amount of 4,000 arms, the value of which would amount to 1,500 silver *ghirsh 'adadi*. Some 500 *ghirsh* were also earmarked to renovate the old paving stones (171/2: 274). In Awasi Rajab 1082/17 November 1671, the *mutawalli* in charge of Hebron and al-Sakhra *waqf*, Ahmad Aga, reached an agreement with the architects al-Hajj Hasan and al-Hajj 'Ali ibn Karim al-Din to cover the esplanade of the Rock with 6,000 *dhira'* (arms) of new and old slabs, the total value of which was more than 300 *ghirsh asadi* (174/1: 190).

References to men laying stone slabs appear in the documents on the occasion of paving work in the yard of a house in Khatt Bab al-Hadid on Ghurrah Safar 963/16 December 1555 (31/1: 7; 42/2: 263). Al-Mu'allim Khalil and the son of his brother Mahmud, Husain ibn Nammar, al-Mu'allim Yusuf ibn 'Abd al-Qadir al-Halabi, Diyab ibn Ramadan, Hanna ibn Da'ud al-Nasrani and 'Aun ibn Musa al-Nasrani all agreed on 20 Rabi' I 963/2 February 1556 to pave two baths which were the property of al-'Amara al-'Amira at a cost of 75 gold *sultani* (31/1: 110). Dair Yasin was one of the places where people specialised in quarrying the slabs (17/2: 279; al-Dabbagh 188 1: 258-9).

5. Faience

Ceramic or faience tiling is traditionally associated with the

city of Kashan (Atallah 1988: 160, 308; al-Rumi 1990 4: 336). *Qashani* are mentioned during the renovation of Qubbat al-Silsila (Dome of the Chain). A document dated 7 Sha‘ban 969/12 April 1562 explains how the dome was in need of *qashani* work on the interior and the exterior façades, in addition to the interior of the *mihrab* (43/6: 280; for Qubbat al-Silsila see al-‘Ulaimi 1973 2: 18-19; Najm 1983: 73-4). In Awasi Rajab 1082/November 1671 the Dome of the Rock needed 3,000 large and 500 small *qashani* at a total cost of more than 1,083 silver *ghirsh* ‘*adadi* (174/1: 190).

6. Marble

Marble—soft, smooth, white or coloured (Ghalib 1988: 199)—was used on the exterior in the construction of an oven in the Maghariba quarter, the property of the Maghariba *waqf*. On 16 Jumada I 958/22 May 1551, twelve pieces of marble were used for the oven, at a total value of 130 *qit‘a* (24/6: 514). Marble was used to face the *mihrab* of Qubbat al-Silsila on 7 Sha‘ban 969/12 April 1562. It amounted to one post (43/6: 280).

7. Gravel

Gravel or small stones (Ibn Manzur 1981 2: 892-3; Ghalib 1988: 133) appear in the documents as *hasma* (20/1: 90) on 11 Dhu‘l-Qa‘da 954/23 December 1547, when reference is made to expenses relating to a house which was the property of Abi Sharif *waqf*; and again in a document dated Ghurra Jumada II 955/8 July 1548 (21/2: 503) when the expenses needed for al-Madrassa al-Tuluniyya amounted to 45 *qit‘a*.

8. Gypsum

This material is used in the building process by applying it to stones during construction (Ibn Manzur 1981 1: 537, 630; al-Qasimi and al-‘Azmi 1960 1: 77; Ghalib 1988: 115). Appendix 12.6 illustrates the quantities required and the prices of gypsum in various places. It shows an increase in the price per *qintar* during the 17th century. A *qintar* was more than 5 *ghirsh* in value.

9. al-Hamra

The documents refer to this material as *ahmar* or *hamar*, meaning red. The red substance would be added to rough-cast to obtain a red mixture. Fakhr al-A‘yan Hamza Çelebi Nazir al-Haramain was one of the people to become involved in the business. On Friday 9 Rabi‘ II 971/26 November 1563 he sold 2 *qintars* of *al-hamra* through two Christians, al-Mu‘allim Mikha‘il ibn Jirjis al-Sairafi and Yusuf ibn Musa ibn Muhayya al-Tarabulsi, in return for 60 *sultani* gold coins, of the new gold *sulaimani* type (45/5: 28).

On another occasion, 18 Muharram 996/19 December 1587, al-Madrassa al-Jauhariyya was in need of

gypsum, the value of which amounted to 130 *qit‘a shamiyya* (67/4: 71; for al-Madrassa al-Jauhariyya see al-‘Ulaimi 1973 2: 37; al-‘Arif 1961: 254; Nasir 1974: 63-4; Ghawanim 1982: 160-1; Najm 1983: 288-91; Nasir 1983: 209-46; Burgoyne 1987: 555-67). On 25 Jumada I 1111/18 November 1699, 5,000 *mudd* were needed to construct al-Marji‘ pools at a total cost of more than 1,200 *ghirsh* (199/1: 318).

10. Linen (al-kattan)

A putty made from threads of lint would be added to the rough-cast. The resulting mixture would be used to plaster and to face walls (Atallah 1988: 323). Al-Nimr pointed out that walls treated with this mixture would last for longer (al-Nimr 1961: 2/113). A document dated Awa‘il Dhu‘l-Hijja 997/11 October 1589 set the sum of 30 *qit‘a misriyya* as the cost of gypsum and lint plaster (69/1: 329). 35 *qintars* of lint were required to construct the al-Marji‘ pools on 25 Jumada I 1111/18 November 1699 at a cost of over 1,300 *ghirsh* (199/1: 318).

11. Brick

As explained above, carmine brick is sun-baked. There is a reference to this material in a document dated 7 Sha‘ban 969/12 April 1562 on the occasion of building with brick inside the Qubbat al-Silsila (43/6: 280).

12. Wood

Wood is one of the primary raw materials used for construction work in general (Atallah 1988: 174). Wooden boards were used for roofs, doors, windows and such like. A document dated 16 Jumada II 952/25 August 1545 refers to the price of *sandyen* wood (17/1: 161). On 29 Jumada I 952/8 August 1545, a house belonging to the Abi Sharif *waqf* needed fourteen wooden boards, at a value of 70 *qit‘a* (17/1: 125). On the other hand, on 7 Shawwal 954/20 November 1547, al-Madrassa al-Manjakiyya was roofed with wooden boards which cost 40 *qit‘a* (20/1: 183). On 3 Rajab 956/28 July 1549, the expenses here amounted to 28 *qit‘a* (23/2: 52). The estimated needs of al-Madrassa al-Hasaniyya for wooden boards, nails and dowelling amounted to 200 *qit‘a shamiyya* on 15 Muharram 996/16 December 1587 (67/3: 64; for the term for nails [*dusur*] see Ghalib 1988: 188; for al-Hasaniyya see al-‘Ulaimi 1973 2/40-1; al-‘Arif 1961: 249; Nasir 1974: 70; Ghawanim 1982: 160; Burgoyne 1987: 534-41). On 18 Muharram 996/19 December 1587, al-Madrassa al-Jauhariyya needed 480 *qit‘a shamiyya* worth of the same material (67/4: 71).

13. Nails

Nails were used for work in wood undertaken by carpenters. Mikha‘il al-Nasrani and his partner were among the specialists in the nail business. On 9 Ramadan

943/19 February 1537, Khan al-Ghadiriyya needed 2 *ratls* of nails (6/2: 354-5; for *ratl* see Atiya 1913 3: 1219-20; Hinz 1970: 29; Ashtor 1991 6: 118).

The expenses of the *khan* at Bab al-Qattanin in terms of nails during different periods in 951-2/1544-5 were as follows: 0.5 *ratl* of nails at 12 *qit'a*; 8 *awaq* at 16 *qit'a*; 1 *ratl* at 24 *qit'a*; 4 *awaq* at 8 *qit'a* (17/1: 204). In the same year, renovation at Maqam Yunus needed 1.5 *ratls* of nails (16/1: 54; for Maqam Yunus see al-'Ulaimi 1973 2: 270).

A house, the property of the Abi Sharif *waqf*, required 1 *ratl* of nails on 29 Jumada I 952/8 August 1545 at a cost of 24 *qit'a* (17/1: 125). During the 17th century, there are also references to estimated amounts of wood and nails. Khan al-Wakala in al-Suq al-Kabir, the property of al-Sakhra and Hebron *waqf*, required 15 *ghirsh*, worth. A house located in al-'Amud quarter was estimated to need 15 *qit'a misriyya* in Awa'il Safar 1017/17 May 1608 (88/2: 50; 1: 79).

Functions of the Architect

The most usual functions undertaken by architects were construction and renovation work. This included *takhil* (repainting), removing walls and houses, building walls, paving, plastering, etc. All this work needed due legal process before it could begin, bearing in mind that all matters regarding construction and building work in general came under the authority of the *qadi*. The *mi'mar bashi* had the same power. The legal process fell into two main fields—inspection and construction.

1. Inspection

The process of inspection included checking the building site as well as estimating any damage to it as a first step towards getting approval for reconstruction, renovation or other maintenance. This, as the legal documents show, would be done by the person in charge of the site in question. He could be a *nazir*, superintendent, head or tenant. He would attend the Noble Council in Jerusalem to clarify the nature of the damage so that he could obtain a permit from the *qadi* to allow him to start the required construction work, after the authenticity of the information presented by the applicant had been checked. It should be noted that the application to conduct an inspection at certain sites would be done via the sultan by way of a royal order, or by way of an *amir* by sending a 'noble' memorandum, or by letter from *mir liwa' al-Quds* to the *qadi* to initiate the necessary process. The *qadi* would appoint a legal architectural committee which very often included the deputy *qadi* and sometimes the *qadi* himself, in addition to a *mi'mar bashi*, architects and others. This committee would inspect the site in the light of the information that had been submitted, and would

determine the necessity of carrying out any repair or construction work. A report was then forwarded to the *qadi* so that he could consider the appropriate action.

Eighty cases of various types of inspection have been found described in the 16th- and 17th- century documents. These refer to: 24 schools (see Appendix 12.7), 20 houses (see Appendix 12.8), 6 *zawiyas* (see Appendix 12.9), 4 *arbitas* (hospices) (see Appendix 12.10), 3 canals (see Appendix 12.11) and 23 Christian sites (see Appendix 12.12). It should be noted that some places were inspected more than once.

When Shaikh al-Islam al-'Afifi ibn Jama'a assumed the post of teacher and *nazara* (administrator) at al-Madrassa al-Salahiyya, he immediately took it upon himself to begin the work of construction and repair of the school and its *waqf*. In Awakhir Rabi' II 944/5 October 1537, he asked the current *qadi*, *maulana al-efendi* 'Abd al-Rahim, to inspect the school and its *waqf* buildings in order to estimate the requirements. He also requested that expenditure on *waqf* beneficiaries should cease because of the cost of reconstruction. The *qadi* himself inspected the school and found that there had been heavy wear and tear in the building and its *waqf* premises, and that it needed both reconstruction and renovation. Nevertheless, the *qadi* argued that the necessary construction work could not be implemented due to a lack of available rough-cast because of the *khudawandkariyya* royal work. He ordered the administrator (*nazir*) of the school to pay out the customary grants to students, employees and assistants. The *qadi* agreed only to the renovation using *qusurmil* of the school roof, the roof of Suq al-'Attarin and Suwaiqat Bab Hitta. The amount of *qusurmil* needed to complete the work was estimated at 600 *himl* (camel-loads) (6/2: 692-3; for al-Madrassa al-Salahiyya see al-'Ulaimi 1973 2: 41; al-'Arif 1961: 236-8; Ghawanima 1982: 166-8; Najm 1983: 102-3; for Suq al-'Attarin see al-'Ulaimi 1973 2: 50). In addition, *maulana al-efendi* Nur al-Din Damra, a former *qadi* of Jerusalem, went himself to al-Madrassa al-Mu'azzamiyya to make his own inspection. He found that it had both upper- and lower-storey dwellings on the verge of collapse, while others were already completely destroyed, and some other places were in need of reconstruction. Other sites required debris to be removed and then reconstruction work to be undertaken. Some roofs were crumbling and had holes as a result of heavy rain and lack of repair and maintenance. He granted permission for Shaikh Sharaf al-Din ibn Musa al-Diri al-Hanafi, the *imam* of al-Sakhra and the *nazir* (administrator) of the school, to spend the 953/1546 *waqf* money (which was due in 954/1547) on the restoration of the school building. The construction work lasted from 11 Ramadan to 6 Dhu'l-Qa'da 954/25 October to 18 December 1547. The total expense amounted to 2,939 *qit'a* (20/1 26; for al-Madrassa al-Mu'azzamiyya see al-

‘Ulaimi 1973 2: 42; al-‘Arif 1961: 240-1; Ghawanima 1982: 170-2; Najm 1983: 134-5). On Awa’il Jumada II 958/6 June 1551, Muhyi al-Din Khalifa ibn ‘Abd al-Karim, administrator of al-Madrassa al-Hanbaliyya, drew attention to the quarter located to the south of the school *waqf*. He found the place beyond use and in very bad shape. No one would rent it and the school had no income to spend on its reconstruction. He therefore asked the *qadi* to inspect the quarter in question and to grant permission for the removal of its eastern side in order to sell the resulting debris so that the proceeds could be spent on rebuilding the school itself. The committee set up by the *qadi* at the time was made up of *maulana* Shams al-Din Muhammad al-‘Alami and al-Mu‘allim Husain ibn Nammar *mi‘mar bashi*. They both inspected the site and found the administrator’s report to be true. The *qadi* allowed the *nazir* (administrator) to have the wall of the quarter in question removed and to sell its debris (rubble) to interested buyers. The proceeds were then to be used to reconstruct and renovate the school (25/3: 59; for al-Madrassa al-Hanbaliyya see al-‘Ulaimi 1973 2: 44; al-‘Arif 1961: 250; Ghawanima 1982: 172-3; Najm 1983: 240-1; Burgoyne 1987: 437-43).

On 17 Rajab 964/16 May 1557, *malik al-umara* ‘Ali Beg, former *mir liwa* of Jerusalem, sent a letter to Qadi ‘Abd al-Rahman asking him to inspect al-Madrassa al-Ghadiyya. If it needed reconstruction, the money for the work was to be taken from ‘Abd al-Rahman al-Jabi. The *qadi* went to the school himself, accompanied by Qadi Sa’d al-Din *al-muhandis* and Ustad Husain ibn Nammar *mi‘mar bashi* and others. They all came to the conclusion that some places were in need of renovation; a high wall overlooking the pool was required as well as repair to stone, wooden doors, stonework of the stairs, renovation of the meeting hall (*al-majma*’), lead for the column, and *qusurmil* to be used for repairing the interior and exterior surfaces. Rough-cast and labourers were also required. The costs of labour and materials would come to a total of 10 *sultani* according to the estimate by al-Mu‘allim Husain *mi‘mar bashi* (33/2: 360; 4: 410; for al-Madrassa al-Ghadiyya see al-‘Ulaimi 1973 2: 22; al-‘Arif 1961: 253; Burgoyne 1987: 526-33).

Shaikh Shihab al-Din Ahmad ibn al-Hajj Nasir al-Din, *nazir* of al-Madrassa al-Afdaliyya, reported that the school and the *barwa’ik* (warehouses) of *‘arasat al-ghilal* (the fallow area for grain) where crops would be sold, in addition to the inner *barwa’ik* where animals would be tethered—all the property of the school *waqf*—were in need of construction and renovation. He added that grain merchants or importers (*jallabat al-ghilal*, literally meaning those who collected a variety of goods) had been damaged economically due to the condition of the site and the lack of places in which to secure their animals. They also complained about loss of ropes as a result of the non-reconstruction of the inner *barwa’ik*. All this had also

resulted in damage to the *waqf* and a decrease in its income. On 12 Muharram 965/4 November 1557, the *qadi* was granted permission to inspect these locations, to assess them and to make an estimate of the necessary work; he also obtained permission to spend the proceeds of renting the warehouse, and to borrow extra funds if needed. The *qadi* appointed a committee that was made up of al-Qadi Taqi al-Din al-‘Alami al-Maliki and *iftikhar al-mi‘mariyya* al-Mu‘allim Muhammad ibn Ramadan, with the administrator (*nazir*) of the school in attendance. The three members of the committee duly inspected the school and its *barwa’ik*. The buildings were indeed found to be in need of reconstruction and repair, the cost of which was estimated at 89 *para* (53/1: 102; 90/1: 287; for *para* see Atallah 1988: 41 n. 82; Cohen 1989: 48-53, 115-17).

On 28 Ramadan 968/12 June 1561, *qudwat arab al-iqbal* Murad Çelebi Daftardar Efendi sent a *tadkhira sharifa* (‘noble memorandum’) to the *qadi* and to *iftikhar al-akarim* Mustafa Beg in Jerusalem informing them of the need to build and renovate al-Madrassa al-Qa’itba’iyya. The memorandum asked him to undertake the building work with the prior knowledge of the *waqf mutawalli*, and explained the necessity of giving priority to the reconstruction work over expenditure on beneficiaries. In accordance with these instructions, the *qadi* himself and *fakhr al-‘ulama* Mahmud al-Diri, *mutawalli al-madrassa* (in charge of the school), together with al-Mu‘allim Muhammad ibn Ramadan *mi‘mar bashi* and al-Mu‘allim Mahmud ibn Nammar *al-mi‘mar* inspected the school and found that some parts were in need of reconstruction and repair. The two architects assessed the cost at 50 *sultani* gold coins. They also estimated that the school would require 80 *dhira*’ of paving stones and local slabs at a cost of 20 *sultani* (40/2: 513).

On Awa’il Jumada II 1003/11 February 1595, Shaikh Shihab al-Din Ahmad ibn Muhyi al-Din ibn Jama’a, *mutawalli* of al-Madrassa al-Khatuniyya, stated that the eastern wall of the stable (*qabu al-tahun*) in the Jewish quarter, property of the *waqf*, had collapsed. Some parts of the northern wall were also crumbling, and its roof was dilapidated due to heavy snow and rain. He also explained that no money was available from the *waqf* that could be used for the reconstruction. He asked the *qadi* to inspect the stable and to give him permission to borrow funds. The *qadi* acted by appointing a committee consisting of al-Hajj Muhammad al-Turjuman and al-Mu‘allim Mahmud ibn Nammar *mi‘mar bashi* to inspect the place. They found that the eastern wall did need reconstruction and part of the western wall needed rebuilding. They also recommended treating the wall with *sarara* and *mu‘allaqa* (materials normally used for the renovation of roofs) and they assessed the required work at 800 *qit’a misriyya*. Basing his decision on this estimate, the *qadi* permitted the *mutawalli* to undertake the stated building work (76/3: 334).

Al-'allama al-shaikh Ya'qub al-Qarqashandi, *al-wakil* (deputy) of Shaikh Ishaq ibn Abi 'l-Lutf, *mutawalli waqf al-madrassa al-malikiyya*, explained that he had been asked by *qudwata' al-a'yan* (dignitaries) Hasan and Ahmad, officials at the Sublime Porte (*al-bab al-'ali*) and the appointees for the inspection and assessment of the *waqf*, to inspect the school and assess its requirements. On Awasiit Jumada I 1041/16 January 1596, Ya'qub asked the *qadi* to set up a committee to inspect the property with the two Porte officials; Musa Efendi ibn 'Abd al-Latif and al-Mu'allim Mahmud ibn Husain ibn Nammar *mi'mar bashi* were duly appointed to do so. The two-member committee made their inspection and found that the roof was in need of treating with *qusurmil*. Other areas required paving repair, and yet others reconstruction or repair. According to the *mi'mar bashi*'s estimate, the work would cost 25 *sultani* for *qusurmil*, rough-cast, paving stones, wages for masons and labourers, and mortar. The *qadi* instructed the *wakil* in question to spend the estimated amount taken from the *waqf* income (77/1: 252; 2: 252; for al-Madrassa al-Malikiyya see al-'Ulaimi 1973 2: 38; al-'Arif 1961: 246; Ghawanima 1982: 157; Najm 1983: 203-6).

On another occasion, on Ghurraṭ Saḡar 1016/28 May 1607, *maulana al-sayyid* Mahmud ibn Abi 'l-Waḡa explained that the stable located in al-Madrassa al-Husainiyya, and leading from al-Aqsa Mosque, was on the verge of collapse and had holes in its walls. The roof of the latrine (*kanif*) also needed repair. He intended to reconstruct and repair it from his own pocket as a form of donation. He accordingly asked for an inspection and structural report on the place. The *qadi* duly appointed *al-'allama* Muhammad al-Ghazzi, al-Ustad 'Abd al-Muhsin ibn Nammar *mi'mar bashi* and others to estimate the required reconstruction; they did so and found that it came to 53 *ghirsh* and 20 *qit'a misriyya* (87/2: 192). Appendix 7 illustrates the funds required to meet the needs of the school in terms of reconstruction and renovation throughout the 16th and 17th centuries.

Because of an earthquake which struck Jerusalem in the middle of the 10th/16th centuries (described in the documents as 'a trembling and heavenly catastrophe' 18/1: 253; 25/1: 204), several parts of the city were damaged and were in need of repair and reconstruction. The following are a few of the locations. When the earthquake destroyed the *qantara* (arch) located in the Ribat of 'Ala' al-Din al-Basir and the small house above it, and other places belonging to al-Madrassa al-Manjakiyya to the west, the damage was immediately evident to neighbours and pedestrians. The neighbours of the Ribat inspected the site on 15 Dhu'l-Qa'da 952/18 January 1546 and the *qadi* came himself with al-Mu'allim Husain ibn Nammar *mi'mar bashi* and other knowledgeable experts. They concluded that there was no point in reconstructing it. Instead they suggested that the stones should be sold and the money

kept for future needs. They also called for the removal of the tomb and for its clearance. The debris from the *qantara* was offered for sale for three days; it was eventually sold for 400 'uthmani to Karim al-Din ibn Abi 'l-Waḡa', *shaikh al-ifta'* and of teaching, as well as *amin* (superintendent) of al-Aqsa Mosque (17/1: 448; for Ribat of 'Ala' al-Din see al-'Ulaimi 1973 2: 43; Burgoyne 1987: 117).

On 13 Jumada II 953/11 August 1546, when no further use was found for a small house (*al-duwaira*) in Mahallat al-Ghawanima, property of al-Hajj Khalifa's *waqf* (for *duwaira* see al-Maqrizi 1987 2: 415; Ghalib 1988: 192), Muhammad ibn Khalifa asked the *qadi* to appoint someone to carry out an inspection of the site. Al-Mu'allim Husain ibn 'Ali ibn Nammar *mu'allim al-mi'mariyya*, together with other architects (who included al-Hajj 'Abd al-Qadir ibn Ahmad al-Sukkari and al-Mu'allim 'Umar ibn Muhammad al-Halabi) participated in the site inspection. They found the place consisted of an open courtyard surrounded by low houses, the majority of which had been damaged. Others had fallen down and the rest were crumbling away, on the verge of collapse. The ground and roofs of the houses were found to have holes. Some places were in need of reconstruction and repair. In other places there was a need for total demolition and building again from scratch owing to flooding and heavy rain, especially after the complete destruction of the *duwaira* following the earthquake. The work of reconstruction and repair was estimated to come to more than 4,000 'uthmani. The inspection committee proposed that the site be replaced with one of the same value, and that either a full estate or part of one should be purchased. The *qadi* agreed to the proposal after appointing al-Hajj Muhammad *nazir al-waqf* (administrator). The place was sold to *malik al-umara'* Sinan Pasha for the price of 10,000 'uthmanis (18/1: 253).

Another house, located in al-'Amud quarter along Khatt Wadi al-Tawahin, was affected by the same earthquake. The house was sold for 30 *sultanis* after a careful examination by the architectural examining committee on 5 Muharram 959/2 January 1552 (25/1: 204; 1: 409). It should be noted that the same method of inspection was also operating in the 17th century (for more detail, see 84/1: 548; 117/1: 334; 150/1: 26; 193/2: 278-9; 198/1: 281).

Appendix 12.8 shows assessments of house requirements, while Appendix 12.9 illustrates *zawiya* requirements; Appendix 12.10 illustrates *arbita* needs during the 16th and 17th centuries.

It is also worth mentioning that the activities of the architects were in fact never restricted to those described above in terms of estimation of construction work. Their work covered other issues such as the inspection of damage resulting from building, participation in the assessment of rent, and the division of common ground. For example, the

property of both 'Ali ibn al-Khwaja Shams al-Din ibn Samum and Hajji Musa ibn al-Duhaina was damaged on 22 Safar 965/14 December 1557 as a result of al-Mu'allim Khalil ibn Abi Zaid al-Bitar digging a pit next to al-Nasiriyya soap-factory. They asked the *qadi* to inspect the site. The *qadi* appointed al-Qadi Yahya al-Diri, al-Hajj Muhammad al-Turjaman, al-Mu'allim Husain ibn Nammar *mi'mar bashi* and al-Mu'allim Muhammad ibn Ramadan, *al-mi'mar* of the Jerusalem Citadel to carry it out. These four suggested that al-Mu'allim Khalil rebuild on the east, constructing a wall of red soil, *qusurmil*, rough-cast, and 1 arm of *dhira' al-'amal* in order to avoid further damage (35/2: 131; for *dhira' al-'amal* see Hinz 1965 2: 231-2; Hinz 1970: 55).

In a document dated Awakhir Shawwal 997/10 September 1589 there is a reference to al-Mu'allim Musa ibn Mahmud al-Kurdi. This man owned a mill (*tahun*) located in al-Bab al-'Amud quarter adjacent to al-Hamra' Minaret; the mill was causing trouble to Shaikh 'Abd al-Wahid ibn Shihab al-Din al-Sururi who lived nearby. The *shaikh* lodged a complaint with the *qadi* after the mill had caused damage to his house and harmed his neighbours. The *qadi*'s response was to forbid al-Mu'allim Musa from operating it, but Musa argued that the mill was a hundred years old and it had never previously caused any harm to anyone; he asked for an inspection of the site. The *qadi* appointed al-Mu'allim Mahmud ibn Nammar *mi'mar bashi*, al-Mu'allim Khalaf ibn Sulaiman and al-Mu'allim Musa ibn Kar'un. These three checked the mill and found that it was indeed an old works, and that it had been grinding grain for over a hundred years. They also concluded that the presence of the mill was of interest and benefit to the residents of the neighbourhood and that it would cause no harm to anyone. On this basis, the *qadi* permitted al-Mu'allim Musa to continue to run the mill as had been the case in the past (69/1: 277).

On 6 Rabi' I 1003/19 November 1594, Shaikh Burhan al-Din ibn al-Shaikh Ahmad al-Hariri lodged a complaint against the wish of Mulla Yusuf ibn 'Abd Allah al-Anbari's to build a latrine (*kanif*) on top of Shaikh Burhan's house. He approached al-Qadi Muhammad Efendi accompanied by experienced men, among them al-Mu'allim Mahmud ibn Nammar *mi'mar bashi*, his son Karim, al-Mu'allim Dhiyab ibn Ramadan and al-Mu'allim Musa ibn Kar'un. The architects explained that if the facility were to be built without any fenestration—not even a single small window—it would not harm Burhan's house. Provided that he abide by the architects' condition, the *qadi* gave Mulla Yusuf permission to build a latrine (76/1: 267).

Muhammad Aga lodged a complaint on 8 Rabi' I 1029/12 February 1620 with the official of *al-bab al-'ali* and the administrator of al-Sakhra *waqf* against a latrine that had been introduced into a house located in the Jewish quarter, the property of the *waqf*, where a number of Jews

were residing. The house was inspected by al-Qadi Mustafa al-'Alami and *fakhr aqranih* al-Usta Mustafa ibn 'Abd al-Muhsin, *ra'is al-mi'mariyya*, who later reported to the *qadi* about their findings after the inspection. The *qadi* ordered the facility to be moved to another site (102/2: 483).

On 10 Jumada II 1048/19 October 1638, because of a dispute between Tauba ibn Salah al-Akhras and Ahmad ibn 'Abd al-Ghaffar al-Akhras concerning an upper-level house belonging to Ahmad located in al-Jawalida quarter, Tauba reported that the house was on the verge of collapse and he feared that it would destroy the lower-level house beneath. Al-Usta Khalil ibn 'Ali ibn Nammar *mi'mar bashi* was ordered to renovate the house. Khalil inspected it and managed to solve the dispute to the effect that Ahmad was to repair the upper-level house by covering its roof with *qusurmil*, renovating and repointing it. Equally, Tauba was to renovate the lower-level house (127/2: 372; for more details see 143/3: 36; 160/1: 70; 2: 193).

With regard to the participation of the architects in estimating and approving rents, a document dated 23 Jumada I 1019/13 August 1610 makes reference to al-Shaikh 'Ala' al-Din ibn Musa ibn 'Asila, who for over sixty years had leased out his father's house which was located in the Christian quarter, for a rent of 15 *ghirsh*. The tenant had the right to benefit from rented property by adding to the building. Two architects, Badr al-Din ibn Sulaiman and Khalil ibn Khalaf, pointed out that the rent was the same as that of other similar properties in the same quarter (91/2: 64). On 21 Shawwal 1024/13 November 1615, *malik al-umara' maulana* 'Uthman Beg rented a plot of land pertaining to al-Madrasa al-Jawiliyya *waqf*, belonging to *Maulana* Shaikh al-Islam Ishaq ibn al-Shaikh 'Umar Siraj al-Din ibn Abi 'l-Lutf. The 6 by 1 arm plot was leased for thirty-six years at a cost of 300 *qit'a misriyya*, and the lessee was given the right to add more buildings if he wished. The architects Badr al-Din ibn Sulaiman *al-mi'mar* and Ibrahim ibn Ahmad testified that the rent was similar to that of other comparable properties (98/1: 88; for al-Madrasa al-Jawiliyya see al-'Ulaimi 1973 2: 38; al-'Arif 1961: 243-4; Ghawanima 1982: 159; Najm 1983: 179-81; Burgoyne 1987: 201-10).

On 3 Jumada I 1030/26 March 1621, *fakhr aqranih* al-Zaini Taha ibn Husain Çelebi rented a vault which was *waqf* property from *fakhr al-kuttab* Ishaq Çelebi ibn Ibrahim Çelebi ibn Shaikh al-Tankiziyya, *mutawalli waqf al-sadaqat al-hukmiyya*. The lease would last for forty-five years at a cost of 990 *qit'a misriyya*. The transaction was completed in the presence of, and with the approval of, al-Mu'allim Sa'd al-Din ibn al-Mu'allim Dhiyab *al-mi'mar* and al-Hajj Husain ibn 'Ali Altinbugha, both of whom were men with expertise in estates and the estimation of their values (105/1: 495; see also 105/1: 499; 116/1: 22-3; 139/1:

63). On Ghurraṭ Jumada II 1030/23 April 1621, al-Ustad ‘Abd al-Muhsin ibn Mahmud ibn Nammar *mi‘mar bashi* estimated the rent of Hammam al-‘Ain located at the Bab al-Qattanin at 26 *qir‘a misriyya* per day (104/3: 227).

The architects also solved the problem of property held in common by dividing it between those in dispute. According to a document dated 10 Ramadan 1036/25 May 1627, following a dispute between ‘Awwad Walad Mikha’il al-Nasrani and his sister Saliha over a house and courtyard located in the Christian quarter, *al-faqir* Sulaiman al-Da’udi and *fakhr al-aqran* ‘Abd al-Muhsin ibn Nammar *mi‘mar bashi* were assigned to inspect it. These men defined Saliha’s share as 3 1/3 *dhira‘* from the south-north side and 6 *dhira‘* from the east-west side. It was also agreed to build a wall separating the two parts (113/2: 679). On 23 Shawwal 1040/25 May 1631 al-Ustad Mustafa ibn al-Mu‘allim ‘Abd al-Muhsin ibn Nammar, *kabir al-mi‘mariyya*, divided a house located in the Christian quarter held in common by Mu‘mina bint Muhammad Abi Siyaj and the sons of her uncle, with 15 *qirat* for Mu‘mina and 9 *qirat* for the others (118/1: 53).

Supervision of the *qanat al-sabil*, the canals supplying Jerusalem with water, was also one of the responsibilities of the architects. Following an interruption to the supply of water to Jerusalem on 12 Shawwal 981/4 February 1574, Sulaiman Çelebi ibn Muhammad Çelebi, the *mutawalli qanat waqf*, asked the current *qadi* to inspect the canal, the pools, and the *balu‘* (water draining) tributaries to the pools in order to check if the areas through which the water ran were in need of clearance or rebuilding, or if the shortage and the disappearance of the source was due to lack of water. A committee consisting of Qadi ‘Imad al-Din al-Shafi‘i and Mustafa Aga Wali *mudhir bashi* was set up for the purpose. Accompanied by the *mutawalli*, they visited the pools and examined the *balu‘*, which fed the pools near Maqam al-Khadr, and the vicinity. They found nothing obstructing or impeding the flow of water. They therefore concluded that the quantity of water available in ‘Ain Salih, ‘Ain al-Jauza, ‘Ain ‘Ata and ‘Ain al-Furukh was scarce as a result of a dearth in the supply from the wells. The *qanawatiyya* attributed this to the lack of rain (56/1: 732; see also 90/3 238 and above). According to a document dated 9 Rabi‘ II 1046/10 September 1636, al-Hajj Mustafa *wakil al-kharj*, al-Hajj Hasan ibn Nammar, and al-Ustad Mustafa *mi‘mar bashi* had been working to open the water canal leading from Wadi al-Abyar to *qanat al-sabil* and supplying the city for ten days, beginning 7 Rabi‘ II/8 September, although they had started the reconstruction work on 6 Rabi‘ I/8 August that year (125/3: 475).

On 27 Rabi‘ II 1090/7 June 1679, *maulana* Ahmad Efendi granted permission to *fakhr al-a‘yan* al-Hajj ‘Umar ibn al-Hajj Hasan Nammar and al-Hajj ‘Ali ibn al-Hajj Karim al-Din ibn Nammar to rebuild the *qanat al-sabil*.

They should refer their expenditure to the authorities (181/3: 258).

Appendix 12.11 illustrates the estimated requirements of the canal at various dates.

As to the Christian and Jewish sites, the royal sultanal orders also defined the procedures and conditions under which permission had to be obtained from the *qadi* whenever there was a necessity for reconstruction or repair when part of a site was demolished. It was essential to repair any area that was damaged (94/1: 86). On the other hand, if someone from either a Christian house or monastery wanted to erect a dry-stone wall without using mud or rough-cast, or to use *al-qusurmil* on the roof of his house, or to isolate a rubbish and soil pit (cistern), or to replace a wooden door (excluding the door or window of a house), or to repair the paving of his house, or to whiten his building with rough-cast, none of these would require a permit (122/1: 159).

On 13 Jumada II 955/20 July 1548, Jermanus al-Nasrani stated that five chambers in the southern part of Dair Mar Ilyas had been demolished following the earlier earthquake in the city. The remaining facilities in the monastery had been in need of repointing and renovation both inside and out. Jermanus asked the *qadi* for permission to reconstruct and repair the damaged or demolished parts of the monastery. The *qadi* responded by visiting the monastery in the company of al-Mu‘allim Husain ibn Nammar *mi‘mar bashi* in order to inspect it. They found that part had been destroyed; the *qadi* immediately asked al-Mu‘allim Husain to measure these destroyed premises. Al-Mu‘allim Husain duly surveyed each chamber inside the monastery to the north and took the following measurements: height 5 arms, width 3.5 arms. The height of the southern wall on the south-west was 11 arms. To the south-west, the height of the wall was 16 arms; the length of the building from east to west was 31 arms. The wall surrounding the monastery was 1.5 arms. Following the completion of the survey, the *qadi* allowed Jermanus to begin the reconstruction work and the repairs inside the monastery in accordance with their findings as to the extent of the damage, but without adding any extra buildings (22/1: 187; for Dair Mar Ilyas see al-‘Arif 1961: 527; Cohen and Lewis 1978: 91).

Another case involved Akhirstorlū ibn Basili al-Nasrani al-Sirbi—*iqlim* (chief) *dair al-sirb* region—also known as the Mikha’il Monastery in the Christian quarter—presenting a *hukmin sharifin sultani* (royal order) dated Awasit Rabi‘ I 955/24 April 1548 to the effect that some Christians of Dair al-Sirb had reported to the Sublime Porte on the need for reconstruction and repair of the church and dwellings in Jerusalem. They added that some people had opposed their intention to do the work, alleging that they had no legal right to do so. If the situation was as stated, they had to be allowed to do the

reconstruction work so long as they made no additions to the original building. The *iqlim* added that some places inside the monastery were in need of reconstruction while others were in need of repair. Still other parts were in need of demolition and restoration. Other parts also were in need of repointing and all the roofs needed treatment with *qusurmil*. He also explained that he was in charge of a house belonging to the monastery which had dwellings that needed to be demolished and rebuilt. The gardens of the site also needed to be reconstructed and repaired and the walls rebuilt. On 17 Rajab 963/27 May 1556 the *iqlim* requested an inspection of the site and permission to undertake the work. The *qadi* met his request and granted permission (31/1: 366; for Dair al-Sirb see Cohen and Lewis 1978: 87).

When Afrathomas, an *ifranj* monk and head of *al-ifranj* monastery, asked al-Qadi 'Abd Allah ibn Mahmud on Ghurraṭ Dhu'l-Qa'da 1030/17 September 1621 to be allowed to reconstruct and renovate the church of *al-ifranj*, the *qadi* granted him permission on condition that no more than three monks were to be allowed to reside in the church. They were also obliged to welcome any visiting Muslims and to feed them as they required. These conditions were similar to those agreed by *sayyiduna* 'Umar ibn al-Khattab in the *'uhda* (agreement) and the head of *al-ifranj* accepted them (89/1: 23; for *al-'uhda al-'umariyya* see al-Tabari 1962 3: 609-10; al-'Ulaimi 1973 1: 253-5; al-'Arif 1961: 91-4; Hamid Allah 1983: 488).

Appendix 12 illustrates the requirements of Christian holy sites undergoing renovation and restoration work during the 16th and 17th centuries. There were a total of sixty-two records of inspections and permits to renovate or reconstruct Christian dwellings. The houses were located in the Christian and al-Risha quarters (for example see 31/4: 367; 78/1: 135; 105/2: 713; 118/1: 370; 150/1: 368; 187/1: 570).

With regard to the Jewish sites, the legal documents also make reference to royal sultanal orders relating to cases where permits were required in order to make renovations or reconstruction. In some cases, no permission from the *qadi* was necessary. These cases were exactly the same as those that applied to the Christians (122/2: 181). The documents focus on the Jewish synagogue located in the Jewish quarter. When *amir al-umara*' Hasan Beg al-Muzaffari, *malik liwa' sanjak al-quḍs wa madinat al-khalil*, learned on 14 Rajab 947/14 November 1540 that the Jews had restored the fabric of their synagogue, made a new door and a new wall on the west, and had paved the courtyard of the synagogue with new paving stones, he sent *mafkhar al-amathil wa 'ain al-aqran* Qasim Kikhya to the *qadi* to inspect the site. Al-Mu'allim Husain ibn Nammar *mu'allim al-mi'mariyya*, al-Mu'allim Shihab al-Din Ahmad ibn Qadi al-Salt, and al-

Mu'allim Ahmad ibn Salim al-Khuraishi visited the synagogue and made a careful inspection. They found that indeed a door, a wall and courtyard paving had been introduced and all of them testified to the fact in front of the Jewish Rabbi Shaikh al-Yahud (12/3: 502; 1: 509).

A document dated 4 Jumada I 956/31 May 1549 refers to al-Shaikh Ahmad al-Dajani who learned that the Jews had built a house located between the mosque in the Jewish quarter and their synagogue, a property belonging to that synagogue. Shaikh al-Dajani sent al-Shaikh Muhammad al-Hafiz to the *qadi* to inform him of the news and to ask him to make the necessary inspection. The *qadi* visited the place himself and found al-Shaikh al-Dajani there. They checked the place closely in the presence of many Muslims, including al-Mu'allim Husain ibn Nammar *mi'mar bashi*. They found that the Jews had renovated one face of the mosque walls by using new rough-cast. As to the wall of the house, they found that it was in fact an old one to which no change had been made. At the same time, Muhammad ibn Muhammad al-Duhaina lodged a complaint against Yusuf ibn Diyab al-Yahudi, Ya'qub Khallaf Shaikh *ta'ifat al-Yahud*, and Musa and Malki *min akabir al-Yahud*. He reported that there was a chamber belonging to the mosque in the north wall which had been annexed and included in the house adjacent to the synagogue without any legal right. When they were asked about it, they denied it and pointed out that the house to the south was old; they said they had been in possession of the old house beside the synagogue for generations both before and after the Muslim conquest, as legal evidence showed. In order to check the evidence, the *qadi* asked al-Mu'allim Husain ibn Nammar to demolish the disputed north wall. After he had done so it was discovered that there was a shortage of stones which proved that its construction was independent of the house to the north, a building which was the property of the synagogue (22/1: 117; see also 64/1: 248; 161/2: 391).

On 15 Jumada I 996/12 April 1588, Shamsun ibn Shamu'il al-Yahudi explained to the *qadi* that one of the chambers and the *iwan* (hall) of the *ribat* (hospice) allocated for Jewish outcasts (*sa'alik*) had been demolished because of heavy rain and was in need of reconstruction and repair. He asked for a close inspection; on completion, it was found that Shamsun was telling the truth. The *qadi* granted him permission to make the necessary repairs and reconstruction without any new additions (67/2: 151).

With regard to the Jewish houses located in the Jewish quarter, some thirty-three cases of inspection have been counted in the documents. All the inspections carried out were necessary before permission was granted for construction or renovation (for more details see 90/3: 307; 100/2: 341; 102/2: 483; 107/2: 303; 110/2: 46; 121/1: 4; 134/1: 290; 137/1: 4).

2. Implementation

The work was undertaken by assigning it or referring it to a person who was capable of completing all the various aspects of reconstruction. An agreement would be made between the person in charge of the site and the architect, who would carry out the specified renovation work in return for an agreed wage. The person in charge of the site could be the owner or tenant, administrator or guardian of the place, who was referred to in the documents as *al-muqati'* (bidder) (31/1: 52) or *al-musta'jir* (tenant) (36/1: 268). The documents make it clear that reconstruction (*muqata'a*) would be done in accordance with the current system of tendering. The *muqata'a* document pertaining to al-Madrasa al-Taziyya refers to al-Mu'allim Husain ibn Nammar who had agreed on 17 Rajab 953/13 September 1546 to bid for the school tender against payment of 44 *qubrusis* (18/3: 77; 18/2: 628; for al-Taziyya see al-'Ulaimi 1973 2: 45; al-'Arif 1961: 249-50; Ghawanima 1982: 174; Najm 1983: 232-3; Burgoyne 1987: 399-411; for *qubrusi* see Cohen 1989: 158 n. 112). Then the outcome of the *muqata'a* was presented to other architects in order for them to 'submit a tender for 36 *qubrusis*'. Al-Mu'allim Husain also accepted the tender against the stated amount (18/2: 628). In the *muqata'a* document relating to al-Madrasa al-Qa'itba'iyya dated 9 Sha'ban 953/5 October 1546, three architects, Muslih al-Din, Muhammad ibn Minqar and Rajab, agreed to reconstruct the parts of the school demolished after the earthquake. They accepted the deal personally and on behalf of those in whom they had confidence for 10,000 '*uthmani dirhams*' (18/1: 349). On the same day, al-Mu'allim Nammar ibn 'Ubaid ibn Nammar accepted the deal for 6,000 '*uthmani dirhams*'. And finally Rajab and his companion also tendered for 6,000 '*uthmani*' (18/1: 359). When al-Mu'allim Husain ibn Nammar *mu'allim al-mi'mariyya* accepted the tender to reconstruct three shops in Suq al-Dukhaniyya which were the property of al-Sadaq al-Hukmiyya *waqf*, it was for 400 '*uthmani*'. Al-Mu'allim Mahmud ibn 'Abd Allah al-Mi'mar al-Halabi accepted the tender for 300 '*uthmani*' (18/1: 621).

The documents also contain references to cases in which the tender rules have been rejected or cancelled. In these cases, the architect had to return any money he had received from the *muqati'* (bidder). After *maulana* Shaikh al-Islam Sharaf al-Din Musa and al-Mu'allim Ahmad ibn al-Khuraishi vetoed the conditions of the tender on a house above Daraj al-Harafish, al-Mu'allim Ahmad reported that he had spent 10 *qubrusis*, 6 *qubrusis* of which had been after the bid. The *muqati'* asked him to provide evidence of expenditure or to repay the sum. He failed to return the 4 *qubrusis* and was imprisoned as a result (18/3: 177). The same thing happened to al-Mu'allim 'Ubaid ibn Nammar. On 13 Ramadan 954/27 October 1547, he and Shaikh al-Islam Sharaf al-Din Musa al-Diri al-Hanafi vetoed the conditions of the tender of al-Madrasa al-Hanafiyya.

Because of this, Sharaf al-Din received back the sum he had previously paid out (19/2 447; for al-Hanafiyya see al-'Ulaimi 1973 2: 42, 219-21; al-'Arif 1961: 248; Ghawanima 1982: 170-2). When Salih ibn Jirjis al-Mi'mar and his father failed to carry out construction work for 'Ali Çelebi ibn Mustafa ibn Hamza Efendi, al-Hajj Khudawardi ibn Husain, who was acting as 'Ali's *wakil* (attorney), requested them on Awasiit Jumada I 973/8 December 1565 to return the amount they had received—a total of 130 *sultani*—in accordance with the document dated 16 Ramadan 963/24 July 1556 (49/3: 233).

The documents also refer to wages for architects (see Appendix 12.13) and their duties and whether the wage covered all or some of the building materials. On 15 Ramadan 952/20 September 1545, al-Mu'allim Husain ibn 'Ali ibn Nammar committed himself to the construction of al-Nuwai'ima bridge—the property of the Jerusalem *haram waqf*—which required digging the foundation, building the walls and all that was necessary in terms of returning the construction, restoration, renovation and the flow of water to their original state. All this was in return for 200 *sultani*, 50 *mudd* of wheat, 50 *ratl* of olive oil, and 50 *ratl* of *dibs* (molasses) (17/1: 334). When al-Mu'allim Ahmad al-Khuraishi al-Mi'mar agreed to plaster the *ivvan* (hall) of al-Madrasa al-Hanafiyya and to whiten the external walls flanking the *ivvan* for 6.5 *qubrusis* on 19 Jumada I 955/26 June 1548, the document makes it clear that the cost had to be supplied by the bidder, al-Shaikh Sharaf al-Din Musa ibn al-Diri al-Hanafi, *imam al-sakhra al-musharrafa* and administrator of the school (21/2: 11; see for example 33/4: 259). On 1 Safar 963/16 December 1555 Maulana 'Abd al-Karim Khalifa engaged al-Mu'allim Tadrus ibn Musa al-Nasrani to pave the courtyard of his house located in Khatt Bab al-Hadid in return for 20 *sultani*. The amount included purchase of the paving slabs, the master's wage, quarrying the new paving slabs, as well as transportation and provisions for masters and labourers. The bidder also had to supply rough-cast, *qusurmil*, sand and *al-hamra* (see above). The document adds that Tadrus had pawned the amount with 'Abd al-Karim, who was living in the Christian quarter (31/1: 7). When on 26 Safar 963/10 January 1556 Ghabriyan ibn Hadid al-Nasrani engaged al-Mu'allim Muhammad ibn al-Mi'mar and al-Mu'allim 'Ubaid ibn 'Ali ibn Nammar al-Mi'mar to complete certain reconstruction works in his house located in Aulad Quttaina quarter for a price of 83 *sultani* gold coins, the tender document stipulates that the building stone, rubble, paving slabs, wood, food and drinking water are to be supplied by the two masters. Ghabriyan on the other hand had to supply soil and rough-cast. Water brought from outside the house would be the joint responsibility of Ghabriyan and the masters (31/3: 53). When *mafkar al-amathil wa zain al-aqran* Muhammad Beg ibn Murad Beg, *al-sibahiyya* notable of Jerusalem district, employed al-

Mu'allim 'Ubaid ibn 'Ali ibn Nammar al-Mi'mar to build a house in al-'Amud quarter against the payment of 60 *sultani* gold coins, the tender document clearly states that 'Ubaid had to provide everything needed for the construction work, including stone, rubble, pebbles, baskets, wood for scaffolding, removal of debris and soil (36/1: 268). A document dated 7 Sha'ban 969/12 April 1562 deals with the reconstruction of Qubbat al-Silsila on the esplanade of the Dome of the Rock for 120 *sultani*. The fee covered the wages of eight architects, manufacturers, labourers, provisions, carpenters, stone-masons and their water costs, cutters and installers of *qashani*, as well as materials including *qashani*, rough-cast, rubble, carmine bricks, nails, copper etc, all to be supplied by the sultanate (43/6: 280; for more details see 83/4: 51; 85/2: 255; 1: 432; 105/1: 379).

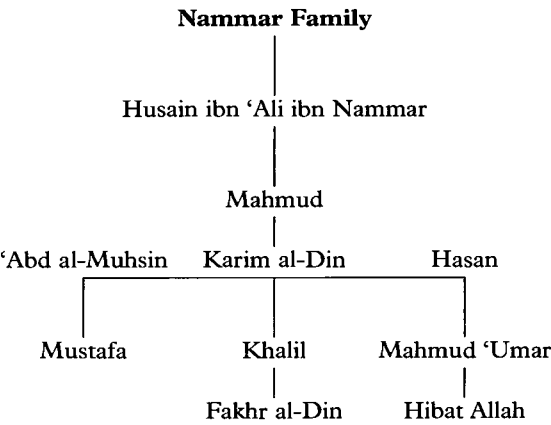

Appendix 12.13 illustrates wages paid to architects for the construction of schools, houses, hospices and other places identified in this chapter. Wages were paid in advance, as for example in the tender for Nuwai'ima Bridge (see above) or in instalments, as in the case of Ustad Khair al-Din ibn Nammar who received 1 *sultani* out of a total wage of 8 *sultani* from Sinan Khalifa, administrator of al-Ribat al-Mansuri, in partial payment for the Dome of Mu'awiyya at the Ribat. The remainder of the wage was forwarded to Musa ibn Husain, *al-jabi* (collector) *al-waqf* (27/2: 120). Al-Mu'allim Mahmud ibn Husain ibn Nammar received 3 *sultani* from Ahmad Çelebi ibn al-Hajj Bairam al-Khalwati, deputy of al-Hajj Sinan, *al-sibahiyya* notable in Ramla district, in return for his bid to pave the narrow street (*zuqaq*) located opposite al-Hajj Sinan's house in Jerusalem. His total wage was estimated to be more than 15 *sultani*. The rest would be paid to him gradually (33/4: 259). Al-Hajj Mahmud ibn 'Abd Allah al-Mi'mar al-Halabi received 13 *sultani* on 4 Safar 966/16 November 1558 from 'Abd al-Karim Khalifa. The money was part of his total wage of 25 *sultani* gold coins for the construction of a house located in Khatt Bab al-Hadid. The rest would be paid upon completion of the work (35/1: 119).

It is worth noting that the guarantees to which the architects had to commit themselves (known now as insurance on a building) in terms of the safety of any construction for twenty, thirty or fifty years were clearly defined by the tender rules. In this way, al-Mu'allim Husain ibn Nammar undertook to guarantee the safety of al-Nuwai'ima bridge for fifty years. In case of any defect, he would rebuild the bridge (17/1: 334). The bidders for the renovation and reconstruction of al-Madrassa al-

Qa'itba'iyya undertook to guarantee its safety for thirty years. In the case of any demolition during that period, they would restore it free of charge. Damage as the result of natural disasters such as earthquakes was not included (18/1: 349; see for example 18/1: 519; 39/3: 282; 102/1: 37). Al-Mu'allim Mahmud ibn 'Ali ibn 'Abdallah al-Mi'mar al-Halabi also undertook to guarantee the safety of renovation work on three shops located in Suq al-Dukhaniyya for twenty years, excluding any damage resulting from natural disasters (18/1: 621). One document which deals with the reconstruction of the house of *mafkhār al-amathil wa zain al-aqrān* Muhammad Beg ibn Murad Beg stipulated that, following completion of the work, there would be an inspection of the house by experts. In the case of any defect or other deficiency, al-Mu'allim 'Ubaid ibn 'Ali ibn Nammar al-Mi'mar would undertake to remove the defect and repair the building free of charge (36/1: 268). But there are documents which refer to the violation of their contracts by some architects. On 18 Rabi' I 967/18 December 1559, al-Hajj Husain ibn 'Abd Allah, deputy of *malik al-umara'* 'Ali Beg, *mutawalli* at al-Madrassa al-Ghadiriyya, reported that al-Mu'allim 'Ubaid ibn Nammar al-Mi'mar had neglected to build as tendered in the *khan* belonging to the *waqf*. The *qadi* ordered him to perform the work in accordance with the tendered conditions agreed between them. In addition, the work had to be completed within twenty days from 23 Safar 967/24 November 1559 (39/5: 46). In a dispute which had broken out between al-Sayyid Mahmud ibn al-Sayyid Mahmud al-Basir, in charge of al-Muthbat *waqf*, and Sa'd al-Din ibn Diyab al-Mi'mar, on 18 Sha'ban 1005/6 April 1597, Mahmud argued that it had been agreed that Sa'd al-Din would build the wall and garden of the *zawiya*, the property of the *waqf*, in return for 3 *sultani* and 2 *qintars* of rough cast, but that he had failed to complete more than half the work. With the coming of winter, heavy rain had destroyed the work. Mahmud therefore asked him to build it up again and to complete the reconstruction in accordance with the agreed conditions. Sa'd al-Din replied by arguing that he had carried out the work according to the agreement. He added that he had even added extra to the 2 *qintars* of rough-cast. But Mahmud did not believe him. Sa'd al-Din brought witnesses to support his claim (78/4: 102).

Finally, the documents specified the period for completion of work. The document concerning the Dome of Mu'awiyya stipulates that al-Ribat al-Mansuri be renovated completely within one month (27/2: 120) while the completion of the house of Muhammad Beg ibn Murad Beg was estimated to take three months (36/1: 268).

APPENDIX 12.1

APPENDIX 12.2

List of masters in the 16th and 17th centuries

1. 'Abd Allah ibn 'Abd Allah al-Mi'mar (118/1: 493; 123/1: 78; 125/1: 148)
2. 'Abd Allah ibn Ibrahim al-Banna' al-Ramli (145/1: 85; 1: 91; 156/1: 389, 1: 470)
3. 'Abd Allah ibn Riziq Allah (116/11: 22-3)
4. 'Abd al-Qadir ibn Ahmad al-Sukkari (18/1: 253)
5. 'Abd al-Karim al-Jaludi (105/1: 379)
6. 'Abd al-Masih ibn Farah al-Nasrani (105/1: 379)
7. 'Abd al-Rahman al-Kishbari (39/2: 149)
8. 'Abd al-Wahhab al-Shibaki al-Mi'mar (31/6: 268)
9. Abu 'l-'Aun ibn 'Ubaid (52/1: 40; 53/1: 314)
10. Abu Bakr ibn Qasim (105/1: 379)
11. Abu 'l-Jud (3/1: 323)
12. Ahmad ibn Abi Bakr al-Tarablusi (102/1: 37; 105/1: 379; 135/1: 214; 138/1: 79)
13. Ahmad ibn 'Ali al-Shami (5/7: 240)
14. Ahmad ibn Hattab al-Najjar (43/6: 280)
15. Ahmad ibn Mahmud al-Ghuwaishani (146/1: 97-8)
16. Ahmad ibn Katib al-Zait (146/1: 73-4)
17. Ahmad ibn Muhammad al-Kharufi (52/1: 40; 64/1: 367; 72/1: 278)
18. Ahmad ibn Sahl (52/1: 40)
19. Ahmad ibn Salim al-Khuraishi al-Mi'mar (10/1: 80; 18/1: 253; 21/2: 11; 96/10: 217)
20. Ahmad ibn al-Shakhis (4/1: 446)
21. 'Ali ibn 'Abd al-Wahhab al-Nabulsi al-'Asqalani (102/1: 37; 103/1: 234-5; 105/1: 379; 125/1: 148)
22. 'Ali ibn Ahmad al-Shami (31/1: 229)
23. 'Ali ibn Karim al-Din ibn Nammar (177/1: 169)
24. 'Ali ibn al-Jumaizi (105/1: 379)
25. 'Ali ibn Khalil ibn Nammar (91/1: 206; 102/1: 37; 105/1: 499; 174/1: 133)
26. 'Ali ibn Sayyidi al-Mi'mar (31/2: 306; 40/4: 316; 58/1: 395; 54/1: 63)
27. 'Ali ibn Shaikh Ahmad al-Shami al-Mi'mar (19/1: 69)
28. 'Ali al-Sharif (20/5: 319)
29. 'Ali ibn Washah al-Mi'mar (10/1: 80)
30. 'Ata Allah Duqmaq al-Nasrani (105/1: 379)
31. 'Ata Allah ibn al-Munir al-Nasrani (105/1: 379)
32. 'Awad ibn Ahmad ibn Nammar (146/1: 73-4; 156/3: 301; 165/1: 16; 168/1: 18)
33. 'Aun ibn Musa al-Nasrani (31/2: 63; 1: 110)
34. Badr al-Din ibn Hasan al-Khayyat (165/1: 48; 171/1: 538).
35. Badr al-Din Sulaiman al-Mi'mar (69/1: 368; 102/1: 37; 105/1: 379; 168/1: 99)
36. Banul al-Istanbuli al-Rumi al-Mi'mar al-Nasrani (31/2: 63)
37. Dib ibn Kar'un al-Banna' al-Turi (52/1: 40; 58/4: 40; 64/2: 110)
38. Diyab ibn Ramadan (31/1: 110)
39. Faraj Allah ibn Sabih al-Nasrani (43/6: 280)
40. Hajji Qasim ibn 'Abd Allah al-Rumi (25/1: 203)
41. Hasan ibn Musa al-Khayyat (91/1: 206; 102/1: 37; 116/1: 39; 123/1: 78; 138/1: 79)
42. Husain ibn 'Ali Altinbugha (104/1: 172)
43. Husain ibn Nafi' al-Mi'mar al-Halabi (17/1: 266)
44. Ibrahim ibn Muhammad al-Qanawati (135/1: 296; 151/1: 7; 156/3: 301)
45. Ibrahim ibn Muhammad al-Tarsha al-Mi'mar (21/3: 588; 52/1: 40)
46. Ibrahim al-Nasrani al-Shami (52/1: 40; 105/1: 379)
47. Ishaq ibn Jirjis al-Nasrani (62/2: 435)
48. Jawhar ibn 'Abd Allah al-Hitti (52/1: 40; 66/2: 621)
49. Jirjis ibn Hanna al-Banna' (31/6: 427)
50. Jum'a al-Qanawati (135/1: 296)
51. Karim ibn Muhammad al-Khayyat al-Mi'mar (72/3: 195)
52. Khalaf ibn Fadul al-Nasrani (62/2: 435)
53. Khalaf al-Muhtadi (102/1: 37)
54. Khalaf ibn Sulaiman al-Mi'mar (52/1: 40; 64/1: 367; 66/2: 253; 69/1: 368; 72/4: 352)
55. Khalil (168/1: 18)
56. Khalil ibn Husain ibn Nammar (37/1: 128; 43/6: 280; 52/1: 40; 105/1: 379)
57. Khalil ibn Karim al-Din ibn Nammar (135/1: 441; 136/2: 322)
58. Khalil ibn Khalaf al-Banna' (85/2: 255; 91/2: 64; 116/1: 390)
59. Khalil al-Nasrani (52/1: 40)
60. Khalil ibn 'Umar (23/2: 52)
61. Khalil ibn al-Zibar (52/1: 40)
62. Khashadur al-Nasrani (105/1: 379)
63. Khattab ibn Musa al-Mi'mar (14/3: 94; 1: 296; 19/1: 243)

64. Khair al-Din ibn Khalil ibn Nammar (156/1: 398; 168/1: 18; 171/1: 538)
65. Khair al-Din ibn Nammar (27/2: 120)
66. Mahmud ibn 'Abd Allah al-Halabi al-Mi'mar (12/4: 351; 17/1: 551; 39/2: 149)
67. Mahmud al-Qanawati (84/1: 522)
68. Ma'tuq al-Nasrani (105/1: 379)
69. Mikha'il walad Salih al-Nasrani (105/1: 379)
70. Muhammad ibn 'Abd Allah al-Halabi (54/1: 63; 165/1: 148)
71. Muhammad ibn Abi 'l-Khair (165/1: 48)
72. Muhammad al-Hamawi al-Shami (1/2: 400)
73. Muhammad ibn Kharufi (69/1: 368)
74. Muhammad ibn Mahmud al-Qanawati (52/1: 40; 102/1: 37; 132/1: 381; 135/1: 359)
75. Muhammad ibn Mansur al-Halabi al-Mi'mar (1/2: 400; 13/2: 351; 14/2: 332; 31/3: 53; 72/3: 68)
76. Muhammad ibn Minqar (18/1: 349; 23/2: 52)
77. Muhammad ibn Qasim al-Shami (118/1: 189)
78. Muhammad ibn Salama (52/1: 40; 54/1: 63)
79. Muhammad ibn al-Shakhis (10/1: 80)
80. Muhammad Shuqair (66/2: 621)
81. Muhammad ibn Yusuf al-Hajjar (3/1: 323; 165/1: 48)
82. Musa ibn Abi 'l-Khair (25/1: 204)
83. Musa ibn al-'Ajiza al-Nasrani (43/6: 280)
84. Musa ibn Hajji (52/1: 40)
85. Musa al-Halabi (66/2: 621)
86. Musa ibn Kar'un al-Mi'mar (52/1: 40; 69/1: 368; 72/3: 68; 1: 278; 4: 352)
87. Musa ibn al-Khayyat (160/1: 70; 165/1: 48)
88. Musa ibn Musa (51/7: 240; 72/1: 278)
89. Musa ibn Sa'd al-Din al-Banna' (134/1: 543; 156/1: 398; 157/1: 70; 168/1: 99)
90. Musa ibn 'Ubaid ibn Nammar al-Mi'mar (31/2: 306; 43/6: 280)
91. Muslih al-Din ibn Hasan al-Najjar (51/4: 590)
92. Muslih al-Daqqaq (168/1: 99)
93. Muslih al-Din al-Mi'mar (14/2: 121; 2: 332; 18/1: 349; 2: 356; 1: 359)
94. Mustafa ibn Hasan al-'Asqalani (102/1: 37)
95. Nammar ibn 'Ubaid ibn Nammar (18/1: 359)
96. Niqula walad Mitri al-Nasrani (105/1: 379)
97. Nuh al-Banna' (15/2: 47)
98. Nur al-Din (168/1: 18)
99. Rafa'il ibn Jirjis al-Qibti al-Banna' Nasrani (52/1: 40; 83/2: 21)
100. Rajab ibn Yahya al-Antaki (5/1: 81; 14/2: 332; 18/1: 359)
101. Sa'd al-Din ibn Diyab al-Mi'mar (72/3: 68; 91/1: 447; 98/4: 504; 104/1: 172; 105/1: 379)
102. Salah al-Din ibn Nammar (168/1: 18)

Chapter 13

THE KHALIDI LIBRARY

Lawrence I Conrad

In the medieval Middle East it was not unusual for individuals to amass important private collections of books, and in some cases these comprised large personal libraries covering most of the subjects studied by scholars and pursued by the literate and educated public. It is often to such private collections that the great national libraries of the modern states of the region owe their manuscript treasures, though in many cases major private libraries still survive to this day.¹ Such collections are important not only for the individual works they preserve, but also for the way in which they illustrate the literary and cultural concerns of their period and region.

In Palestine the tradition of private book collecting and library building is probably of no less antiquity than elsewhere in the Islamic world, though research on the subject is still limited and concrete details presently available take us back only to the library of a certain Burhan al-Din Ibrahim al-Nasiri, a scholar from Jerusalem who died in 790/1388 (al-‘Asali 1983, 1: 50; Haarmann 1984). Much more is known about libraries of the Ottoman period. Eminent families and individuals in Jerusalem frequently established private libraries, and the 543 manuscripts from Palestinian family collections currently held at the Jewish National and University Library (JNUL) in Jerusalem make it clear that the tradition was well-represented in most of the main towns of

Ottoman Palestine.² Leaving aside the main holdings of the JNUL, which are not indigenous but represent donations or acquisitions from collectors abroad, these collections contain a total of more than 4,000 Islamic manuscripts, mostly in Arabic (Salama 1983: 2). Each collection is important in its own right, but the most significant in terms of contents, size, and research potential is clearly the Khalidi Library in the Old City of Jerusalem. Though founded only a few decades before the demise of the Ottoman empire and possessed of a history which continues to be significant through Mandate times and on to the present day, the Khalidi Library provides valuable insights on Palestinian Arab culture throughout the Ottoman era, and its post-1918 history raises important issues concerning the survival and preservation of Ottoman Jerusalem.

The family to the time of Sun‘ Allah

The Khalidi Library is based on a core collection of nearly 600 manuscripts assembled by Muhammad Sun‘ Allah al-Khalidi and endowed as *waqf* by him from 1133/1721

¹ See Roper 1992-94. This work surveys the Islamic manuscript collections in more than 80 countries and highlights the potential for very important work in little-known private collections.

² See al-‘Arif 1986: 449-52; also the fuller discussion in al-‘Asali 1981: 369-92; Salama 1987, 1: 3-24. Cf. further ‘Ali 1958; Crecelius 1991: 69-71. Preliminary research on the JNUL collections has been undertaken by the present writer, who would like to thank the World of Islam Festival Trust and its director Alistair Duncan for their support, and Efraim Wust at the JNUL, who is presently cataloguing the manuscripts, for his cooperation and assistance.

onwards. This collection itself reflects literary and cultural interests in the family in Mamluk times and the first two centuries of Ottoman rule in the Arab East.

The Khalidi family first emerges to our view in the Mamluk period, when members of the family in Jerusalem, Nablus, Safad, and Cairo gain attention in medieval biographical dictionaries. The original name of the Jerusalem Khalidis was al-Dairi, a name which figured in family prosopography even into the early years of this century. Family members still today explain the name as arising from the fact that monks in a certain monastery (*dair*) near Jerusalem sheltered fugitive members of the family during the Crusades. The story reveals attempts to assert the importance of the family in Jerusalem at a crucial time in the history of Palestine, but in historical terms it is baseless. The Dairis took their name from their home village of Dair ‘Uthman in the district of Nablus, near Mt Gerizim.³ The progenitor of the Khalidis of Palestine was Abu ‘l-Sa‘adat Sa‘d ibn Muhammad al-Dairi (d. 867/1463), and the Dairis were certainly already established in Jerusalem in the 8th/14th century. This is where Sa‘d ibn al-Dairi was born and his father, the renowned jurist and *qadi al-qudat*, Shams al-Din al-Dairi (d. 772/1373), was the one who moved the family there, went on to gain a reputation in the Islamic religious sciences, and figured among the purchasers of manuscripts from the Jerusalem library of the al-Nasiri referred to above (al-‘Asali 1983, 3: 190-91; Haarmann 1984: 329). Sa‘d ibn al-Dairi was a respected scholar who moved to Cairo, followed his father as head of the Madrasa al-Mu‘ayyadiyya, became the Hanafi *qadi* there in 842/1438, and held this post for 25 years. He was regarded as profoundly learned in many fields and an authority in *tafsir* and *hadith*, and wrote a number of juridical and dogmatic works (Brockelmann 1937, S2: 144; Zirikli 1990, 3: 87).

The shift to the name al-Khalidi, already under way in the Mamluk period, marked an attempt to identify the family as the descendants of Khalid ibn al-Walid, one of the commanders who led the Arab conquest of Syria in the early 7th century (Donner 1981: 119-32, 135-42, 149-51, 173-90), and a detailed genealogy tracing this descent back to Khalid was traditionally offered as proof.⁴ The

Dairis of Nablus were not the first to lay claim to the name of al-Khalidi, but medieval biographers were rightly sceptical. Ibn Khallikan (d. 681/1282), for example, was given precisely the same explanation of the name by the descendants of the Aleppan poet Ibn al-Qaisarani al-Khalidi, but was unconvinced (Ibn Khallikan 4: 461):

This family name traces descent back to Khalid ibn al-Walid al-Makhzumi, or so the people of his family allege. But historians and scholars of genealogies state that [Khalid’s] lineage has not continued down to [our day], but rather came to an end long ago.

In early Islamic times, in fact, it was already well known that Khalid’s line had ceased within a few generations after his own death (Caskel 1966, 1: Table 23). For present purposes, these claims concerning family origins suggest that in Mamluk times the Khalidis comprised a rising social power in Jerusalem society and were seeking to assert their claims to eminence over and above those of older and better-established families. Still, readers’ and owners’ notes in manuscripts in the Khalidi Library indicate that even in the Ottoman period scholars of the family had for some time put little store by their status as Khalidis, and rather preferred to present themselves as, for example, *sibt al-Khair al-Ramli*, or just al-Khairi, i.e. descendants of the great jurist and *mufti*, Khair al-Din al-Ramli (d. 1081/1671). But through the course of the 12th/18th century, when the waning of Ottoman

³ This origin is explained in several sources: e.g. al-Sakhawi 3: 249; Mujir al-Din, 2: 221. Cf. also al-‘Asali 1983, 3: 191.
⁴ In the 19th century a family member also wrote a history of the conquests of Khalid that served to introduce the more recent history of the family. See Ahmad ibn ‘Abd al-Rahman ibn ‘Abd Allah al-Khalidi, *Al-Durr al-farid fi futahat Khalid ibn al-Walid*, Khalidi Library Ms Ar. 553. A copy of the genealogy is still shown to visitors, but in its present form it serves to trace, on the one hand, Sun‘ Allah al-Khalidi’s descent through single ancestors back to Khalid (i.e. it is not at that point a genuine family tree), and on the other, his descendants down to the present day, which of course provides vital information

for the distribution of shares of *waqf* revenues. Yusuf Diya’ al-Khalidi boasted of this lineage in Vienna in the 1870s (Schölch 1980: 321 n. 35), and in 1900 Hajj Raghīb al-Khalidi (1858-1951) still took the genealogy seriously, referring to the Khalidi family as ‘the tribe of Makhzum’ (Raghīb al-Khalidi 1900) and tracing his own descent back 37 generations through Muhammad Sun‘Allah al-Khalidi and Sa‘d ibn al-Dairi to Khalid ibn al-Walid (*Barnamaj*’ 2-3). Today, however, the family views the claim of descent from Khalid as a matter of historical interest but is well aware of its weakness.

central power had allowed for the resurgence of local interests in the provinces, claims to venerable and prestigious family names were important vehicles used by various kinship groups to assert their eminence and priority over their rivals (Abu-Manneh 1986: 94, 99).

An especially interesting family member involved in this process was an obscure 9th/15th-century personality known as Ibn al-Sairafi, but whose name was Muhammad ibn ‘Abd al-Rahman ibn ‘Abd al-‘Aziz ibn ‘Ali al-Makhzumi al-Maqdisi al-Khalidi al-Hanbali. Perhaps a government secretary, he composed a manual arranged according to the standard topics of Islamic jurisprudence on how the secretary should deal with various situations and formulate the appropriate documents; later he was asked to prepare an abridgement, which survives in the Vatican Library in Rome⁵ and in the Khalidi Library.⁶ Apart from the book itself his name is also of interest. One notes again the claim to affiliation with Khalid ibn al-Walid, this time by asserting membership in Khalid’s tribe, the Makhzum. This author also refers to himself as a Hanbali. Most of the later Khalidis were scholars of the Hanafi school, the dominant one in Ottoman Palestine, but at times they also display certain Maliki affiliations, and in this case we see an earlier family member who adhered to the Hanbali school, which enjoyed strong support in Jerusalem and such other towns as Tulkarm (Little 1989: 192; Conrad and Kellner-Heinkele 1994: 285).

The figure of Muhammad Sun‘ Allah al-Khalidi (d. 1140/1727) is central in the genealogy and *waqf* affairs of the family, and it is likely that his career marked the apogee of the Khalidi dominance of social and political circles in Ottoman Jerusalem. A scholar of the traditional

Islamic sciences trained at the renowned religious academy of al-Azhar in Cairo, Sun‘ Allah returned to Jerusalem and quickly secured the important position of *bashkatib*, or chief secretary, of the Shari‘a Court in Jerusalem, and held this post for over 45 years. He was also a major figure on the social and economic scene, and endowments by him (beginning in 1123/1711) for the benefit of his family encompassed no fewer than 26 properties, including houses, shops, and bakeries (Dumper 1986: 62-3).

An important factor behind the proliferation of family endowments (*waqf dhurri*) was an effort to prevent assets from being lost or vitiated through division among increasing numbers of heirs (Sa‘ati 1988: 130-71), and the notables of Ottoman Jerusalem, a town which had more *waqf* per capita than any other city in the empire, including Istanbul (Reiter 1991: 35), were clearly adept at creating such shelters. It was almost certainly with this aim in mind that late in his life, in Rajab 1133/April 1721, Sun‘ Allah began to endow his library holdings for the benefit of ‘his male descendants, one generation after another in perpetuity’. A *daftar* prepared by his son⁷ lists a first instalment of 85 titles (Table 13.1), followed by a second of 466 (Table 13.2).⁸ These volumes apparently comprised the whole of Sun‘ Allah’s collection of Arabic, Turkish and Persian manuscripts, and it was this corpus that came to form the core of the Khalidi Library.

In several ways the distribution of titles and interests is a fairly predictable one. A scholar of the Islamic religious sciences needed to be able to comment authoritatively on both practical and hypothetical problems put to him, and his responses and judgments had to be made with reference to the precedents available in the classical texts of early Islamic times or the later commentaries, abridgements, or compendia based upon these texts. The dominant position in Sun‘ Allah’s library of such subjects as *fiqh*, *usul*, *fara’id*, and *hadith* is entirely consistent with such priorities, though one might note the relatively minor role that *tafsir* and the Qur’anic sciences play in the collection.⁹ The sizeable group of texts on grammar, logic and related subjects also relates to these concerns, since it was of course important to be able to understand the exact grammatical sense of a text, argue

⁷ Khalidi Library Ms. Ar. 1126. The data in this register is discussed in Conrad and Kellner-Heinkele 1994: 289-90.

⁸ In the second list the term *makramat* refers to mss intended for presentation as gifts to eminent personalities. Such works were copied with great care, were usually decorated in gold and colours, and represented enormous investments of time and money. The Khalidi Library still contains numerous such texts.

⁹ Under *tafsir* Muhammad ibn Sun‘ Allah includes such works as the *Itqan fi ‘ulum al-Qur’an* of al-Suyuti (d. 911/1505), which is, strictly speaking, not a Qur’an commentary, but rather a manual on the Qur’anic sciences.

⁵ Brockelmann 1937, S2: 976; in this ms. the author is called al-Makhzumi al-Qurashi, Ibn al-Sairafi.

⁶ *Mukhtasar al-mukatabat al-badi’a fima yuktab min umur al-shari’a*, Khalidi Library Ms. Ar. 700.

logically on the basis of one's evidence, and defend one's interpretation.

Of some interest is the large number of works on dogmatic, devotional, and mystical topics. This may be explained in terms of the policies of the Mamluks, who beginning in the reign of Barquq (r. 784-91/1382-89, 792-801/1390-99) promoted the foundation of *khanqahs* and *zawiyyas* and encouraged the integration of popular Sufi-style practices and literature into academic life (Haarmann 1984: 331; Little 1989: 192-93). The impact of these policies can already be seen in the library of al-Nasiri, which also contains an important element of popular devotional and mystical literature (Haarmann 1984: 331). Numerous Sufi-style organisations maintained lodges and study centres in Ottoman Jerusalem, and in 1672 Evliya Çelebi counted a total of 70 of them (Baer 1984: 171-72; al-'Asali 1989: 211; Ze'evi 1994, 1996: 63-85). In the books that eventually made their way into the Khalidi Library the same trend is reflected in the frequency with which Ottoman-period authors, owners, copyists, and readers of the manuscripts specify their affiliation with various Sufi orders (Khalwati, Qadiri, Shadhili, Maulawi, Naqshabandi, etc.). The Khalidi Library contains an *ijaza* granting a notable of Jerusalem membership in the Qadiriyya order as late as 1330/1912 (Little and Üner Turgay 1980: 60). An interest in such subjects is also evident in the extant library holdings of another notable of Ottoman Jerusalem, Muhammad al-Budairi (d. 1220/1805),¹⁰ and in other Palestinian collections (Abu Lail 1983; Salama 1987, 1: 146-237; Conrad and Salameh 1993: 577).

It is noteworthy that the subjects of poetry, *belles lettres*, and history are grouped together, as if the fact that they stand outside the main religious sciences gives them some common ground. Even when so combined they comprise only 7 percent of Sun' Allah's library, and upon checking the titles it emerges that most of the poetry volumes are copies of the *Diwan* of Ibn al-Farid (d. 632/1235), an Egyptian mystic whose verse was often chanted by *sufis* during their prayer and recitation sessions. History proper is actually represented very poorly, a phenomenon also encountered in other Palestinian family and private collections, in which one rarely finds any historical writing beyond a few limited tracts on the history and merits of Jerusalem. One is left with the impression

that in Ottoman Palestine the past was perceived primarily—if not exclusively—in terms of the applied and theoretical learning it had made available for pursuit of the religious sciences and the questions they had to address in contemporary Arab-Ottoman society.

Also noteworthy is the presence of 21 medical works in Sun' Allah's collection. By Mamluk and early Ottoman times, formal medical learning had percolated into society at large through a variety of channels; these included books on the 'Medicine of the Prophet', self-help manuals, and general encyclopaedic works with a chapter on medicine (Conrad 1995a: 122-25). But Sun' Allah seems to have taken more of an interest in the subject than one expects from a general reader, and his books include precisely the sorts of works that a practising physician would have found useful: a commentary on the *Aphorisms* of Hippocrates, the mnemonic *Manzuma* of Ibn Sina (d. 428/1037), the *Tashil* of Ibrahim al-Azraq (fl. 9th/15th c.), the *Tadhkira* of Da'ud al-Antaki (d. 1008/1599), and various books on *materia medica* and the preparation of compound drugs. It is not known that Sun' Allah was a physician, but if he was not, the question arises of why he was interested enough to acquire so many manuscripts on the subject.

Under *majami'* and *rasa'il* are primarily listed volumes containing multiple works, with the result that many works on, for example, Arabic grammar are listed under *majami'* because multiple works on the topic have been bound together. Some of the volumes of this kind that now survive in the Library were all copied together by a single scribe and were undoubtedly meant for presentation as a corpus, while others clearly comprise small originally separate books bound together for the sake of convenience or to save money on binding. But in other cases it is difficult to see why a book is listed in these sections. The *Al-Munqidh min al-dalal* of al-Ghazali (d. 505/1111) and several individual manuals on grammar, for example, are listed under *rasa'il*.

The library of Sun' Allah al-Khalidi may usefully be compared to that of another notable of the 18th century, Muhammad Beg Abu'l-Dhahab, the Mamluk *shaikh al-balad* who built and endowed a large mosque and *madrasa* complex in Cairo in 1774 and deposited his personal library in it ('Ali 1958; Crecelius 1991: 69-71). It would be rash to assume that Muhammad Beg was typical of other bibliophiles of Ottoman Egypt, but the comparison is nevertheless useful in light of the fact, as we shall see below, that Cairo and the circles of Islamic scholarship at al-Azhar were important sources of influence for the Khalidis of Jerusalem.

For the same reasons that applied to Sun' Allah, Muhammad Beg collected large numbers of books on the Islamic religious sciences, among which books relating to Hanafi law were dominant, followed by texts of the Shafi'i

¹⁰ See Salama 1987, 1: 146-237; Conrad and Salameh 1993: 577. The Khalidi Library holds copies of two works written by al-Budairi. Ms. 219 is his *Matn bughyat al-talib nafi' li'l-mubtadi wa-mughnim li'l-muntahi*, a grammatical essay accompanied by two poems on similar topics. Ms. 744 is his *Al-Kaukab al-waqqaq fi 'l-dalala 'ala ba'd fadl al-jihad*, an essay on the merits of *jihad*, perhaps written late in his life just after Napoleon's invasion of Egypt. Cf. Conrad and Kellner-Heinkele 1994: 284 no. 9.

and Maliki schools. Grammar, rhetoric, and logic are also similarly stressed, and while history would seem to be well represented, Crecelius points out (1991: 70) that most of the titles are listed under this rubric by mistake and that in fact the subject was not at all well covered. This would accord with our assessment above of the status of history in Palestine as a whole.

There are also areas where the coverage of the two libraries manifests significant discrepancies. Muhammad Beg's collection displays none of the interest in *tasawwuf* that one so often sees in Palestinian collections. This divergence becomes clear when one recalls that al-Azhar, where most of the Palestinian scholars trained, disapproved of *sufi* tendencies; the Palestinian '*ulama*' completed this part of their religious education when they returned home (Ze'evi 1994: 132). Also, whereas the exact sciences are represented in Sun' Allah's collection by books on medicine, in that of Muhammad Beg they are covered by works on mathematics, which was of course relevant to calculation of inheritance shares and a major reason why some of the leading scholars of inheritance law were also known as mathematicians. It must also be noted that Sun' Allah's library was a private collection intended for his own use and that of his family, while that of Muhammad Beg was a *madrasa* library and may have been built up with that end in mind. This may account for the fact that the latter collection contains many more duplications of the same works.

The consolidation of Sun' Allah's library into a stable collection supported by the protective structures of *waqf* was decisive in the formation of the Khalidi Library. It essentially institutionalised its founder's wide-ranging intellectual and cultural interests, and provided an incentive that served to encourage further growth and development.

Khalidi literary and collecting activity in Ottoman times

Far less is known of the immediate descendants of Sun' Allah, but sufficient information is available to comment on developments relevant to the history of the Khalidi Library. Certainly it is clear that his family continued many of his interests. Several very well-known members of the family in the late 19th century could be cited as examples of authorship among the Khalidis, but these will be dealt with below, and here note will rather be taken of less prominent writers and literary figures within the family. In late Mamluk times the Muhammad ibn 'Abd al-Rahman al-Khalidi already discussed above had composed his manual for secretaries. In the early Ottoman period Ahmad ibn Muhammad al-Khalidi (d. 1034/1624-25) trained at al-Azhar and then returned to Palestine for a career of

teaching and service as a *mufti* and *qadi*. His writings were primarily in grammar and prosody, and he was also a poet in his own right (al-Muhibbi 1: 297-98); for modern scholars his most important contribution, however, was his history of the Ma'nid *amir* Fakhr al-Din II. Ahmad ibn Hasan al-Khalidi, who lived in Cairo and was better known as al-Jauhari (d. 1182/1768), was a broadly learned Shafi'i scholar, *mufti*, and teacher at al-Azhar (al-Muradi 1: 97); he wrote a number of books (Brockelmann 1937, 2: 331; S2: 459-60), and the Khalidi Library has from him a short essay on the interpretation of a Qur'anic passage on the temptation of Adam and Eve.¹¹ Another member of the family was Husain ibn Muhammad al-Khalidi (d. 1200/1786), who was an eminent Hanafi scholar and man of letters; he wrote a number of essays, most of which revolved around praises for the Prophet Muhammad (al-Muradi 2: 72). The year 1200/1786 also witnessed a further endowment of books; unfortunately, nothing is yet known about this *waqf* apart from references to it in notes in the manuscripts. Sometime in the 19th century Ahmad ibn 'Abd al-Rahman al-Khalidi wrote a historical work on the Arab conquests seeking to promote his family's claims to descent from Khalid ibn al-Walid,¹² and from about this same period comes an untitled collection of Hasan al-Khalidi's pieces in prose and verse, interspersed with religious, didactic and literary selections from older authors.¹³

Musa al-Khalidi (d. 1249/1832) was especially significant as a literary and religious figure who also gained considerable political importance. He wrote a number of legal treatises and was respected as far afield as Istanbul itself, and also served as *qadi* 'askar of Anatolia, one of the highest judicial posts in the Ottoman Empire (al-'Asali 1989: 217). In 1257/1841 'Umar ibn Muhammad Sun' Allah al-Khalidi wrote a manual on Hanafi law.¹⁴ A few years later, in 1266/1850, 'Ali Raghīb al-Khalidi composed a creed in 80 verses.¹⁵ In 1269/1852-53, Nu'man ibn Raghīb al-Khalidi, another product of al-Azhar, wrote a brief but wide-ranging essay on the interpretation of the *basmala*.¹⁶ This same scholar may be the author of another short work on inflection in Arabic poetry, concerning the many cases in which poets conceal a sense that is

¹¹ Khalidi Library Ms. Ar. 636.2, [*Risala fi ta'wil 'fa-waswasa lahum al-shaitan*'], an essay on Surat al-A'raf 7: 20—*fa-waswasa lahum al-shaitan*, 'Then Satan whispered to the two of them'.

philologically difficult in an expression that appears to be corrupt.¹⁷ Working in Istanbul in 1281/1864 on the basis of an earlier work composed in 1791, Yusuf Muhammad al-Khalidi drafted an essay criticising the Christian Gospels, refuting various false claims and pointing out absurdities and contradictions among the different books.¹⁸ A few years later, in 1299/1882, Ahmad al-Khalidi al-Sa'ardi composed a work complaining in verse about governmental and other abuses.¹⁹

Such vignettes provide some indication of the continuing broad scope of the family's literary interests, and these are confirmed by the activities undertaken by individuals to acquire books for their personal collections. Members of the family could of course easily obtain books from Palestine: a number of important Palestinian authors were active in Ottoman times, and the status of Jerusalem as the third most holy Islamic shrine city ensured a steady flow of visitors and hence also of books accompanying scholars wishing to study at the Haram al-Sharif. The family thus acquired such important works as the unique autograph of a *qisas al-anbiya* ('tales of the prophets') book written by the Jerusalem scholar Ibn Abi 'Udhaiba (d. 856/1452)²⁰ and the autograph fair copy book of the *fatawa* of Ibn Qadi 'Ajlun (d. 876/1471).²¹ But Palestine also had a place within a complex cultural network extending over much of the Near East, and the notables of the Khalidi family made full use of this to pursue their own literary interests and expand their holdings of manuscripts.

The most important external source of books was probably Cairo. As commented above, scholars from the Khalidi family were quite often products of the academy of al-Azhar.²² Many of them spent long periods of time there, and while in Cairo they not only studied but also acquired manuscripts. Some of the Library's manuscripts bear notes attesting to a member of the family reading the book in question 'while a student at al-Azhar', and in such cases study of the text has clearly led to its purchase. These

acquisitions do not appear to have been incidental to a stay in Cairo, but rather one of its objectives, since notes in the Library's manuscripts sometimes refer to the efforts made to obtain books specifically for shipment back to Jerusalem and to ensure their safe arrival. In 1154/1741, for example, a shipment of books copied or purchased in Cairo for the family in Jerusalem was sent by ship to Palestine by Musa al-Khalidi. The shipment included a five-volume copy of an important *hadith* commentary that had taken three years to complete, but unfortunately one of the volumes was lost at sea. Musa had to commission another transcription of the missing volume, and hastened to explain what had happened on the title page of this manuscript.²³

Another source for family members seeking to obtain books was Istanbul, which as the imperial capital and a major Islamic cultural centre was of course also an important emporium for books. The presence in the Khalidi Library of manuscripts copied in Anatolia and the Balkans suggests access to this market in any case, but uncatalogued *daftars* found among the Library fragments in 1988 tell a fuller story. These registers were used to record a variety of family transactions in the 12th/18th century—i.e. in the time of Sun' Allah and his immediate descendants—and include notes on transactions involving books. All of these refer to dealings with Istanbul, and from the notes it would seem that some books were acquired by family members not for their own use, but rather for resale in the capital. These books were sent to a dealer there, who sold them on behalf of the Khalidis and likewise filled orders for the family and sent the required books back to Jerusalem. Though attested only for the 12th/18th century, this fact probably reflects nothing more than the survival pattern of the relevant evidence. It is likely that this sort of procedure was a standard method for acquiring books, and access to strategically placed professional dealers able to find important manuscripts would explain why the Khalidi Library, a family collection in a provincial centre, contains a disproportionately large number of *makramas*, autographs, copies from autographs, and unique manuscripts.

The third important source of manuscripts for the Library was Mecca and Medina (al-Shamikh 1973). Jerusalem was often visited by pilgrims on their way to or from the Hijaz, and members of the Khalidi family often joined the *hajj* caravans and remained in Arabia for considerable lengths of time. The copying of texts in the Islamic religious sciences was a prominent activity of

²² On al-Azhar under the Ottomans see Dodge 1961: 77-105; Marsot 1968. Valuable eyewitness descriptions of al-Azhar in the 19th century are to hand in the accounts by Ignaz Goldziher, who was a student there in 1874. See Goldziher 1880; 1881: 299-340.

²³ Al-Qastallani (d. 923/1517), *Irshad al-sari fi sharh Sahih al-Bukhari*, Khalidi Library Ms. Ar. 329, fol. 1r. The remaining volumes in the set are Mss Ar. 489-92. The point of Musa al-Khalidi's explanation is to assure the reader that while the volumes do not match, they comprise a single set copied from a single source text.

learned pilgrims, and owners' and readers' notes in Library manuscripts attest to their origin in this sort of work. It was also common for pilgrims to finance their travels by purchasing in one region goods they expected to sell at a profit elsewhere later in their journey. This included manuscripts, and a number of books in the Library were apparently purchased in Mecca or Medina and brought back with pilgrims to Jerusalem, either by family members or by other individuals rightly anticipating a market for religious books in another important Islamic shrine city.

It may at least be noted in passing that Damascus was not an important source of books for the Khalidis, nor indeed, it seems, for many other Jerusalem families. The Library does contain quite precious manuscripts of Damascene origin, most importantly a *majmu'a* of essays by Taqi 'l-Din al-Subki (d. 756/1355), drafted and corrected with additional notes, all in his own hand.²⁴ And of course there was regular traffic between Jerusalem and Damascus throughout the periods of interest to us here, and Damascus too was a major centre of Islamic culture.²⁵ But this simply renders all the more noteworthy the fact that in Ottoman times the Khalidis and most other Jerusalem families seldom refer to study in the Syrian capital or buying or selling books there, and thus do not seem to have looked to Damascus for cultural or intellectual inspiration. In what was probably an intensification of a developing intellectual tradition of Mamluk times (Little 1984), Palestinians in the Ottoman era who aspired to scholarship or a career in which a solid grounding in traditional Islamic learning was expected normally made their way to al-Azhar, even in cases in which Damascus was far closer to the places where they lived (Kupferschmidt 1984, 1986: 126; Ze'evi 1994: 132). It was not until well into the 19th century that Palestinian scholarship in general established close working ties with the Syrian capital.

In the Ottoman period the Khalidi family traditionally enjoyed a high reputation for the intellectual and religious credentials of its members, and in a time when, as will be seen, *waqf* endowments often failed to outlive their founders for very long, the mere survival of Sun' Allah's library would in itself have been a fact of some

significance. But the period between his death in 1727 and the founding of the nascent Khalidi Library in 1886 in fact marked a high point of the collection in terms of new acquisitions and saw it more than double in size.

Information on this growth can be extrapolated from the corpus of 445 manuscripts in the present Khalidi Library collection that are dated by their colophons. This comprises a third of the manuscript holdings, and there is no reason to doubt that it is representative of the collection as a whole. The distribution of dates must of course be assessed with the watershed date of 1133/1721, the date of Sun' Allah's library *waqf*, in view. Manuscripts dated before that year represent the extent to which old manuscripts were available to a Jerusalem family that had probably been collecting books at least since the time of Sa'd ibn al-Dairi in the 9th/15th century, if not earlier. The sharp rise in the representation of books copied in the 9th/15th centuries probably means that Sun' Allah's collection had roots in a Dairi collection that itself was being maintained up to Sun' Allah's time, with books from earlier periods being rare and extremely difficult to find. The further sharp rise in dated manuscripts copied in the 11th century demonstrates that Sun' Allah's collection came into being near the end of an active era in the transmission of Arabic-Islamic literary culture. The even sharper rise in the number of dated manuscripts of the 12th and 13th centuries AH (i.e., after the creation of the *waqf* of Sun' Allah) represents not the extent to which older manuscripts were available, but rather the extent to which new ones were being produced. Fully a third of the dated manuscripts currently in the Library were copied in the 12th/18th century, and the graph shows that intellectual and religious personalities in the family continued to pursue Sun' Allah's interests vigorously, and that new acquisitions largely comprised purchases of recently copied texts or copies specifically prepared for a member of the family, rather than searching out rare old exemplars.

Particular care and labour seems to have been devoted to the collection throughout the Ottoman period. Books were examined to determine if any folios or quires were missing from them, and gaps were made good by recopying the missing text from another manuscript. In many cases manuscripts were purchased before work on them had been completed, perhaps because of concern for shipping schedules or other time considerations. Books thus arrived in Jerusalem as stacks of quires of copied text inserted into their intended binding, but still requiring the addition of rubrications, final trimming of the text block, and stitching into the binding. Much of this sort of work was apparently being done in Jerusalem, but a number of unfinished books of this kind, usually manuscripts copied in Cairo in the 12th/18th century (cf. Pedersen 1984: 129-30), still survive in the Library's collections.

By the beginning of the 19th century the Khalidis possessed a far larger collection of books than one would

²⁴ Khalidi Library Ms. Ar. 49. This volume consists of a number of essays, both completed and partially so, as well as notes on various subjects, written by al-Subki at al-Madrassa al-'Adiliyya between 740/1339 and 755/1354. The first five texts are corrected and revised drafts ready for final copying, but left in a non-book hand without *nuqat* and apparently still unpublished by the author at the time of his death. The collection was in all likelihood bound in its present form by a subsequent owner (a student?) after al-Subki's death. Cf. Mukhlis 1926: 368; Talas 1945: 49.

²⁵ On the connections of Palestinian scholars with Damascus in the Ottoman period, see Kupferschmidt 1984: 179-82.

normally expect to find in private possession in an Ottoman provincial centre, and by comparison, several times larger than the holdings of such other families as the Husainis or Budairis (Conrad and Salameh 1993: 576-79).²⁶ But apart from those preserved in the *waqf* of Sun‘ Allah, these holdings were scattered in private possession among numerous family members in Jerusalem and did not yet comprise what one could call a unified family Library. It was late in this century, which marked the course of so many other fundamental changes in the Middle East, that the decisive movements in this direction were made.

The formal foundation

In modern scholarship the establishment of the Khalidi Library is almost universally assigned to the year 1318/1900, but in fact there was already a nascent institution in place more than a decade earlier. There was no recollection of information about this among elderly family members interviewed in the 1980s, but in the old Library building one of our research teams found a large decorative wooden plaque bearing the carved inscription: *al-Maktaba al-Khalidiyya sana 1304* (The Khalidi Library, [founded AH] 1304). An old register of books is similarly entitled, and the conclusion to be drawn must be that a library institution proclaiming itself to the public as ‘the Khalidi Library’ and containing an at least rudimentarily organised collection of books already existed in 1886-87. This library probably comprised the surviving books from the old original *waqf* collection of Sun‘ Allah, plus others that had been added to the corpus over the intervening two and a half centuries, and the circumstances under which it came into being are explained in an unpublished announcement of the opening of the Khalidi Library in 1900 by Hajj Raghib al-Khalidi (1858-1951). He states that most of the original collection of Sun‘ Allah had subsequently been dispersed under unfavourable circumstances, and that Ruhi al-Khalidi (1864-1913) had gathered together what remained of the scattered books (the language is rather figurative here) and planned to use them as the basis for the founding of a public library in Jerusalem; the demands of his studies in Istanbul denied him the time required to do so, but his interest had instilled the idea among other members of his family (Raghib al-Khalidi 1900). In an autobiographical essay published in

Jaffa Ruhi states that he spent six years in Istanbul on this study trip and returned to Jerusalem in AH 1311 (Ruhi al-Khalidi 1908: 155); i.e. he left Jerusalem in 1305/1887, hardly a year after the first stages of organisational work in 1886. The collection of 1886 in all likelihood thus represented these preliminary but unfinished efforts of Ruhi al-Khalidi.

It is not known where this 1886 collection was kept, but the plaque strongly suggests a site fronting onto the street and specifically dedicated to housing the library, if not necessarily making it available to the public, and the accommodation of a large mass of books elsewhere (e.g. in a room in one of the family’s flats in Tariq Bab al-Silsila) would have been difficult in any case. A likely location for such a collection is the present site of the Khalidi Library, the *turba* of Husam al-Din Barakat Khan (Walls 1974; Burgoyne 1987: 109-16), a Khwarizmian chieftain who died in battle near Hims in 644/1246. Located in Tariq Bab al-Silsila about 100 metres from the Haram al-Sharif and at the end of a series of flats and houses owned by the family, this complex consisted in the mid-19th century of the original *turba*, a separate property on its eastern side comprising a large courtyard where arched open markets and later a mosque had once stood, and a second smaller low-ceilinged cross-vaulted chamber on the far side of the courtyard. In 1865 the *turba* was being used as a school and the adjoining area was in ruins (Sandreczki 1865: Day 9); the condition of the latter is confirmed by Raghib al-Khalidi’s reference to this plot as a dilapidated run-down site next to the *turba* (Raghib al-Khalidi 1900). Subsequent to 1886 the complex was extensively renovated: all of the walls of the *turba* except for the magnificent Mamluk façade facing Tariq Bab al-Silsila on the north side were rebuilt, the *turba* was converted into a family mosque, and the ruined courtyard area was at least partially revaulted (Walls 1974: 40; Burgoyne 1987: 115).²⁷ It may also have been at this time that a door was opened from the *turba* into the courtyard beside it, thus producing the single complex essentially as it exists today.

That the collection of books was already here is

²⁶ That the present courtyard was once a mosque is attested in a Mamluk *waqfiyya* of 797/1395; see al-‘Asali 1983, 1: 237-39. There has been much discussion of the three funerary inscriptions presently embedded in the west wall of the courtyard, each with a low stone platform in front of it. Sandreczki saw two of these inscriptions placed elsewhere in 1865, and clearly they were reused again in the subsequent rebuilding of the complex, with the three funerary slabs being added at that time. The courtyard itself stands over a high vaulted room (breached during renovation of the Library in the 1990s), and public works in Tariq Bab al-Silsila subsequently revealed that the street in front of this chamber is the Umayyad bridge leading to the Haram. There could therefore never have been any graves in this courtyard in Mamluk times, since what lies underneath has been an open room since long before the 13th century.

²⁶ In assessing such matters one really must judge on the basis of extant collections. The sight of many books on a wall often evoked extremely exaggerated guesses at numbers by both local and foreign visitors, as will be discussed presently, and any count not based on a detailed survey or estimated shelf run must be regarded as suspect.

suggested by the fact that the family became concerned about the appropriateness of using its family mosque as a library. For an opinion they sought the advice of Shaikh Tahir al-Jaza'iri (1851-1920), an outspoken Damascene advocate of political reform and modern education who frequently travelled and was approached by the Khalidis shortly after his arrival on one such trip in Jerusalem.²⁸ His opinion on Islamic libraries would have been of particular relevance to the Khalidis. Shortly after the appointment of Midhat Pasha as *wali* in 1878, al-Jaza'iri had established in Damascus the first Arab public library, an institution that eventually expanded into the renowned Syrian national library, the Dar al-Kutub al-Zahiriyya.²⁹ Later he was to serve as inspector of libraries, and his reputation as an authority on matters concerning the Arabic literary heritage was enormous (al-Khatib 1971: 105-106, 111-12; Escovitz 1986: 297). To the Khalidis' query he responded that the quest for knowledge was enjoined by Islam, and that there could therefore be no religious objection to using the *turba* of Barakat Khan as a library.³⁰

Al-Jaza'iri then became involved in the task of establishing the Khalidi collection as a formal library, and it is all but certain that he contributed not only a major portion of the actual cataloguing, but also the ideas informing the way it was organised and administered. But contrary to claims by his student Muhammad Kurd 'Ali (1876-1953) and others following him (Kurd 'Ali 1984: 11; Escovitz 1986: 294-95, 297), the Khalidi Library was not al-Jaza'iri's personal project and its collection was not based on his private library.³¹ The core manuscript collection was unquestionably that of Sun' Allah al-Khalidi: while the manuscripts abound with owners' and readers' notes in the name of Khalidi family members and many of the items in the *daftar* of Sun' Allah's collection are still to be found in the Library, research on the collection has failed to produce a single manuscript attesting to any origin with al-Jaza'iri (although in some of the documents held by the Library he figures as a witness). The building itself had been Khalidi property for centuries. Its owner in the mid-19th century was the Nu'man al-

Khalidi mentioned above (Raghib al-Khalidi 1900), and after his death it passed to the possession of his wife Khadija Khatim al-Khalidi, daughter of Musa al-Khalidi, also referred to above; urging that the family's library holdings be unified as a formal *waqf*-based institution based in the *turba* of Barakat Khan, she relinquished ownership of the property for this purpose (Talas 1945: 236).³²

The *turba* was thus converted into a reading room, the nearly five-metre height of which was gradually stacked floor to ceiling with bookcases, shelves, and cabinets on all four sides; access to the higher shelves was via a long wooden ladder. A large reading table with sloped sides to support books dominated the centre of the room, and in the southeast corner a French safe held the 25 most valuable manuscripts (pl. 13.1). Lighting was entirely natural, through a large circular window high on the south side of the room and single windows looking out onto the street to the north and the courtyard to the east.

With the help of another Damascene scholar, Muhammad Mahmud al-Habbal, Tahir al-Jaza'iri and Hajj Raghib al-Khalidi catalogued the books primarily according to the traditional classification used in the register of Sun' Allah's collection, with some expansions and additions (Table 13.3). Printed books were included, but in the handlist published in Jerusalem in 1318/1900 it is stated that not all of the collection had been listed:

There are many other books to be found in the Library which we have set aside and decided not to mention, either because they are duplicates, because they are commonly available, or because some of them are missing folios and time has been too short to collect and complete them. God willing, we will record them in the second edition (*Barnamaj*¹: 78).

These uncatalogued books were ultimately registered by the curator, Muhammad Amin al-Ansari (d. 1954), in an undated list (*Barnamaj*²) in his handwriting (Table 13.4), but a second edition of the handlist was never formally published. There are also cases in which it is not certain whether a printed book or a manuscript is meant. Nevertheless, the distribution of books among the various

²⁸ De Tarrazi (1947: 143) places this contact in the wake of al-Jaza'iri's banishment from Damascus, but this was in 1905 (Escovitz 1986: 295), whereas al-Jaza'iri had already played a fundamental role in the preparation of the handlist of the Khalidi Library printed in 1900.

²⁹ The Zahiriyya Library was established in the Madrasa al-Zahiriyya, which took its name from the tomb, located on this site, of the Mamluk sultan al-Zahir Baibars I (r. 658-76/1260-77). See al-Imadi 1967; Kurd 'Ali 1980: 269, 1984: 11; Shamir 1968: 375.

³⁰ For these details I am grateful to the former *mutawalli*, the late Mr Haidar Khalidi, who discussed this stage of the Library's existence with me at length.

³¹ The following elaborates on the argument in Conrad and Kellner-Heinkele 1994: 290.

³² Later in his life Kurd 'Ali (1980: 269) would in fact correct his error on the origins of the Library, commenting that the manuscript collection consists of the books of Khalidi family members. Al-Jaza'iri did amass a large and valuable library of his own, but he took it with him when he left Damascus for Cairo in 1905 and eventually sold it there to Ahmad Taimur (Escovitz 1986: 295).

subjects in the handlist and al-Ansari's list provides a valuable impression of the state of the collection upon its formal opening in 1900. As the categories under which books were listed in the two registers are not always the same, it would be potentially misleading to combine the two lists.³³

A number of important conclusions can be drawn from these registers, which show that the collection as first formally constituted in 1900 contained 2,168 volumes: 960 manuscripts, mostly in Arabic but some also in Turkish and Persian, 1,138 printed books, and 70 for which the information provided is unclear. First, it may be noticed that the list compiled by al-Ansari confirms the published

handlist's concluding statement that not all of the manuscripts in the collection had been listed. But the decision about what and what not to include clearly involved not only relegation of duplicates, commonly available books, and defective copies, but also judgments on what works were most important. That is, the selection of books for cataloguing tells us something about the founders' aims and purposes in establishing the new Library. All of the works on Islamic law, both manuscripts and printed books, were taken up for inclusion in the printed handlist. There is no lack of duplicates, common works, and defective copies in this corpus, but the founders listed them all the same. Clearly they considered that it was worthwhile to make available a full and complete corpus of material in this field. Interestingly enough, however, they did not feel the same way about other areas: three quarters of the books on legal theory, a total of 124 volumes, were set aside, perhaps reflecting a concern for the more immediately practical dimensions of Islamic law.

There are other fields in which all of the available books were catalogued early on. The rubric of wondrous and marvellous tales need not detain us: this is an artificial category created by removing from *adab* such printed books as the *Thousand and One Nights* and the Middle Arabic tale *I'lam al-nas bi-ma waqa'a li 'l-baramika min bani 'l-'Abbas* by Muhammad Diyab al-Itlidi (d. 1100/1688). The other categories, however, are of some import. These comprise works on politics, mathematics, and astronomy, and their inclusion probably reflects the importance attached to such subjects in the 19th-century reform agenda, which not only stressed the need for political liberalisation, but also sought to identify means through which a response to the technological advantage of the West could be made. It is worth noting, however, that the stress on scientific subjects did not lead the founders of the Library to include all of the works on medicine, only half of which were listed in the printed handlist of 1900.

The two lists of Khalidi Library books also reflect the dramatically expanding role of the printed book in the Arab East in the second half of the 19th century (cf. Pedersen 1984: 131-41). Just as the family's main sources for Arabic manuscripts had been Cairo and Istanbul, it was these two centres that provided their primary access to printed books in the 50 years prior to the formal foundation of the Library (cf. Tadrus 1982; Gdoura 1985: 188-244; al-Tanahi 1996), with Beirut lagging behind in a distant third place. Even in such traditional Islamic religious topics as *tafsir* and *tauḥīd* the role of the hand-written manuscript was being overtaken by the printed book, and in other fields printing was clearly reshaping the relative representation of the various fields of study, and hence, their accessibility to the educated public. This can be seen most clearly in the field of history, which through much of the Ottoman period in Palestine, as noted above,

³³ The final category in the second list was added later in a different hand, and additions to some of the earlier sections in this list have also been made. Khalidi Library Ms. Ar. 1177 is a preliminary list of these holdings, registering 210 manuscripts and 227 printed books.

was only a minor topic of study as compared to other fields. In the second half of the 19th century, however, a rapidly increasing interest in history was accommodated by the new printing presses and publishing houses of the region, which made up for the traditional religious scholars' indifference to the subject by producing printed books on a large scale and at affordable prices. The result can be seen in the Khalidi Library of 1900, in which history is represented by only seven manuscripts but no less than 206 printed books, including copies of such central historical works as those of Ibn al-Athir (d. 630/1233), Abu 'l-Fida' (d. 732/1331), Ibn Khaldun (d. 808/1406), al-Suyuti (d. 911/1505), and Mujir al-Din al-'Ulaimi (d. 928/1485), and more contemporary works in Arabic by al-Jabarti (d. 1825) and in Turkish by Ahmet Cevdet Pasha (d. 1895). Similar expansion appears in the field of *adab*, represented by 23 manuscripts but 104 printed books, and the disparity becomes even greater when one takes into account that many printed literary texts are listed under other categories.³⁴

The Library not only organised its collections, but

also gained formal stable financial support when, in consultation with Tahir al-Jaza'iri, Hajj Raghīb al-Khalidi established a *waqf* in favour of the Library in 1904 (Sijill 397: 245, 1322/1904; al-'Asali 1983, 1: 166-68). His share of the Hammam al-'Ain in Tariq al-Wad and six shops affiliated to it were endowed in perpetuity to pay the costs of the Library, which was to make its treasures available for reading and consultation by all interested parties. After defrayment of essential expenses, the entire income of the *waqf* was specified in perpetuity as salary for a curator, who was to open the Library every day during its specified hours and safeguard its collections. The *mutawalli* was to be Raghīb al-Khalidi himself, and after his death his male descendants of sound mind and deportment; should none of his own line be available, the *waqf* was to pass to the authority of the male descendants of his sister. The provisions of the *waqfiyya* were further elaborated through specific rules according to which the Khalidi Library was to operate. These were set forth in a list of articles hand-copied by al-Ansari and prominently posted in the Reading Room:

1. The Library will be open in the morning from 9:00 until 12:00 noon, and in the afternoon from 2:00 until an hour before sunset, except for the month of Ramadan, during which it will open in the afternoon only.
2. The smoking of cigarettes and waterpipes inside the Reading Room of the Library is strictly forbidden, regardless of who is concerned.
3. Those consulting books must not retrieve books themselves, but must request the book they wish to consult from the curator of the Library, who will remove it from its place and bring it to the reader. When a reader is finished with a book, he must personally hand it over to the curator.
4. The reader must handle the book carefully and cleanly. If he wants to copy something from it he must not write on top of the book, soil its pages with ink, or make any corrections in it.
5. Readers must not engage in excessive conversation, shouting, or argument, so as not to distract those who are reading or copying.
6. Absolutely no book held by the Library may be removed from it—whether on loan, or

³⁴ The ten double volumes of the *Kitab al-aghani* by Abu 'l-Faraj al-Isfahani (d. 356/967), for example, are listed under *tarajim*, whereas the work is usually considered a classic of medieval Arabic literature.

upon payment of a deposit, or in any other way—except according to the terms specified in the following article.

7. Certain books on *fatawa*, jurisprudence, and inheritance law, if they are printed books held in multiple copies, may be removed to the Shari‘a Court only, but must be returned on the same day, after the legal principles they contain have been consulted. Under absolutely no circumstances may manuscripts or rare books be removed, whether to the Court or anywhere else.

8. Those using the Library may do so only to read and conduct research. While they are within the Library or in its courtyard they must not pursue personal matters.

9. The Library will be closed on Sundays, feast days, and recognised official holidays.

These regulations are of great interest for the light they shed on the completely innovative way the Library was organised and run.³⁵ A traditional Islamic library consisted of books laid down flat with titles or other identifying rubrics written on the head, tail, or fore-edge,³⁶ while in the Khalidi Library books were stood upright, as in Western libraries, with authors, titles, and catalogue numbers written on a paper label affixed to the spine. An individual or family library was also customarily regarded as the private affair of its owners,³⁷ and the conversion of such a collection to one to which the public had systematic access was in itself another remarkable innovation. The specification of regular opening hours was likewise a singular departure, as also were the arrangements for a curator with the responsibility of running the Library on a regular basis. It is not known how successful the Library was in enforcing its ban on general socialising within its walls, and its restrictions on the external circulation of books are known to have lapsed, but these too were quite modern measures. For the inspiration behind all this one

ought probably to look to Tahir al-Jaza‘iri. Raghīb al-Khalidī says little about his Damascene collaborator and routinely refers to himself as the founder of the Library, but the organisation of both the collection and the Library itself are suggestive of the thought of someone thoroughly experienced in the administration and inspection of libraries. Raghīb al-Khalidī undoubtedly contributed a great deal of work and support, but there is little indication in his published writings of the sort of specialised expertise that the foundation of the Khalidī Library represented.

The statements of Raghīb al-Khalidī provide specific reasons why the family collections were being converted into a public library offering systematic access to any interested readers in Jerusalem. Knowledge is a divine light that God bestows upon mankind, one is told, and civilisations of the past—the ancient Greeks, for example—have found that, in order to be truly useful, knowledge must be recorded in papyrus scrolls or books and made available in some systematic way, i.e. in libraries. The Arabs too established libraries, among them the great institutions of the early ‘Abbasids, and on these foundations rested the greatness of Arab culture and civilisation. These included many family libraries in Jerusalem, but neglect and the vicissitudes of the times have overtaken most of them. Yet the present moment is an occasion when libraries are urgently needed, since the challenges facing the Arab and Islamic world require the concerted action of both enlightened political leadership and ‘genuine scholars’ (*al-‘ulama’ al-haqiqiyyun*) (Raghīb al-Khalidī 1900, 1913a, 1913b). The perceived role of the Library within a larger perspective on modernisation and Islamic reform of course fits very well with the priorities of selection already commented upon above.

It would be overly simplistic, however, to see the foundation only in terms of religious, intellectual, and pedagogical motives. The social, economic, and political scene in Ottoman Jerusalem was dominated by families of local notables manoeuvring and competing for advantage and domination on a more or less constant basis (Hourani 1968; Abu-Manneh 1986, 1990; Muslih 1988: 24–37), and as observed above the 18th century was a period when the position of the Khalidis was especially strong. But it was precisely at this time that a new challenge appeared in the form of the rise to eminence of another family of notables, the Husainis, who had roots in Yemen and apparently migrated to Palestine in the 16th century, where at first they settled near Ramallah under the name of al-Aswad (Taggar 1986: 10–11). The later head of this family, ‘Abd al-Latif ibn ‘Abd Allah al-Husaini (d. 1188/1775), managed to acquire and hold on to several leading posts in Jerusalem, and his status was such that al-Muradi (3: 126) considered him the leading notable of the city and a man so powerful that nothing could be done without his approval. Throughout the 18th and 19th centuries, the

³⁵ On the traditional organisation of a library based on *waqf*, see Eche 1967: 301–91.

³⁶ Cf. Pedersen 1984: 129. In the manuscript stores of the Zahirīyya Library in 1973, books were still being kept in this fashion.

³⁷ Cf. the experience of James Finn (d. 1872), who was the British consul in Jerusalem between 1846 and 1863 and recorded the following remark by a notable of Jaffa in 1852: ‘When I have money to spare I lay it out on a house, a slave, a diamond, a fine mare or a wife; but I do not make a road up to that object in order to invite strangers to come that way’ (Finn 1878, 1: 191).

rivalry between the two families was played out in various ways, with the Khalidis benefiting from their al-Azhar connections and credentials, a reputation for religious and intellectual leadership that made them much sought-after witnesses and representatives in legal disputes, and their control of the office of *bashkatib* for long periods of time,³⁸ and the Husainis making use of their own practically hereditary office-holdings in Jerusalem (especially that of *naqib al-ashraf*), contacts with Damascus, and careful cultivation of influence and favour in high places. There was also sometimes—as elsewhere in Palestine—serious social animosity based on factional (Qais-Yemen) antagonisms harking back to those that had prevailed in early Islamic times (Abir 1975: 293-94; al-Asad 1970: 25-34; al-‘Asali 1983, 3: 69, 75; Baer 1984; Little and Üner Turgay 1980; Schölch 1980: 312, 317-19, 1989: 239; Abu-Manneh 1986, 1990: 14-26, 38-43; al-‘Asali 1989: 216-18).³⁹ Both sides established strong connections in Istanbul and sought local support through their claims of venerable status extending back to the beginnings of Islam; the Khalidis’ assertion of descent from Khalid ibn al-Walid was matched by similar claims by the Husainis, whose family name identifies their ancestor as al-Husain ibn ‘Ali ibn Abi Talib, the martyred grandson of the Prophet Muhammad.⁴⁰ The increasing population, size, and importance of Jerusalem throughout the period also meant that more was at stake, and rivalries over political positions, control of *waqf*, and occupation of administrative positions became very prominent indeed (Hourani 1968: 44-45; Baer 1986; al-‘Asali 1989: 217; Ze’evi 1994: 138).

The continuing rivalry between the two families throughout the 19th century eventually assumed a marked political character relating to Ottoman reform. In the wake of the Tanzimat, the Khalidis, the heads of what had been the Qais faction in Jerusalem, adopted a highly visible

position in favour of liberal reform and a secular democratic agenda that would embrace non-Muslims as well as Muslims and provide what they regarded as the only secure foundation for saving the Ottoman empire. The Husainis, the leaders of the Yemen faction, on the other hand, supported the absolute authority of the Ottoman sultan and the continuation of Muslim domination. The impact of this rivalry on local politics was perceptively described in 1898 by David Yellin (Gerber 1986: 41):

Among our Muslim citizens there are two aristocratic families whose genealogy goes back to the days of the establishment of Islam in the country, the families of Husayni and Khalidi. And from olden times the competition among them is great; while the power of one of them is supreme, most important offices go to its sons, and it rules, while the other becomes weaker, until the balance is redressed in the opposite direction.

The reforms of the Tanzimat provided a temporary advantage to the Khalidis, but when the reform agenda was abandoned the family suffered a major setback and found themselves under more or less constant suspicion (Abu-Manneh 1978: 26-28; 1986: 100-101; 1990: 38-43). The appointment of Yasin Efendi al-Khalidi as head of the Jerusalem city council in 1898 was an important victory after a long period of political decline for the family (Schölch 1980: 319; Gerber 1986: 41), but ultimately it was the Husainis who triumphed, remaining the leading family of Jerusalem—and indeed, of Palestine as a whole—throughout the period of the British Mandate (Muslih 1988: 219).

The formal establishment of an innovative cultural institution like a valuable family library accessible to a wider public conveyed a powerful message asserting—both implicitly and in explicit statements associated with the foundation—the Khalidis’ central claims to eminence: venerable status reaching back to the Arab conquest of Syria, connections with traditional centres of Islamic scholarship, religious and intellectual leadership in Jerusalem, and, within a broader Ottoman context, commitment to modernisation and liberal reform. This message was conveyed even by the visual aspect of the Library, with its elegant Mamluk façade and a sign over the entrance bearing the name of the Library in Arabic and French and the inscription: *Fiha kutub qayyima*, ‘Within are precious books’.

The opening of the newly established Library was favourably received, and photographs of al-Jaza’iri and the leading members of the Khalidi family were taken to commemorate the occasion. The new curator, Shaikh Muhammad Amin al-Ansari, a member of the Danaf

³⁸ Cf. al-‘Asali 1983, 3: 32-33, 37-38, showing that if one Khalidi was cashiered from the post another was appointed to replace him.

³⁹ Much could be learned from the registers of *ijazat* collected by the various members of the two families. An example from the Khalidi family has been noted above (n. 16). A volume of 20 such documents including the name of or pertinent to ‘Abd al-Rahim ibn Abi ‘l-Lutf al-Husaini, mainly his *ijazas*, is available in Khalidi Library Ms. Ar. 889.

⁴⁰ Cf. also Murtada al-Zabidi (d. 1205/1791), *Al-Raud al-mi‘tar fi nasab al-sada al-Ja‘far al-Tayyar*, Khalidi Library Ms. Ar. 1193.1, which is a genealogical history of the descendants of Ja‘far ibn Abi Talib and their teachers and students, with special attention to the branch of the family established in Nablus up to 1191/1777. Here again one observes a family seeking special status by asserting that it originated in the earliest days of Islamic history. The Khalidi Library Ms. (for another copy in Cairo cf. Brockelmann 1937, S2: 398 no. 12) has two continuations and bears the attestations of various witnesses in Nablus to the accuracy of the genealogies given in the book.

Pl. 13.1. The reading room of the Khalidi Library, 1986, with the French safe on the floor in the corner. Much more clear wall area shows in a similar photograph taken shortly after the formal foundation of the Library in 1900, but subsequent acquisitions quickly consumed almost all available space for shelving books.

family, who was also curator of the Islamic sites on al-Haram al-Sharif and a savant of the Islamic literary heritage in his own right,⁴¹ devoted much of his time to the Library and in fact prepared numerous new copies of the Library's manuscripts there. Though the family seems never to have pursued any external acquisitions policy and rather viewed its library as a vehicle for unifying the holdings of its various representatives, the position of curator quickly proved to be a major responsibility, for a number of Khalidi family members soon donated their own personal libraries for incorporation into the family library. Of these, two collections are of particular importance, not only for their role in the Library, but also for their illustration of the range of literary and intellectual life in a leading Arab family of late Ottoman Jerusalem.

⁴¹ Cf. Khalidi Library Ms. Ar. 1181, *Fihrist asma' al-kutub allati fi mulki*, a register in al-Ansari's handwriting of 41 manuscripts and 503 printed books in his possession.

Yusuf Diya' al-Din al-Khalidi, born in 1842, was the son of a leading official in the Shari'a Court of Jerusalem, received a traditional education in the religious sciences of Islam, and held numerous posts in Jerusalem and elsewhere in Palestine. He was also, however, the first of the many Khalidis who went abroad to pursue his education, took up the study of western languages, and enthusiastically embraced topics outside the boundaries of the traditional Islamic disciplines. He taught Arabic and served in the Ottoman diplomatic corps in Vienna (where he may have made a perfunctory conversion to Christianity), held political posts ranging from mayor of Jerusalem to member of the Ottoman parliament, and corresponded with scholars and political figures all over Europe.⁴² In 1877 Eugene Schuyler, the American Consul-General in Istanbul, was enormously impressed by his command of English and French, his skills as a speaker, and his liberal demeanour: according to Schuyler, Yusuf Diya' preferred to live in a Greek monastery in Istanbul and was 'almost as liberal as a French Republican, both in politics and religion' (Schuyler 1901: 104). His library reflects his broad and liberal interests, and all of these books were deposited in the Khalidi Library after his death in 1906. The collection consisted of 433 printed books in English and French, and comprised works on history, epigraphy, religion, politics, music, philosophy, law, travel, language, and art, including the complete works of Plato and Voltaire, dictionaries of various languages, reference books of all sorts, and seminal texts by such authors as Dante, Darwin, Gibbon, Josephus, Milton, and Shakespeare.⁴³ He also donated manuscripts to the Library, including some important items, but these are not listed as his in any of the Library's registers.

Of no less importance was the contribution of Yusuf's nephew Ruhi al-Khalidi. Born in Tariq Bab al-Silsila in 1864, he too combined a commitment to traditional Islamic learning with a zeal for modernisation and reform and an abiding interest in the West. His studies took him away from Jerusalem to Nablus, and beyond to Beirut, Tripoli, and Istanbul, in this last case against the

⁴² The most important source of information on Yusuf Diya' is his autobiography, an account of his life from his birth in 1842 until 1876, preserved in Khalidi Library Ms. Ar. 764.2 and used in Schölch 1980, 1989: 241-44. Yusuf attended (and perhaps organised) a reception for the Egyptian poet 'Ali al-Laithi (d. 1896) in Vienna in 1876, and the next day the latter asked him for an account of himself. Yusuf agreed, and the resulting autobiography was taken back to Cairo by al-Laithi, where it remained among his papers after his death. One of his colleagues, Muhammad 'Ali Sa'udi, then transcribed the text and several related accounts and sent the copy to Yusuf Diya' in Jerusalem.

⁴³ There are two uncatalogued registers of the library of Yusuf Diya' in the Khalidi Library, the most complete being written in several different hands and including volumes as late as 1913 for journals to which he had subscribed.

wishes of his fearful parents. He was only 22 when he hit upon the idea of establishing a unified family library accessible to the public, and his studies in Istanbul beginning in the following year eventually led him on to Paris, where he was a student at the Sorbonne. In 1898 he was appointed as Ottoman consul-general to Bordeaux, and his political career culminated in election to the Ottoman parliament in 1908. Throughout his life he continued to be interested in literary and cultural affairs, and he published extensively on contemporary political topics, history, and literature.⁴⁴ By the time of his premature death in 1913 he had accumulated a considerable library of his own, and as in the case of his uncle, his collection was soon incorporated into the family library. His books included nearly 100 Arabic manuscripts, plus a few in Turkish (*Barnamaj*³: 102-12), and a large corpus of printed books, for the most part in French. As with the library of Yusuf Diya' the collection of Ruhi displays very broad interests; his, however, devotes special attention to Montesquieu, and even more to the fine arts, drama, music and literature, in particular the works of Victor Hugo, whom he regarded as a champion of human freedom (Ruhi al-Khalidi 1921).

Hajj Raghīb al-Khalidi also donated books and manuscripts to the Library, as is clear from the numerous books bearing his signature or owner's note or those of his father, Nu'man. Further research may identify one of the anonymous registers of acquisitions as the list of his books, but for the moment all that can be said is that he made several endowments of books to the Library in the decades following the foundation.

Further individual contributions were added over the years,⁴⁵ and many manuscripts were donated to the Khalidi Library by external parties (*Barnamaj*³: 113-36). Registers of some of these additional collections—unfortunately not identified by donor or source—further indicate the scale of acquisitions in the early years of the Library. One such register lists 138 printed books and nine manuscripts,⁴⁶ another records 241 Arabic printed books, 41 Arabic manuscripts, and 70 titles in Turkish and Persian,⁴⁷ and a third mentions 418 volumes without reference to whether they are manuscripts or printed

books, but includes, for example, 50 volumes on *tasawwuf*, 85 on *fiqh*, 126 on language and literature, 5 'historical novels' (*riwayat ta'rikhiyya*), 48 assorted school textbooks, and 7 Ottoman official documents.⁴⁸

The Khalidi Library received many visitors and readers, to whom Muhammad al-Ansari—the curator for nearly 50 years (al-'Asali 1981: 380)—proved to be an efficient and learned guide to the collections. Arab visitors included 'Ali 'Ala' al-Din al-Alusi and his brother Mahmud, 'Arif al-'Arif, Ahmad al-Khatib, Muhammad Kurd 'Ali, and Constantine Zuraik, and the visitors' registers bear numerous inscriptions, including quite a few in verse, recording praise and appreciation for the Library. 'Abd Allah Mukhlis spent time at the Library in 1917 and gave an account of the valuable manuscripts he found there, and during the Second World War As'ad Talas visited and produced an even more detailed inventory of the rare and unique manuscripts in the Library.⁴⁹

The Library also came to the attention of Western scholars. Pre-war visitors included Max van Bercham, Richard Gottheil, Paul Kahle, Ignatius Kratchkovsky, D S Margoliouth, Marmaduke Pickthall, and A S Yahuda. 'Capitaine Louis Massignon' and Ronald Storrs came in 1918, and later visitors included W F Albright, Harold Bowen, A S Fulton, H A R Gibb, R W Hamilton, W Höffner, Arthur Jeffrey, D S Margoliouth again (this time with a copy of his edition of Yaqut's *Irshad al-arib* to donate to the Library), Johannes Pedersen, Arthur Schaade, Laura Vecchia Vaglieri, and K V Zettersteen.

There were likewise callers from the local Jewish community, who sometimes left comments in Hebrew in the visitors' register; these visitors included Raphael Patai, who took the first PhD awarded by the new Hebrew University, Max Schloessinger, and in later years, M J Kister. The Khalidis in fact seem to have regarded the Jewish scholars of Jerusalem with no disfavour. In 1925 the new Hebrew University received an inscribed copy of the Khalidi Library's printed handlist of 1900, and in subsequent times Jewish readers were allowed to borrow books from the Library. Even during the tense years of the *Intifada* Israeli scholars had access to the Library, and several provided crucial support during the family's efforts to revive the Library in the 1980s and early 90s.

In 1917 al-Ansari told the local Jerusalem scholar 'Abd Allah Mukhlis that the Khalidi Library contained about 4,000 books, a third of them manuscripts (Mukhlis 1925: 366). At its largest extent it probably contained about 6,000-7,000 books, a strict upper limit being imposed by the size of the Reading Room, which even with shelving filling every possible space could never have had a

⁴⁴ A number of studies have been devoted to Ruhi al-Khalidi. See Asad 1970; Khateeb 1987; Walid al-Khalidi 1988; Muslih 1988: 58, 83.

⁴⁵ Donations by Ahmad Badawi Beg al-Khalidi and Nazif Beg al-Khalidi are often mentioned, and consisted mainly of printed books; the former donated three manuscripts and the latter nine (*Barnamaj*³, 112-13). The important collection of Khalil al-Khalidi (d. 1941), including the 360 manuscripts in the collection of Shaikh Muhammad al-Khalili (d. 1147/1734), were endowed by his heirs to al-Aqsa Mosque Library in 1979 (Conrad and Salameh 1993: 591-93).

⁴⁹ Mukhlis 1926; Talas 1945. Both of these essays are reprinted in al-Munajjid 1982.

shelf run of more than 200 metres, and that as an absolute maximum (pl. 13.1). Of these volumes perhaps about 1,500 were manuscripts, the rest printed books. The visual impression was quite overwhelming, however—as much so in 1986 as 80 years previously—and estimates of the collection were as a result often exaggerated.⁵⁰ Al-‘Arif, who visited the Library before the First World War, estimated the collection at 12,000 volumes (1986: 449) and his figure has reappeared in several subsequent studies (Walls 1974: 25; Burgoyne 1987: 111). Kurd ‘Ali, another earlier visitor and a scholar who examined many of the manuscripts in detail, correctly placed the collection at that time at about 4,000 volumes, but considered that two thirds of these were manuscripts (1983, 6: 195). Talas (1945: 236) put the figure at 10,000 volumes, half of them manuscripts, and an encyclopaedia of Palestinian history (Hashim 1984, 4: 287) and several reports apparently referring to it (Abu Khudair 1988: 9; 1990: 4) speak of 10,000 volumes, two-thirds of them manuscripts.

In addition to its intellectual and pedagogical functions, the Library also played a social role that, no less than its more formal activities, served to demonstrate and promote the status of the Khalidis as a leading family in the city. During Ramadan and on feast days the Library courtyard was opened to the public and was used to distribute sweets and special offerings to the poor. These were festive communal occasions, and several family members remember them fondly. This custom unfortunately lapsed with the shortages that quickly developed after the outbreak of the Second World War in 1939 (Dumper 1986: 61).

Decline and revival

The Khalidi Library was clearly an extraordinarily successful institution in its early years, and for some decades it appears to have fulfilled its intended mission as well as—and perhaps better than—could have been expected of any small private establishment. But by the 1920s and 30s serious problems were already in evidence.

One of these was the accumulation of what was called *dasht*, with reference to Geniza-like masses of usually fragmentary materials.⁵¹ If a weak binding failed and a manuscript came apart (e.g. as would occur if a book fell from a shelf), or if a signature or page became separated and its proper place could not be ascertained, the material in question was stored in the space between the Reading

Room ceiling and the roof, presumably in expectation that in the future it would be possible to restore the manuscript to order. Fragments of this kind—the *dasht*—rapidly accumulated, however, and whatever order was originally intended must soon have been lost. The scale of the problem is implicitly recognised by a corpus of inscriptions appearing in various forms in many of the manuscripts:

The poor Husain Hasan al-Khalidi, son of al-Hajj ‘Ali Efendi al-Khalidi, has collected the folios of this book after they had been scattered among the *dasht*, and has arranged it in its proper order and restored it to its original form, in hope for forgiveness from God his Master, the most Benevolent, and asking that he who peruses it raise supplication for pardon for him.

These inscriptions are all dated to Muharram 1309 (= August 1891), i.e. nearly a decade before the formal foundation of 1318/1900, and while the claims to a role in what would have been a major restoration enterprise must be rejected (since the manuscripts often show no evidence of such work or have bindings predating the late 19th century), they do attest to an awareness of the problem of accumulating *dasht*. By 1900 there was enough for Tahir al-Jaza’iri to recover major parts of 24 manuscripts from it (*Barnamaj*¹: 76–77), and the draft of the second edition of the handlist refers to identification of fragments of 21 further manuscripts by Muhammad Amin al-Ansari (*Barnamaj*³: 136–38), who also made notes in manuscripts identifying them as works he had rescued from the *dasht*. By 1927 a large mass of some 20,000 sections, fragments, and loose folios (about three cubic metres in volume) was in storage above the ceiling. The great earthquake of that year damaged the Library, and during the subsequent repairs the access hatch to the space was sealed up.⁵² The cache of fragments was gradually forgotten, not to be rediscovered until an engineer examining the roof in 1987 commented on what could be seen beneath him when he removed several roof tiles (Conrad and Kellner-Heinkele 1994: 291–92). By this time, of course, dust, moisture, heat, and insects had caused considerable damage; the surface materials were thickly caked with dust and dirt, many were stuck together to other sections touching them, others had been crumpled up into fragile balls, and many were completely limp from many years of alternating heat and cold and fluctuating humidity (Bish 1992: 178). On the other hand, some were in surprisingly good condition and during the preliminary survey of the fragments in 1988–90 it proved possible to restore numerous fragments from the *dasht* to their proper

⁵⁰ This problem was already pointed out by Donald Little (Little and Üner Turgay 1980: 44–45), who dismissed the earlier exaggerated estimates and put the contents of the Library at about 6,000 volumes.

⁵¹ On such caches of manuscripts and documents in the Middle East in general, see Sadan 1986.

⁵² I am grateful to Haidar and Mufid Khalidi for their comments on this earthquake and the subsequent repairs.

places in manuscripts in the Reading Room.

Further problems arose when many of the manuscripts were rebound in the 1930s. While some were carefully and skilfully repaired, with beautiful Mamluk bindings being reused where possible, in the majority of cases books were taken to the bindery of a local orphanage where they frequently suffered serious damage at the hands of youths being taught the binder's craft. In cases where the first and last folios had been pasted into the binding (hoping thereby to strengthen the book), removal of old bindings led to the loss of these folios, and with them, valuable information on the author, title, and copying details. Manuscripts were crudely sawn across the spine and tightly rebound, with the result that the book could not be opened out flat without damaging the binding. The head, tail, and fore-edge were trimmed to produce smooth edges or, in the case of large books, to reduce the size of the volume, and in the course of this trimming texts and notes in the margins were sometimes clipped or lost (Bish 1992: 179-80). In some instances manuscripts seem to have fallen into disorder at the bindery and were returned to the Library rebound with their contents in complete disarray,⁵³ or with folios from one volume of a multi-volume work bound by mistake into a different volume, and quires returned to the book folded incorrectly, so that pages no longer appeared in the correct order.⁵⁴

No less serious was the loss of important manuscripts from the collection once the original rule forbidding removal of manuscripts from the Library was relaxed. No comprehensive details on this are known, but a number of vignettes provide some sense of what was happening. Already in 1907, for example, a judge by the name of Amin Efendi noticed that al-Ansari had made a copy of a Khalidi Library manuscript on the merits and holy places of Jerusalem and Palestine, and so 'took' the older manuscript 'by permission' (*akhadhaha samahatan*), leaving the Library with only the new copy, into which al-Ansari wrote two notes explaining what had happened.⁵⁵ In an arrangement in the 1940s between Ahmad Samih al-Khalidi (1896-1951) and St Hanna Stephan, a historian working at the Rockefeller Museum, a number of

manuscripts were loaned to the Museum for preparation of handwritten or photostatic copies; some of these are among the books now known to be lost, though fortunately the copies, including several of unique autograph manuscripts, are still available for consultation at the Rockefeller Museum.⁵⁶ Other manuscripts were removed to Ahmad Samih al-Khalidi's house and subsequently to Beirut, where they were destroyed during the Israeli invasion of Lebanon in 1982. A number of Jewish and Arab visitors who had borrowed books before 1948 returned them in the wake of the reunification of Jerusalem in 1967; it may be that other works were lost in similar circumstances, though a search of the manuscripts originally held by Palestinian families and now deposited in the JNUL in Jerusalem turned up no books bearing Khalidi Library stamps or notes by Khalidi family members. Reports of stolen or sold manuscripts have in any case been rife, and in 1967 this led the incoming *mutawalli*, Mr Haidar Khalidi, who conceded that many books had disappeared, to insist on the preparation a new handlist as a register of the books for which he was responsible.⁵⁷ Use of this handwritten list of over 4,400 works in Arabic, Persian, Turkish and Hebrew and nearly 1,600 in English and French (completed by 'Abd Allah al-'Akkawi, Mr Khalidi, and his son Kamil Khalidi, the present *mutawalli*, in 1973) is problematic, since it bears many errors and registers modern lithographic editions as manuscripts; still, it does show that many of the treasures remarked by early visitors had disappeared by the 1960s. Using the various lists and registers at his disposal in the 1970s, al-'Asali (1981: 384-85) calculated the loss at the unlikely level of about 50 percent, but with the important caveat that he assumed all of the figures available to him to be 'correct or approximately so'.⁵⁸

Such losses almost certainly occurred earlier than

⁵³ E.g. Khalidi Library Ms. Ar. 460, a collection of creeds by al-Sanusi (d. 892/1486) with a few other related texts; the recto of the first folio of the manuscript as rebound bore the terminal colophon of one of the creeds, the Ms. was in complete disorder, and fols. 11-12 and 18-26 were recovered from the fragments. This sort of problem arose in manuscripts of even very well-known texts, such as the Qur'an.

⁵⁴ E.g. Khalidi Library Mss Ar. 330-31 (a copy of the *Sahih* of al-Bukhari, d. 256/870), in which fols. 181-200 of the second volume actually belong between fols. 159 and 160 in the first volume. In the second volume, the text in fols. 161-70, 371-80, and 431-40 does not follow because of the incorrect refolding of opened quires at the bindery.

⁵⁵ Ibn al-Firkah, *Ba'ith al-nufus ila ziyarat al-Quds al-mahrus*, Khalidi Library Ms. Ar. 1183: 1.

⁵⁶ Cf. Conrad and Salama 1993: 595. These works are unfortunately not identifiable in the Rockefeller Museum Library card catalogue as copies of Khalidi Library manuscripts. For details on these arrangements between the Rockefeller Museum and the Khalidi Library, I am grateful to Mr Hussam Alami, who worked with Stephan on the manuscripts, remembered the works involved, and showed me the copies during one of my visits to the museum.

⁵⁷ Cf. Birnbaum 1983: 705, whose discussions with Mr Khalidi in 1979 were confirmed by my own with him in 1986 and subsequently. Cf. also Conrad and Salama 1993: 590-91.

⁵⁸ It should be noted here that al-'Asali was particularly distressed by the apparent loss of so many unique and autograph manuscripts (1981: 383), but while quite a few of these do indeed seem to have disappeared, 25 of them were in the Library's safe, which was not opened until 1986. It would of course require a complete current catalogue to determine the extent of the losses with any accuracy. Iskafi (1994: 18) also states—perhaps following al-'Asali—that the collection has been reduced by 50 percent, but this figure is far too high; a collection twice as large as what presently exists would have required a room twice as large in order to shelve it.

this time, since the onset of the general decline of the Library as an institution may be guessed at from the fact that after the 1930s the visitors' registers contain only one entry (in 1952) until 1974. One might suspect that the zeal of the founders would have sustained the Library through much of the long life of Hajj Raghib al-Khalidi, who died in 1951. But by 1930 he was already over 70 years old and probably could not have supervised the daily affairs of the Library. Routine maintenance was gradually abandoned, and broken windows let in dust, rain and insects. The cracking rubble-fill walls of the building were penetrated by water from above and were affected by rising dampness that penetrated the plastered interior walls of the Reading Room from below; increasing moisture in the Reading Room thus passed to books on the shelves. The folios of many books became stuck together, in some cases sealing the volume into a solid mass; in other volumes dampness caused ink to run or led high-acid content paper or ink to attack the book itself. Insect infestation was extreme; some books were eaten so thoroughly that they could not be opened or read, and others were reduced to fragile lacework. A photographic team from the Arab League came to the Library in 1953 to make microfilms of the most important manuscripts, but while this project was successful in other cases, the films used in Jerusalem were of poor quality and within 20 years could no longer be used or read (al-'Asali 1981: 385). Visitors in the 1970s commented on the deteriorating conditions that then prevailed, and by the time of this writer's first visit in 1986 the situation was desperate, but not beyond redemption. Insect infestation in particular was rampant, and some books were literally alive with larvae of the highly destructive furniture beetle (al-'Asali 1981: 385; Abu Khudair 1988: 9; 1990: 9; Bish 1992, 1996: 51-52). For several years after the beginning of restoration work in 1986, in fact, conservation concerns were a far higher priority than those of historical research.

Lamentable as this situation was, it must be borne in mind that the fate of many *waqf*-based libraries throughout the Arab world demonstrates that *waqf* has not been a reliable vehicle for the maintenance and protection of libraries (Sa'ati 1988: 172-86). The dismemberment of the Cairo *waqf* of Muhammad Beg mentioned above, for example, began only a year after his death (Crecelius 1991: 71-78), and in Ottoman Jerusalem the families of local notables routinely used various means of access to posts in other families' *auqaf*, as well as legal devices allowing for the alienation of *waqf* assets, to promote their own positions and material benefit (Baer 1986; al-'Asali 1989: 218-19). Indeed, the Khalidi Library itself contains manuscripts bearing the Ottoman-period *waqf* notices of other families and family libraries (e.g. from a family collection endowed by 'Abd Allah ibn Ibrahim al-Da'udi at various times in the 12th/18th century), which demonstrates that status as part of a *waqf* did not necessarily prevent manuscripts from

leaving the collection and returning to circulation in literary circles. Such losses even affected al-Aqsa Mosque, where hardly a single one of the many beautiful and magnificently decorated *rab'at*—special presentation Qur'ans copied in 30 volumes—donated to it in medieval times has survived to the present without the loss of at least some (and sometimes most) of its volumes (Salama 1991). In the early 1980s Khadr Salameh, the most knowledgeable researcher on the manuscript heritage of Jerusalem, commented that these books were usually stored in premises exposed to the effects of humidity, that a large part of them had at least some insect damage, and that some had disappeared; unfortunately, most of those that remained required conservation (Salama 1983: 2).

Where Jerusalem and the Khalidis are concerned, political vicissitudes arising from Israeli expropriation policies beginning in 1948, and especially in the wake of the 1967 war, have had particularly deleterious effects. The effective operation of *waqf* is of course entirely dependent upon the continuing integrity of its income-producing resources, and in the Jewish Quarter of the Old City alone the Khalidis lost sixteen *waqf* properties in 1967 (Dumper 1994: 119). In the 1980s the annual revenue of the Hammam al-'Ain *waqf* supporting the Library was reportedly only about 20-22 Jordanian dinars, or about £25.00, clearly only a mere fraction of the costs of running such a facility (al-'Asali 1981: 381; 1983, 1: 166; Abu Khudair 1988: 9, 1990: 4).

In this regard it is worth noting that while the Palestinian family collections in the JNUL, which came into Israeli control in 1948 and 1967, are in generally good condition, the private libraries that remained in Palestinian hands have all suffered more or less serious loss and damage.⁵⁹ It would be a great mistake, however, to draw simplistic conclusions from this contrast or to view the decline of Palestinian private and institutional libraries solely in terms of personal or corporate culpability. The simple fact of the matter is that these collections traditionally owed their survival and protection to their central role in a living cultural tradition. Islamic literary culture was essentially characterised by what can be described as a continuum of processes of affirmation and confirmation, in which the creation, revision, reading, study, copying, and preservation of literary texts served both to assert the status and qualifications of an individual scholar or *littérateur* and, at the same time, to comment on the status and qualifications of others with whom his work

⁵⁹ This judgment is based on the present writer's inspection of the Khalidi Library, that part of the Husaini family collection deposited at the Markaz al-Abhath al-Islamiyya in Shaikh Jarrah, the Aqsa Mosque Library, and the Shaikh Khalil al-Khalili collection now held at al-Aqsa (cf. Conrad and Salama 1993: 565). The present physical condition of the Budairi Library is not known, but al-'Arif (1986: 451) describes it as disorderly.

was linked (Conrad 1995b). The large numbers of abridgements, commentaries, and glosses on the key texts of the various fields of learning, for example, served not only to affirm their authors' place in the circles of scholarship represented by those texts, but also to confirm the continuing importance of these works and their composers and their relevance to contemporary problems. The institution of *waqf* was inextricably bound up in this process, since it was largely the institutional and financial structure of *waqf* that sustained scholarly endeavour.

Reform and modernisation beginning in the 19th century posed serious challenges not only to the course of traditional scholarship, but more importantly, to the underlying processes that endowed it with its legitimacy and relevance. The increasing importance of learning European languages undermined the position of Arabic, and a steadily rising interest in Western research methodologies posed a brisk competition to the canons and agendas of traditional Islamic scholarship. The spiralling ascendancy of the printed book offered a cheap and readily accessible alternative to the handwritten manuscript, and in so doing not only deprived the scribe of his livelihood but also marginalised the structures of intellectual life that revolved around the critique and study of hand-copied manuscripts (Mahdi 1995; Roper 1995).

Similar challenges were posed to the institution of *waqf*. In traditional Islamic social and communal organisation it was private charity endowed as *waqf* that took responsibility for such public services as could be offered within the limits of pre-modern technology: for example, soup kitchens for the poor, water bearers, public fountains, hostels for pilgrims, baths, and so forth. But modern amenities—a national electricity grid, for example—cannot be delivered under the auspices of small independent religious endowments all over a country, and in any case the modern western concept of a state and municipality, by which the Ottoman-period reformers were much influenced, devolved to these entities exclusive responsibility and authority over public services, and thus decisively undermined the charitable purposes and relevance of *waqf*. Jerusalem, for example, was constituted as a municipality with a city council in 1863, and it was the municipality that assumed the leading role in establishing such public services as sewage, public health, lighting, street paving, water supply, and garbage collection (Schölch 1989: 239-41). The Arab reformers of late Ottoman Palestine did not immediately appreciate the full extent of this problem; in 1913 Raghib al-Khalidi, for example, demanded reform in the management of *waqf* in the interests of providing a better school system (Shamir 1975: 512). The real problem, however, was that *waqf* had been overwhelmed by the pace and character of modernisation, and as its relevance and status diminished so also did the appreciation for a need to preserve and maintain it.

This destructive combination of factors affecting manuscript collections has not arisen in Israeli circles, where, as in Western educational and cultural institutions, manuscripts are perceived as historical artefacts—like Roman mosaics, for example, or Mamluk glass. As such, their care has been entrusted to stable, well-funded institutions staffed by professionally trained scholars and curators. But the operative term here is 'artefact', as contrasted to a functioning element of a living culture, and the crucial question is whether the organisation and preservation of artefacts actually serves to preserve cultural heritage.

Given the proper conditions, facilities, expertise, and financing, it is always possible to make major progress in restoration of buildings and books and to organise the contents of a library collection. Thus, between 1986 and 1995 at the Khalidi Library it was possible to halt the damage to the manuscript collection, clean and box the manuscripts, conserve more than 100 of the most valuable works, undertake a partial survey of the fragments (Bish 1992: 179, 1996: 49-51), and complete cataloguing of about 90 percent of the manuscripts. But this does not touch upon what one might call the problem of intellectual fabric. One of the greatest problems facing efforts to record and preserve the Islamic heritage of Jerusalem is that monuments and manuscripts are only the venues and products of cultural heritage, and that for their future to be secured they need to be made relevant to the needs and priorities of contemporary society.⁶⁰

⁶⁰ Here I would like to thank the colleagues and students who participated in the ten years of conservation, cataloguing and historical research work at the Khalidi Library. My colleague Tony Bish at the Wellcome Institute came every year as head of conservation beginning in 1987, and is personally responsible for saving the manuscript collection. Prof. Dr Barbara Kellner-Heinkele was in charge of Persian and Turkish cataloguing and provided much expertise and sound advice.

The results achieved would have been much reduced without the enthusiastic and dedicated work of our student assistants from Leiden University who worked long hours under often quite adverse conditions: Ingrid Schroeder (1990), Dirry Oostdam (1992, 1994, 1995), Noor van Beers (1993, 1994), Petra Sijpesteijn (1993, 1994, 1995), Hans van der Meulin (1994, 1995), Siti Wurian Hutomo (1994), and Mauritz van der Boogert (1995). Ali Zeyadeh and Robert Hoyland also joined us for part of the 1990 season. David Carradine and Mark Clark joined the conservation team in 1994, and Helen Loveday in 1995. To all I offer my heart-felt thanks.

I would finally like to acknowledge the invaluable support of Professors Remke Kruk and Jan Just Witkam at Leiden University, and the financial contribution of the Netherlands government, which provided the vast majority of the funding for work on the Library project, including all of the systematic conservation and Arabic cataloguing and the restoration of the Library complex.

Chapter 14

THE URBAN STRUCTURE AND PHYSICAL ORGANISATION OF OTTOMAN JERUSALEM IN THE CONTEXT OF OTTOMAN URBANISM

Paolo Cuneo*

The four centuries of more or less direct Ottoman rule over most of the North African and Near Eastern Arab countries are still considered, despite recent contributions to a general reappraisal of the period, as an era of general decline in terms of urban life and architectural activity.¹

What has been shown in an authoritative way for the great metropolises and other big cities could be extended to some of the cities of lesser size, and Jerusalem, despite the millenary story of its Holy Places and its multi-confessional pilgrimages, has always belonged to the class of 'medium cities', a term used by urban geographers and town planners when the population amounts to only a few tens of thousands. Indeed throughout the whole Islamic era (and until very recently) Jerusalem no longer played the role of capital as it had done before the Roman occupation and under the Latin Kingdom. Under the Ottomans it was, alternating with Gaza, merely the centre of the small *pashalik* of Palestine, ruled by local *pashas* dependent on the chief *pashas* of Damascus, which was the official and actual capital of the *vilayet* (province) to which Jerusalem and other small towns belonged.

Despite its reduced political significance, at the time of the Ottoman conquest Jerusalem possessed a fairly well-defined structure and organisation, the outcome of its long history and specifically of the intense building activity conducted by its Mamluk governors and élite in the 14th and 15th centuries. The urban structure of its Islamic quarter was characterised by a system of monumental

madrasas, convents and hospices with related buildings, similar to, though on smaller scale, the parallel development of the central capital, Cairo, and the main regional towns such as Damascus and Aleppo. This system, together with the two venerable religious complexes dating from earlier periods—the Holy Sepulchre and the Haram al-Sharif—shaped most of the 'definitive' urban townscape of the Holy City still visible today.

Nevertheless Ottoman rule left its own quite legible traces, additions which mainly overlapped with pre-existing structures without erasing them. The whole period, lasting exactly four centuries, from the conquest of 1517 (by Sultan Selim I Yavuz 'the Grim') up to the British occupation of 1917 (led by General Allenby), can be subdivided into three main phases.

First Phase: the earlier 16th century

The first phase largely corresponds to the long reign (1520-66) of Sulaiman the Magnificent, a sultan whose interest in the history and culture of conquered countries paralleled that of his philhellene ancestor, Mehmed II Fatih 'the Conqueror', and who was also pleased to think of himself as the 'Great Builder', a role which in both Jewish and Arab tradition belonged to the homonymous King Solomon who had reigned some 2,500 years before. Sulaiman loved Jerusalem and aspired to make it rival Mecca and Medina as a religio-cultural centre. He planned and executed a

* Sadly, the author died before he could read his proofs.

¹ See Raymond 1984: 5, quoting the understated comments on Cairo by M Clerget in the 1930s, and those on Aleppo by J Sauvaget in the 1940s.

general programme of works vast in conception and scale, aimed at preserving, fortifying and embellishing the town (Sharon 1973: 28-9; Meinecke 1988).

According to the Turkish traveller Evliya Çelebi, who visited Jerusalem in 1648-50 and described the town in his books, Sultan Sulaiman had been inspired by an apparition of the Prophet who ordered him to spend part of the booty from his conquests on 'the fortification of the Citadel of Jerusalem ... embellish his Sanctuary ... and the Rock of Gold and rebuild Jerusalem', so 'he dispatched the master architect Khoja Sinan and transferred Lala Mustafa Pasha' who, 'having been ordered to carry out the restoration of Jerusalem, gathered all the master builders, architects, and sculptors available in Cairo, Damascus and Aleppo and sent them to Jerusalem to rebuild and embellish the Holy Rock.'²

The City Walls

Among the very first tasks undertaken was the complete rebuilding of the wall of the conquered city, achieved in the brief span of the four years from 1538 to 1542. The purpose was to endow the Holy City with a 'modern' defensive system to replace and reinforce the medieval enclosure, enlarging it to the scale of the squarish perimeter we still see today. The wall embodied the evident significance of protection, boundary, limit and sacred enclosure: a 'masonry casket' expressing its function of shielding the many treasures of faith, memory and art it contained, and 'the symbolic as well as physical separation of the Holy City from the rest of the world' (Grabar 1980: 344).

In fact, however, 'for many years (previously) the walls surrounding the city were too dilapidated to provide any significant protection, but the Mamluk authorities did nothing to repair them. The Ottoman administration knew that providing elementary safety to life and property would have an immediate effect on the flagging economy and dwindling demography of Jerusalem' (Cohen 1989: 2).

The wall enclosure took the shape of an irregular quadrilateral formed of a tall masonry curtain punctuated by salients and thirty-five square towers, and pierced by several crenellated gates, mostly at points corresponding to openings created in Roman and even earlier times. A series of sixteen inscriptions over the main gates giving the dates for the building of 'the walls of Sulaiman' hymn the praises

of the sultan (van Berchem 1927: 431-49).

Against what threat, one might ask, was the wall built? First of all 'surrounding Jerusalem with strong walls was ... a means to defend the Muslims and their Holy Shrines from the covetous eyes of the Christians' (Cohen 1989: 4), since, despite its inland position, Jerusalem was subject to possible attacks from the sea, being similar in this to the coastal towns of Syria and Palestine (Tartous, Tripoli, Sidon, Acre, Jaffa, Gaza): such attacks could come from a Venetian army (the Venetians were lords of Cyprus until 1570), trying in the 16th century to repeat the military exploits of the Crusaders. Another reason, not less important, could have been 'the defence from inroads by marauding Beduins of the surrounding areas' who made periodic attempts to scale the obstacle, to climb the walls at night with ropes (Cohen 1989: 120; Bahat 1986: 66).

The Jerusalem wall enclosure, one of the most complete of its kind to have survived intact from the 16th century, has to be considered 'a major feat since there are not many places where the Turks built fortifications of this kind and took pains to embellish them with all manner of adornments.'³

A major feature of the town walls were the gates. The best known of them and the largest is the Damascus Gate, also known as the Nablus Gate (Bab al-'Amud or 'Gate of the Pillar' in Arabic) on the north, which was given a façade topped with pinnacled battlements and decorated with flowered and geometric reliefs, and where entrance was made difficult by stairs and winding passages.⁴

This device can be observed also in the Sion Gate (Bab Nabi Da'ud) on the south, and in the Jaffa Gate, also known as the Hebron Gate (Bab al-Khalil in Arabic) on the west, and existed too in the Lions' Gate (the medieval Josaphat Gate, also known as St Stephen's or St Mary's Gate) on the east, where it was later done away with to allow the passage of vehicular traffic.

In terms of design, one is struck by a sort of stylistic continuity and even neo-medieval (Crusader and

² E Çelebi, *Seyatname* ('Travels'), quoted in Peters 1985: 482-3. Sinan is not, however, considered to have played an important role in the renewal of Jerusalem, since the three projects generally attributed to him (the restoration of the Dome of the Rock, and a *madrasa* and *'imaret* complex; see Kuran 1987: 283) did not change the general structure of the Holy City.

³ Bahat 1986: 66. In fact the situation of Jerusalem was different from that of many Anatolian towns (Bursa, Ankara, Konya), Middle Eastern ones (Cairo, Damascus, Aleppo) and even Maghribi examples (Tunis, Algiers) around which 'vast unprotected suburbs' (Raymond 1984: 2) developed outside the medieval walls, since the majority of the inhabitants of Jerusalem lived inside and 'the gates to Jerusalem were locked from sunset to daybreak' (Cohen 1989: 2). Only a few of them were in use. 'Presumably it was in this time that the Golden Gate, the Single Gate and the Triple Gate were sealed' (Bahat 1986: 64).

⁴ This well-known defensive device, already present in the remotest Middle Eastern fortified settlements, was adopted by early Islamic architects, beginning with the 'Round City' of Baghdad built by the 'Abbasid Caliph al-Mansur in the mid-8th century, and there are more recent examples in Ayyubid citadels from the end of 12th century, e.g. in Cairo and Bosra.

Ayyubid) revival both in the conception of the gate, meant more as a façade to intimidate those approaching the town from outside, than as a triumphal entrance, and because the architecture relies on compact surfaces, small openings, machicolation and crenellated parapets.

Before starting on the city wall, Sulaiman's architects renovated the citadel (the so-called Tower of David), the only defensive structure in the town that still had some Ayyubid and Mamluk walling. They reinforced it and brought it up to date with contemporary progress in warfare, and by order of the governor it was occupied by a small garrison armed with thirty cannon.⁵

The Water System

After seeing to security 'the Ottomans addressed themselves to satisfy another basic requirement: water supply' (Cohen 1989: 3), something that had been 'always a topline challenge to the rulers of the city' (Bahat 1983: 66).

In its improvement of the city water system, the Turkish administration entirely repaired or rebuilt the aqueduct bringing water from the spring of Irtas (some ten miles to the south), dating back to Roman times but considerably damaged in the course of the centuries. From Solomon's pool, near Bethlehem, the water was brought to an old reservoir at the western foot of Mount Sion. The reservoir was also restored and thereafter was known as Birkat al-Sultan (the Sultan's Pool).

Out of this initiative in hydraulic engineering came a comprehensive system of public fountains, which probably incorporated various pre-existing ones.⁶ Most of the fountains were built within the wall, in the Muslim quarter: five around the Temple Mount, three within its precincts, including the Sabil al-Haram (1537), and only one outside the town wall on the edge of the Birkat

al-Sultan itself.⁷

Two baths were also given additional outlets (al-'Asali 1982: 163-216), the Hammam al-Asbat in the vicinity of al-Salahiyya Madrasa at the north-eastern corner of the town, and the other, Hammam Da'ud, built in 1589 beside the tomb of David on Mount Sion.

Religious Image

The provision of walls and water supply was merely the first step towards enhancing the character and embellishing the religious image of the city. Other works of construction concerned the image of the town as an Islamic religious centre and place of pilgrimage—a multi-faceted task that centred first and foremost on the condition and the appearance of the Haram al-Sharif (the Arab name for the Temple Mount or Mount Moriah), from its exterior wall inwards.

The setting, shape and function were not changed, obviously, but were enriched and embellished by work on each of the main elements set in their concentric gradation—enclosure, platform and the Holy Qubba itself. Of the variety of improvements carried out on different sections of the sacred precinct, it is enough to mention the restoration of the Qubbat al-Sakhra, including the replacement of mosaic decoration with coloured tiles and marble (see St Laurent and Riedlmayer 1992).

In its efforts to improve the conditions of life in the newly-conquered territory, the Ottoman administration was not without 'concern for the lower strata of local society' and encouraged the religious, charitable and teaching establishments which 'proliferated during the early years of Ottoman rule' (Cohen 1986: 8-9). The

⁵ The Turkish governors resided, like the Mamluks, in the area called Jauliyya, the former Herodian Antonia Fortress, at the north west corner of the Haram al-Sharif, in a palace which 'continued to be the seat of government in Ottoman times until 1870, when the *pasha* moved to the new *sarai* in 'Aqabat al-Sitt' (Burgoyne 1987: 203-4).

⁶ Van Berchem 1927: 412-17. According to al-'Asali (1982: 218-96) there were nine: Sabil Zahir al-Quds, Sabil Bab al-Silsila, one ablution fountain for the Hanafites and another for the Shafi'ites near the Aqsa Mosque, Sabil Bab al-Qattanin, Sabil Bab al-Nazir, Sabil Bab al-Da'dariyya, Sabil Bab al-Asbat (or Bab Hatta). All these were built by Muhammad Jalbi al-Naqqash, who was in charge of the treasury. The author gives his source as an article by Shaikh Muhammad As'ad al-Imam al-Hussaini, '*Birkat Sulaiman waqf islami khairi sahih*' ('The pool of Sulayman, an Islamic charitable foundation for proper benefit') published in the newspaper *Jardat al-Jihad al-Maqdisiyya* of 17 March 1955.

⁷ It is worth remarking that the façades of some of these fountains reveal interesting instances of a hybrid or eclectic style, an effort at the imitation and sometimes re-use of medieval-Crusader architectural elements, perhaps the result of a continuity of taste and style in the craftsmen and designers. Some of these façades bring together *muqarnas* (stalactite) vaulting, classical rectangular frames ending in spirals similar to those in some early Christian churches of upper Syria, rose or wheel windows reminiscent of Romanesque façades, round and ogee arches including chevrons (a kind of zig-zag moulding known under the French term *bâtons rompus*) of Normano-Crusader-Romanesque design. The latter motif (also found in some 12th-13th-century English, central Italian and Sicilian architecture) was part of the architectural language of the Anatolian Menteshid Amirate (Firuz Beg Mosque of 1398 at Milas) and had been known in Islamic Jerusalem since Ayyubid times, where it can be found in the main arch of the portico of al-Aqsa Mosque (1227) and in a few Mamluk portals, such as Habs al-Ribat or Ribat al-Mansuri (1282-3) (see Burgoyne 1987: 133; Burgoyne 1971: pl. Vb), and in the Turba of Barakat Khan (see the so-called 'Romanesque doorway' in Walls 1974: figs. 4, 6, pl. VIIIA, and also Burgoyne 1987: 112-15), where it is accompanied by 'gadroned voussoirs'.

largest and the best known was the one linked to the enterprise and name of Sulaiman's beloved favourite, who had become the only wife and 'trusted adviser' of the sultan—the Christian-born Roxelana, also called Khassaki Hurram (in Turkish Haseki Hürrem),⁸ who personally backed the setting-up of a considerable charitable endowment, the al-Sara'iyya Kitchen, a large building complex incorporating and expanding the pre-existing Palace of Lady Tunshuq, turning it into 'a soup kitchen for poor people and students', a *sufi* monastery and a caravanserai with stables which continued to function up to 1870.⁹

The sultan lent support to other pious (religious, charitable and teaching) establishments in the Muslim quarter of the Old City, among them the *ribat* with *kuttab* (convent with primary school) built in 947/1540 by the Amir Bairam Jawish as a hospice for pilgrims, also known as Madrasa Risasiyya or Rasasiyya (van Berchem 1927: 430-1; Grabar 1980: 343), which was in close proximity to the Sara'iyya Kitchen, with the result that together they formed a sort of small specialised section of the town, devoted to the public assistance of the poor, of foreigners, pilgrims, and students.

Mention should also be made of the foundation of some dervish monasteries, which supplemented the system of Islamic brotherhoods already existing—the Maulawiyya or Mevlevi Zawiya-Mosque, for example, adapted out of the Crusader Church of St Agnes.

The urban role of these institutions was certainly crucial, but less important than that of analogous institutions set up in areas of other Ottoman towns not yet urbanised. These gave rise to ample complexes (better known under their Turkish name of *küllîye*) rich in open spaces and porticoed buildings often surrounded by unplanned clusters of dwelling units, and functioning as nuclei around which new districts could develop.¹⁰

The urban vision of Sulaiman included a policy of appropriation to the Islamic community of various shrines located outside the city walls. A first sign of his concern in this respect can be seen in the taking over of the important

Christian sanctuary built on the site of the tomb of the Prophet David (a site venerated by Jews also) and the Coenaculum of the Last Supper on Mount Sion. This was made possible by the conversion of the Coenaculum Church into a mosque in 930/1524,¹¹ the building of another mosque over the tomb of David, and later the expulsion, in 936/1530, of the Franciscans who had been taking care of the place since the time of the Crusaders.¹² The site was claimed as an Ottoman possession by the addition of a simple cylindrical minaret, a feature rare in the city.¹³ Expelled from Mount Sion, the Franciscans and their establishment were relocated from 1588-60 onwards in the Christian quarter.

Another example of Ottoman interest in Christian sites strategically located on hills was the refurbishment of the Mosque of the Ascension (Jami' al-Mas'ud) on the Mount of Olives. Built within a roundish enclosure with a minaret, it stood on the foundations of the round Crusader Chapel marking the traditional spot of the Ascension of Jesus (St Laurent and Riedlmayer 1992: 79).

The urban role of the Holy Sepulchre and the surrounding area, however, saw little change throughout the whole of the first Ottoman phase, even though in 1545, during Sulaiman's reign, an earthquake brought down the dome of the small bell-tower of the Anastasis Rotunda, and the entire building had to be replaced. In 1555 the Sublime Porte granted permission for rebuilding to Charles V and his son Philip II. It became a Latin possession from then on (Buhl 1913: 1168; St Laurent and Riedlmayer 1992: 77), but, as a result of the mutual antagonisms of the different Christian communities, restoration did not begin until 1719.

The Four Quarters

Another important feature of the Holy City, existing from earlier times, was its subdivision into four quadrants or quarters, roughly separated by two main NS and EW streets corresponding to the *cardo* and the *decumanus* of

⁸ Her name is also linked with similar charitable institutions in Istanbul, Edirne and Mecca (Stephan 1944: 172-73).

⁹ After which it housed local government offices, then the residence of the *pasha*, and the civil court. To-day it is partly used as an orphanage with dependent workshops (Burgoyne 1987: 486-7).

¹⁰ Indeed the unique historical and topographical character of the Holy City imported changes into the principles and practices in use in other Ottoman-ruled Arab and Balkan towns, where the *waqf* system and the public services they provided usually led to demographic growth and an intensification of urban life. Sometimes these factors succeeded in making up for the lack of any form of deliberate town planning and 'local urban organization' (Kark 1981: 99). On this subject see chiefly Raymond 1969: 370; and Cuneo 1986: 363 note 1.

¹¹ Van Berchem 1927: 403-11; Burgoyne 1987: 417. The change of cult required the simple addition of a *mihrab* to the southern wall. The place was further 'Ottomanised' by the later (1589) building in the vicinity of a Turkish bath, the Hammam al-Da'ud (al-'Asali 1982: 212).

¹² This event is extensively investigated in Cohen 1986: 147-57.

¹³ All the other cylindrical minarets in Jerusalem are in strategic positions: Bab al-Asbat Minaret (perhaps of Mamluk origin but more probably rebuilt in Ottoman times; Burgoyne 1987: 417) stands out near the north east corner of the Haram al-Sharif; one similar to it, that of the Jami' al-Maulawiyya not far from the Damascus Gate, marks the Islamisation of the former Crusader church of St Agnes; that built on the citadel in 1655 (Johns 1950: 173) gives an evident Ottoman accent to an outstanding monument named after the Hebrew King David.

Ælia Capitolina. The quarters took their character from the main ethnic and religious groups settled there for many centuries—Jews, Arabs, Christians of different rites, groupings and provenance, and Christian Armenians—each of which had its dominant architectural structures and religious focal centre (Hopkins 1971). But, as opposed to the others who had set up their homes and activities close to their relative sanctuaries, the Islamic population did not settle in close proximity to the Dome of the Rock, which was thus destined to preserve its isolated position in the middle of the large unbuilt terraced space of the Haram al-Sharif right up to the present day.

This cruciform pattern, an expression of the persistence of the ancient (Herodian, Hellenistic, Roman) plan, its subsequent modifications during the various post-classical (Byzantine, Umayyad, Fatimid, Crusader, Ayyubid, Mamluk) periods, and its resistance to change, upheaval and fire, was adopted by the Ottoman rulers. After all, the co-existence and physical separation of national groupings suited their system of governing and controlling conquered towns, and became one of the general principles of their urban planning. Poly-ethnicity was in fact considered the most apt way of stimulating production and trade (and consequently tax revenue), and of engaging the experience, traditions and skills of the different communities in competition and specialisation. Like other Ottoman Mediterranean cities, Jerusalem offered a haven to minorities and hospitality to refugees from less tolerant countries.¹⁴

The Jews, for instance, were freer than in most contemporary European cities and their community was to increase in numbers because many of them, immigrants from Italy, Greece and Turkey (where they had previously settled after their expulsion from the Iberian peninsula) were received and allowed to settle in the town, and they gave life to a Sephardic community which prospered and built its own places of worship. The first of these was the Synagogue of the Prophet Eliyahu Hanavi, inaugurated in 1586 (Wager 1988: 58).

The Muslims occupied the north eastern quadrant (marked by the trio of streets forking from the Damascus Gate),¹⁵ flanking the Haram al-Sharif on two sides and dominating the whole city from its hilltop site.

The Christians were mostly settled in the western area, which included the north-west quadrant around Calvary and the Holy Sepulchre, and the south-west quadrant where the Armenians lived. The four

communities were separated and united at the same time by a typical urban element, the cruciform bazaar which had developed out of the original colonnaded streets into a network of vaulted alleys similar to those in many Near Eastern towns, but differing in that it was not adjacent to the religious and political centres. It continued to form the hub of the commercial street system which is still vibrant today, performing a function that demands and provides (along with religious life) the conditions of ethnic co-existence and tolerance necessary to the peaceful exchanges of goods and services.

Another feature in the rehabilitation of the city was the creation of new commercial opportunities, necessary 'after the long years of Mamluk neglect' to 'compensate the town for its lack of natural resources'; as a result 'Jerusalem's markets became increasingly specialised during the second half of the sixteenth century' (Cohen 1989: 6, 8) and new sections were created or renovated. The Suq and Khan al-Qattanin (the cotton-weavers' market and warehouses) forming part of the Dome of the Rock endowment, already in place during Mamluk times but later neglected, were restored and enlarged; the related building work began in 1544, and 'between 1564 and 1566 the number of shops grew from 28 to 32.' The same thing was to happen with the new Suq al-'Attarin (the spice-dealers' market) from 1565.¹⁶

Second Phase: 17th-18th century

A second and longer phase was that of the 17th and 18th centuries, a period lacking in large urban programmes and building activity, with only a few monuments constructed. It is looked on by many historians as a period of inertia and decay, the outcome of the rapacious rule of local *pashas* under pressure from their chief *pashas* in Damascus. Indeed, some travellers comment on the city as a ghost town, describing late medieval Jerusalem as dusty and dilapidated, the existing public facilities neglected and in disrepair, the streets labyrinthine and chaotic. Jerusalem, thus, did not enjoy that accumulation of monumental building typical of Istanbul, Cairo and Damascus—a building boom financed by tax revenue from the provinces. Indeed, by the end of the 18th century the population had dropped to just 11,000 inhabitants, of whom 1,200 were Jews from Spain, Morocco and Egypt.

Notwithstanding this contraction, urban development during this particular phase of the Ottoman period needs thorough re-investigation and re-appraisal uncontaminated by the prejudiced notion of 'Ottoman

¹⁴ Not unlike other Arab cities during the Ottoman era, Jerusalem became more cosmopolitan than it had ever been before (Raymond 1984: 69).

¹⁵ This typical topographical feature, very probably belonging to the 2nd-century plan of the Emperor Hadrian, consisted of porticoed streets, as shown in the 5th-century Byzantine mosaic of Madaba (Wilkinson 1975).

¹⁶ Cohen 1989: 119. The development of trade has been viewed as one of the causes of the 'impressive demographic growth throughout the first 50 years of Ottoman rule' (*ibid.* 124).

decline¹⁷ (a phrase chiefly used in reference to town building and architecture), in line with what modern historiography has been doing for other Mediterranean Islamic towns.¹⁸ Despite some minor changes in urban features and the few new monuments whose dates are known, we can assume that it was precisely during this long period that the main lineaments of the urban fabric as we know it from 19th-century engravings, and still in existence today, were established and consolidated. Each of the quarters acquired the 'final' organisation (not always closed to infiltration by ethnic enclaves from the neighbouring quarters) we see at present (Hopkins 1971).

The various descriptions and maps dating up to the first decades of the 19th century (i.e. before the modern changes) clearly indicate the different roles of the system of main streets and religious centres, showing their character as planned entities, and the irregular topography of back streets and residential units filling the quadrants. Alongside the wall inside the city ran a broad green belt free of buildings (this was, however, to be completely covered with new construction in the 19th century).

Among the few changes relevant to the city as a whole was the work carried out by Muhammad Pasha on the Citadel in 1635–55, which included crowning the south tower with an element now fundamental to the present day townscape—the remarkable cylindrical minaret, 'a prominent Jerusalem landmark' (Wager 1988: 129; Johns 1950: 173).

The four quarters were sub-divided into eighteen districts: eight inhabited by Christian Greeks, Latins, Copts (Harat al-Nasara); four by Christian Armenians, four by Muslims and two by Jews (Harat al-Yahud). As in all the cities of the vast empire, these groups were confirmed in their status of 'protected communities' (*dhimmi*).¹⁹

The Islamic quarter continued to discharge its role of protecting the Sacred Enclosure by flanking it on the two sides—north and west—facing the inhabited area, and of maintaining it through tax revenue from the *waqf*-owned commercial buildings concentrated in the overcrowded surrounding areas. For the 18th century we have evidence of four periods of restoration at the Dome of the Rock and the Aqsa Mosques—in 1721–2 under Ahmad III (1703–

30), then again in 1742, in 1753–4 and in 1780 (St Laurent and Riedlmayer 1992: 77, 84 n.12).

Neither did the Christian quarter undergo radical change, though the work begun in 1719 on restoring the dome and bell-tower of the Anastasis Rotunda had relevance for the townscape. As already noted, this work had been necessary for a long time but had always been delayed because of antagonisms and rivalries among the Christian communities.

The Armenian quarter remained the smallest of the four (about one sixth of the area inside the Old City walls), but given that its existence in Jerusalem can be traced back to the 5th century AD, and that for most of its history it occupied its present location in the south-eastern quarter of the Old City, it developed into a remarkable physical and social structure. A modern sociological study lists a series of specific characteristics, the roots of which can be looked for in the late Ottoman period.²⁰ We can speak of 'a city in miniature since it include(d) residential quarters, schools, library, and religious and cultural institutions for the community' (Wager 1988: 115), with an open space running along the local section of the town wall (the so-called 'Armenian Garden'), that was to remain entirely unbuilt on until 1879, when a seminary was constructed on part of it. Within this district the lay and monastic communities lived together in a very large monastery surrounded by walls, which remained unchanged in structure, while large-scale restoration was conducted during the 17th–18th centuries on the 11th-century Cathedral of Surb Hakop (Saint James). This work included the erection of a conical dome on six cross-over arches modelled on certain medieval Armenian antecedents,²¹ a monumental entrance built, according to an inscription, in 1636, and the panelling of the prayer hall with fine ceramic Kütahya tiles imported from Turkey.²²

The Jewish quarter in the south-eastern quadrant was logically located since the Jews will have been naturally 'drawn to their major religious centre, the Wailing Wall, but in fact it was not close to this site' (Ben-Arieh 1975: 225)

¹⁷ An old-established commonplace—see, for example, *les Turcs Ottomans qui étaient peu capables de conférer de la vigueur aux pays qu'ils dominaient* (Buhl 1913: 1167). It is still accepted in some cultural milieus.

¹⁸ I refer chiefly to the historical investigation and synthesis included in the works already quoted by André Raymond, especially for the 17th and 18th centuries.

¹⁹ The obvious motives for these regroupings (reinforcement of cohesion, ensuring security, tighter control) are neatly expressed in Raymond 1984: 59 (see also Hopkins 1971).

²⁰ Azarya 1984. The author states that a lay community of 1,500, out of an estimated Armenian community of 25,000 for the whole of Jerusalem, lives in the Armenian monastery with families and children. They have their own parish church, clubs and schools (*idem.*, 6) and form the overwhelming majority of the total monastery population (*idem.*, 20), while only fifty seminarians are being trained for the priesthood by twenty clergy (*idem.*, 7).

²¹ Similar domes are still visible in the Armenian 13th-century churches of Khoranashat and Neghutsivank (Cuneo 1988: 776).

²² Carswell 1972: 43–58. The main court of the Convent (which houses the Armenian Museum) was built at this date as well, following the model of the 13th-century Khatuniya Madrasa or Çifte Minareli in Erzurum, an outstanding Muslim monument in the very heart of historic Armenia.

because the zone adjacent to the Haram was forbidden to them for purposes of building. All they were allowed was access to it.²³

In this period Jewish dwellings grew up around the above-mentioned Sephardic nucleus, which developed into a complex of four synagogues, including (besides the already existing Eliyahu Synagogue) that of Yohanan Ben Zakkai, built at the beginning of 17th century, the Middle or Kehal Katan or Zion Synagogue, built in the mid-18th century, and the Stambuli Synagogue built in 1764 by immigrants from Istanbul.²⁴

The main Ashkenazi Temple was the Great Hurva ('Ruins') Synagogue founded at the beginning of the 18th century by the Ashkenazi Rabbi, Judah the Hassid, continued under Ibrahim Pasha in 1836 and completed after the fire of 1857.²⁵

Because of the prohibition on Jews building their homes in the vicinity of the Mount Wall (and particularly in the section of it known as the Wailing Place), a part of the SE quadrant of the town was occupied by the Magharibine Arabs, as testified by the toponymy of old maps—Bab al-Harat al-Maghariba (the medieval Tanners' Gate, also known as Bab al-Zibala the 'Dung Gate', or Silwan Gate) in the south wall of the town, Harat al-Maghariba in the partly built area then existing near the Mahakma²⁶ and the Wailing Wall, the Bab al-Maghariba in the same wall, and the Maghariba Mosque, built in 1871 inside the sacred enclosure.²⁷ A small Muslim enclave existed in Mamluk times around a mosque in the heart of the Jewish district close to the Ramban and Hurva Synagogues.²⁸

Third Phase: from the beginning of the 19th century to the beginning of the 20th century

A third and different phase, spanning the 19th century, includes the occupation of Palestine (in 1831, some years after the expedition of Napoleon to the Near East) by the ruler of Egypt, Muhammad 'Ali; the reign of his adoptive son Ibrahim Pasha from 1832 to 1841; direct Ottoman rule re-established by Sultan 'Abd al-Majid (1839-61), with growing European influence following the Tanzimat or 'capitulations'; continued westernising modernisation, chiefly under the 'enlightened' 'Abd al-Hamid (1876-1909); and the British conquest by General Allenby in 1917.

Even though these different rulers intended to put their stamp upon the city, there were no planned projects of ample vision during the whole period.²⁹ Nevertheless a series of initiatives carried out in the second half of the century led to an entire re-shaping of most of the walled town and the creation of the different *extra-muros* districts which now form the heart of modern Jerusalem.³⁰

The introduction of the system of 'capitulations' to the European powers resulted in territorial concessions to foreign institutions in the heart of the old city, beginning with the establishment in 1838 of a British consulate, then followed by others, while foreign companies were

²³ This area was severely damaged during the fighting of 1948 and by the fire of 1967, and was subject in the following decades to a comprehensive plan for clearing, excavation, restoration, re-shaping, and re-developing aimed at enhancing its residential, cultural, commercial and touristic functions.

²⁴ 'These synagogues were central to the life of the Jews of Jerusalem between 1721 and 1836, a period when the Ashkenazi compound lay in ruins' (Wager 1988: 57). But the Jewish places of worship in Jerusalem failed to become urban landmarks not least because the Ottomans 'forbade that synagogues be higher than mosques.'

²⁵ All that remains to be seen of this building, destroyed in 1948, is the lower level of the perimeter wall and one free-standing arch, symbolically reconstructed. Though it goes beyond the scope of the present study, it is worth mentioning that Louis Kahn conceived (1968 and 1974) some very handsome designs, never actually built, in the shape of a towering square fortress (Romer-Yahveri 1970: 362-7).

²⁶ The Courthouse, built in 1483 (Baedeker 1912: 61).

²⁷ Most of the built-up area facing the wall was also damaged during hostilities and was later partly demolished in order to extend the excavations for the 'Ophel Archaeological Gardens'. On the international debate to which this gave rise, see Goichon 1976: 213-55; Lawless 1980: 193-8.

²⁸ The existence of this mosque, now gone, is still recalled by the solitary square 'Sidi 'Umar Mosque minaret', restored after 1397 (Burgoyne 1987: 513), standing out from the archaeological ruins and the renewed areas of the Jewish district.

²⁹ At all events, the expansion of the city betrays western rather than Ottoman patterns. And, despite the Ottoman custom of dotting Mediterranean Arab townscapes with domed buildings, the presence of two venerable domes on the Jerusalem skyline (only in recent times challenged by competing structures) may have helped in this late phase, as perhaps over the centuries, to prevent the appearance of other domed structures. A tentative list of large domed structures of classical and late Ottoman religious architecture in Arab countries would include, geographically from west to east, the following mosques: the Pasha (1791) in Oran; the Safir (1533), 'Ali Bitchnin (1622), the New or Fishermen's (1659), the Katshawa (1794), the Qasba New (1818) in Algiers; the Salih Beg (1771) in Annaba; the Sidi Mahriz (1674) in Tunis; the Rashid Pasha (1883), Bu Ghillaz (1884) and Great Mosque (1892) in Benghazi; the Sinan Pasha (1571), the 'Abd al-Dahab (1774), and the Muhammad 'Ali (1848) in Cairo; the al-Jazzar Pasha (1781) in Acre; the Abu Nabbut (1810) in Jaffa; the Sulaiman Pasha Madrasa and Tekke (1553), the Darwish Pasha (1570) and the Sinan Pasha (1585) in Damascus; the Khalid ibn al-Walid (rebuilt in 1908) in Hims; the 'Adiliyya (1516), Khusrau Pasha (1545), 'Uthman Pasha (1585) and 'Uthmaniyya Madrasa (1750) in Aleppo; the Muradiyya (1576), Bakiriyya (1586), Talka (1619) and Mahdi 'Abbas (1750) and the Mutawakkil (rebuilt in 1903) in San'a'.

³⁰ The first part of this period was a mere continuation of the preceding one, with low population growth—8,000 in 1806 to 11,000 in 1838: in 1806 the Jewish minority constituted 25% (Bahat 1986).

authorised to invest in building projects, as they were throughout the whole Turkish empire.³¹ This growth of enterprise led to the building outside the wall of an increasing number of dwellings and to the provision of public utilities aimed at bringing the city more in line with modern ways of life.³²

The Holy City's great renaissance came around the mid-19th century with the re-establishment in 1848 of the Latin Patriarchate (abolished in 1291) and the activity resulting from the different attitude of the Ottoman authorities towards foreign investments. The Holy City largely kept the historical separation into ethnico-religious districts but the rigidity of division slackened as old or new enclaves of alien cultures were consolidated or created.³³

The Walled City

In the Islamic quarter, despite changes aimed at encouraging Muslim presence, such as the re-opening in 1875 of Herod's Gate (Bab al-Sahira or the Gate of the Plain; cf. Le Strange 1890: 216) in the northern wall, progressive 'Christianisation' of the area took place over the decades, chiefly because of the creation of the Via Dolorosa (Tariq Bab Sitti Maryam or St Stephen's Gate Street) crossing the Muslim quarter from Lions' Gate westwards, parallel to the northern side of the Haram al-Sharif (i.e. in close vicinity to several Ottoman institutions, including the headquarters of the governor of Jerusalem [Ben-Arieh 1975: 258], the Old Serai which became the State Prison and the Turkish Barracks built in 1835 on the site of the Antonia Fortress in the north-west corner of the Haram al-Sharif).³⁴

Christian infiltration into the quarter came about through the gradual admission of a series of religious institutions, such as that of the Church of the Flagellation in 1839, the re-opening to Christian worship of St Anne's Church in 1856,³⁵ the building of the massive Austrian Hospice in 1856-60, of the Monastery of the Sisters of Zion in 1868, of the Convent of the White Fathers in 1878, and of the Church of Our Lady of the Spasm in 1881 (Bahat 1986: 65). The various European consulates added

a Western character to the daily life of the district.

As for the Christian quarter, much of the Church of the Holy Sepulchre was destroyed by fire in 1808 and the western portion of the monument demolished. But the restoration, performed by Komnenos Kalfa,³⁶ a Greek architect from Mytilene, imposed no great change on the shape of the district, which maintained its character for many decades.³⁷

It was only after the Capitulations and the consequent building de-regulation that the Christian quarter underwent complete re-structuring—albeit without a general plan. The streets were systematically paved in 1864-5, and gas, water and sewage pipes were laid in 1868. The most visible transformation was engendered by the rapid installation of a series of Christian institutions and related commercial activities that eventually filled in all the unbuilt areas alongside the city walls,³⁸ and the medieval aura of the area around the Holy Sepulchre blended into a compact urban fabric.

The main phases of building are given by the following dates: 1876 Christian Brothers' School; 1885 Imperial Hotel; 1868 Greek Catholic Patriarchate and new see of the Latin Patriarchate; 1868-1905 Greek Market; 1889 Russian Hospice; 1898 German Church of the Redeemer.

The latter undertaking was the largest of the various works carried out for the official visit in 1898 of Kaiser William II, guardian of the rights of the German Lutheran Church. The massive building, occupying the site of the former Crusader Church of Saint Mary the Latin, was given a large bell-tower in German Romanesque style. A disturbing omnipresent intrusion on the skyline, built too close to the Holy Sepulchre, its bulk offends the eye considerably more than the two slender Mamluk minarets (those of the 'Umari Mosque and the Khanqah Salahiyya), built five centuries previously, supposedly to frame the dome of the Anastasis.

The neighbouring area of the former Roman forum (which in Crusader times had become a compound

³⁶ This restoration was considered '*malheureuse*' and given as the cause for the architect's '*célébrité hérostratique*', in Buhl 1913: 1168.

³⁷ The only new building of this period is the Coptic Khan of 1838.

³⁸ The extent of open unbuilt areas inside the town is quite legible in the 'original 1865 survey map of Jerusalem prepared by the British team led by Wilson and modified by Schick' (St Laurent and Riedlmayer 1992: 84 note 28). This plan shows the city before the large-scale changes in the last decades of the century, chiefly in the Christian quarter, and before any *extra-muros* settlement except that of the Russian Compound of 1858-60. Among the other topographical sources for this period there is the model in zinc of 1873, made by Stephan Elias, a Hungarian Catholic living in Jerusalem, commissioned by the Turkish rulers for an exhibition in Vienna, now in the Citadel Museum (Wager 1988: 130).

³¹ From this time on non-Muslims were admitted on municipal councils (Bahat 1986: 64).

³² In 1860 there was a Jewish majority (60-70 per cent) and the population was to reach 100,000 by 1898.

³³ 'The residential segregation was not absolute. The various groups intermingled and met in the economic sphere of life' (Kark 1981: 105).

³⁴ In fact, in this area the 'religious and administrative centres were close together: mosque, *madaris*, and Governor's Palace nearby' (Kark 1981: 100).

³⁵ This church, which had been confiscated by Salah al-Din and changed into the Madrasa al-Salahiyya, was given by the Turks to Napoleon III, as a reward for his help in the Crimean War (Ben-Arieh 1975: 259).

formed by Sainte Marie la Grande, Saint John the Baptist and the medieval Muristan, the hospital run by the Hospitallers of St John and then by the Ayyubids) was entirely razed in 1903-5 to make way for the Greek Market (also called Suq Aftimos or New Market), sponsored by the Greek Orthodox Patriarchate, which still enjoys a good commercial site next to the crowded approach to the Holy Sepulchre. It was built in the shape of a St Andrew's cross, with a baroque fountain in the centre celebrating the 25th anniversary of Sultan 'Abd al-Hamid, and consisted of a series of low buildings, not disturbing in height but nevertheless conflicting with the surrounding urban fabric.³⁹

A nearby handicraft and shopping centre built in 1885, consisting of two covered streets meeting in a handsome oval-shaped space in late Baroque style, offers a contrasting example of a refined and modest inset of European stamp.⁴⁰

Another change in the Christian quarter was brought about in these same years by the opening in 1889 of Bab al-Jadid (the New Gate, also known as Bab 'Abd al-Hamid) in the northern wall, as a short cut between the institutions inside the wall and the ones just outside, such as the Hospice-Convent of Notre Dame de France and the St Louis Hospital, as well as the large Russian Compound (to be mentioned later) somewhat farther away.

The south-west quadrant, mostly taken up, as already mentioned, by the Armenian compound, also changed in this period through a parallel increase in the number of Christian institutions,⁴¹ in this case aimed at creating a 'Protestant nucleus'. It arose on various plots, mostly in the northern section of the area (Ben-Arieh 1975: 258) in a crescendo of construction: 1838 the British consulate; 1841 the Anglican Christ Church in front of the citadel; 1843 the English School; 1846 the Hospital of the German Deaconess Sisters.

This nucleus was to be further enlarged during the last decades of the century by the German Lutheran compound which occupied an adjoining area (the so-called Muristan) of the Christian district, just across the shopping street on the line of the Roman *decumanus*. In the same area the most important change to the surviving late medieval urban structure came with the opening of a section of the town wall adjoining the Jaffa Gate to allow for the passage

of carriages (and the mounted Prussian emperor), while a new road was built flanking the exterior of the old walls to link the Jaffa Gate to Mount Sion (Schick 1898: 116-18). On the Jaffa Gate itself a tall clock-tower was put up in 1907, a modern secular endowment in western classical style (defined by some, however, as an example of 'modern Arab style' because of its 'Islamic pointed arches'), facing, and to some extent mirroring, the Tower of David and the 17th-century cylindrical minaret surmounting the south tower of the citadel.⁴² The clock-tower, still existing in 1910,⁴³ was subjected to severe criticism and was demolished after 1917 (St Laurent and Riedlmayer 1992: 82), along with 'the orientalising fountain (that had) appeared in 1901 just beside the breach in the wall.'⁴⁴

The City outside the Walls

In this period some Christian communities started to build religious and educational institutions, not only hostels, outside the walled town, preferably 'near the sites associated to the history of their faith' (Bahat 1986: 70), thus marking the beginning of the growth of residential suburbs along lines that were to be followed in the future planning of modern and contemporary Jerusalem. In the second half of the century, and especially after the Crimean War of 1856 when the carriage road to Jaffa became established,⁴⁵ creating easier access to the gently sloping areas around it, a new city grew up in the north-western and northern areas between the ramparts and the Cross Valley. Among the first and largest new settlements was the 'Russian Compound', built in 1858-60, with its cathedral,

⁴² The Jerusalem clock-tower was built in the context of a general programme of construction carried out by Sultan 'Abd al-Hamid II, who in a period of a few short years provided most of the towns of the empire with similar utilitarian symbolic buildings set in dominant positions near the city centre, and functioning 'as icons of municipal modernization' (St Laurent and Riedlmayer 1993: 82). Recent well-illustrated surveys of such installations in Anatolian towns are to be found in Özdemir 1993; Acun 1994.

⁴³ See Schiller (ed.), photographs 52, 53, 57, from the archives of the American Colony Photographers.

⁴⁴ St Laurent and Riedlmayer 1992: 82. This fountain, called Sabil Bab al-Khalil, was also built by Sultan 'Abd al-Hamid II (al-'Asali 1982: 289). After the British conquest of 1917, 'restoration works' were begun with the intention of recovering 'Medieval Jerusalem', (and archaeological excavation intended to bring to light the earliest strata of the Jerusalem settlement was also undertaken). Since work was carried out before the elaboration of the modern principle of preserving all the significant traces of building activity, including those of recent strata, the result was a partial destruction of Ottoman and late Ottoman features (so-called 'incrustations') in the historic territory of the Holy City.

⁴⁵ The Jaffa-Jerusalem Railway came only in 1892 (Goitein 1980: 336) and Jerusalem Station was inaugurated in 1905 (Chouraqui 1981: 77, photo from archives Zev Radvan).

³⁹ See Wager 1988: 110-11, and plan in Bahat 1986: 56. Among other works conducted under 'Abd al-Hamid mention can be made of the restorations at the Haram al-Sharif (St Laurent and Riedlmayer 1992: 81) and those made in 1883 at the Sabil and the Madrasa al-Ashrafiyya of Qa'itbai (Burgoyne 1987: 610-12; Walls 1993: 85).

⁴⁰ In a circle at the intersection of the four covered streets stands a column with an inscription in honour of the Roman prefect of Judaea in 70 AD, uncovered in 1885 (Wager 1988: 112).

⁴¹ With the sole exception of the Turkish Barracks (the *kishla*), built in 1845 adjoining the citadel.

three large hospices, hospital and consulate.⁴⁶

From 1875 to 1887 five new residential Jewish districts developed in the area of the present Agrippa's Way, designed with dwellings arranged around one or more courtyards.⁴⁷

In 1895 in the northern suburb outside Herod's Gate (re-opened, as mentioned above, in 1875) a small religious hilltop complex with mosque and octagonal minaret was built at the entrance of the Kedron Valley around the Ayyubid tomb of a noted *sufi* saint, Shaikh Jarrah, who had served in Saladin's army, and from whom it took its name.⁴⁸ There was further urban development in this area with the building of the German and American colonies in Wadi Jauz and the hills west of it (Goitein 1980: 336; Bahat 1986: 70). A less dense settlement was created in the eastern suburbs beyond the Jehosaphat Valley (the Kedron Valley, a place of lonely rock tombs and vast

cemeteries), on the hilly north-south range of Mount Scopus, the Mount of Olives and the Mount of Offence, and to the south of Siloa or Silwan village.

The religious settlements on the western slopes of the Mount of Olives facing the Old City (consisting mainly of the Russian Establishment, with a hospice, the Church of Mary Magdalene, a bell-tower and other buildings erected between 1870 and 1890 to the east of the Sanctuary of the Ascension at the behest of Tsar Alexander III [Meistermann 1907: 199-200; Bahat 1986: 68]) created yet another disturbance in the delicate balance of the landscape, but could not altogether cancel the romantic setting of sparse olive groves rich in archaeological remains, biblical and historical memories, made famous in the paintings and drawings of dozens of artists, the forerunners, contemporaries and successors of David Roberts.

⁴⁶ Already visible in the British map of 1865.

⁴⁷ Bahat 1986: 71; Goitein 1980: 336 reports that 'the Jews founded sixty suburbs'.

⁴⁸ This was the area where after 1925, under the saint's auspices as it were, 'the Muslim neighbourhood of Shaykh Jarrah will develop around the summer villas of leading Arab families' (Wager 1988: 214).

Chapter 15

INTELLECTUAL LIFE IN LATE OTTOMAN JERUSALEM

Rashid I al-Khalidi

I

During the final half-century of Ottoman rule in Jerusalem, as elsewhere in the region, a momentous shift took place from a long-standing and stable Islamic system of justice and education, and the traditional intellectual pursuits and ways of thought that went with this system, to Western-based forms in all these domains. For centuries before this shift took place, the Islamic religious court, *al-mahkama al-shar'iyya*, near the Haram al-Sharif, had been the focus of legal affairs, and the venue for mediating many of the most important social, economic and political affairs of Jerusalem and the surrounding region. At the same time, the religious schools, the *madrasas* and *kuttabs*, around the Haram al-Sharif were the scene of the initial stages of training for a career within the Islamic legal and educational system which prevailed throughout the Ottoman empire. In the *shari'a* court, as in the schools and mosques, learned members of prominent urban families held positions of varying prestige, power and influence, often handing them down from father to son.

Within a period of a few decades, starting in the middle of the 12th/19th century, the locus of power shifted dramatically in Jerusalem and other provincial centres throughout the empire. New courts, administering laws based on Western models, and staffed by newly-trained personnel, were set up, and took over many of the legal tasks of the *shari'a* courts, which were gradually restricted to matters of personal status and inheritance. Similarly, secular schools were rapidly introduced, and became the path to positions in the new, European-style bureaucracy of the Ottoman state. As a result of these trends, the venue for

local politics, in Jerusalem and elsewhere, shifted from the courts, schools and religious institutions, which the old local élite had always dominated, to new arenas governed by a completely different set of rules. More importantly, the new dispensation decisively tipped the balance between the central government and local centres of power in favour of the former. In consequence, the influence of formerly semi-autonomous local élites in cities like Jerusalem rapidly became dependent on their relationship with the central authorities.

Given the material and other resources of these notable families, and their experience in adjusting to the realities of power over the centuries, it should not be surprising that they accommodated rapidly to this shift from a system which had been in place for many centuries, and from which they had benefited substantially, to a new one, and in doing so largely managed to preserve their standing and influence. Within a generation, most of the same families which had for centuries produced judges, teachers, officials and preachers for the old system had secured access to the modern educational institutions which were the path to positions in the new legal, administrative, educational and political order.

This chapter will trace the changes in the intellectual life of Jerusalem which resulted from these new circumstances, stressing both the important elements of continuity with the traditional order, and the rapid incorporation of components of the new one. Among the issues it will examine is how an élite, whose prestige and position had for centuries been a function of the centrality of religion in public life, reacted to the decline in the importance of religion as an organising principle of

government which followed on the administrative upheavals of the mid-13th/19th century. It will conclude by assessing how these developments, which occurred within a relatively restricted circle of the élite in Jerusalem, affected the broader populace in the city and beyond, and how they contributed to the shaping of political and cultural identity in Palestine in the late Ottoman period and afterwards.

II

During the nearly eight decades between the beginning of the Tanzimat reforms in the Ottoman empire and the end of the First World War, a profound change took place in the situation in the Arab provinces.¹ This was a function of momentous transformations in the structure and scope of government which resulted from the legal provisions of the Tanzimat, from successful efforts to strengthen the Ottoman central government, and from the intensive state-building activities of Sultan 'Abd al-Hamid II (1293-1327/1876-1909). These changes were both the culmination of a long-standing drive from within to reform and modernise the Ottoman state, and a response to external pressures which grew as the power of Western states in the Middle East grew apace. Among the spheres most affected by these sweeping changes were law and education. Both were areas where Arab notables had traditionally held a certain advantage in the Ottoman system (as they had under the Mamluks and Ayyubids before that), largely because of their command of the Arabic language. Arabic was naturally instrumental in both the mastery of all the branches of the *shari'a*, and in education, which before the 19th-century reforms was almost entirely religiously based.

Under the rapidly evolving new dispensation of the Tanzimat, education was largely secularised and brought under control of the government, which established throughout the provinces a network of state schools which taught many subjects in Turkish. Even the remaining religious schools followed the lead of government and private schools in introducing modern methods and teaching foreign languages and other non-traditional subjects. Ottoman legal institutions were transformed as well, leading to the gradual circumscription of the role of the *shari'a* courts, which had governed virtually all aspects of dispute-resolution in traditional Islamic societies (and usually also played a much broader role), as a new network of courts grew up to administer the growing system of secular, Western-influenced laws.

¹ The best analysis of the Arab notables before these changes took place remains the seminal article by Albert Hourani (1968: 41-68).

Alongside these developments, the rest of the state bureaucracy grew in size and changed radically in composition, absorbing more personnel, notably the graduates of the expanded and modernised educational system. The creation of a more powerful, pervasive and thoroughly centralised administrative system, and of an expanded and strengthened army, both benefiting from the greatly improved communications made possible by the railway, the steamship and the telegraph, enabled the central government to extend its control over broader areas of Ottoman society, and in particular over the far-flung provinces, many of which had long enjoyed a great degree of autonomy.

The impact of these measures on the Arab provinces and other remote areas of the empire in the latter half of the 13th/19th century was revolutionary. Earlier, many outlying districts had been beyond the effective control of the Ottoman government, and such law and order as existed was in the hands of local tribal, sectarian and feudal leaders. Even in provincial capitals, where the central government had always retained a presence, such as Damascus, Aleppo, Mosul and Baghdad, local notables had enjoyed a dominating position in local society, with their influence often barely mediated by representatives of the central government. As a result, their freedom of action was great, at times shading into overt insubordination, in which they might be joined by military officers and provincial officials.²

However, the new capabilities, which the development of modern state structures put at the disposal of the central Ottoman authorities, changed all of this. And with these profound changes in power relationships came a change in intellectual outlook. Under the old Ottoman order, which privileged religious learning, Arab notables were in many cases at the cutting edge of scholarship, and had great prestige because of their mastery of the traditional Islamic sciences. Arabs often reached the highest levels of the Ottoman judicial bureaucracy, serving in positions such as *Shaiikh al-Islam* and *Qadi 'Askar* of Rumelia or Anatolia, which were the pinnacle of achievement within the Ottoman religious bureaucracy.³ Centres of Islamic learning such as Cairo, Damascus and Jerusalem were visited by scholars from all over the Islamic world in search of great libraries, respected teachers, and the prestigious *ijazas* which the latter could confirm on worthy students.

After the Tanzimat, these intellectual pursuits

² For illustrations of this autonomy in several major Arab centres see Rafeq 1970; Kemp 1982; Marcus 1989; and Creclius 1981.

³ Zilfi 1988. Among them was the Jerusalemite Musa Efendi al-Khalidi, *Qadi 'Askar* of Anatolia in 1248/1832, whose daughter bequeathed the sum with which the Khalidi Library, al-Maktaba al-Khalidiyya, was established in 1318/1900.

continued, and many Arab provincial notables with an Islamic education continued to enter the Ottoman religious bureaucracy and to rise within it. However, this bureaucracy rapidly ceased to be a locus of power, and Islamic learning gradually ceased to confer prestige and status in society as it once had. Instead, Western-based scholarship was increasingly seen as the locus of true knowledge about Islam, while great prestige came to attach as well to disciplines which had been revolutionised by Western methods in the sciences and mathematics, the social sciences and the humanities, all of which were accessible only in foreign languages, or in translation into Turkish and Arabic. This in itself was a major change: heretofore, throughout Islamic history, Arabic had been the medium of scholarly interaction in many fields of intellectual endeavour in the Islamic world, notably religion and law, with Persian paramount in literature and *belles-lettres*, and Turkish in government. Suddenly, a new situation obtained, in which it was not Arabic, Persian, and Turkish, but rather French, English, and German which were the languages in which the vital intellectual issues of the day were being pursued.

This situation on the intellectual plane changed as the balance of power between the Ottoman empire and the European states changed, as the latter encroached ever more aggressively on the Ottoman dominions. Previously, it had been possible for Arab and other Ottoman notables to look down on Europeans, and to assume that while the latter had benefited from certain material advances, on the cultural plane they remained inferior, and indeed objects of contempt. An example of this traditional attitude can be found in the message sent by the governor of Gaza to the *qadi*, the military commanders and the notables of Jerusalem, warning them that Napoleon's army had reached the outskirts of Palestine in 1213/1799. The contemptuous language used to describe the French is revealing: they are called: *kuffar al-faransa al-mala'in, damarrahum Allah ajma'in* ('the damned French infidels, may God destroy them all').⁴

This attitude was modified as time wore on, with Europe's achievement of a decisive ascendancy over the Ottoman empire, and the attendant shifts on the intellectual plane. As members of notable families acquired Western educations or were trained in Western-influenced state, missionary and private schools, they came to value Western intellectual traditions. Thus we see a member of one of these Jerusalem families, Yusuf Diya' al-Din al-Khalidi, lamenting in the conclusion to his 1298/1880 edition of the verse of the *jahili* poet Labid ibn Rabi'a that not one Arab scholar answered an appeal he published in the leading Arabic-language journals of the time,

al-Jawwa'ib, al-Finan, and Hadiqat al-Akhbar, asking for help in collecting the poetry of Labid (1880: 148-9). By contrast, foreign scholars of oriental languages had been generous in providing him with material. Although he concludes with the hope that the Arabs would soon regain their former glory, it is clear that for al-Khalidi, and many of his contemporaries, it was now towards Europe and European science that one had to look for true scholarship.

There was, however, a continuity between the old and new scholarship, as can be seen from an examination of the holdings of family libraries in Jerusalem such as al-Maktaba al-Khalidiyya and al-Maktaba al-Budairiyya, and the Aqsa library, which groups together a large number of formerly private collections.⁵ Catalogues of the latter two libraries show continued copying of religious, historical and literary manuscripts into late in the 13th/19th century, at a time when printed books were first being introduced. It is clear from such an examination that traditional Islamic scholarly pursuits still retained at least some of their vitality. Thus of the 255 manuscripts of the Aqsa Library which have been catalogued and bear a date of copying, 39 were copied in this period, the majority of them after 1267/1850.⁶ Similar results are emerging from the ongoing cataloguing of over 1,200 manuscripts of al-Maktaba al-Khalidiyya.⁷

Also revealing in this context is the appearance of printed editions of classic texts in these libraries. An examination of the contents of al-Maktaba al-Khalidiyya shows that even while the copying and collection of manuscripts continued, the members of the family whose personal libraries went to make up this collection were also buying copies of the printed texts of the major works of the traditional Islamic sciences.⁸ In the field of history, the oldest printed edition in this collection is a single copy of the 1274/1857 Cairo edition of Ibn Khaldun's *al-Muqaddima*.⁹ More significantly, the library contains five

⁵ The Aqsa Library includes three main collections: that of Dar Kutub al-Masjid al-Aqsa; part of the library of al-Shaikh Muhammad al-Khalili; and part of the library of al-Shaikh Khalil al-Khalidi. The author examined it and both family libraries mentioned during research in Jerusalem in 1991-93.

⁶ This can be deduced from the two-volume work edited by Khadr Ibrahim Salameh, Director of the Library, in 1980 and 1983.

⁷ Undertaken by Dr Nazmi al-Ju'beh, this was completed in 1998, and will soon be published. The manuscripts in al-Maktaba al-Budairiyya were mainly collected by Shaikh Muhammad ibn Budair ibn Hubaish (d. 1220/1805), and only a few were added after his death; many of these additions, however, date from the late 19th and early 20th centuries, according to the two-volume catalogue compiled by K I Salama (1987).

⁸ The printed books in this library have not yet been catalogued.

⁹ This was a one-volume edition of *al-Muqaddima*, without the remaining volumes of the author's *Kitab al-I'bar*. There are many older Arabic and Turkish-language printed books in the library in other fields.

⁴ The original document is located in the Khalidi Library and is dated 27 Rajab 1213/4 January 1799.

sets of the 7-volume 1284/1867 Bulaq edition of Ibn Khaldun's *Kitab al-I'bar* in its entirety, including the *Muqaddima*; three sets of the 1283/1866 Bulaq edition of al-Kutubi's *Fawat al-Wafayat*; two of the 1284/1867 Cairo edition of al-Muhibbi's *Khulasat al-Athar*; four of the 1286/1869 Istanbul edition of Abu 'l-Fida's *Ta'rikh*; three of the 1291/1874 Bulaq edition of al-Muradi's *Silk al-Durar*; two copies of the 1297/1879 Cairo edition of al-Jabarti's *'Aja'ib al-Athar*; four of the 1299/1881 Bulaq edition of Ibn Khallikan's *Wafayat al-A'yan*; and four of the 1303/1885 Cairo edition of Ibn al-Athir's *al-Kamil fi'l-Ta'rikh*.

The significance of the existence of multiple copies of these earliest locally printed editions of major Islamic historical works is clear: several members of the al-Khalidi family considered it important to obtain printed versions of works, which in many cases they owned in manuscript, in order to benefit from the relatively modern scholarship which these new editions represented. This is a striking example of the shift in the intellectual sphere which this period witnessed. Even as some members of this family continued to pursue the traditional religious sciences (the library contains numerous multiple copies of printed editions of basic reference works in the religious sciences by authors such as al-Bukhari, Muslim, Qastalani, and al-Tabari, which constitute a far larger proportion of its total holdings than the historical works), others were becoming interested in history and other subjects which, although traditional in some respects, were increasingly influenced by Western scholarship and methodologies. This can be seen not only from the large number of standard Islamic history works in new editions, but also from the many works of contemporary European orientalist scholars in the library, ranging from Renan, Dozy, Carra de Vaux, Muir, and de Goeje, to E G Browne, Margoliouth, E J W Gibb and Massignon.¹⁰

Perhaps linked to this renewed interest in Islamic history, whether based on traditional sources or more recent European scholarship, was an involvement in the *salafi* tendency, with its concern for the revival of Islam, a return to the original sources of religion, and the modernisation of Islamic society.¹¹ All of these interests are apparent in the holdings of printed books, periodicals and pamphlets in the Khalidi library. One of the most important leaders of the *salafi* movement in Syria, al-Shaikh Tahir al-Jaza'iri, who founded the Zahiriyya Library in Damascus, played an instrumental role in helping to found al-Maktaba al-Khalidiyya, and was present at its

formal opening, as is evidenced by a contemporary photograph.¹² Several of his books, some in multiple copies, are found in the library, together with the writings of other *salafis* such as al-Sayyid Rashid Rida, fourteen volumes of whose periodical *al-Manar* are among its holdings.

Numerous other Islamic reformers were also close to several of the men whose collections went into the library, notably Muhammad 'Abdu, one of whose autographed works is in the collection, and al-Sayyid Jamal al-Din al-Afghani, whose photograph, with a warm autograph to his close friend Yusuf Diya' Pasha al-Khalidi, is in the library collection.¹³ The brother of Yusuf Diya', al-Shaikh Yasin, was also a friend of the leading Tripoli *salafi shaiikh* and reformer, Husain al-Jisr, founder of al-Madrasa al-Wataniyya in Tripoli, whom Yasin met when he was *qadi* there. Several of al-Jisr's books are in the library, which has three copies of one of them; these originally belonged to different members of the family.¹⁴

Linked to this *salafi* tendency was an apparent interest in the writings of European positivist authors, especially the popularisers among them. One of those who caught the fancy of the generation which came to maturity in the late Ottoman period was the prolific French writer Dr Gustave le Bon. His books on the development of civilisations, the evolution of peoples, and political psychology found a wide audience in the Middle East, and were translated into Arabic by such literary figures as Taha Husain, Ahmad Fathi Zaghlul Pasha, and 'Abd al-Ghani al-'Uraisi, and into Turkish by 'Abdullah Jevdet. It is therefore not surprising to find six of le Bon's works in the Khalidi Library, five in translation and one a lavishly bound French-language volume, *La Civilisation des Arabes* (1884).¹⁵

III

Whatever the importance of the books in such libraries and the scholarship which went into them, these things were restricted to a limited segment of society, even if there was

¹⁰ In 1918, Louis Massignon visited the library and donated an inscribed copy of his edition of al-Hallaj 1913. The names of 'ulama' and Western scholars listed in the visitors' book of the library indicate the role it played in the intellectual life of the city in the first decades after its establishment.

¹¹ Perhaps the best work on the *salafi* movement in a specific context is Commins 1990.

¹² On al-Jaza'iri, see the article by Joseph Escovitz (1986: 293-310).

¹³ The work by 'Abdu, one of many in the library, is his report on the reform of the *shari'a* courts in Egypt, with an introduction by Rashid Rida (1317/1900). It is inscribed by 'Abdu to Yusuf Diya' Pasha al-Khalidi. Al-Afghani's inscription (he signs himself 'Jamal al-Din al-Asadabadi') on the reverse of his photograph is very complimentary to Yusuf Diya'.

¹⁴ Al-Jisr, n.d. Multiple copies also exist of al-Jisr, 1305/1890.

¹⁵ This volume was dedicated to Yusuf Diya' Pasha al-Khalidi in Istanbul in 1888 by a former student with the inscription 'Resurgat Arabia!' The other works by le Bon in the library are: 1908; 1909a; 1909b; 1341/1923; 1925.

the likelihood of a certain 'trickle-down' effect over time. The crucial elements in the shift, from a well-established intellectual pattern restricted to a small élite to a new one influenced by European models and involving larger numbers of people, were the steady growth of new social formations, classes and professional groups, and the impact of major new institutions established after the Tanzimat began. The new schools founded to teach foreign languages and modern science and mathematics, as well as some traditional subjects, were particularly important, partly because they had an influence far beyond the narrow bounds of the existing élite.

Unlike the new courts and administrative structures, which were in large measure initially filled with personnel brought in from the outside and followed a fixed pattern set by the centre, the new schools were mainly staffed with local teachers, frequently differed from one locality to another, and were often established as a result of local initiative. This was not initially true of missionary schools, although they did eventually have local as well as foreign teachers, but it was the case for state schools and the many private schools which were set up all over the Arab provinces in response to the desire for access to education of those Muslim families wary of missionary schools, and whose needs could not be met even by the rapid expansion of the state system.¹⁶

The need for such schools can be seen from figures provided in the Ottoman *salnama* for 1288/1871 for the *vilayet* of Syria, which at this time included Jerusalem. For a Muslim population of the city listed as 1,025 households, there were seven schools with 341 students, while the Christian and Jewish populations of 738 and 630 households respectively had between them nineteen schools with a total of 1,242 students.¹⁷ If one assumes that there were six children per household, half of them of school age, it follows that while only about one tenth of Muslim children in the city of Jerusalem had access to schools, over one quarter of non-Muslim children had such access. According to another source, around the turn of the century there were 35 local Christian and missionary

schools in Jerusalem with over 2,200 students and more than 150 teachers (Landman 1984: 93-5).¹⁸

Although the Ottoman state established many schools towards the end of the 13th/19th century, there were never enough places in them to meet the demand for education.¹⁹ Numerous private schools were eventually set up in Jerusalem to meet this deficiency. One of them was Raudat al-Ma'arif al-Wataniyya al-'Uthmaniyya al-Islamiyya, founded in 1324/1906 (*Barnamij* 1331/1912). It was typical of such schools in a number of respects, having been founded by a cleric, Shaikh Muhammad al-Salih, but also in having a number of young men with Western educations from well-known families as teachers of modern subjects: thus we find the names al-'Alami, Dajani, Husaini and Nusaibeh among the teachers (as well as four foreign women who taught languages). The school was also typical in having leading notables as members of its board of directors, in this case the *mufti*, Muhammad Kamil Efendi al-Husaini, and the parliamentary deputy for the city, Sa'id Beg al-Husaini. The name of the school indicates the different cultural tendencies which the school embodied: patriotic, Ottoman and Islamic. In this too it was characteristic of many such schools.

A similar response to the growing demands of the population of Jerusalem for more and better education can be seen in the expansion and transformation of the school of the Church Missionary Society (CMS) in 1322/1904 from a free school, established about 30 years earlier to teach religion and train missionaries, into a fee-paying preparatory school designed to feed students into the Syrian Protestant College in Beirut (later renamed the American University of Beirut), the most prestigious of the Protestant missionary institutions in the Arab world. The pamphlet which announces these changes in the structure and syllabus of the CMS school stresses in its introduction that circumstances had changed in the country: 'These days in the eyes of the citizens knowledge is given greater importance and its benefits are more appreciated. As a result, parents of every class are more eager to educate their children in the most modern ways, and want the doors to be

¹⁶ These included institutions such as al-Madrasa al-Wataniyya established by Butrus al-Bustani in 1285/1868, the schools set up by Jam'iyyat al-Maqasid al-Khairiyya, which was established in Beirut in 1295/1878, al-Madrasa al-Hamidiyya, set up in Tripoli in 1313/1895, the famous Maktab 'Anbar in Damascus, and many others. Some were short-lived, and others came under state control, but there was a constant proliferation of such schools during the last half century of Ottoman rule in the Arab provinces.

¹⁷ These figures are from *salnama* 1288/1871: 149-50 which does not give a break-down of the non-Muslim schools or students. This volume is nevertheless a very valuable source on Palestine and other parts of Syria for this period, containing much more data than do most other provincial *salnamas*.

¹⁸ Tibawi notes (1956: 20) that for all of Palestine in 1914 there were 95 elementary and three secondary schools with a total of 234 teachers and 8,248 pupils, 1,480 of them girls. He adds that according to Ottoman government estimates, there were also 379 private Muslim schools with 417 teachers and 8,705 pupils (only 131 of whom were girls).

¹⁹ This was a constant problem: according to Raqiyya al-Khalidi, who started school at the end of the Ottoman period, there were never enough places in the government or private schools for girls in Jerusalem. She herself attended both types of school in this period (interview, Jerusalem, October 7, 1993). An article in a Jerusalem paper (*al-Munadi* 1912: 1-2) paints a fascinating picture of the educational system in Palestine, calling for the implementation of the Ottoman constitution's promise of free universal primary education.

opened for them to learn foreign languages and science ...' (*Jam'iyyat al-Tabshir al-Kanisiyya* 1904: 2).

Of the other loci for the intellectual life of the last few decades of Ottoman rule, perhaps the most widespread in its impact on society was the press, both periodicals and daily newspapers. It has been argued that one cannot deduce too much from the press: we can read what is written in it, but we cannot be sure who was reading it, or what impact it had.²⁰ Whatever the merits of this argument, we can deduce certain things if we find how widely distributed a given organ of the press was. Ideally this would mean circulation figures, and even lists of subscribers, to establish a full picture of the range and scope of the newspaper or periodical. Such luxuries are unfortunately rarely available to the modern historian of the Middle East, but there is a substitute in our case: this is the holdings of periodicals in private libraries.

What can be deduced from the three libraries which have been examined in Jerusalem, two of them grouping together at least three separate collections, is clear. In al-Maktaba al-Khalidiyya, for example, we find copies, usually bound and often multiple, of late Ottoman periodicals, such as Ahmad Faris Shidyaq's *al-Jawa'ib* (founded in Istanbul in 1277/1860); Butrus Bustani's *Finan* (Beirut, 1286/1870); Ya'qub Sarruf and Faris Nimr's *al-Muqtataf* (Cairo, 1294/1877) and later publications such as Jurji Zeidan's *al-Hilal* (Cairo, 1309/1892); al-Sayyid Muhammad Rashid Rida's *al-Manar* (Cairo, 1315/1897); and Muhammad Kurd 'Ali's *al-Muqtabas* (founded in Cairo in 1324/1906 and two years later moved to Damascus).²¹ While each of these periodicals had a different focus—that of *al-Jawa'ib* and *al-Manar* tended to be religious, while the other four were more secular in orientation—all attempted to describe and interpret for their readers the latest developments in science and industry, to reassess Islamic and Arab history, and to examine the reasons for the rise of the West and the relative weakness of the Islamic world.

That this collection is not exceptional can be seen from the periodical holdings of the Aqsa Library, which contains runs of most of the same publications as in the Khalidi Library, like them frequently in fine old leather bindings and often carrying an indication of who the original owner was. It contains a forty-year run of *al-Muqtataf*, a thirty-year run of *al-Hilal* from the first issue, and similar runs to those in the Khalidi library of *al-Manar*

and *al-Muqtabas*.²² These two collections of the most important of the first Arabic-language periodicals, made up of volumes which largely predate the formation of both of the libraries in question, were both established out of the private collections of several different individuals. They constitute evidence of a deep interest on the part of these individuals, and presumably others like them, in the newest writings on both Western science, history and politics, and Islam, Arab history and Middle East politics.²³

This interest can be followed in a different manner in the daily press, which in turn broadcast it to a wider audience than had access to such periodicals. Through serialisation in daily newspapers, much of what was published in *al-Hilal* and *al-Muqtabas* in particular, was thus accessible to a broader readership, together with the news of the day. Such papers as *al-Mufid* in Beirut, published by 'Abd al-Ghani al-'Uraisi, *al-Muqtabas* in Damascus (the daily newspaper, with the same name as the periodical, and also published by Muhammad Kurd 'Ali), *al-Karmil*, published in Haifa by Najib Nassar, and *Tarablus al-Sham*, published in Tripoli by Muhammad Kamil al-Buhairi, regularly reproduced over a number of issues periodical articles by leading *salafi* thinkers, as well as historical, literary and scientific pieces. Like many newspaper and periodical editors, Kurd 'Ali, Nassar and al-Buhairi each owned a press which published books by some of these same authors.²⁴ Rashid Rida had the same arrangement in Cairo with the press of his periodical *al-Manar*.

This practice was also followed by some publishers of newspapers and periodicals in Jerusalem. Two years before he began to publish the newspaper *al-Quds* in 1326/1908, Jurji Hananiyya had established a printing press and publishing house. Khalil Baidas, the publisher of the periodical *al-Nafa'is al-'Asriyya*, also published pamphlets and the occasional book (he used the printing presses of Jerusalem's Dar al-Aitam), while Muhammad Hasan al-Budairi, publisher of the short-lived newspaper *Suriyya al-Janubiyya*, and his cousin Muhammad Kamil al-Budairi, publisher of another daily, *al-Sabah*, used to publish books and pamphlets on the press their papers were printed on, which was located in a room adjacent to

²² Library holdings of *al-Muqtataf* are continuous from vol. 5-57; *al-Hilal* from 1-31; *al-Manar* from 1-22; and of the shorter-lived *al-Muqtabas* from 2-7.

²³ Ruhi Beg al-Khalidi was a contributor, under the pseudonym 'al-Maqdisi', to *al-Hilal* and a number of other periodicals and newspapers, while he was Ottoman consul-general in Bordeaux. In 1320/1902-1321/1903, for example, he published a series of studies of Victor Hugo and European and Arab literature in *al-Hilal*. The standard work on Ruhi al-Khalidi is al-Asad 1970.

²⁴ Al-Buhairi's press was *Matba'at al-Balagha*, where among other things he printed collections of articles from his newspaper.

²⁰ This refers notably to comments made at a 1986 Columbia University conference on early Arab nationalism (Khalidi 1991: ix).

²¹ The Khalidi library has seven years of *al-Jawa'ib*; eight years of *al-Finan*; 26 years of *al-Muqtataf*; eight years of *al-Hilal*; 14 years of *al-Manar*; and six years of *al-Muqtabas*. All are bound, and are additional to a large number of incomplete volumes of these and other periodicals.

the Haram al-Sharif which today houses al-Maktaba al-Budairiyya.²⁵ On balance, however, Jerusalem in the late Ottoman period was too small a market, and too provincial a city, to be a major publishing centre, and instead largely depended on the newspapers, periodicals and book publishers of the cities of the Palestinian coast, Jaffa and Haifa, those of the Syrian littoral and interior like Beirut and Damascus, and the major regional centres, Cairo and Istanbul.

There were nevertheless several newspapers published in Jerusalem during this period, although many of them were relatively short-lived. Notable among them were the official *al-Quds al-Sharif/Quds Serif*, Jurji Hananiyya's *al-Quds*, Iliya Zakka's *al-Nafir*, Sa'id Jarallah's *al-Munadi*, Jamil al-Khalidi's *al-Dustur*, and Bandali Mushahwar's *Bait al-Maqdis*.²⁶ We can assume that, owing to the limitations of their printing facilities, the press runs of most daily newspapers in the region were small, and that their readership was limited. Indeed, most of them only came out once, twice, or three times a week, and we know that the size of the newspaper-reading public was severely restricted by widespread illiteracy and poor transportation outside the urban centres.

Nevertheless, a number of factors have to be weighed against these constraints in measuring the influence of the press in this early period. The first is that newspapers were commonly circulated from hand to hand, or posted in public places. The Khalidi Library subscribed to a number of them, and we can assume that they were available to all those who used it. We know from a number of sources, moreover, that people were accustomed to having the newspapers read aloud to them at home and in public places, meaning that, while the low level of literacy was a barrier to the influence of the press, it was not an impermeable one. In addition, people in this era were accustomed to news reaching them after a delay, particularly outside the cities. Thus, news in a paper which reached a distant town or village days late was still

devoured eagerly by the reading and listening public.

There are in addition various indications in the press itself and elsewhere of its growing influence in Palestine and other parts of the Arab world as time went on, particularly in the larger cities. One of them was the tendency of those in authority to close down newspapers when they published articles which offended them, a step which surely would only have been taken because these papers had some effect on their readers. One of the most forceful instances of the impact of the Palestinian and Arab press was the role newspapers played in the opposition to the Zionist movement, a fact recognised by both Zionists and Palestinians at the time, and amply demonstrated in the available issues of the pre-First World War Jerusalem daily press.²⁷

There were other important centres for intellectual life in Jerusalem at the end of the Ottoman period, such as political parties and organisations, and religious and social clubs. We can follow some of their activities through the press, and it is clear from even a superficial examination of its coverage of these domains that while Jerusalem was by no means as active a centre as were larger cities in the Ottoman Arab provinces, previously unheard-of types of political and social organisations there were growing apace.

It remains to mention the circles around foreign diplomats, scholars, and missionaries, and the growing institutions of the Jewish *Yishuv* in Palestine, which were also the foci of much intellectual activity. However, it appears that these were largely isolated from most of the rest of society, and thus had a relatively limited impact on the intellectual and cultural life of most of the indigenous inhabitants of Jerusalem (except via the medium of schools run by Christian missionaries and the Alliance Israélite Universelle, which attracted many Christian and Muslim students), although some members of the élite were undoubtedly influenced in some measure by their contacts with both foreigners and Jewish settlers in this period.²⁸

IV

As we have seen, Jerusalem and the rest of Palestine were in a nearly constant process of transition during the last half-century of the Ottoman period. As these

²⁵ *Suriyya al-Janubiyya* began publication in 1338/1919, and lasted for under two years; after it was closed by the British authorities, *al-Sabah* was founded in 1340/1921. The same press may have been used to publish a paper in the Ottoman period, but the evidence is unclear.

²⁶ *Al-Quds al-Sharif/Quds Serif*, which was printed in Arabic and Turkish on opposite sides of the page, was first published from 1320-5/1902-7, and then resumed publication in 1332/1913. *Al-Quds* was founded in 1326/1908 and continued publishing through the rest of the Ottoman period. *Al-Nafir*, founded in Alexandria by Ibrahim Zakka, was moved to Jerusalem in 1326/1908, and then to Haifa in 1332/1913. *Al-Munadi*, founded in 1331/1912, published until the outbreak of the war, as did *al-Dustur*, founded in 1332/1913. *Bait al-Maqdis*, founded in 1326/1908, seems to have appeared irregularly thereafter, only to reappear after the war, together with the papers mentioned in n. 25 above. For more on the Palestinian press during this period, see Khuri 1976.

²⁷ Not all papers were anti-Zionist. While *al-Munadi* frequently attacked the Zionist movement fiercely, *al-Quds* was generally silent on the subject. Most other Palestinian papers, notably *Filastin* and *al-Karmil*, were strongly opposed to Zionism. For more on this subject see Khalidi 1982.

²⁸ The Khalidi Library contains a number of elementary Hebrew language books, most of them belonging to Yusuf Diya' Pasha and his nephew Ruhi Beg al-Khalidi. See Khalidi 1994 for details on both men.

transformations in government, administration, education, justice, communications and transportation took place, and as the security situation in the country improved, the population grew, and the economy responded positively to these changes and to the blessings of the last lengthy period of uninterrupted peace in the country's modern history. Although the first signs of the Palestinian-Zionist conflict, which was to consume the country for most of this century, were already apparent, notably in the press and in those parts of the countryside where Zionist settlements founded in the wake of the second *'aliya* had expanded at the expense of the indigenous peasantry (see Khalidi 1988), it is unlikely that more than a few prescient contemporary observers would have pointed to this as the issue which would completely dominate the future of Palestine.²⁹ Most others would probably have looked to the momentous changes on which we have focused for clues to the future.

In the intellectual realm, much had changed, although some things stayed the same. While under the Tanzimat, religion had lost much of its centrality to the processes of governance, and the religious institution was marginalised as a pillar of the daily administration of justice and much else, in the period of Sultan 'Abd al-Hamid popular religion was perceived by the Ottoman authorities as a useful tool of legitimacy and control (Schölch 1994). On the local level in Jerusalem, this shift back towards religion, albeit a religion robbed of much of the substance of power, meant a shift by the state away from favouring the families, such as the Khalidis, associated with reform in government and liberal *salafi* thought in religion, and towards favouring those like the Husainis with a more conservative intellectual and political bent, and an involvement with popular religion. After the 1326/1908 Constitutional Revolution, this trend of state reliance on more conservative notables was temporarily halted, but it was to be resumed during the British mandatory period.

One of the other crucial changes of this period, however, was that these issues of infighting among the notables mattered less, as the intellectual sphere was no longer the exclusive preserve of such families, although they were adept in maintaining much of their old influence in the very different new circumstances. Now, hundreds of educated individuals were needed as teachers, government officials, military officers, journalists, telegraph operators and railway employees, all professions which either did not exist before or had changed and expanded greatly: thus, as we have seen, in Jerusalem around 1318/1900, Christian and missionary schools employed over 150 teachers, most of them locals. Elsewhere, in Beirut, the Syrian Protestant College alone in 1330/1912 employed 34 local instructors, exclusive of foreigners (Syrian Protestant College 1913). This massive expansion of opportunities for access to prestigious positions gave scope to individuals of both non-notable and non-Muslim backgrounds to achieve status.

At the same time, the economic expansion, which half a century of peace, rapid population growth and improvements in security, communications, and transportation had made possible, opened up opportunities for many individuals of these and other backgrounds to prosper. Not surprisingly, Jerusalem and the rest of the country were as a result in a state of ferment which increased in the years leading up to the First World War. As the Ottoman era in Palestine ended with the capture of Jerusalem by Allenby's troops in 1337/1917, there passed with it not only sovereign dominion—transferred from one power to another—but also possibilities of autonomous development for the indigenous population, and of untrammelled economic, social and intellectual interaction between Palestine and other parts of the region. These possibilities were not to be replicated for many decades, and indeed perhaps not until the present day have they even been approximated.

²⁹ There were those who clearly foresaw the struggle to come. Among the first was Negib Azoury 1904. Others who looked with foreboding to the growth of the Zionist enterprise in Palestine included a number of Palestinian writers and political leaders, such as the journalists Najib Nassar and 'Isa al-'Isa, editors of *al-Karmil* and *Filastin* respectively, and the deputies Ruhi al-Khalidi and Sa'id al-Husaini.

Chapter 16

THE COMMERCIAL LIFE OF OTTOMAN JERUSALEM

George Hintlian

At no time in its long history can Jerusalem be described as a commercial centre of any significance, nor can it be said that, like Damascus or Cairo, it served as an entrepôt famous for its *dar al-wakalas* (warehouses). Its importance has always lain rather in its constellation of holy sites, mushrooming over the generations in every direction, and as a focus of pilgrimage. The life of the inhabitants has always revolved around these holy places, and they have seen their primary task as catering to the needs of the visitors. The Ottoman period was no exception, and towards the end of the 19th century the city saw the transformation of the sacred 'duty' of pilgrimage into the 'industry' of tourism.

In the first period of Ottoman domination, in the 16th century—the age of Selim and Sulaiman—the Porte accorded greater importance to Jerusalem by virtue of the fact that it was a holy city. The city walls were rebuilt and renovations were carried out at the Dome of the Rock, and a whole hierarchy of Ottoman officials was instituted with titles similar to those in the capital. In the same way, there was more human traffic to the Holy Land and increased commercial activity. The study undertaken by Cohen and Lewis (1978) elaborates on this aspect. The authors include mention of Suq al-Dawab (the animal market), the *dar al-wakalas* of *ghalla* (huge warehouses for grain), and agricultural produce, which was primarily olive products and cotton. They devote an entire section to olive-oil and soap production, writing of an 'active export of soap from Jerusalem to Egypt through the port of Gaza' (Cohen and Lewis 1978: 55).

In the following centuries (17th–18th), the Ottomans paid scant attention to Jerusalem in its status of

a remote province. There were fewer visitors to the holy city, and a marked deterioration in security on the roads, with a consequent decline in commerce and income. Jerusalem survived as a modest city, its agricultural needs catered for by the surrounding villages, while, for the immediate needs of the inhabitants, there were the local craftsmen. Despite this economic decline, we find a smoothly-functioning guild-system, which continued well into the 19th century.

In a two-volume publication, Atallah (1991) has examined the documents from different guilds in 17th-century Jerusalem. For the first time, we have an insight into these craft corporations and associations, which had extensive powers to police prices as well as quality, to take individual members to court, and to supervise and tax the craftsmen. Equipped with full guild regulations, the associations created a system which had its own rewards and penalties. The *shaikh*, chief or elder, of the guild was responsible for the initiation ceremonies by which new masters were inducted. Guilds grouped craftsmen and shopkeepers who practised the same trade in the same locality, irrespective of religion.

It will be useful to compile an inventory of some of the guilds which functioned in Jerusalem around 1688—the guild of *attiba' wa jarrahin bi salahiyya bimaristan*: doctors and surgeons; *bayatira*: veterinary surgeons; *dabbaghin*: tanners; *iskafiyya*: shoemakers; *haiyakin*: weavers; *tahhanin*: millers; *khaiyatin*: tailors; *dallalin*: public criers; *qazzazin*: glassmakers; *muza'inat*: women's hairdressers; *hammali mauta*: porters of corpses; *tarrabin*: carriers of earth; *saqqa'in*: water-carriers; *sallakhin*: sheep-skinners; *shamma'in*: candle-makers; *sabbaghin*: dyers;

suyyagh: goldsmiths; *sakakiniyya wa suyufiyya*: knife-makers and swordsmiths.

The documents in Dr Atallah's book furnish a wealth of information on other aspects of commercial life. For example, Document no. 26, dated 27 July 1604, indicates the cost of the production of soap and its transport from Jerusalem to Egypt. Seven soapmen of Jerusalem complained of losses incurred by them in the transport of soap by camel to Egypt via Gaza, and they requested an equitable solution (Atallah 1991 1: 41-4). In Document 408, dated 28 November 1642, the names of mills and millers in Jerusalem are mentioned (Atallah 1991 2: 26-7), while in Document 444, dated 1 November 1632, two merchants of Jerusalem—Shahin ibn 'Abd al-Rahman and Mahmud ibn al-Hajj Alawan—are mentioned by name; they went to Saida to buy wool and brought it back to Jerusalem where it was sold (Atallah 1991 2: 61).

Let us now take an imaginary stroll through the markets of late 19th-century Jerusalem. If we approach the Jaffa Gate (Bab al-Khalil), we find villagers selling their produce in the trench or moat of the Citadel, which was popularly known as the *khandaq*. Later the municipality was obliged to clean up the 'trench' and move the vendors on. On the street in the open air, we find peasant charcoal merchants. As we descend the Suwaiqat Allun we find shops filled with choice fruits and sweets. Further down on the same street the polyglot money-changers (*sarrafs*) are stationed, sitting with their small tables and with boxes covered with wire-netting and filled with coins. There was no constant rate of exchange and the *sarrafs* dealt in all currencies, whether the Ottoman *majidi* or the English sovereign, and they would accept a Russian imperial, an Austrian ducat, or Maria Teresa gold coin. Then, before continuing on to the main bazaar, let us turn left into Christian Quarter Road where the first section is known as the Mar Yuhanna Maqtu' al-Ra's (St John the Beheaded). Here they sold, among other things, buttons, threads and colourful ribbons. New brides did their shopping here.

A little further, on the staircase leading to the Coptic Khan, was the site of the saddlers (*sarraj*). Turning right on Christian Quarter Road, we come to the Suq Aphtimos, named after the Greek Archimandrite, which was also known as Suq al-Jadid, or the New Market. Towards the end of the 19th century, Aphtimos founded this huge commercial centre, where the first-class tailors and cloth merchants were located. It was common practice for many cloth merchants to hire pedlars to sell clothes by transporting them on their shoulders. The shops leading to the Holy Sepulchre and the square before it were the province of vendors of Christian pious objects, like crucifixes, rosaries and incense.

At the end of Suwaiqat Allun, we come to the main vegetable and fruit bazaar (Suq al-Khudra'). The *khudarji* (greengrocer) had to rise early to waylay farmers bringing

their produce into the city. The place teemed with villagers in colourful, embroidered dresses. The *simsars* or middlemen—in this case acting for the *khudarji*—would meet the villagers on their way to the bazaar and complete the wholesale transaction.

Behind the bazaar lay the Suq al-Dabbagha, or the Market of the Tanners and the *sabbaghs* (dyers), who were easily identified by their blue hands. After 1860 the tanners were moved out to another location, beyond the walls near the Silwan spring, because the foul smell from the tannery polluted the heart of the city. Turning right off Suwaiqat Allun, we find ourselves in the Street of the Chain, a section of which was called Tariq al-Dallal, the Street of the Public Criers. When something was advertised, or the loss of an animal or object was announced, the crier was known as *munadi* or *munnabih*. The term *dallal* referred to his work as a commission agent, broker. One well-known *dallal* of the 19th century was called Abu 'Id al-Dallal.

To the east of the main vegetable bazaar lay the most famous of the markets—the renowned triple market reputed to have been founded in the 12th century by Queen Mélisande. It is a remarkable fact that the location and function of the main *suqs* in Jerusalem have not altered since the time of the Crusaders. For example, exactly the same type of trade takes place now in the triple market as during the previous eight hundred years of its existence. These three covered markets are intercommunicating and run parallel to each other. The first was (and is) Suq al-Lahhamin (the Butchers' Market); at its northern extremity was the line of shops of the *nahhasin* and *tanakjiyya* (coppersmiths and tinsmiths), and those of the *jawalda* (leather-workers). The middle street was known as Suq al-'Attarin, the Market of the Apothecaries or druggists, who sold spices, saddlery, herbs, ropes, gunpowder and hunting materials. Suq al-Khawajat, sometimes also known as Suq al-Tujjar, was where goldsmiths, drapers and *hallajs* (cotton-carders) were found. Yet another name for this market was the Suq al-Munjidin (Market of the Cotton-threshers).

As we emerge from the northern end of the herb market, we enter one of the longest streets of the Old City, leading to the Bab al-'Amud (Damascus Gate). This is the street known as Khan al-Zait on account of its oil-presses and soap factories. In 1847 there were ten workshops making soap in Jerusalem; later this figure was reduced to only seven, employing a total of sixty-seven workers, because Nablus developed into a more important centre for the production of soap. At Bab al-'Amud, we find the grain-merchants with their camels, bringing produce to the city from Transjordan. The *najjars* (joiners or carpenters), *skafiliskafiyya* (shoemakers) who made shoes of red and yellow tanned sheep-skin, and the *sammans* (grocers) were dispersed throughout all the streets. The coffee-shops (*qahwas*) were to be found usually at the corner of one of

the more important streets, or, above all, near the city gates.

After 1860, many of the activities previously contained within the Old City spilled out beyond the city walls, and the centre of commercial activity moved to outside the Bab al-Khalil (Jaffa Gate). Just beyond the gate were the *arabajiis* (carriage-drivers). In the summer of 1910, the municipal authorities required the carriage-drivers to display copper plates on their coats. It is recorded that ninety of these plates were prepared for Jerusalem, thirty for Bethlehem, and ten for Ramallah (Yehoshua 1977: 84-5). There were three popular coffee-houses just outside Bab al-Khalil—the Bristol (against the city wall), Qahwat al-Ma'araf and Qahwat al-Bank. Along the length of the wall and facing it were two long lines of shops—photographers, rug-dealers, and the European market, where it was possible to find alcohol, quality cheeses, biscuits and other delicatessen items. Certain of these grocers were known as *baqqal al-ifranji*. Near Bab al-Khalil stood the biggest banks—the Anglo-Palestine Bank, Banque Crédit Lyonnaise, Anglo-Egyptian Bank and, opposite the Citadel, the Banco di Roma.

Before the 19th century, Jerusalem served as the market town for the region, and its population was never higher than ten thousand. It was a city with modest needs and potential, and anything produced there was intended for local consumption. It had no adequate medical services or printing presses. As Baedeker recorded in 1876 '... Jerusalem possesses neither manufactories nor wholesale trade worthy of mention' (Baedeker 1876/1973: 96). It was an isolated city with almost no trading or cultural links with the outside world. At times, the city's government was dependent on the governor of a larger city like Gaza, Acre or Saida. Water shortages were chronic and this, compounded by the absence of proper hygienic conditions, led to frequent outbreaks of disease. There was, for example, a major cholera epidemic in 1865, which claimed at least 2,000 lives. It was so frightening that according to the report of the Austrian consul 'the Pasha of Jerusalem escaped to the mountains with his army for fear of cholera, leaving behind forty soldiers within the walls in order to guard [it]' (Eliav 1985: 135-42). Most of the streets were unpaved, including the roadway inside the Bab al-Khalil. In 1864, prisoners were brought from the common jail and set to paving the roadway (Hanauer 1910: 5)

A visitor to the city in the 19th century has left a vivid description:

As the sun goes down over Soba, four of the five gates now used by the people of Jerusalem are closed and barred. These are: the Damascus Gate on the north, St Stephen's Gate, Dung Gate, Zion Gate, lying between the lepers' sheds and the tomb of David. But

the Bethlehem (Jaffa Gate), the inlet of trade and travel from Egypt and from the sea, stands open for half an hour after gun-fire, a sentinel turns the key, and no man has the right to pass that portal until another morning shall have dawned. The streets of the Holy City should be trod by day, business of life suspends itself from sunset to sunrise. No gas, no oil, no torch, no wax lights up the streets of Jerusalem by night. The alleys of Jerusalem reek with decaying fruit, dead animals, and human filth, and in the midst of which fertilizing garbage innumerable armies of rats race and fight. Except in the souks, the streets are all unpaved, an open sewer runs down each lane ...' (Dixon 1867: 215).

The military campaign of Ibrahim Pasha (son of Muhammad 'Ali) and the Crimean War proved to be the catalysts engendering a chain of events which allowed Jerusalem to emerge from its isolation. Ibrahim Pasha introduced many changes, abolished some arbitrary taxes and took measures to enhance public security in Palestine. For the first time this allowed European merchants to trade within the whole country rather than only at the ports, as before. The military setbacks which the Ottoman sultan suffered at the hands of Ibrahim Pasha obliged him to make concessions to the European powers. The sultan agreed that foreign consuls were to be posted to Jerusalem. Ibrahim Pasha had already allowed the British consul to settle in the city as early as 1838. Protestant churches—Anglican and Lutheran—were also allowed to be established in Jerusalem. More changes were to follow after 1856 in the wake of the Crimean War. This proved to be a major turning point as far as Ottoman official attitudes were concerned, for Turkey consented to further concessions to Europeans in return for military help against Russia. These were embodied in two reform edicts known as the *Khatta Sharif* (1839) and *Khatta Humayun* (1856), the significance of which is best summarised by Yapp:

The Tanzimat edicts of 1839 and 1856 should be seen primarily as statements of principles which should govern reforms rather than as decisions to be implemented forthwith. The main principles were equality and security for all citizens, the removal of administrative abuses and, in 1856, the notion of administrative and economic development (Yapp 1993: 113).

For the first time, according to the Ordinance of 1858, foreigners could purchase land and set up banks

within Palestine. The subsequent influx of European missions meant extensive construction activity in Jerusalem. According to Alexander Schölch 'in the decade after 1856, twenty-four construction projects were carried out inside and outside the walls of Jerusalem' (Schölch 1993: 121). By the 1890s, half the labour force of Bethlehem was employed in construction works. For example, during the building of the Austrian hospice, 300 labourers and 50 animals of burden were employed daily for months. Apart from eight consuls and their vice-consuls in Jaffa, who usually dealt with commerce, and scores of religious orders, European postal services were established which were involved in financial transactions, acting as a sort of postal bank. A report in the periodical *Levanon* in 1910 reads 'It was learnt that the Austrian Post Office is selling stamps for a quarter of a million francs per year. The Russian Post Office sells for 100,000 francs a year, and the Turkish Post Office 15,000 francs a year' (Sliva and Amotz 1973: 189).

Maritime traffic reached unprecedented dimensions according to the port report of 1895. A total of 457 ships disembarked at Jaffa. 101 ships belonged to Austro-Hungarian Lloyds, 101 ships to the Khedive, 54 to the Messageries Maritimes Françaises, 48 to the Russians, 32 to the Mahsoussa, 28 to the English, 9 to the Fabre and 84 others were miscellaneous (Cuinet 1896: 623). European banks began opening branches in Palestine—Crédit Lyonnaise in Jaffa and Jerusalem in 1892, the Deutsche Palästinische Bank in Jaffa and Palestine in 1896, as well as the Ottoman Bank which was controlled by shareholders from France and Britain. There were minor bankers like Bergheim and Valero (Jewish-owned) and Frutiger and Co. In 1894, commercial activity at the port of Jaffa amounted to 554,231 tons (Cuinet 1896: 623). In order to stimulate exports, in 1861 the Ottoman authorities reduced the export custom rates by a considerable percentage (from 12 per cent to 8 per cent), and again in 1869 by a further 1 per cent a year (Whiting n. d.). The principal Palestinian export items were (in order of importance): oranges, soap, sesame, melons and wine. Around the end of the 19th century, there were five hundred orange orchards in Jaffa alone. The annual production reached 60 million oranges, 20 million of which were exported to France, Austria, and England, and a further 30 million oranges were exported to Constantinople, Bulgaria, Rumania and Russia (Cuinet 1896: 592). On the other hand, Palestine imported coal, iron, cotton and textiles from England, petroleum from America and Russia, porcelain and glass from France and Belgium, flour from Russia, and rice from Egypt. A new local Arab entrepreneurial class emerged, which sometimes worked in partnership with Europeans (Divine 1994: 118-26).

In effect, Palestine was becoming a typical

commercial area, subject to all the usual economic vicissitudes of inflation, depression, wars and the resulting fluctuations in prices. Halevanon reports in 1913 'the price of petrol, olive oil, meat and coal have risen, the local currency rates dropped. The villagers are upset that town merchants are not accepting Ottoman currency' (Sliva and Amotz 1973: 191). Commerce and tourism could not expand without basic amenities like roads, improved hygiene and facilities for the urban dweller. The upgrading of the *sanjak* of Jerusalem into a *mutasarrافیyya* with the concomitant establishment of a municipality was a timely development, which created conditions in the city that were conducive to relatively comfortable living conditions by the standards of the day.

The main source of income remained tourism. The improved physical conditions in Palestine and modern transport by sea and rail contributed enormously to its growth. In 1909, 34,492 foreigners used the train between Jaffa and Jerusalem. In 1910, this figure had risen to 40,702 visitors. The figure had dropped again by 1912 to 29,462 visitors, and again in 1913 to 24,428 (*Jerusalem* (monthly periodical) 1912: 478). This decline was due to the outbreak of the Italo-Turkish War, which repeated the pattern of the Crimean War and the Russo-Turkish War in 1877-78. John Whiting, the American vice-consul of Jerusalem, commented in his report dated 9 February 1912:

The general business of Jerusalem cannot be dealt with separately from the tourist business, for when the latter is good or bad the general business is sure to follow. The Turko-Italian war at the outset upset business considerably. Quite a quantity of various goods used to be imported from Italy which now are not admitted and the impression that travelling in Turkey is now unsafe has been considerably prevalent, which has hurt the prospects for the season this year, which just now has commenced (Whiting n. d.).

With the constant flow of the new type of tourism, the Christian institutions—which traditionally had acted as hosts to pilgrims and foreign visitors—could not cope, although there were by this time forty-eight hospices. Thomas Cook, among others, handled tourism from America and the West. The Thomas Cook groups were small but Frank Clark brought in 600-700 American tourists at a time in his huge liners. The American Colony, which had started as a religious commune, began to take an interest in tourism. They opened a Vester souvenir shop at Bab al-Khalil, and began to put part of their Shaikh Jarrah facilities at the disposal of the new type of visitor, who found it to their taste. Herbert Clark, who lived in

Jerusalem, was responsible for the intricate details of the Frank Clark tours. Clark built himself a beautiful mansion on Mamilla Street, facing the city wall, with the intention of providing a congenial Oriental ambiance for the western visitors. Every afternoon Mrs Clarinda Clark acted as hostess for Clark passengers for 'afternoon tea'.

Accommodation remained a primary problem for the modern tourist. The first grand project was the Notre Dame de France (1886), which had several hundred rooms. The first building to look like a hotel was the Howard Hotel put up by the Armenian Convent in 1898 on the lower Jaffa Road. The name was later to change to the Fast Hotel. The Clark Tours used this as a first choice. Opposite the Municipal Gardens, the Armenian Convent then erected in 1902 a long building known as the Hughes Hotel. After this came the Kaminetz Hotel and Amdursky Hotel, situated inside the Jaffa Gate (Bab al-Khalil). The New Grand Hotel built in 1889 and run by Marcos Brothers was the one mainly used by the Cook's tours (Yehoushua 1977: 73).

These profound changes were only possible because of the goodwill of the Ottoman authorities. It is true that the Ottoman Treasury did not invest much in the way of capital funds, but the positive attitude of the authorities in Constantinople was vital. It is also true that there was an expansion of European presence and influence—European investment and goods were flowing into the Palestinian towns, but the Turkish governors were very accommodating and took their own initiatives. The only disruptive factor that interrupted the policy of continuity was the frequent and recurrent removal of Ottoman governors from the city. New officials, whose term of office was on average only two to three years, did not have sufficient time to adapt to the changing conditions of the country.

The physical look of the city was also changing. New Arab and Jewish neighbourhoods were springing up in every direction outside the city walls. The New Gate (Bab al-Jadid) was opened in 1889, and Herod's Gate (Bab al-Zahra) was enlarged in 1875. The road between Jerusalem and Nablus was built in 1870, and one between Jerusalem and Hebron in 1889. The lepers' village, which had been inside the Zion Gate (Bab al-Nabi Da'ud), was removed to a hill surrounded by olive trees near Bi'r Ayyub. The authorities moved the cattle market from Mount Zion to the Pool of Sulaiman (Birkat al-Sultan) outside the walls. In 1863-4, the authorities ordered the removal of all *mastabas* (raised benches), which had previously lined the streets, to make room for pedestrians within the narrow thoroughfares of the Old City. The only ones that still remain are to be found in the Suq al-Khwaja.

By 1874, by imperial order, the *sanjak* of Jerusalem became one of the privileged *mutasarrافیyyas* of the empire. It had three *kaimakams* (sub-governors) of Jaffa, Gaza and

Hebron, assisted by an administrative council (*majlis 'idara*). There was a municipality with a municipal council (*majlis baladi*) which had a separate budget. Members were nominated by a sort of popular election. The municipality took over responsibility for most of the public services, education, health issues, water installation, and social welfare. At the beginning of the establishment of the municipality, the revenue did not exceed 500 Turkish *liras*, but by 1913 the figure was as high as 11,000 *liras* (Namura 1994: 134; al-'Arif 1961: 330-33). The municipality offices moved from the second floor of the Sarai in the Old City to Mamilla Street, opposite Bab al-Khalil, where extensive infrastructural work was carried out. In 1870 they installed and expanded the sewage system. In 1895 they paved most of the streets of Jerusalem. In 1892 they built a municipal garden where the Turkish military band played twice a week, on Fridays and Sundays. They also constructed a bridge over the River Jordan. In addition, the municipality was in charge of order and security, and in 1886 they set up a Jerusalem police force, consisting of fourteen gendarmes. In 1891 the municipality established a hospital with thirty beds and an outside infirmary. In 1882, a doctors' union was founded with twelve doctors, all resident in Jerusalem (Sliva and Amotz 1973: 111). This new municipal hospital was in addition to half a dozen hospitals run by Christian orders as well as a newly-opened English ophthalmic hospital. Four of these Christian-run hospitals are still in operation—St Joseph's, St Louis', St John's Ophthalmic Hospital and Spafford's Children's Hospital. There were official programmes for inoculation against smallpox. Public health and hygiene were now even adequate to contain successfully an outbreak of cholera in 1902, for in 1901 it was realised that there was a severe shortage of water, which was then brought in 4-inch pipes from Wadi Artas to the city.

The courtyard in front of the Bab al-'Amud was paved, and warehouses were built for storing grain. In 1911, negotiations were already under way to introduce electricity to the city, but the plans were interrupted by the outbreak of the Great War. The municipality was increasingly becoming a recognisable form of administrative apparatus—municipal councils took care of the roads, water-system and the cleanliness of the streets; they were responsible for lighting, building parks, taxing carriage drivers, and monitoring weights and measures. They even issued rules governing the number of passengers who were allowed to be transported in each carriage, which had to have two lanterns attached to the side after sunset.

There were also improvements in the legal system. In 1874, Sultan 'Abd al-Majid issued a new ordinance separating the executive from the legislative branch, which resulted in *nizami* (reformed) courts. In 1901, a commercial court was installed in Jaffa, whose remit was to resolve business disputes. With regard to taxation, the

municipality had imposed ten different kinds of tax, while taxation of the farmers was still handled through *iltizam*, or tax farming, although this had been officially abrogated by the Edict of 1839.

In the field of education too there was some progress. Some new schools were established but the introduction of compulsory education was not successful. However, on the other hand, as Divine (1994: 119) has recently written, 'by century's end, notables in Jaffa, Haifa and even Jerusalem had degrees in law, public administration, and engineering from universities in Beirut, Istanbul, and various European capitals.'

To sum up, Palestine in the period post-1840 bore little resemblance to its state before 1830. Jerusalem had grown from a small town into a trading city with an agriculture that was export-oriented. The substantial improvement in public security and in hygienic conditions,

as well as the demographic changes—which saw figures of 9,000 in 1820 rise to 51,000 inhabitants by 1896—all resulted in attracting tourists, and investments, into Jerusalem (McCarthy 1990: 15). Changes were not resisted but, on the contrary, were welcomed and absorbed, for they meant new opportunities, new horizons, international trade and growth. Very few other cities in the Middle East underwent such drastic growth or experienced so profound a transformation in such a short period of time as was the case of Jerusalem from the 1840s onwards. After being an economic backwater for three centuries, Jerusalem had become a vibrant and populous city. Western capital and Western institutions, coupled with Ottoman goodwill and co-operation, as well as the formation of new Arab bureaucratic cadres and a new trading class, all made possible for Jerusalem the transition from anonymity and insignificance to prominence and importance.

Chapter 17

REALITY, IMAGINATION AND BELIEF: JERUSALEM IN 19TH- AND EARLY 20TH-CENTURY PHOTOGRAPHS (1839-1917)

Ruth Victor Hummel

Truly, neither the head nor the heart of that person is to be envied that manifest no interest in such a place as the Holy City! that feels for it no yearning of heart, and derives no pleasure from even the inspection of its faithful photographic and topographic portraiture (Barclay 1858: xx).

In his introduction to *The City of the Great King*, Dr Barclay, a missionary and probably the first American to photograph in Jerusalem, set out the basic themes and attitudes of the 19th-century Westerner approaching the holy terrain of Palestine. The assumption was that one would, of course, be naturally drawn to Jerusalem and that photographic images vivified the sacred topography because they were '*fac similes* of nature' (Barclay 1958: 4). These 'sun-pictures' seemed to possess a verisimilitude and undeniable veracity which gave the Westerner a comforting certitude that this was reality itself, untainted and available for observation.¹

The aim here is to provide the reader with some guidelines for approaching and interpreting the photographs of 19th-century Jerusalem, rather than

presenting a comprehensive or chronological survey. These images were taken by Western or Western-trained photographers initially for a European or American audience. As cultural critic Roland Barthes notes:

The photograph clearly only signifies because of the existence of a store of stereotypical attitudes which forms ready-made elements of signification ... a 'historical grammar' of iconographic connotation ought thus to look for its material in painting, theatre, associations of ideas, stock metaphors etc., that is to say, precisely in 'culture' (Barthes 1977: 22).

To make their work compelling and marketable to their audience, the Westerners, who were photographing Jerusalem, used a shared canon of visual images taken from previous artistic renditions and from cultural presuppositions of Western imagination steeped in the biblical narrative. They gave their audience the selected reality they wanted and expected to see. The photograph operates on various levels of signification and meaning and what the 19th-century viewer 'saw' might be quite different from how his late 20th-century counterpart deciphers the same image. Although these photographs reveal to us the *Weltanschauung* of the 19th-century Western mind, this visual record can also be decoded to provide information about Jerusalem that was not perhaps part of the original intention of the photographer, for:

the very fact that people are photographed is

¹ Gavin 1982: 4. Gavin relates the following tradition: 'King Abd al-Aziz Al Sa'ud convinced the *ulema* that a cameraman differs from every other artist because he is not making images himself but rather "recording the shadows cast by God's sunlight ..."; this argument is quite possibly based upon the literal explication and logical deduction of an early Arabic term for photographer (to be found in graffiti in an 1875 Bonfils photography): *musawwir shamsi*—one who makes pictures by the sun.'

part of their history, their changing existence in a broadening world. Photographs can, with close contextual examination, be read as broad texts which reveal ... 'hidden histories' rather than as individual descriptive documents (Edwards 1992: 12).

After issuing the warning *caveat spectator!* we need to investigate some of the attitudes which motivated the photographer (both the visiting Westerner and the local Jerusalemite) and the visual syntax and rhetoric employed to depict the landscape and indigenous inhabitants of Jerusalem—that is, to understand the 'historical grammar' used to communicate a visual reality of the city.

The birth of photography is intimately intertwined with the history of 19th-century Jerusalem. A few months after Daguerre announced his photographic breakthrough in 1839, the first daguerreotypes produced outside Europe were taken in the Middle East and the Holy Land by Frédéric Goupil-Fesquet and the painter Horace Vernet, who had been dispatched by the Parisian optician, Lerebours, as part of a commercial enterprise to photograph the most outstanding views in the world.² The engravings made from their photographic efforts and published in *Excursions Daguerriennes* included three scenes from the Holy Land (Jerusalem, Nazareth and the Crusader's fortress in Acre). The photograph of Jerusalem was the first ever to be taken and published (Nir 1985: 29).

When the calotype process (1840) and then the wet collodion technique (1851) provided the means of producing a negative and therefore the possibility of printing numerous positive images, which (as footnote 2 explains) was impossible with the unique image of the daguerreotype, photographers continued to flock to Jerusalem to document the sites and the terrain as archaeological artefacts (Du Camp 1851), to support a specifically stated ideological argument (Bridges 1858) or to extract a livelihood from sale of the sought-after images (Frith 1859). Photographing Jerusalem was good business, both for its ideological benefits and/or its lucrative rewards.

The political opening up of the Holy Land in 1830 under Muhammad 'Ali and his son, Ibrahim Pasha, and the beginning of the Tanzimat reforms in 1839 made it possible for Westerners to penetrate more easily and safely into Palestine. So the explorer, missionary, scholar, romantic, ecclesiastic, archaeologist, imperialist, entrepreneur and pilgrim (or various combinations of all of the above), descended on Jerusalem with the desire to make the city

the handmaiden of his ideological proclivity. In the first half of the 19th century, the West became captive to the relentless currents of social, religious and political dislocations flowing from the urbanisation and mechanisation bred by the Industrial Revolution. The Orient, the East, entranced and captivated the Westerner with its exotic, romantic, pre-industrial society and—in the case of the Holy Land—with the hallowed origins of its religious tradition. It was the epitome of 19th-century technology, the ever-evolving photographic process, which provided the West with the means to impose the reality it required on the Holy Land.

Edward Said argues that Orientalism is a Western practical intellectual network 'for dominating, restructuring, and having authority over the Orient' (Said 1991: 3).³ He also posits that the 'Orient ... is corrected, even penalized for lying outside the boundaries of European society, "our" world; the Orient is thus Orientalized' in order to make it conform to some aspect of the West (Said 1991: 67). In the case of Jerusalem we can say that the West not only orientalised but biblicalised the landscape and people of Jerusalem in order to vivify the scriptural narrative and to lay terrestrial claim to the celestial city.

The European and American relationship to Jerusalem and the Holy Land was unlike that with any other geographical location. The classical world of Greece and Rome was the intellectual and philosophical homeland of Western culture; but Jerusalem was the sacred hearth. His intimate knowledge of the biblical narrative shaped the Westerner's expectations as he approached this *locus sacer*. Of course, the Bible itself was a product of the hills, valleys and plains of Palestine. An intense dialogic relationship between the image of what one expected to see and the reality as described in the scriptures lay deeply embedded in the Western psyche. In 1869 the imperial pilgrim, the Hapsburg Emperor Franz-Joseph, simply stated a feeling of familiarity which so many pilgrims and visitors routinely mention: 'It struck us all how everything, especially the Mount of Olives and the Josephat valley, seemed to be just like one imagined it from one's childhood stories and its description in the Bible' (Nostitz-Rieneck 1966: 111-12).

Those Christian clerics and laymen who wished to counter the assault of biblical criticism on the veracity of the scriptures looked to archaeology and the land of Palestine to vivify and validate the biblical narrative. The landscape itself could assume a revelatory if not a sacramental quality (Hummel 1995: 28). An American pilgrim, J M P Otts, explained to his readers in 1893 that:

² A daguerreotype was a copper-plate coated with a very thin layer of silver which was treated with an iodine bath, exposed, and then developed by treatment with vapours of mercury. The reversed (positive-negative) mirror image produced was unique, since the process did not create a negative that could be reproduced.

³ For an interesting and informative critique of the legacy of Said's theory, especially as it relates to the interpretation of 19th-century popular culture, see MacKenzie 1995.

This is not a 'book of travels', though it never could have been written if the author had not travelled in Palestine, for it is the result of the careful reading of the Gospels in the lights and shades of the land where Jesus lived and taught. When so read it is found that the land of Jesus so harmonizes with the four written Gospels, and so unfolds and enlarges their meaning, that it forms around them a Fifth Gospel (Otts 1893: 5).

Photography with its possibilities of the mass production of images became the common man's means not only for 'photo-voyaging' but, in the case of the Holy Land, for 'photo-pilgrimage'.⁴ Thus it is not surprising that the wildly popular painted panoramas of the first half of the 19th century, which made available to the masses an intimate knowledge of the Holy Land until then only accessible to the 'cultural élite', were replicated in early photographic 'fac-similes' of Jerusalem (Davis 1996: 59). The early (1850s to early 1860s) commercial landscape photographers—men like Frith, Bergheim and Diness—consciously tapped into a visual vernacular when they photographed Jerusalem from angles and vantage points known to their prospective audience from panoramas, dioramas, paintings and engravings (pls. 17.1-17.15).⁵ Even the theatrical positioning of token 'natives' in the foreground to provide human scale to sacred space can be traced from painting to photography (pls. 17.16-17.18).

Most of the panoramic landscapes of Jerusalem produced in the 19th century depict a vast, desolate and unpopulated land. But to the Western imagination the valleys and hills were not lifeless—rather it gazed on a landscape *vivant*, saturated with biblical significance and above all with intimations of Jesus himself. Views of or from the Mount of Olives were particularly popular since one could be certain that, unlike unauthenticated sites, Olivet was indeed *terra sancta* (pl. 17.19). As Sir Frederick Treves in his book, *The Land That is Desolate*, mused :

It is, I think, the least beautiful hill I can call to mind. [But] this Olivet, this path to the village of Bethany, this way leading down to the Jordan, are all sacred sites of unquestioned genuineness. This is the country that was transversed by the feet of Christ. This is the very view that, in every dip

and knoll, was familiar to His eyes (Treves 1913: 86).⁶

Each technological advance in the photographic process increasingly put in the grasp of every 'common man' the opportunity to possess images of Jerusalem. In the first half of the 19th century, the painted panorama was the 'highly successful bridge between high art and mass entertainment' (MacKenzie 1995:190). In the latter half of the century the hand-held stereoscope, invented by Oliver Wendell Holmes in 1861, provided cultural enrichment and religious edification as well as popular amusement.⁷ An average family in Europe, or more probably in America, sitting at home, could pick up its stereoscope which transformed an almost identical pair of photographs pasted on cardboard backing (a stereograph) into a three-dimensional image '... the aim ... [was] to lose all consciousness of one's immediate bodily surroundings and to gain a distinct experience of being in the place [biblical land] itself' (Kent 1900: 10)—the 19th-century equivalent of a virtual reality experience! Now it was possible—as Professor Charles Kent of Yale University continues in his introduction (1900), '... in every class and in every home, not only to read about biblical lands, but also to travel through them'⁸ (pls. 17.20-17.21).

⁶ Although this is not the place for a lengthy discourse on various strands of 19th-century theology, it is important to note that American and English Protestant religious writing and travel literature often discussed the Holy Land as 'cursed' (and thus desolate, stagnant and suffering) and in need of redemption, because the Jews, and subsequently the Muslims, rejected the Gospel of Jesus (see Hummel 1995: 33-5). This belief, perhaps, helps to explain why Protestant photographers in particular are more oriented towards portraying a desolate landscape. Although he does not elaborate on the theological *raison d'être* for this theme of desolation, Nir (1985: 103-7) speculates on 'the difference in nuance in terms of subject matter and composition' in the work of Protestant and Catholic photographers, especially the British emphasis on photographing 'more of the surrounding natural environment'.

⁷ Davis (1996: 74) states that in the United States 'over five million stereographic negatives' were produced (a figure found in Darrah 1977: 6) and that '... one of the most enduring subjects, repeatedly featured in numbered sets issued by individual photographers and larger companies alike, was the Holy Land.'

⁸ In the introduction to *Palestine through the Stereoscope: a Tour conducted by Lesse Lyman Hurlbut* (New York 1914: xiii-xiv), Kent explains to his reader the *modus operandi* of the stereograph, which '... consists of two single photographs, taken from two points of view, between two or three inches apart, the normal distance between our eyes. When seen in a stereoscope these two flat surface photographs are reunited as in the natural vision, and become a *space*—a space of three dimensions, breadth, height and *depth*. The two small, flat prints, 3 x 3 inches in size, about six inches in front of the eyes, serve as two windows *through* which we look, and *beyond* which we see representation of the object or place, standing out as large as the original object or place would appear to the eyes of one looking from the place where the camera stood.'

⁴ In his article 'Photography and the Social Sciences—in Light from Ancient Lands' (Gavin 1989: 49), Carney Gavin uses the term 'photo-voyaging' which inspired my coinage of the term 'photo-pilgrimage' used here.

⁵ See Wahrman 1993: 26-7 for a discussion of how early photographs 'copied' each other's angles, etc., which sometimes led to conflict and recriminations.

The marriage of text and image transformed photographs of Jerusalem into frozen, timeless moments of the sacred. Jerusalem was not to be sensually exotic and titillating like the 'Oriental' Beirut, Cairo or the Mahgrib.⁹ The Westerner desired to tread the hills of Palestine and the streets of Jerusalem 'in the earthly footsteps of the Man of Galilee'.¹⁰ The terrestrial Holy City should reflect the spiritual splendour of its heavenly template—and this necessitated an earthly hallowed topography permeated with the transcendental. The living, decidedly 'mundane' 19th-century men and women of Jerusalem proved to be obstacles to implementing this religious agenda. The solution for most Western photographers was to biblicalise the indigenous inhabitants into icons or allegorical ciphers of an unaltered, atemporal biblical way of life.

In 1865 the Palestine Exploration Fund stated in its original prospectus that a series of photographs urgently needed to be taken of the 'Manners and Customs' of Palestine. The reason for this scientific task-force was that '... many of the ancient and peculiar customs of Palestine are fast vanishing before the increasing tide of Western manners, and in a short time the exact meaning of many things which find their correspondence in the Bible will have perished' (Conder and Kitchener 1881 1: 8).¹¹ Earlier individual portraits had been produced (pls. 17.22-17.23) but under this mandate Sergeant Phillips produced the first series of portraits of the indigenous people of Palestine. As Nir states (1985: 137-8), these twenty-seven photographs, one-third of which were of Samaritans or Armenians, were 'in no sense a representative sample' of the population.¹²

The invention of the half-tone process (c. 1880) revolutionised the printing of photographs in books and newspapers by dramatically reducing costs and the labour

required to merge text and images.¹³ This technological breakthrough made it possible for the average citizen to purchase one of the most extensive photographic surveys of the Holy Land, *The Earthly Footsteps of the Man of Galilee: Being Five Hundred Original Photographic Views and Descriptions of the Places connected with the Earthly Life of Our Lord and His Apostles* (1894). In the introduction John H Vincent, a bishop of the Methodist Episcopal Church and founder of the Chautauqua movement, clearly set forth the perceived *raison d'être* of the contemporary occupants of Palestine. It merits quoting at length as it provides a manifesto of Western attitudes towards the people of Palestine and a key to interpreting this enormously popular genre of photograph:

The manners and customs of this Eastern country have not been changed. People dress and eat and sleep and live and labor as they did two thousand years ago. The scenes of the Bible are reproduced with startling fidelity to the old record. One may find feasting and funeral, seed-sowing and harvest, elders in the gate and veiled women, grass on the housetops, sparrows seeking their nests in holy places, the grass of the field that today is and tomorrow is cast into the oven. The old customs and costumes remain.

The general scenic features of Palestine render it interpretative of Biblical events and shed light upon difficulties which, but for the perpetuity of its features, would have been unsolvable problems. Every traveler through Palestine discovers and makes report of these features and finds his faith in the Book confirmed. It is this feature which renders so valuable the contribution of the present volume to the illustration of Biblical history. The perfection of photographic art is reached in the production of this book. The land is brought within the purview of every reader' (Vincent 1894 : unpaginated Introduction).

Clearly the importance of the inhabitants was the extent to which their biblical ethnographic authenticity and 'purity' could further the cause of Christian scriptural exegesis. The enormous size of the photographs (8ins x 10ins) by R E M Bain coupled with extensive captions

⁹ Issam Nassar, 'The Image of Jerusalem in Nineteenth-Century Photography' (manuscript 15-16), published as *Photographing Jerusalem: A study in Colonial Imagination* by Boulder (East European Monographs 1997). Nassar states that it is difficult to find photographs of nude women who are identified as being indigenous to Jerusalem, although this does not extend to the rest of Palestine. For example, Bonfils' photograph entitled *Bédouine de Jéricho vendant de l'herbe à Jérusalem* depicts a woman with one breast exposed.

¹⁰ The phrase is taken from the title of Bishop John H Vincent's *Earthly Footsteps of the Man of Galilee* published in New York in 1894.

¹¹ The original prospectus from 1865 is printed in Conder and Kitchener 1881 Vol.I.

¹² The six photographs of Arabs were of a Kavass, and of 'picturesque' Bedouins rather than 'peasants in the hill country and the majority of Moslem townspeople.' Nir also notes that a caption for a photograph entitled *Two Women Grinding Corn* was followed by the biblical reference *Illustrating the prophecy: 'Two women shall be grinding at the mill; the one shall be taken, the other left'*.

¹³ Before the invention of the half-tone process, the woodburytype method was commonly used to reproduce photographs in books, etc. This required the photograph to be printed as an insert plate—the half-tone process rendered this laborious method obsolete. See Daval 1982: 173 for more on the revolutionary nature of the half-tone process.

under each expounding its biblical significance greatly facilitated the reader's ability to photo-pilgrimage in the Man of Galilee's footsteps. The indigenous men, women and children who appear could be read as allegorical figures of the Holy Family or biblical characters, but more frequently they represented the Bedouin (nomads), *fallahin* (farmers, shepherds and villagers) and *madaniyya* (town and city dwellers) whom Jesus would have seen and interacted with during his 'earthly life' as he transversed Palestine (pl. 17.24).

Sometimes the local inhabitants are acknowledged as such, as in the photograph *A Fence at Dotham* in which the man 'with white head dress' (*kaffiya*) is identified as the dragoman of Bain's 'photographic company of 1894' (pl. 17.25). This dragoman stands with a *fallah* in front of a magnificent twelve-foot wall of Palestinian *sabr* (cactus) which clearly captivated Bain and his pilgrimage companion, the Reverend James Lee, who describes it in the accompanying text. But as this scene cannot stand on its own merits as a vignette of contemporary Palestinian life, Lee continues 'We linger at Dotham because, besides the memories of Joseph and his brethren, there is an Old Testament picture which must have been recalled by Mary on her pilgrimage to Bethlehem.' In the next fifteen lines, Lee explicates the Elisha story from II Kings V: 13-18, relates it to the 'doctrines which the Man of Galilee came to proclaim' and—in a breath-taking exegetical leap—finally states 'These are the doctrines which gave strength and comfort to Mary in her pilgrimage from Nazareth to Bethlehem' (Vincent 1984: 86).

The assigned role of the indigenous inhabitants was participation in a scriptural *tableau vivant* supervised and controlled by the Western eye. The demand for photographs elucidating the biblical narrative was virtually limitless. As we shall see below, the photographic studio of the American Colony produced many striking images of Ottoman Jerusalem, but they also serviced a tourist trade hungry for items like its photographic series on the Twenty-Third Psalm ('The Lord is my Shepherd') which depicts sheep and shepherds posed in a Palestine untouched by the passage of two millennia (pl. 17.26). Stereographs, mentioned above, also catered to this desire for biblical correspondence. Underwood and Underwood's stereographic series on Jerusalem, which are keyed to scriptural passages, include an image of crowded Christian Street with the note that 'through a street not unlike this, Jesus was walking one day when He saw the blind man begging (John IX: 1-7)' (pl. 17.27). *The Cattle Market Day in the Lower Pool of Gihon, Valley of Hinnom* simply refers the viewer to Isaiah XXII: 9 (pl. 17.28).

Frequently there was no reference made to the indigenous inhabitant posed in the photograph—he, she or they functioned as part of a constructed photographic reality which relied on the synergistic relationship of

landscape, text and their silent witness as nameless biblical mannequins (pls. 17.29-17.30). The Western viewer easily merged all three elements mentally into the reality that was Jerusalem for the 19th-century psyche. Of course there was always the occasion when the 'native' was useful to provide scale and a bit of local colour (pl. 17.31).

Let us now turn to local Jerusalem photographers and those who were resident in the Levant. What were their agendas? Some of the best-known photographs of the Middle East were produced by the Maison Bonfils, a family of prolific commercial photographers based in Beirut from 1867 to 1918.¹⁴ Félix, Adrien and Marie-Lydie Bonfils were not particularly interested in providing a biblicised version of the Holy Land (although they did produce a small number). Most of their studio portraits and genre scenes were posed and the participants paid for their services, some assuming a variety of personas.¹⁵ These images represent another strand of photography in Jerusalem—one which targeted an audience intrigued by an exotic Orient. So Jerusalem was orientalist and romanticised without direct reference to the biblical narrative—although the scriptural significance is always a cultural *sub rosa* text—in images which are evidence of a variation of the overpowering manipulation and construction of reality discussed above in relation to the photographs.

Adrien Bonfils clearly articulated his family's romantic longing to preserve 'the pristine character and special *cachet*' of the beloved region they had made their home:

In this century of steam and electricity everything is being transformed ... even places: already in the ancient Plain of Sharon is heard the whistle of the locomotive ... The moment is probably not far off, when the holy Mount of Olives and Tabor will each possess its funicular like Mt Righi [outside Lucerne]! Before that happens, before Progress has completed its destructive work, before this present—which is still the past—has disappeared forever, we have tried, so to speak, to fix and immobilize it in a series of photographic views ... (Gavin 1982: 1).¹⁶

¹⁴ In 1970, during student demonstrations at Harvard University against the United States of America's incursion into Cambodia, two female protesters planted a bomb which blew the roof off the Semitic Museum and revealed a forgotten cache of photographs stored there. Amongst the hundreds of photographs thus 'resurrected' from oblivion, there were a substantial number by the family Bonfils.

¹⁵ See Micklewright, Ch. 20, pls. 20.4 and 20.6.

¹⁶ Gavin is quoting from the unpublished manuscript *Nouveau Testament* by Adrien Bonfils (Beirut 1898).

Here is the romantic's melancholic musings on the unsettling and dark face of industrialisation and urbanisation, and the desire to seek refuge in the past and what was perceived as the 'immutable Orient'. But the Bonfils' desire 'to fix and immobilize' produced landscapes and *vues* of the streets and buildings which indeed preserved and documented Ottoman Jerusalem. These were of interest *per se* and not only for their religious significance (pls. 17.32-17.36).

How did the resident and indigenous population perceive and practice photography? The debate continues on the extent to which anti-iconic religious prohibitions affected the acceptance of photography in Jerusalem by Jews and Muslims (see Nir 1985: 163-84; Gavin 1989: 50-1; Cisgen 1989: 15-16). Economic factors, a complex array of local traditions and customs reinforced by anti-iconic attitudes provide a cluster of reasons why Jewish and Muslim photographers did not appear on the scene until the end of the 19th and the beginning of the 20th century. Although Muslim and Jewish inhabitants allowed themselves to be photographed, it was the local Christians who first practised the art of photography (Hummel 1995: 182-3).

About 1856, M J Diness, Peter Bergheim—both converted Jews—and Yessayi Garabedian, then the Armenian Patriarch of Jerusalem, experimented with photographic technology. All acquired their skills from Westerners or Western-trained photographers, and each embraced the Western conventions and *modus operandi* of photographing landscape and people (see Wahrman 1993: 15-19 and Hummel 1995: 185-7). Yessayi realised the enormous potential of photography to educate its viewers, to record cultural monuments and to disseminate information. In his autobiography, Patriarch Yessayi stated that one of his ultimate goals in establishing a photographic atelier (1865-85) within the Armenian Convent of St James, was 'familiarizing the nation [Armenian] with the Holy Places through photographs' (Garabedian 1938: 45) (pls. 17.37-17.38).

The clergy who were apprenticed at the convent mastered not only the art of producing panoramas, images of the 'Holy Places', and stereoscopes but also the *carte de visite* (2.25ins x 3.5ins) and the cabinet portraits (4.5ins x 5ins) which were so popular in the West. Now in addition to the mother-of-pearl or olive-wood *objet de pitié*, the pilgrim could commission a portrait of himself as both souvenir and documentation of his newly-acquired 'hajji' status. Pilgrims, indigenous inhabitants and resident Westerners passed through the portals of St James Convent to be photographed in a Western-style studio complete with backdrops of columns, drapery and foliage—all the trappings of Western bourgeois decorum (pls. 17.39-17.41).

The work of the Armenian atelier was carried on by Yessayi's photographic disciple, Garabed Krikorian, who in

1885 created his own photographic studio which survived outside Jaffa Gate until 1948 (pl. 17.42). Kaiser Wilhelm II's visit to Jerusalem in 1898 was memorable for many reasons, one of them being that it provided the impetus for the launch of the photographic successes of Krikorian and the struggling American/Swedish religious enclave, the American Colony. Krikorian proudly proclaimed on his colophon (verso of a *carte de visite*) that he was now 'Königl. Preuss. Hof-Photograf'—the Prussian Emperor's Court Photographer (pls. 17.43-17.44). In 1898 Krikorian was commissioned to provide photographs for 'Abd al-Hamid's private photographic collection in Istanbul (Landau 1979: 3). It was at Krikorian's atelier that Khalil Raad, an Arab Lebanese Christian, was apprenticed before opening his own studio on Jaffa Road (pl. 17.45). In addition to providing all the usual tourist and pilgrim services (which included 'dressing up' in Palestinian garb, especially the *kaffiya*—pl. 17.46), Krikorian, Raad and other local photographers were called upon to document local ceremonies and institutional events (pls. 17.47-17.50).

A tourist or pilgrim could visit the American Colony Store just inside Jaffa Gate and inspect eleven albums of over 5,000 photographs of Palestine and the Middle East. As George Hobart states in his introduction to *The Middle East in Pictures* by Eric Matson, who was the chief photographer for the Colony and later for its successor, the Matson Photo Service: 'Many of these photographs were carefully and artistically conceived examples of the photographic estheticism of that period [1898-1934], while many more were matter-of-fact documentation of persons, places, and events' (Hobart in Matson 1980 1: 1) (pls. 17.51-17.59). The members of the American Colony, which had been founded in Jerusalem in 1881 as a messianic commune, quickly integrated into the local scene where they freely mingled with Jewish, Muslim and Christian communities and, after 1898, roamed the city and countryside with their photographic equipment. They were even permitted to photograph Turkish, German and Austrian activities in Palestine during the First World War (pl. 17.60). Their stereographs, prints, lantern slides and postcards found their way into many a tourist's luggage, were sold via catalogue to customers around the world and illustrated articles written by members of the American Colony about the Holy Land.¹⁷

The resident and local photographers brought with them—or assimilated—the Western way of seeing, whether it was the positioning of the subject in *carte de visite* portraits or the framing of panoramas (pls. 17.61-17.63). Most importantly, the acceptance of the Western technology of photography entailed the adoption of

¹⁷ See, for example, 'Village Life in Palestine' by John Whiting, with photographs by Lewis Larsson, for *The National Geographic* (Washington, March 1914).

Western cultural presuppositions about perception and knowledge. The Western cultural imperative to capture people, places and events *in situ*, to replicate the empirical reality or, as Barclay stated, to provide '*fac-similes* of nature' entered the Orient with the camera. The epistemological tenet of the Western philosophy of positivism—that reality is reducible to discrete bits of information—found an evangelical medium in the photograph which presented the viewer with visual 'facts'.

Our goal here has not been to furnish a comprehensive chronological survey,¹⁸ but rather to make the reader sensitive to the necessity of approaching images of Ottoman Jerusalem as constructed realities, and to ask the appropriate questions about a photograph. Christopher Pinney of the Royal Anthropological Institute states that

... the notion of photography as the 'real thing' precludes any acknowledgement of the maker. And yet these images, because they are vital historical documents of anthropology and colonialism, have to enter the public domain and the problem then arises of deconstructing their original content. One

route to the deconstruction of the object is to introduce the figure of the objectifier ... the photographer ... either literally or by signalling and awareness that the object is a subject which has been objectified by ... the photographer (Pinney 1989 1: 59).

The modern viewer who does not accept the photograph as a Barclayian '*fac-simile*' is then obliged to ask questions about the context of the photograph. Who is the 'maker'? What is the nature of the relationship between the person being photographed and the photographer? Is there a disparity of power between the subject and objectifier? Why was the image made? Who was the intended audience? The West biblicalised, romanticised and finally 'imperialised' Jerusalem, and in the process unintentionally bequeathed to its inhabitants a visual legacy which still needs to be fully claimed. The late 20th-century spectator has the task of becoming conversant, if not fluent, in the 'historical grammar' and visual vernacular of the 19th century in order to have the possibility of utilising this legacy as an historical tool with which to reconstruct the city and people of Ottoman Jerusalem.

¹⁸ The numbers of photographers—individuals and institutional—was, to say the least, substantial. Perez (1988: 76) gives the number of photographers who were resident or travelling in the Middle East between 1839-1885 alone as two hundred and fifty.

Pl. 17.1 The Mount of Olives (1860). Note the absence both of the Russian Church of Mary Magdalene and of the Church of the Agony (Peter Berghem, Library of Congress).

Pl. 17.2 Jaffa Gate from the Bethlehem Road (1860) from the crest of the Hinnom Valley with the *sabil* of Sulaiman the Magnificent at the mouth of the Gehenna Valley, commonly known today as Sultan's Pool (Peter Bergheim, Library of Congress).

Pl. 17.3 View of the Pool of Hezekiah (1860) from what is now the Petra Hotel. Of special interest is the open plot of land to the south of the Holy Sepulchre called the Muristan or Dabagha. Today it is the site of the Lutheran Church of the Redeemer, and Suq Aftimos. The Dome of the Holy Sepulchre is shown in a state of disrepair (the renovations on the dome were completed in 1869). The hills of the Mount of Olives are still bare (Francis Frith, Library of Congress).

Pl. 17.4 The Dome of the Rock taken from the city wall as it descends from the Gate of Nabi Da'ud (Zion Gate) towards the Maghribi Gate (Dung Gate) in 1858. Note the buildings of the Maghribi quarter to the west of the Haram al-Sharif and the banks of *sabr* (cactus) within the city walls (Francis Frith, Library of Congress).

Pl. 17.5 Panoramic view of the Haram al Sharif (1858). This photograph by Diness offers a more comprehensive view of the Maghribi Quarter, demolished in 1967 (M J Diness, John Barnier Collection, Archives for Historical Documentation).

Pl. 17.6 Al-Aqsa Mosque (1860) taken from the south west. In the foreground are the fields of *sabr*. The secondary roof-tops of the mosque which were destroyed in the earthquake of 1927 are clearly visible (Bergheim, Library of Congress).

Pl. 17.7 Walls of the city from the Birkat Mamilla and cemetery in 1857. The mausoleum from the Mamluk period can be seen at the left of the pool (M J Diness, Scottish National Portrait Gallery, Edinburgh).

Pl. 17.8 The Citadel and the road leading to Bethlehem and Hebron c.1875 (Bonfils, Collection of Fouad Debbas, Paris).

Pl. 17.9 The St. Anne complex from the north-east corner of the walls of the city c.1860. Note the absence of the residential quarters and seminary of the Pères Blancs (Peter Berheim, Library of Congress).

Pl. 17.10 A rare photograph (early 1860s) of the vacant space immediately to the left of the entrance of Jaffa Gate which is presently occupied by the Imperial Hotel and the Latin Patriarchate (Collection of the American Colony, Jerusalem).

Pl. 17.11 Mount Zion c.1856 from the north with the Tomb of David (Nabi Da'ud), the Cenacle and the American Cemetery (behind the stone wall enclosure on the right). The space in the foreground, including the American cemetery, is now the site of the Dormition Abbey complex (M J Diness, John Barnier Collection, Archives for Historical Documentation).

Pl. 17.12 The Damascus Gate, which was the only northern entrance to the Old City when Bonfils photographed it in the mid-1860s (Bonfils, Collection of Fouad Debbas, Paris).

Pl. 17.13 St Stephen's, or Lion's Gate, c.1860 with two cenotaphs visible behind the stone wall of the Muslim cemetery to the left (Peter Bergheim, Library of Congress).

Pl. 17.14 Jaffa Gate c.1860 with its unpaved approach and unbreached wall to the left (Peter Bergheim, Library of Congress).

P1. 17.15 The western staircase leading into the Haram al Sharif c.1856 (M J Diness, John Barnier Collection, Archives for Historical Documentation).

Pl. 17.16 The Tomb of Zachariah, a lithograph from a painting by David Roberts. Roberts' training as a theatrical designer is evident from his 'staging' of this painting with crucially-placed humans and an exaggerated out-cropping of rock behind the tomb. In pls. 17.17 and 17.18 it can be seen how the artists and photographers 'borrowed' angles and compositions from one another (David Roberts, *The Holy Land, Syria, Idumea, Egypt*, 1st edition, 1842).

Pl. 17.17 Absalom's Tomb, a lithograph from a painting by W H Bartlett (W H Bartlett, *Walks about the Environs of Jerusalem*, 1842).

Pl. 17.18 Tomb of Absalom c.1857 (M.J. Diness, John Barnier Collection, Archives for Historical Documentation).

Pl. 17.19. A shepherd contemplating the sunset over Jerusalem and an olive tree in the foreground create a biblicalised Holy City c.1910 (Lewis Larrson, John Larrson Collection).

Pl. 17.20 Lepers evoked biblical associations and thus were a popular subject among visiting photographers. The caption on this stereoscope (1896) reads 'Unclean! Unclean! Wretched Lepers Outside of Jerusalem' (*Works and Studios*, Hummel Collection).

Pl. 17.21 Bedouin tents pitched outside of Damascus Gate (c.1896 stereograph) and an accompanying flock of sheep vivify the biblical landscape (*Works and Studios*, photograph copyright of Underwood and Underwood, Hummel Collection).

Pl. 17.22 Man with a *narghila* c.1856 (J M Diness, John Barnier Collection, Archives for Historical Documentation).

Pl. 17.23 The governor of Jerusalem, Surayya Pasha (1857-64), who gave permission to Diness to photograph in the Haram al-Sharif in 1859. Diness gave this photograph the title *Governor of Jerusalem with Secretary and Slave* (J M Diness, John Barnier Collection, Archives for Historical Documentation).

Pl. 17.25 Although the nearly twelve-foot high *sabr* depicted above (1894) intrigued the photographer *per se*, the author used it (see text) as an opportunity to discourse on the biblical narrative (R E M Bain, in *Earthly Footsteps of the Man of Galilee*).

Pl. 17.24 Two *fallahin* posed at the southeast corner of the Old City overlooking the Kidron Valley and with the Garden of Gethsemane in the background c.1900 (*Works and Studios*, photograph copyright of Underwood and Underwood, Hummel Collection).

Pl. 17.26 This photograph (c.1900) entitled *The Lord is my Shepherd*, from a series on the Twenty-Third Psalm produced by the American Colony, depicts a Palestine as most tourists and pilgrims wished to it to be—untouched by the passage of two millennia (American Colony Studio, Matson Collection, Library of Congress).

Pl. 17.27 A stereograph (c.1900), from the series *The Holy Land through the Stereoscope*, entitled *Christian Street—motley life in the Holy City's bazaar district (Underwood and Underwood, Hummel Collection)*. These two similar but not identical images were intended to be viewed superimposed one upon the other through a stereoscope, to produce a three-dimensional image.

Pl. 17.28 *Cattle market day in the Lower Pool of Gihon, Valley of Hinnom (Isaiah XXII: 9)—a stereograph, c.1900 (Underwood and Underwood, Hummel Collection).*

Pl. 17.29 *'The New Calvary' outside the Damascus Gate from the northern wall, stereograph c.1901. The four indigenous people are in this photograph to provide biblical overtones to Gordon's Tomb, considered by many Protestants to be the actual tomb of Christ. In the background are tombstones of the Bab al-Zahra cemetery and the newly established neighbourhood of Shaikh Jarrah (Works and Studios, photograph copyright of Underwood and Underwood, Hummel Collection).*

Pl. 17.30 *A Tomb with the Stone rolled away, stereograph c.1901. Although this is the Tomb of the Kings, north of St George's Cathedral, the woman in 'biblical' attire is placed next to the tomb by the photographer to evoke scriptural associations of Easter morning when the three women found Christ's tomb empty (Works and Studios, photograph copyright of Underwood and Underwood, Hummel Collection).*

Pl. 17.31 *Jerusalem . . . seen west from a tower on Olivet, Palestine, stereograph c.1900. The tower is the belfry of the Russian Convent on the summit of the Mount of Olives. The Church of the Ascension and the Dome of the Rock can be seen in the background (Underwood and Underwood).*

Pl. 17.32 An unusual photograph of Jaffa Gate in the early 1860s. None of the buildings in the photograph exist today. Note also the unbreached city wall with battlements to the left of the Gate (Bonfils, Library of Congress).

Pl. 17.33 Jaffa Gate was the hub of commercial activity in the Old City. In the background of this photograph (late 1870s) can be seen Cook's Travel Office, the American Consulate (in the upper floor of the same building) and one wall of the Austrian Post Office to the extreme right (Bonfils, Collection of Fouad Debbas, Archives for Historical Documentation).

Pl. 17.34 Many hotels and souvenir shops were located inside Jaffa Gate to cater to the needs of the tourists and pilgrims. In the forefront to the right of this photograph (c.1881) the New Grand Hotel, which was built in 1881, is clearly visible. The souvenir shop of Boulos Meo, seen in the foreground, closed in 1997 after over 120 years in business (Bonfils, Collection of Fouad Debbas, Paris).

Pl. 17.35 In the early 1890s Jaffa Street, which ran north-south along the city wall, was the busiest commercial artery of the city and was lined with shops and coffee houses (Bonfils, Collection of Ralph Marcove, Archives for Historical Documentation).

Pl. 17.36 The newly-constructed Russian Compound in the background including Holy Trinity Church to the left, taken from the western slopes of Mt Zion c. 1870 (Bonfils, Library of Congress).

Pl. 17.37 A photograph of the Holy Sepulchre signed and dated 1861 by Yessayi Garabedian. Note the vacant plot of land, today occupied by the Church of the Redeemer and the Aftimos commercial complex, to the west and south west of the Holy Sepulchre (Yessayi Garabedian, Armenian Patriarchate Archives, Jerusalem).

Pl. 17.38 The Tomb of David and the whole residential complex of al-Dajani family and the walled American cemetery is in the foreground. In 1897 the American tombs were moved to the Protestant Cemetery on Mt Zion (Yessayi Garabedian, Stepanian Family Collection, Cairo).

Pl. 17.39 A young Armenian pilgrim couple from the Caucasus in traditional dress, a *cabinet* portrait c.1880. Note the studio rocks and trees (Armenian Convent Studio, Armenian Patriarchate, Jerusalem).

Pl. 17.40 A major in the Ottoman army, a *cabinet* portrait c.1885 (Armenian Convent Studio, Armenian Patriarchate, Jerusalem).

Pl. 17.41 A funeral procession of an Armenian pilgrim girl photographed outside the convent of St James in the early 1880s (Armenian Convent Studio, Armenian Patriarchate, Jerusalem).

Pl. 17.42 Walking towards Jaffa Gate from the north, the pedestrian would pass a line of shops including the photograph studios of Garabed Krikorian (in the foreground to the left), Khalil Raad (on the right almost directly across from Krikorian) and the Greek, Miliadi Savvides. The insignia of the *kaiser*, Krikorian's royal patron (see pl. 17.43), can be seen above his name, c.1910 (American Colony Studio, American Colony Collection, Jerusalem).

Pl. 17.43 and 44 Krikorian's colophon (on the verso of a cabinet or carte de visite) with Kaiser Wilhelm II's royal insignia and an advertisement highlighting patronage by the *Kaiser* and the sultan (American Colony Collection, Jerusalem).

Pl. 17.45 Khalil Raad (c.1890). After he served his apprenticeship with Krikorian, Ra'd open his own studio in 1897 (G Krikorian, American Colony Collection, Jerusalem).

Pl. 17.46 A *carte de visite* portrait of a man who was most probably a tourist (c.1900). He is dressed in Bedouin attire with sword, handgun and rifle, against an unlikely fjord and mountain studio background (G Krikorian, Hummel Collection).

Pl. 17.47 The Jerusalem train station at the inauguration of the Jerusalem to Jaffa railway in 1892 (G Krikorian, Hummel Collection).

Pl. 17.48 A football match near the north-east corner of the Old City outside Bab al-Zahra, c.1910 (Krikorian or Raad, Institute for Palestine Studies).

Pl. 17.49 The inauguration of a hospital at the village of Shaikh Badr (c.1910), located on the northern ridge of the Valley of the Cross (Musallaba), attended by Palestinian notables, civil servants and Ottoman officials (Krikorian or Raad, Institute for Palestine Studies).

Pl. 17.50 A celebration of al-Hurriyya in 1908 (Krikorian or Raad, Institute for Palestine Studies).

Chapter 18

THE CEMETERIES OF OTTOMAN JERUSALEM

Kamal ʔ al-ʿAsali*

The significance of the Jerusalem cemeteries

The burial areas of Jerusalem form a belt surrounding the city. There are hundreds of graves of eminent personalities scattered throughout this area. They belong to different periods of the long history of Jerusalem and testify to its grandeur. The fact that Jerusalem was the third holiest city in Islam lent a special significance to its cemeteries. In the Traditions of the Prophet Muhammad, Jerusalem was given special prestige among cities: 'Jerusalem is one of the four cities of Paradise' (Abu Huraira in al-Hanbali, *al-Uns* 1 1973: 238); 'he who dies in Jerusalem is like him who dies in Heaven' (al-Maqdisi, *Shihab, Muthir* 1985: 214); 'Jerusalem is the place of the congregation of the dead and of resurrection' (Ibn Hanbal, *al-Musnad* 6 n.d: 493; al-Hanbali 1 1973: 232; Ibn al-Jauzi 1980: 136; al-Maqdisi, *Shihab* 1985: 41). Safiyyah, the wife of the Prophet, standing on the Mount of Olives said: 'This is the place whence people will go either to heaven or to hell' (al-Suyuti, *Shams* 1982: 321). It is reported that Imam Muhammad al-Shafi'i prohibited the transfer of the dead to any place except to Mecca, Medina, or Jerusalem (al-Maqdisi, *Shihab* 1985: 267).

These beliefs highlighted the merits of Jerusalem as a burial place, and thus many dignitaries, *shaikhs* of Islam, saints, judges, kings and princes were laid to rest in Jerusalem. In a recent study it was revealed that nine

companions of the Prophet were buried in the Holy City (al-ʿAsali, *Ajdaduna* 1981: 16).

Islamic cemeteries

In Ottoman times there were three principal Islamic cemeteries in Jerusalem outside the Old City walls, and some fifty mausolea (*turba*, pl. *turab*) and tombs mainly inside it. The three principal cemeteries are described below.

(a) Bab al-Rahma Cemetery

This cemetery is located immediately behind the eastern wall of the Jerusalem Haram and extends several hundred metres along the wall. It is the oldest cemetery in Jerusalem, going back to the 7th century AD. It is reported that three companions of the Prophet were laid to rest in Bab al-Rahma: 'Ubada ibn al-Samit (died 34/644; al-Maqdisi, *Shihab* 1985: 362), Shaddad ibn Aus (died 58/667; al-Maqdisi, *Shihab* 1985: 363), and Dhu 'l-Asabi' al-Tamimi (al-Maqdisi, *Shihab* 1985: 375; al-Harawi 1953: 28).

The tombs of these Companions of the Prophet have now disappeared along with a host of historic tombs and mausolea in the Bab al-Rahma cemetery. Owing to the existence of these tombs in Bab al-Rahma, and because of its proximity to the Haram, this cemetery was frequented by almost all visitors to Jerusalem. In travel and history books the cemetery is often mentioned in connection with two Companions of the Prophet, 'Ubada and Shaddad (see

* This chapter was submitted by Dr al-ʿAsali, but sadly he died before it could be proof-read by him.

inter alia Abu Salim al-'Ayyashi, *al-Rihla*, and Ghani al-Nabulsi, *al-Hadra al-Unsiyya*, both published in al-'Asali, *Bait al-Maqdis fi Kutub al-Rihlat* 1991: 212 and 269-70). Al-'Ayyashi says that the two tombs were under the eastern wall of the mosque (al-Aqsa) overlooking Wadi Jahannam. He adds: 'There is a great cemetery here. Around the two tombs inside the wall of the mosque one sees a huge hewn rock, about fourteen cubits in length and two cubits in breadth' (al-'Asali 1992: 211-12). Al-Nabulsi says that the cemetery is familiar and well-known because of its proximity to the (Aqsa) mosque. It is the nearest cemetery to town (al-'Asali 1992: 270).

'Ali al-Qayati (14th/19th century) says in *Nafhat al-Bisham* that in Bab al-Rahma there are 'the graves of some Companions of the Prophet as well as ancient scholars ... and a large number of learned and righteous people. But ruling nations—be they Christians, Muslims or Jews—in the region and the passing of time have resulted in making the localities unknown or dubious, with the exception of those religious shrines which could not be concealed or denied, in spite of the lapse of time. These are the places which are visited to-day, and which have buildings to protect them' (al-'Asali 1992: 327). There are few buildings standing now.

The tombs in Bab al-Rahma, like those in other cemeteries, are usually built of stone. The orientation of the tomb is in general from east to west, as is the case with all tombs in this part of the Muslim world. 'The dead are laid on their right sides with their heads to the west, and their feet to the east thus turning their faces to the *qibla*' (Canaan 1927: 25). Canaan adds (1927: 26) that the tomb may be as high as 1-1.50m but that some are very low.

A list that comprises 54 eminent people buried in Bab al-Rahma includes 3 Companions of the Prophet, 3 princes, 38 scholars, 4 pious people and Sufis, and 7 judges. About half of these were not Palestinians, but came from different Islamic countries (al-'Asali 1981: 155, 198-202).

The following are the names of some dignitaries buried in the Bab al-Rahma cemetery:

- 1) Muhammad ibn Yahya al-Nasiri, a scholar and man of letters, d.1057/1647 (Muhibbi 1284 AH: 4/264)
- 2) Hafidh al-Din ibn Muhammad al-Maqdisi al-Sururi (of Banu Ghanim), a scholar and a Sufi, d. 1063/1652 (Muhibbi 1284 AH: 4/264)
- 3) Muhammad ibn al-Rumi, resident of Jerusalem, a scholar, d. 1081/1670 (Muhibbi 1284 AH: 4/228)
- 4) San'ullah al-Dairi, a scholar, and chief clerk of the Shari'a Court, d. 1139/1726 (Muradi 1988: 3/229)
- 5) Muhammad ibn 'Abd al-Rahim Jarallah (Abu 'l-Lutf), *shaikh* of al-Salahiyya Madrasa and *mufti* of Jerusalem, d. 1141/1728 (al-

Husaini, *Tarajim*, folio 45; al-Muradi 1988: 3/209,4/52)

6) 'Ali ibn Habib Allah ibn Abi 'l-Lutf, *shaikh* of al-Salahiyya and Shafi'i *mufti* of Jerusalem, d. 1144/1731 (Muradi 1988: 3/209)

7) 'Abd al-Mu'ti al-Khalili, scholar and copyist (*nasikh*), d. 1154/1741 (al-Luqaimi, *Mawanih*, folio 135 and al-Husaini, *Tarajim*, folio 65)

8) Badr al-Din ibn Muhammad ibn Jama'a, Hanafi *mufti* and scholar, d. 1187/1773 (al-Jabarti n.d. Cairo 2/296).

Epitaphs

Among the old tombs in the Bab al-Rahma cemetery is the *turba* of Shaikh 'Ali al-Ardabili, an eminent Sufi, who died in 832/1428. The tomb was rebuilt in 1133/1720, according to the following epitaph that still exists on the tombstone (al-'Asali 1981: 135-6):

١- هذا قبر الامام المحقق والحبر المدقق جامع الشريعة والحقيقة الشيخ

٢- علاء الدين ابو الحسن على الاردبيلي توفي سنة اثنين وثلاثين وثمانمائة

٣- ثم انهدمت القبة بكرور الاعوام فجدها من ذريته افضل

٤- الفضلاء ولي الدين الشهير بابن الكواكبي القاضي بالساكر

٥- المنصورة في الدولة العثمانية سنة ثلاث وثلاثين ومائة بعد لالاف

Translation:

1. This is the tomb of the accomplished *imam*, the researcher and thorough scholar who combined the *shari'a* and *haqiqa*, Shaikh

2. 'Ala' al-Din Abu 'l-Hasan 'Ali al-Ardabili. He died in the year 832 (1428)

3. Then the dome collapsed in the course of years. It was renovated by one of his progeny, the worthiest of

4. the worthy Wali al-Din, known as Ibn al-Kawakibi, the judge for

5. the victorious armies of the Ottoman state in the year 1133 (1720)

In the Bab al-Rahma cemetery one can still read an epitaph testifying to the existence of a burial chamber (*fisqiyya*) of members of the Maulawiyya Sufi order built in 1033/1623 (van Berchem 1922: 450)

هذه الفسقية وقف على السادة المولوية في سنة ١٠٣٣

Translation:

This burial chamber is a *waqf* instituted for the masters of the Maulawiyya order in 1033.

(b) The Mamilla Cemetery

The Mamilla Cemetery is the largest Islamic cemetery in

Jerusalem. It is situated to the west of the Old City about one mile west of the Jaffa (Hebron) Gate and has an area of about 42 acres. Mujir al-Din holds that the origin of the name Mamilla is *ma min Allah* (that which comes from God) (al-Hanbali 2 1973: 64). But according to Bernard the Wise (9th century AD), Mamilla was the name of a Christian saint (Bernard the Wise, *PPTS* 1971 3: 10). Incidentally it may be noted that in Latin, *mamilla* means breast.

Some features of the cemetery

The oldest feature in the cemetery is the Mamilla Pool which may well have started as a rain-fed pool in the time of Herod the Great (Prag 1989: 281). The pool is 89m long and 59m broad. Its greater part is rock-hewn. It lies at the head of the Hinnom Valley, constituting the upper end of the rift formed by this valley which separates the Mount of Zion and the hill of Abu Tor.

Another feature of Mamilla at one time was an old *zawiya* named 'al-Qalandariyya', which has completely disappeared. Mujir al-Din says that the *zawiya* had splendid buildings. It was formerly a Greek church; then it accommodated a group of Sufis of the Qalandariyya order—hence the name (al-Hanbali 2 1973: 64-5).

A beautiful architectural feature of Mamilla, which still stands, is al-Turba al-Kabakiyya. It is located about 100m north east of the pool. It is the burial place of Amir 'Ala' al-Din Aydughdi ibn 'Abdallah al-Kabaki who died in Jerusalem in 688/1289. Al-Kabaki was governor of Safad under Sultan Baibars. Towards the end of his life he was banished to Jerusalem where he died.

Mamilla has a rich past. It is reported that thousands of Muslims massacred after the Crusader conquest of Jerusalem in 492/1099 were thrown into the 'skull cave' at Mamilla (al-'Asali 1981: 118; Khalaf 1979: 63). After Salah al-Din's capture of Jerusalem in 583/1187 Mamilla was used continuously as an Islamic cemetery until 1927 when burial there was stopped at the order of the Supreme Muslim Council. During these long centuries, a large number of men illustrious for their learning and piety, or fighters who fell in battle as martyrs, were laid to rest in Mamilla (al-Hanbali 2 1973: 64). Among the first who were buried in the cemetery was Diya' al-Din 'Isa ibn Muhammad al-Hakkari, the renowned *faqih*, statesman, and friend of Salah al-Din, who died in 585/1189.

A detailed list recently published of eminent Muslims buried in Mamilla contains the names of 149 persons divided into the following categories:

princes and governors	16 persons
scholars (' <i>ulama</i> ')	66 persons
saints and Sufis	36 persons
judges (<i>qada</i>)	33 persons

(al-'Asali 1981: 154, 159-96).

The list contains a large percentage of prominent Muslims who came to Jerusalem from various Islamic countries. Among dignitaries buried in Mamilla in Ottoman times were the following:

- 1) Shams al-Din Muhammad al-'Ajami, a famous preacher, a member of the entourage of Sultan Sulaiman the Magnificent. He died in Jerusalem before 970/1562 (Muhibbi 1284 AH: 1/489)
- 2) Muhammad ibn Musa al-'Usaili, an author and a poet. He died in 1033/1623 (Muhibbi 1284 AH: 4/234)
- 3) Taha ibn Salih Abu al-Rida al-Dairi, a scholar and teacher. He died in 1071/1660 (Muhibbi 1284 AH: 2/260-1)
- 4) Yahya al-Dajani, the *mutawalli* of the shrine of the Prophet David, d. 1148/1735 (Muradi 1988: 4/228)
- 5) 'Uthman ibn 'Ali al-'Alami, *khatib* of al-Aqsa, d. 1168/1754 (Muradi 1988: 3/166)
- 6) Salih ibn Ishaq ... ibn Jama'a, *khatib* of al-Aqsa, d. 1170/1756 (Husaini, *Tarajim* folio 130)
- 7) Mustafa ibn Muhammad al-'Alami, al-Salahi, *faqih*, and *khatib* of al-Aqsa, d. 1171/1757 (Muradi 1988: 3/218)
- 8) Ahmad ibn Muhammad al-Muwaqqit—Moroccan by origin—*mufti* of Jerusalem, d. 1171/1757 (Muradi 1284 AH: 1/175)
- 9) Najm al-Din al-Khairi, *mufti* of Jerusalem, d. 1173/1759 (al-'Arif 1961: 509)
- 10) Muhammad al-Tafilati, a famous Maghribi scholar, *mufti* of Jerusalem, d. 1192/1778 (Husaini, *Tarajim* folio 137)
- 11) 'Abd al-Latif ibn 'Abdallah al-Husaini, Shaikh al-Haram al-Qudsi and *naqib al-ashraf*, d. 1188/1774 (Muradi 1988: 3/89)
- 12) Ahmad al-Dajani, scholar, *imam* and Sufi, the ancestor of the Dajani family, d. 969/1561 (Ghazzi 1979: 3/120)
- 13) Abu 'l-Wafa al-'Alami, a famous Sufi, d. 1109/1697 (Muradi 1988: 1/71)
- 14) 'Abdallah al-'Alami, Sufi of al-'Alami family, d. 1181/1767 (Muradi 1988: 3/88)
- 15) Sulaiman ibn Abi 'l-Huda al-Dawudi (al-Dajani), Shafi'i *qadi* of Jerusalem, d. 1073/1662 (Muhibbi 1284 AH: 2/211).

Mamilla in books of travel

As a sacred and historic spot, Mamilla was a major object of visits by Muslims during the Ottoman period. Visitors to Jerusalem flocked to visit the graves of hundreds of notables and religious personalities, and to read *al-Fatiha*

for the comfort of their souls. Among such eminent visitors were the great Sufis and travellers 'Abd al-Ghani al-Nabulsi (1050-1143/1640-1731) and Mustafa As'ad al-Luqaimi (b.1105/1693), who paid tribute in their books to the large number of dignitaries, scholars, holy men and martyrs buried in Mamilla. Among the graves mentioned by al-Nabulsi were those of al-Wasiti, al-Daghistani, Mujir al-Din al-Hanbali, al-Kamal ibn Abi Sharif, Abu 'Abdallah al-Quraishi, Ahmad ibn Arslan, Ahmad al-Dajani and others. Al-Nabulsi, who was a scion of the Ibn Jama'a family of Jerusalem, naturally visited also the graves of his ancestors (Banu Jama'a) in the cemetery (al-Nabulsi, *al-Hadra al-Unsiyya* in al-'Asali, *Bait al-Maqdis fi Kutub al-Rihlat* 1992: 274-5).

Mustafa As'ad al-Luqaimi, who visited Jerusalem from Egypt in 1143/1730, described the Mamilla cemetery in *Mawanih al-Uns* in the following words: 'In the afternoon I went with some gracious and noble friends to the Mamilla cemetery, the burial ground of the quintessence of righteous people, whose merits are reiterated in traditions and sayings. Al-Hasan says that the origin of the word is *ma min Allah*, and that burial in it is like burial in Heaven. We visited the masters in its soil, and stood at the thresholds of these weighty people, such as 'Abdallah al-Quraishi, Ibn Raslan, Ibn al-Humam, Ibn Jama'a, al-Shaikh al-Dajani and al-Kamal ibn Abi Sharif, from whose graves all traces are gone, but whose tidings are still read in books. I recited on their graves such Qur'anic verses as I could' (al-'Asali, *Rihlat* 1992: 307). In popular belief cemeteries and graves are closely associated with anecdotes and superstitions. In *al-Hadra al-Unsiyya*, al-Nabulsi reports many of the anecdotes which he heard during his visit: for example, the famous striped slab, at which prayers are answered; or Shaikh Abu Sha'ra who bought hairs of the Prophet and asked that they be put into his eyes. If people suffering from indigestion said 'Shaikh 'Abdallah al-Quraishi . . . to-day is a feast,' they would be cured. Shaikh Yusuf al-Dajani could bore a hole in a rock with a small stick. Shaikh Ahmad al-Dajani used to have a need met if he placed a stone on his tomb, and asked for relief. In Mamilla there was a multi-coloured weed that had legs and hands and that could even walk. A dead man once stood up from his grave and asked 'has the Day of Judgment come?' then both—deceased and grave—disappeared.

In those days the atmosphere was laden with supernatural tales, and such tales were reiterated in anecdotes about graves and cemeteries (al-Hadra, in al-'Asali, *Rihlat* 1992: 274-5).

Epitaphs

Among the tombs that were frequently visited in Mamilla during the Ottoman period was that of Abu 'Abdallah al-Quraishi al-Hashimi, who belonged to Banu Hashim, the family of the Prophet. Al-Quraishi came to Jerusalem from

a city called al-Jazira al-Khadra' in al-Andalus, via Egypt. He lived in Jerusalem for many years until he died in 599/1202. His tomb was visited by 'Abd al-Ghani al-Nabulsi (*al-Hadra al-Unsiyya*, see al-'Asali, *Bait al-Maqdis fi Kutub al-Rihlat* 1992: 274, and *al-Haqiqa wa'l-Majaz, Rihlat* 285) and by Muhammad As'ad al-Luqaimi al-Dimyati in the 12th/18th century (*Mawanih al-Uns*, see Asali, *Rihlat* 1992: 307). The tomb was restored for the second time during the Ottoman period in 965/1557—a previous restoration had taken place in 722/1322. The epitaph on al-Quraishi's tomb was read by H Nubani about 1950 (Nubani 1956 in *ADAJ* 13-14). The three lines of poetry in Ottoman *thulth* read as follows:

١. شيخ عبد الله قرشي يعني مداركم آثار
اصفيا سرور اندن اول آثار روزگار
٢. مرقديت المقدس قريدمرامله نام
نور رحمت نازل اولور ليل ونهار
٣. مشهدين تعمير ايدن اول شاه حق بابلاند
قلدي تاريخي جهانده شاه کار

Translation:

1. Shaikh 'Abdallah Quraishi, that is, the centre of miracles,
Which 'indicate' the time of that chief of saints;
2. [has] his resting-place in the vicinity of Jerusalem, called Mamilla,
Where the light of mercy is descending by night and day.
3. He who restored his shrine in Babilla was that true king.

The chronogram is 'In the world the King did beautiful things.'—AH 965 (= began on Sunday 24 October 1557).

Another epitaph read by Nubani (1956: 13) was that on the tomb of a certain 'Ali ibn Ya'qub. It reads as follows:

١. يرحم الله امرى اذا استغفره ودعالي بالمغفرة
٢. هذا قبر العبد الفقير الى الله تعالى
٣. السعيد الشهيد المحتاج
٤. الى رحمة الله تعالى على بن يعقوب
٥. المتوفى صاحب القبر من شهر
٦. في سنة ثمانية واربعين وتسعمائة

1. May God be merciful to a man if he asked Him for forgiveness and prayed for my forgiveness.
2. This is the tomb of the servant yearning for Allah, may He be exalted,
3. the happy, the martyr, who is in need
4. of God's mercy, may He be Exalted, 'Ali b. Ya'qub
5. the deceased, the owner of the tomb, in the months
6. of the year 948 [1541].

At one time Mamilla cemetery presented to the eye an impressive and august sight. It was full of structures of polished white and coloured stones and various kinds of marble. There were hundreds of tombstones, with inscriptions pertaining to various eras of Islamic history; but most of these are now gone. In 1948 the Israeli authorities turned a large part of the cemetery into what has become known as 'The Independence Park'. Only one small area was left for graves. In place of the hundreds of graves that once stood there, there are today a hotel, a car park and a commercial centre.

(c) Bab al-Sahira Cemetery

Bab al-Sahira Cemetery is located on a hill overlooking the northern wall of the Old City, opposite Bab al-Sahira Gate (Herod's Gate). The name Sahira is mentioned in the Qur'an—'Surely it will need but one breath, and lo! they will be in Sahira' (*Surat al-Nazi'at*, 14: 15). Thus in Islamic tradition al-Sahira, which is adjacent to the Valley of Kidron/Jehoshaphat, is the meeting place of mankind after the resurrection.

In all probability al-Sahira cemetery was first used after the reconquest of Jerusalem by Salah al-Din in the 6th/12th century. The oldest extant epitaph on a tombstone is that on the tomb of Sharwat al-Hakkari who fell in battle in Ramla in 587/1191 (al-'Asali, *Ajdaduna* 1981: 213,263-4). In the 8th/14th and 9th/15th centuries, as well as in Ottoman times, scholars and Sufis of the Adhamiyya Sufi order were buried in Bab al-Sahira cemetery. The Adhamiyya were followers of Ibrahim ibn Adham, a *mujahid* and ascetic who died in battle in 161/777. They used to dwell in a cave under the Bab al-Sahira cemetery which was later known as al-Zawiya al-Adhamiyya (al-'Asali, *Ajdaduna* 1981: 144). 'Abd al-Ghani al-Nabulsi visited the cave of al-Adhamiyya in the 12th/18th century and then visited the Sahira cemetery: 'Then we visited the Sahira cemetery, which lies above the Adhamiyya *zawiya*. There is a well-known saying in this connection, to the effect that in this place the dead [in the cemetery] are above the living [in the Adhamiyya beneath the cemetery]' (al-Nabulsi, *al-Hadra*, in al-'Asali, *Rihlat* 1992: 272). It seems that most graves in the cemetery were badly damaged in Ottoman times, when most epitaphs and monuments disappeared. Thus the names of the majority of dignitaries buried in the cemetery were lost forever. This was indeed the fate of all Islamic cemeteries in Jerusalem. The lapse of time, the neglect of man and the turbulent history of the city combined to wreak havoc on valuable vestiges of the past, cemeteries in particular. It seems that in Ottoman times the cemetery was much larger than it is now. Al-'Arif says that in the past it included the site of the Palestine Archaeological Museum (formerly called Karm al-Shaikh). Considering the many martyrs buried in the cemetery, it

was sometimes called Maqbarat [cemetery of] al-Mujahidin (al-'Arif 1961: 509).

Islamic mausolea and tombs inside Jerusalem

In Jerusalem, especially in the Old City, a large number of mausolea, tombs (*turbas*) and *maqams* still exist, although many have disappeared. We know now the names of about fifty renowned personalities buried within the walls. The burial places are of various kinds, ranging from separate mausolea to ordinary tombs:

- 1) The mausolea were buildings especially erected for certain persons in which to be buried. In some cases they were designed to be part of a *madrasa*, *zawiya* or mosque. Hence they were called *turba* or *madrasa* or *zawiya*. But primarily they were *turbas*. Some of these mausolea were very well built. Many of them are located along the Bab al-Silsila road. Examples are the following *turbas*: Turkan Khatun, al-Sa'diyya, al-Gailaniyya, al-Tashtamuriyya and al-Auhadiyya.
- 2) *Madrasas* or *zawiyas* or *ribats* in which their owners or dedicators were buried in one of the rooms: examples are al-Khatuniyya Madrasa and al-Aminiyya Madrasa, and the following *zawiyas*: al-Jarrahiyya, al-Wafa'iyya and al-Qiramiyya.
- 3) Tombs over which or near which *maqams*, *mazars* or mosques were built; examples are the *mazar* of Shaikh Haidar and the mosque of Shaikh Raihan.
- 4) Separate tombs or groups of tombs built in open space or inside buildings and whose owners are unknown. Many of these were martyrs who fell in war. Such tombs exist in al-Badriyya and al-Mu'azzamiyya *madrasas*.

Mausolea are usually surmounted by domes. One also notes inside them places for prayer, *mihirabs* or mosques. Some *maqams* consist of one simple room or open space, while others have two or three buildings. The tomb usually stands in the middle of the room, but occasionally it is built in the courtyard or outside the *maqam*. The majority of the *turbas* were objects of visitation during the Ottoman period. As the list is very extensive, we shall here mention only the more important *turbas* and tombs which date from the Ottoman era and which still exist:

1) The Mausoleum of Bairam Jawish

Bairam Jawish was an influential Ottoman functionary in Jerusalem. He was appointed

by Sultan Sulaiman the Magnificent as overseer of the building of the wall of Jerusalem. He established in Jerusalem a famous *ribat* in 947/1540, and built for himself a mausoleum adjacent to it at the junction of al-Takiyya road and al-Wad road. Bairam's tomb can still be seen inside the mausoleum.

2) *The Tomb of Muhammad al-'Alami on the Mount of Olives (Jabal al-Tur)*

Muhammad ibn 'Umar al-'Alami (964-1038/1556-1628) was a very prominent Sufi in Jerusalem in the 11th/16th century. His tomb—and that of his wife—is located in a subterranean cell in al-Zawiya al-As'adiyya, built by As'ad al-Tabrizi, the Grand Mufti of the Ottoman Empire (died in 1034/1624) (Muhibbi 1284 AH: 1/396). Inside the *zawiya* there was also a mosque with a lofty minaret. The tomb was visited and described by 'Abd al-Ghani al-Nabulsi in 1101/1689. In 1122/1710 Mustafa al-Bakri also visited the *zawiya* and slept in it (al-'Asali, *Ajdaduna* 1981: 99).

3) *The Tomb of Muhammad al-Uzbaki*

Muhammad al-Uzbaki was a Sufi of the Naqshbandiyya order, and a *shaikh* of the Naqshbandiyya (also called Uzbakiyya and Bukhariyya) *Zawiya* which was built in the 8th/14th century for Muslims coming from Bukhara, Turkistan, Uzbekistan and Central Asia in general. Above the tomb of Muhammad al-Uzbaki, the governor of Jerusalem, Mustafa Zada built a beautiful dome in 1144/1731 (al-'Asali, *Ajdaduna* 1981: 36).

4) *The Tomb of Muhammad al-Khalili*

Al-Khalili was a grand *shaikh*, the Shafi'i *mufti* of Jerusalem and a Sufi of the Qadiriyya order (Muradi 1988: 4/94). In the 12th/18th century the ownership of al-Madrassa al-Baladiyya in Bab al-Silsila passed into his hands (the *madrassa* was originally founded by Amir Mangali Bugha in 782/1380; al-'Asali, *Ma'ahid* 1981: 154). When al-Khalili died in 1147/1734, he was buried in the *madrassa* (Muradi 1988: 4/94; al-'Asali, *Ajdaduna* 1981: 52-3).

5) *The Tomb of Muhammad ibn Budair*

Muhammad ibn Budair (1160-1220/1747-1805) was a notable scholar, author and Sufi. He lived in an old and historic *zawiya* adjacent to the Haram, called al-Zawiya al-Wafa'iyya (today known as 'Dar al-Budairi'). His tomb is located in al-Wafa'iyya, inside a room with a window overlooking the Haram

(al-Baytar, *Hilyat al-Bashar* 3/1351; al-'Asali, *Ajdaduna* 1981: 38-40).

6) *The Tombs of Members of al-Imam Family*

Al-Imam family is an old Jerusalem family which produced many scholars and religious dignitaries, several of whose tombs are located in al-Aminiyya Madrasa, an old Mamluk *madrassa* north of the Haram, established by the Mamluk amir Amin al-Din in 730/1329. Those interred in the first floor of the *madrassa* in Ottoman times include:

(a) Yahya Sharaf al-Din ibn Qadi al-Salt, *imam* of the Aqsa Mosque, d.1040/1630

(b) Muhammad Salih al-Imam, Shafi'i *mufti* of Jerusalem, d.1243/1828

(c) Muhammad As'ad al-Imam, Shafi'i *mufti*, d.1308/1890

(d) Yusuf al-Imam, Shafi'i *mufti*, d.1321/1903 (al-'Asali, *Ajdaduna* 1981: 30; al-'Asali, *Ma'ahid* 1981: 235; al-'Arif 1961: 245; Manna' 1986: 43-7).

In addition to the above-mentioned shrines with tombs (*mazars*) dating from Ottoman times, travellers and visitors to Jerusalem during the Ottoman period used to visit *mazars* of several dignitaries who had died in the preceding epochs, from the 7th to the 15th centuries. The most popular *mazars* in the Ottoman period were the following:

Within the Old City of Jerusalem

1) The mausoleum (*turba*) of 'Ala' al-Din al-Basir

2) The *mazars* of Shaikh Haidar, Shaikh Suyufi, Shaikh Musa al-'Alami, Shaikh Muhammad al-Qirami, Shaikh Ahmad al-Muthabbat, Shaikh Hasan ibn 'Ali ibn 'Ali, and Shaikh Ghabayin.

Outside the Walls

1) Mazar Salman al-Farisi and Mazar Rabi'a al-'Adawiyya (both on the Mount of Olives)

2) Mazar al-Nabi Da'ud (David), on Mount Zion

3) The tombs of the two Companions of the Prophet, 'Ubada ibn al-Samit and Shaddad ibn Aus, in Bab al-Rahma (al-Nabulsi, *al-Hadra al-Unsiyya* in al-'Asali, *Rihlat* 1992: 265, 267-8; al-'Ayyashi, *al-Rihla* in al-'Asali, *Rihlat* 1992: 211-12; al-Nabulsi, *al-Haqiqa wa 'l-Majaz* in al-'Asali, *Rihlat* 1992: 284-5; al-Luqaimi al-Dimyati, *Mawamih al-Uns* in al-'Asali, *Rihlat* 1992: 305; al-'Asali, *Ajdaduna* 1981: 75-9, 80-2).

Chapter 19

THE LIBRARIES OF OTTOMAN JERUSALEM*

Kamal J al-‘Asali

I The cultural scene in Ottoman Jerusalem

When the Ottomans occupied Jerusalem in 922/1516 there were more than fifty schools (*madrasa*, pl. *madaris*) in the city, staffed by dozens of scholars (*‘ulama’*) and attended by hundreds of students. All these were *waqf* *madrasas*, that is, they had been instituted by charitable religious endowments which supervised and maintained them. Besides the *madrasas* there were hundreds of other institutions for the cultivation of mystical life—*zawiyas*, *ribats* and *khanqahs*. All these institutions contributed to the transmission of education. However, the main centre of learning in the city was of course al-Haram al-Sharif—al-Masjid al-Aqsa and the Dome of the Rock—where religious tuition was given regularly. In the Haram and *madrasas* there were libraries, large and small, and in addition, the *‘ulama’* had their own private libraries in their houses. These institutions encouraged cultural life and made Jerusalem an important centre of learning in the Islamic world. The institutions of learning were mainly concerned with religious sciences and to a lesser degree with linguistic and literary studies. Natural sciences, philosophy and logic had almost no place in the curricula, although astronomy and arithmetic were sometimes taught.

After the Ottoman occupation, the *madrasas* and Sufi institutions continued. In fact at least four *madrasas* are known to have been established under the Ottomans

(al-‘Asali 1981b: 46). Several *kuttabs* (Qur’an schools) were added to similar ones established under the Mamluks and before. This activity in cultural life continued during the first two centuries of Ottoman rule, especially in the 16th century. But the *waqf* institutions of learning started to deteriorate in the second half of the 17th century, with the general collapse—political, economic and social—which afflicted the Ottoman state and society as a whole. The 18th century witnessed the almost complete decay of the *madrasas* and similar institutions. In the 19th century the *madrasas* disappeared. Only the *kuttabs* remained. The old educational system broke down, and a new one began slowly to emerge, as will be noted below.

II The libraries

The educational and cultural situation was naturally reflected in the libraries of Jerusalem. Religious books constituted the bulk of the collections and had the largest circulation. Literature *per se* was in a state of decline and most of the new books written in this period were mere compilations or summaries of classical time-honoured books, a spilling of old materials into new pots.

Ottoman libraries in Jerusalem can be divided into two main categories—public libraries and private libraries.

Public Libraries

Public libraries were the collections of religious or

* The editors regretfully announce that the death of Dr al-‘Asali occurred before it was possible for him to proof-read this chapter.

educational institutions. They included:

- (i) The libraries of al-Haram al-Sharif — the Aqsa mosque and the Qubbat al-Sakhra
- (ii) School libraries
- (iii) Libraries of Christian monasteries and convents.

(i) *Libraries of the Haram*

The most important repositories of books were the libraries of the Aqsa Mosque (including the Sakhra) which was an important centre of learning in the Middle Ages. The Aqsa Mosque library comprised a large number of volumes covering the Islamic sciences, and the sciences of the Arabic language, as well as history, mathematics, astronomy and other subjects. The library was rich in the writings of the scholars (*mudarrisun*) who had taught in the Haram throughout the centuries. Among these were books on the merits of Jerusalem (*fada'il Bait al-Maqdis*).

The most precious library items, which were endowed as *waqf* by sultans, princes and state dignitaries, were copies of the Holy Qur'an, elegantly ornamented and decorated. When Salah al-Din restored the Aqsa Mosque to Islam, he presented to the mosque copies of the Qur'an and a number of *raba'at sharifa*—collections of the Qur'anic chapters (al-Hanbali 1: 339). It was the habit of Mamluk sultans to endow the Aqsa with copies of the Qur'an and to institute a special *waqf* for the benefit of their readers (*qurra'*). This was done by sultans Barsbai,¹ Jaqmaq (Shari'a Court registers in Jerusalem, Sijill 245, 1060-1/1650: 375) and Inal (al-Hanbali 2: 16).

The Ottoman sultans and governors followed their example. Sultan Sulaiman the Magnificent endowed the mosque with a Qur'an and appointed a reader (*qari'*) for it (Sijill 44 971/1563: 500). Copies of the Qur'an were further endowed by the Ottoman vizier Sinan Pasha in the 11th/17th century (Sijill 143 1060/1650: 57) and by the superintendent of the two Holy Harams (of Mecca and Medina) Enver Pasha in 1917.

Copies of the Qur'an were also often endowed by ordinary people² and many scholars used to send copies of their works as a present to the Aqsa library ('Abd al-Muhdi 1980: 270). The Islamic museum in the Haram contains a rare collection of Qur'ans dating back to the Ottoman age and before. These precious copies number 650; they were written between the third and the 12th century AH. Among them is a copy of the Qur'an written by the Sultan of Morocco 'Uthman ibn Abi Yusuf in 745/1344. The

mushafs endowed by the Mamluk Sultan Barsbai in 838/1434 and by the Ottoman vizier Enver Pasha in 1336/1917 are still kept in the Museum.

It seems that bookcases were scattered in various places in the Aqsa mosque and the Dome of the Rock, and that both sanctuaries had a special librarian. Sakhawi says that Muhammad ibn Ahmad al-Ghanimi was the librarian of the Aqsa library in the middle of the 9th/15th century (Sakhawi 6 n.d: 301). Shaikh Bashir al-Khalili was the librarian of al-Sakhra in the 11th/17th century. On his death the post was inherited by his two sons (Sijill 143: 58). In 1010/1601 Muhammad ibn Muhammad al-Khalili was appointed as the librarian of the Sakhra (Sijill 83: 76).

(ii) *The libraries of the madrasas*

Among the large school libraries in Ottoman Jerusalem was the library of the Fakhriyya Madrasa/Khanqah in the esplanade of the Haram. The *madrasa* was established as *waqf* in 732/1339 by Qadi Fakhr al-Din. Its library, which had at one time about 10,000 volumes, was rich in manuscripts on astronomy and various religious disciplines. It is reported that the *mutawallis* (*waqf* superintendents) divided the books among themselves, and thus they were dispersed (al-'Arif 1961: 451; de Trazi, *Khaza'in* n.d: 294; Stephan 1939: 84 fn).

At al-Aminiyya Madrasa in the northern portico of the Haram there was a library which contained the manuscripts of the ancestors of the Imam family, among them the books of Muhammad Salih al-Imam, the *shaikh* of the *madrasa* in the 13th/19th century (al-'Asali, *Ma'ahid* 1981: 235).

At the Ashrafiyya (Sultaniyya) Madrasa (established as *waqf* by the Mamluk Sultan Qa'itbai in the 9th/15th century) the library had officials holding various posts such as *khadim al-mushaf* and *khadim al-rab'a* and *mufarriq* (distributor) *al-rab'a*. Sultan Qa'itbai endowed the *madrasa* with a copy of the Holy Qur'an (al-'Asali, *Ma'ahid* 1981: 168; Nasser 1974: 80). Al-Ashrafiyya continued to function until the 12th/17th century (al-'Asali, *Ma'ahid* 1981: 171). At al-Ghadiriyya Madrasa there were also books endowed for the benefit of the community. In 945/1538 Shihab al-Din al-Antaki established for the benefit of the *madrasa* a *waqf* consisting of a collection of books (Sijill 10 945/1538: 563). Even some *zawiyas* maintained small libraries; one such *zawiya* was al-Zawiya al-Wafa'iyya (now known as Dar al-Budairi) which housed the books of Shaikh Muhammad al-Budairi (al-'Asali, *Ma'ahid* 1981: 311,325). Another was al-Zawiya al-Bukhariyya (al-'Asali, *Ma'ahid* 1981: 351-2).

In this connection mention must be made of a mine of information about Jerusalem, which has been only very imperfectly tapped. It is the registers of the Shari'a Court of Jerusalem. The registers constitute a huge library

¹ The large *mushaf* of Barsbai is still kept at the Islamic Museum in Jerusalem. The *waqfiyya* of Barsbai in regard to the *mushaf* is mentioned in *Tapu tahrir defteri* no. 602. It is dated 838/1434 (al-'Asali, *Ma'ahid* 1981: 377).

² The library of the Aqsa mosque contains, for example, books which were endowed by 'Ala' al-Din Qaraman in 788/1376 and by Muhammad ibn al-Hajj 'Uthman in 918/1512.

of documents, the importance of which cannot be exaggerated. The registers begin in the year 934/1527 and cover the whole Ottoman period. Here one finds a wealth of political, economic, social and cultural data about Jerusalem and other parts of Palestine. Some documents in the registers even date back to the Mamluk and Ayyubid periods. The number of registers, which are still running, exceeds 650 (al-‘Asali, *Watha’iq* 1 1983: 10-22).

(iii) Libraries of Christian monasteries and convents

The convents and monasteries of Jerusalem are richly provided with libraries which contain large collections of documents relating to the affairs of the different denominations, from the Byzantine era down to the present time. These documents are written in as many as fifteen languages, including Arabic. The bulk of the documents deal with religious matters such as questions of worship, liturgies, litanies, histories of saints, copies of the Bible, commentaries on the Gospels, and so on.

Besides these in the convents there is a sizeable proportion of documents written in Arabic. These deal mainly with mundane affairs, and in particular with the relations between the Christian communities and the Islamic ruling authorities during fourteen centuries. They include sultans’ decrees and *firmans*, court judgments and governors’ orders regulating the relations of the communities with the state and defining their rights and duties.

The most significant among the monasteries and convents with rich collections are the following:

(1) The Greek Orthodox Patriarchate and Convent

The Patriarchate Library is one of the richest libraries in the Orient for old manuscripts. In 1865 its collection was augmented with the addition of the manuscripts of St Saba Monastery and the Church of the Cross. The collection contains approximately 2,400 manuscripts in eleven languages. About three-quarters of the manuscripts are in Greek, but there is a good number in Arabic and Syriac. The majority were written between the 5th and 18th centuries. The library was organised in 1883, and in that year a printed catalogue of the manuscripts was published (de Trazi 2 n.d.: 475). In 1897 the Greek scholar A Pappadopolos Kerameos published selections of the documents under the Greek title Αναλεκτα (Vryonis, *Bilad al-Sham* 1 1983: 155-6).

(2) The Latin Patriarchate and St Saviour Convent

This library is situated in the Christian Quarter and is known as St Saviour Library. Among the old holdings of the library there is a large number of decrees and *firmans* issued by the Mamluk and Ottoman sultans regulating the

relations between the Franciscan fathers and the state. These *firmans* are in Arabic for the Mamluk period, and in Turkish for the Ottoman period. The number of Ottoman *firmans* in the library is 454, while the total number of documents housed in St Saviour’s is 2,644.

(3) The Armenian Patriarchate and St James Cathedral and Monastery

The Armenian Patriarchate in Jerusalem houses the largest collection of Armenian documents in the world. Some of these documents go back to the early Christian centuries. The documents constitute a mine of information and include among other things decrees and *firmans* issued by Muslim rulers to the Armenian community (al-‘Asali, *Watha’iq* 1 1983: 65-8).

(4) The Syrian Orthodox Convent, Church and Monastery of St Mark

St Mark’s Monastery Library is one of the oldest libraries in Jerusalem. Although a large proportion of its valuable collections has perished or has been lost in the course of the centuries, it still abounds with documents, *firmans* and decrees of the sultans. These invaluable items were catalogued in 1925. The oldest of them goes back to 825/1421. Some of them are written in Arabic, some in Turkish. Philip de Trazi tells us that ‘there still exist in the monastery 362 manuscripts adorned with marvellous decorations. Here we find documents, deeds, writs, *firmans* and significant messages and letters which are of great interest to researchers in the history of the Orient and especially in the heritage of Jerusalem’ (de Trazi 2 n.d.: 479).

In addition to these essentially manuscript libraries, there are important and relatively recent Christian libraries. The largest among these are:

- 1) The Dominican Library, or the library of the École Biblique et Archéologique Française which was established in 1898 and is located on the Nablus road outside the Damascus Gate.
- 2) The Gulbenkian Library which was established in the Armenian Compound in 1929 through a donation made by the Armenian millionaire Tourian Gulbenkian.
- 3) The Franciscan Bible School library in the Old City (near St Stephen’s Gate).

Private Libraries

The Shari’a Court registers reveal that there was a large number of private libraries in Jerusalem in both the Mamluk and the Ottoman periods. Most of the private libraries we know date from Ottoman times, a fact which

may warrant some amendment in the dark picture that we have about cultural life in this period. It seems that the existence of manuscripts in the private collections of the 'ulama' was a common feature. Even ordinary people used to collect manuscripts, as is indicated by a lawsuit filed by a certain Mullah Mahmud against Muhi al-Din ibn 'Abdallah concerning the theft of books. The suit acquaints us with the prices of books in those days (Sijill 57, 984/1576: 512). Books and libraries are mostly mentioned in *waqfiyyas* and testaments. We have lists of hundreds of books bequeathed or endowed by scholars in the Ottoman period.

The following are some examples:

- 1) Muhammad ibn Budair al-Qudsi (d.1220/1805) endowed his house and his library in 1205/1790. It is reported that the library possessed one thousand manuscripts.³
- 2) Ahmad ibn Muhammad al-Muwaqqit, the Hanafi *mufti* of Jerusalem (d.1171/1757) had a valuable library which he endowed for the benefit of students in 1181/1767 (Hussaini 1985: 233-4; al-'Arif 1961: 451)
- 3) Hasan ibn 'Abd al-Latif al-Husaini, the *mufti* of Jerusalem (d.1226/1811) had a big library which he instituted as *waqf* in 1201/1786 (Sijill 267, 1201/1786: 156-62).
- 4) Muhammad Sun'allah al-Khalidi, who was chief clerk of the Shari'a Court in Jerusalem and died in 1140/1727 (Hussaini 1985: 290), endowed his books for the benefit of his sons and grandsons (*Fihrist al-Maktaba al-Khalidiyya*, pt.1, 94).
- 5) Immat Khalifa ibn Ibrahim, a scholar of the 10th/16th century, endowed his books for the benefit of his children and, after them, to the Arghuniyya Madrasa (Sijill 23, 957/1550: 525).
- 6) Sharaf Musa al-Dairi, *imam* of the Sakhra in 984/1576, bequeathed more than a hundred books (Sijill 57, 985/1577: 354).
- 7) Muhibb al-Din Muhammad ibn al-Duwaik, the *qadi* of Jerusalem, bequeathed about 150 books (Sijill 79, 1007/1598: 501-7).
- 8) Muhammad Zadah, *mufti* of Jerusalem, who died in 1151/1739, bequeathed:
 - a) collection of books on medicine and philosophy (Sijill 230, 1152/1739: 123-5)
 - b) Hajji Khalifa, (pt. 1: 836).

³ For the *waqfiyya* see Shari'a Court register no. 272: 147-150, 1205/1790.

- 9) 'Abd al-Mu'ti al-Khalili, Shafi'i *mufti* of Jerusalem, bequeathed a collection of books enumerated in his testament (Sijill 231: 65-6).

It would be convenient here to talk in some detail about two libraries mentioned at length in the *waqfiyyas* of two eminent scholars.

Muhammad ibn Muhammad al-Khalili was born in al-Khalil (Hebron) and received his education at al-Azhar. In 1104/1695 he came to Jerusalem, where he became the Shafi'i *mufti*. He settled in Jerusalem for the rest of his life and became famous for his learning and wealth. He died in 1147/1734 (al-Khalili 1979: 7-14). Of his library Hasan ibn 'Abd al-Latif al-Husaini, the *mufti*, said, 'Our master collected a unique library which he consecrated as *waqf*. It is now a useful asset for every seeker of knowledge' (al-Hussaini 1985: 13). The *waqfiyya* included a list of books. There were seven *mushafs*, books on religion, language, literature, arithmetic, astronomy, logic, medicine and other disciplines. There were in all 7,000 volumes. Al-Khalili endowed the books for the benefit of himself, then for his sons and descendants and, thereafter, for the benefit of al-Zawiya al-Muhammadiyya and Shafi'i scholars. The *waqfiyya* shows that the *shaikh* was most careful about his books. They could only be lent to scholars. They should be well maintained. Naturally they could not be sold, donated, mortgaged, or presented to people in authority. In his *waqfiyya* al-Khalili appealed to the people of Jerusalem to make good use of books so as to be able to compete with foreigners (al-Khalili 1979: 22).

The second *waqfiyya* is that of Yahya Sharaf al-Din Muhammad ibn Qadi al-Salt. It was written in 1007/1598 (Sijill 79: 488). Yahya was the *imam* of al-Masjid al-Aqsa. The titles of books included in his *waqfiyya* exceed one hundred, one third of which were on *fiqh*. There were ten books on language and grammar, nine on Hadith, and eight on *tafsir*. The *shaikh's* interests lay chiefly in *fiqh*, and then in language. But he was also interested in Hadith and *tafsir*. These subjects were of course the pillars of the prevailing culture. Not surprisingly therefore, the other subjects were poorly represented: logic had four books, while geography, arithmetic, and '*ilm al-kalam*' had one book each. It seems that the *shaikh* had no interest in medicine, astronomy and philosophy, and not even in literature and poetry.

The majority of titles in this library were widely spread throughout the Islamic world. The authors of Yahya's small collection came from fifteen Islamic countries. This is a brilliant example of the diffusion of Islamic culture from Cordova to Herat. Moreover, the circulation of the same books continued for centuries. In Jerusalem, for example, we find these books in libraries which dated from before the 11th/17th century and in

those that followed it. On comparing the titles mentioned in the *waqfiyya* with those in the catalogue of al-Khalidiyya Library (1387/1969), the catalogue of al-Aqsa Library, (1407/1980), and the list in the *waqfiyya* of al-Khalili (12th/18th century), it turns out that almost one half of the titles of Shaikh Yahya are found in these three libraries.

III Some organisational aspects of libraries in Ottoman Jerusalem

The traditional name for a library in Islamic countries was *khizana*, a cupboard or bookcase. A library was in fact a collection of bookcases. In many libraries, reading rooms were not known. Books were taken out of the bookcase to be read inside the mosque. If borrowing was allowed, they could be read elsewhere. In the *madrassa* the *iwans* (halls) served as reading rooms.

Bookcases were usually made of wood. They were locked and the keys were kept by the librarian (*al-khazin*). Books were arranged according to subject. Copies of the Qur'an headed the list of subjects. Next came books of *tafsir*, Hadith and *fiqh* - in that order. Next in line after religious subjects were language and literature, while third place was given to natural science, the exact sciences, logic, medicine and so on. Although there were certain minor differences among libraries in this respect, arrangement by subject was always adopted. Books were placed on the shelves vertically according to size, so that the smallest one was placed at the top and the largest at the bottom. This meant that if any book was to be taken out, all those stacked above had also to be lifted down.⁵ Catalogues were generally produced in large registers according to subject. In some cases, however, lists of books placed in a given room were fixed at the door of that room, indicating the books inside (Krenkow, *EI*² 1925-8: 1046). As a rule books were lent in accordance with the conditions laid down in the *waqfiyya*. Borrowing outside the premises was not always allowed. In some cases stringent conditions were set for the borrowing of books; occasionally only scholars and serious users of books were allowed to borrow. Borrowed books had to be carefully handled, and had to be returned in their original condition without delay (al-Khalili 1979: 33-4).

The chief authority responsible for the library was the *nazir* (superintendent) or *mutawalli* of the *waqf*. However, in many cases special librarians were appointed. To help the librarian, there were also assistants in big libraries, deliverers of books (*munawilun*) and copyists. Mujir al-Din gives the names of some famous copyists in

his day (al-Hanbali 2 1973: 191, 197-88, 240-1). Copying was a brisk business, and the wages of copyists were high. Books were, therefore, expensive (al-'Asali, *Watha'iq* 2: 259 ff; Sijill 57 984/1576: 512).

IV Emergence of new libraries in the 19th century—al-Khalidiyya Library

The 19th century was a time of radical change in Palestine. In the first place it witnessed Western penetration at various levels: political, economic, social and cultural. On the other hand, the Ottoman government embarked on attempts at educational and social reform. A number of official government schools were established in Jerusalem and other cities, and the old *madrassas* disappeared. At the same time foreign missionaries, British, Russian, French, German etc., began to establish new schools in Jerusalem. Western archaeologists, likewise, flocked to Palestine and established archaeological centres and libraries. Among the new libraries were those of the Russian Orthodox Society (al-'Arif 1961: 449), the German Evangelical Institute for the Archaeology of the Holy Land (est. 1902), the Dominican École Biblique (1898) and the American School of Oriental Research (1900). The new libraries introduced modern library practice and organisation into the country, provided readers with reading rooms, and compiled catalogues for their collections.

The increasing contacts between Palestine on the one hand and the Arab world and Europe on the other produced a new generation of intellectuals. In the last quarter of the 19th century and the beginning of the 20th new books started to arrive, transmitting modern sciences.

As a result of this cultural revival new private libraries emerged, and the first public library was opened—al-Maktabat al-Khalidiyya. Al-Khalidiyya was established as a *waqf* in 1900 by Raghib al-Khalidi, one of the notables of Jerusalem. The nucleus of the library was composed of the books of educated members of the Khalidi family, such as Yusuf Diya', Ruhi and Nazif (de Trazi 2 n.d.: 124). The library was housed in an old building belonging to the Khalidi *waqf* at the Bab al-Silsilah.

Al-Khalidiyya was a public library open to all students of knowledge (Talas 1945: 236), but the founders stipulated that books were not to be borrowed outside the premises (*Barnamaj al-Maktaba al-Khalidiyya*, 1). The library grew with the addition of valuable collections of deceased members of the family and thus became renowned for rare books and manuscripts, magazines and newspapers, some of which were in Turkish, French and other languages. In 1900 a special catalogue came out *Barnamaj al-Maktaba al-Khalidiyya al-'Umumiyya*. In

⁵ See preface to Khair al-Din al-Ramli, *al-Fatuwawa al-Khairiyya fi Naf' al-Bariyya* (R Mach, *Catalogue of Arabic Manuscripts, Yehuda Section*, Princeton University Press, 1977: 110, no. 1237).

addition to classical books, the catalogue contained hundreds of new books printed in Cairo, Beirut and Istanbul. The majority of these dealt with the modern sciences: medicine, geography, chemistry, botany, zoology and so on, an indication of the trend towards modernisation.

It is regrettable that a large proportion of the library collection has been lost over the years. This fact calls upon all concerned to do everything possible to preserve the remaining vestiges of this heritage of the past. (For further details on this library, see Chapter 13 in this volume.)

Chapter 20

COSTUME IN OTTOMAN JERUSALEM

Nancy Micklewright

The dress of the inhabitants of Palestine has long attracted the attention of visitors to the region, and, more recently, of scholars.¹ While Jerusalem was often the most eagerly anticipated objective on a tour of the Holy Land, it was generally the regionally diverse (and identifiable) costume of people outside the city which caught the eye of travellers. Within Jerusalem, there was too much to look at, too much going on, for any but the most careful of observers to be able to distinguish one sort of dress from another. Mary Eliza Rogers, an unusually clear-eyed and lucid Englishwoman who lived in Haifa for several years in the late 1850s and visited Jerusalem frequently, provides the following description of the inhabitants of the city enjoying a Sunday promenade:

The men's dresses were picturesque and various in the extreme, and of every tint and colour, from the sombre robes of the processions of monks, to the gorgeously embroidered jackets of the Turkish officers and *employés*, the high-pointed hats and long gabardines of the Jews, the bright sashes and turbans of the Moslem gentlemen, and the

light braided suits and red tarbouches of the Christian Arabs; but the women, who kept in groups quite apart from the men, sitting under the olive trees or strolling into the valley below, were all shrouded in sheets, and whether Jewish, Christian, or Moslem, the only variety in their dress depended on the colour of the veil or mask, and the form or colour of the shoes; some of them being of European fashion, while others were yellow or red and pointed. The black slaves were shoeless, and thus could be distinguished from their mistresses. A few of the ladies carried gay parasols embroidered with spangles (Rogers 1862: 31).

The particular characteristics of Jerusalem, a religious centre which was the destination, or residence, of followers of three major religions from a variety of ethnic groups, had a determining influence on many aspects of life in the city, and certainly on the development of the local dress. The fact that the city's importance derived from its religious significance, and not from its political, economic or cultural importance, meant that it was never the home of the politically powerful, of the intellectual élite, or of the wealthiest entrepreneurs—as were other cities of the Ottoman empire, such as Istanbul, Cairo or Damascus. In terms of costume history, Jerusalem was never a fashion capital. Its costume history is nonetheless significant for an understanding of the social history of the city. The choices that the inhabitants of Jerusalem made in their dress, in how they presented themselves to their families, their

¹ A pioneer in the study of Palestinian dress was Grace Crowfoot, whose careful studies of embroidery and dress variation began to be published in the 1930s. She was followed by Violet Barbour and Jan Macdonald, whose work was published in the 1950s. More recently, Yedida Stillman and Shelagh Weir have published numerous works on specific collections and other aspects of the topic. For bibliographic details of the work of these authors, as well as numerous others, see the bibliographies of Stillman 1979 and Weir 1989.

neighbours, and the foreigners who were constantly moving through their city, reveal a great deal about their sense of ethnic or religious identity, as well as their changing relationships with the Ottoman and European outsiders whose presence in Jerusalem grew steadily throughout the period of Ottoman rule. Unfortunately, despite the potential importance of costume history for the social and economic history of the city, there are a number of serious obstacles in the way of its study. Some are present in any investigation of costume history, but some are peculiar to the study of the costume history of Jerusalem.

Perhaps the most serious problem which must always be confronted in studying historical dress is the lack of material evidence. For Jerusalem, little if anything survives from before the 19th century. For the first three centuries of Ottoman rule, we must rely on the scanty descriptions of travellers and the notoriously unreliable illustrations which sometimes accompanied their work. Evidence from within the Ottoman world is equally problematic. Government archival records and court documents, such as wills, contain potentially valuable information concerning textile production, trousseaus, garment types and so on, but in the absence of any corroborating garments and a general paucity of visual documents for costume, it is difficult to construct a secure costume history on patchy textual sources alone.

The situation for the 19th century, in terms of surviving garments, is somewhat better. For that reason, as well as restrictions of space, we will restrict ourselves here to the study of the 19th-century costume of Jerusalem.

There are a number of excellent collections of Palestinian dress, both public and private, which began to be assembled in the second half of the 19th century.² Because of the circumstances in which some of these collections were assembled, there is an unusually extensive amount of documentation associated with many of the garments, a real boon for the costume historian. In addition, descriptions of the region and its inhabitants in

travel and guide books increased dramatically through the 19th century. Artists and, after the middle of the century, photographers, produced apparently endless views of the Holy Land in a variety of media to satisfy an insatiable demand for such images in Europe and North America.

These sources, valuable as they are, are not without problems. For the most part, visitors to the Holy Land were interested in touring religious sites and locating for themselves the exact places where biblical events took place. Their writing reflects these interests, and generally includes much less information about inhabitants and local customs than can be found in the travel accounts of visitors to other regions of the Ottoman empire. When descriptions of people, costume or other aspects of social life are included, these must be recognised for what they are: documents of the 19th century, with all of their concomitant shortcomings.³ Visual documents, i.e., book illustrations, paintings and especially photographs, are much more compelling as evidence for costume history, yet these must be used with even more caution than the written accounts. These seductive images vary in how they are constructed, from pure fantasy to attempts at ethnographic documentation, albeit in a 19th-century context. Rather than accepting their apparent contents at face value, the circumstances surrounding the production and intended audience of any of these images must be carefully assessed before they can be used in the study of costume history.⁴

Scholars of costume history, particularly those who study the dress of Europe and North America of the last three centuries, often assume that traditional dress in non-Western societies is unchanging, with the clothing of the 19th century, for example, providing reliable evidence of what dress in that region would have been like in the distant past. While it is true that traditional dress in most regions changes slowly in comparison to the fast-paced fashion trends which have characterised dress in the West for the past two centuries or so, it is also true that careful studies of dress in many regions of the world have clearly demonstrated that traditional dress does change in

² In the late 19th century two of the missionary societies, the Church Missionary Society and the Jerusalem and East Mission, began collecting examples of Palestinian dress, many of which have ended up in the collection of what is now the Museum of Mankind in London. A second large collection outside the region itself is housed at the Museum of International Folk Art in New Mexico, based on the material collected prior to the First World War by John Whiting, a founder of the American Colony in Jerusalem. The Whiting collection has been augmented by other acquisitions, particularly from the collection of Mrs Widad Kavar, a long-time collector of Palestinian costume who lives in Amman. In Jerusalem, the Palestine Folk Museum was founded (partly through the efforts of Crowfoot, Barbour and Macdonald) in 1936, when a costume collection was assembled. There are, of course, numerous other private and public collections throughout the region, but these are perhaps the best known.

³ In the last two decades, scholars of the 19th-century Middle East have come increasingly to realise the historical value of the writings of contemporary visitors and foreign residents, but have also become much more aware of the difficulties inherent in using such material. There is a large body of writing in a variety of disciplines which addresses these problems, of which some particularly useful examples include Kabbani, Asad, Melman, and Hatem.

⁴ As is the case with the written descriptions of the 19th-century Middle East, the paintings and photographs produced by visitors or residents in the region in the last century have begun to be analysed in a critical fashion only relatively recently. It is impossible to list all of the important sources here. Some of the most important include: Nochlin, Perez, Nir, Chevedden and Edwards.

response to economic and social change and to changes in the lives of the people whose dress is under investigation.⁵ This is certainly the case for costume in the Ottoman empire, particularly in the 19th century with its dramatic economic and social upheavals. Changes which can be documented in the costume of the women and men of Jerusalem throughout the 19th century provide clear evidence of such upheaval.

Any study of costume history must begin with the identification of the population whose dress will be investigated. For Jerusalem in the 19th century, this is no small task. Nearly every visitor to the city recorded his or her confusion at encountering crowds of people, Christian and Muslim Arabs, Turks, Greeks, Armenians, Jews from Eastern Europe as well as the Middle East, Bedouin, missionaries, Greek Orthodox clergy, resident Europeans and various itinerants. Were all of these different groups resident in the city? If so, what were their relationships to one another? How big was the city, and how did the population break down into religious or ethnic groups? Population estimates vary widely depending on the source, ranging from 11,000 to 32,000 at mid-century, although a number of sources agree on a figure of about 20,000.⁶ Whatever the actual population of the city, and the exact percentages represented by the different religious groups, the fact of this extreme diversity is paramount for the purposes of costume history. Also essential to remember is the fact that there were always large numbers of people, both local and foreign, passing through the city for shorter and longer stays.

In terms of costume history, the three main population groups which must be considered are the native residents, the Turks who were the representatives of the Ottoman government in Istanbul, and the various Europeans, long and short term residents, who came to the region as missionaries, tourists or bureaucrats. Naturally, there were important differences in costume within each of these groups, depending on religious identity, age, economic position, national or ethnic origin, and so on. The history of the dress of the residents of Jerusalem throughout the 19th century is the history of the influence

which the dress of the Ottoman rulers and the Europeans had on the traditional costume of the local residents, and the ensuing changes in the costume of local residents. Although it is somewhat artificial to focus solely on the costume of one religious group since there was so much contact among the population of the city, it would be impossible to discuss every aspect of costume in the 19th century city here, so we will concentrate our discussion on the dress of the Muslims of Jerusalem, to the extent that it is possible to isolate them from other residents.

The traditional dress of Turkish and Arab men no doubt appeared very similar to an outsider, but there were differences. Men throughout the Arab world wore basically the same sort of clothing, with variations in quality or style of textile, and details of construction and ornamentation reflecting differences in class or region.⁷ By the 19th century, their costume consisted of a long tunic or shirt (*thub*), reaching to the knees, made of cotton or wool, and baggy cotton trousers (*sirwal* or *libas*), reaching to between the knee and ankle, close fitting at the bottom and gathered at the waist with a draw-string or *dikka*. Most men then wore a *qumbaz*, or long-sleeved coat of plain or striped fabric which was wrapped and tied in the front, had long, narrow sleeves, and reached to the ankles (col. pl. XII). It was held more securely closed by a wide sash, *hizam*,⁸ wrapped around the body, and made of wool, silk or cotton, depending on the season and the class of the wearer. For additional warmth, a sleeveless baggy cloak, the '*abaya*, generally made of heavy wool, often indigo blue and white striped, or brown and white, was worn on top of the *qumbaz*. Headgear consisted of a cotton skullcap worn beneath a tall, stiff *tarbush*, the *tarbush istambuli*, made of red wool felt, with a dark silk or cotton tassel. Many men wrapped their *tarbush* with a piece of fine fabric, creating a turban. The colour and type of the fabric signalled the religious or class identity of the wearer.

The traditional dress of urban Turkish men, on the other hand, included a loose shirt, called *iç gömlek*, of wool, cotton or silk, *şalvar*, or long baggy trousers gathered at the

⁵ There are a number of costume studies which document changes in the historical dress of non-Western people. For the Middle East in particular, see Micklewright 1986, 1987, 1990; Scarce 1980; and Weir 1989.

⁶ Peters 1985: 564-5, quotes one historian who gives population estimates of 15,000 for Jerusalem in 1840, and 20,000 by 1860. Joseph Schwarz, who lived in Jerusalem for 16 years at mid-century, provides the following population breakdown: out of a total population of 32,000, there were 15,000 Muslims, 10,000 Christians, and 7,500 Jews (each of these categories includes both natives and recent immigrants) (Schwarz 1850: 273). Stillman estimates the population of Jerusalem at mid-century at 11,000, and Charles Issawi gives a figure of 20,000 for 1860 (Stillman 1979: 11; Issawi 1982: 101).

⁷ Palestinian society is generally divided into three intersecting groups: the Bedouin, the *fallahin* or village dwellers, and city dwellers. Men's dress reflected these social and economic divisions in a number of ways, despite overall similarities in garment type and the way in which individual garments were combined to create a complete outfit. For example, Bedouin and villagers went barefoot long after city dwellers had begun wearing shoes. City dwellers generally wore much more elaborate sashes wrapped around their *qumbaz*, of fabric similar to what Ottoman officials might have worn, while villagers wore leather belts to which a variety of tools and possessions could be attached (Weir 1989: 55ff).

⁸ While *hizam* is the basic word for belt, and can refer to any sash of woven material, there are a number of other words which are also used for sash or belt: *kamr*, or tablet-woven belts from Syria, or *zummar* or *ishdad*, both sashes of various kinds of fabric.

waist, an *entari*, or inner robe similar to the *qumbaz*, and a kaftan, or robe worn on top of the *entari*. Although the basic combination of garments is similar to what was worn by Arab men, the kinds of fabric used for each garment, and the details of cut, differed for each garment type. Turkish men's dress was dramatically affected by the governmental reforms of Mahmud II (1808-39), who decreed in 1829 that all male subjects were to wear fitted trousers, frock coat, shirt, European-style shoes and *fez*. The costume of the Ottoman military had been similarly Europeanised in 1826, when the traditional uniforms were replaced by serge trousers, broadcloth vest and jacket, and *fez*. Only the *ulema* were allowed to continue wearing the traditional *salvar*, *entari* and turban.

Thus from 1829 onward, Ottoman governmental officials and military personnel in Jerusalem would have been easily differentiated from local residents on the basis on their dress (pl. 20.1). European men, too, would have been easy to identify on the basis of their clothing and headgear. As Europeans became more numerous and more visible in Jerusalem, and as their political influence increased, local men began to adopt elements of their costume⁹ (pl. 20.2). The following passage from Mary Eliza Rogers' book, quoted above and published in 1862, provides a telling description of the variety which existed in costume among the men of Jerusalem in the late 1850s. She is describing the three guides who were accompanying her on a trip from Jerusalem:

Mr Finn's head *kawass*, a clever and energetic Moslem, led the way. He wore a scarlet cloth jacket braided with gold, full white cotton trousers, and a red cloth tarbouche. He carried a sword and pistols ... Mohammed, our faithful Egyptian groom, who had charge of the luggage, was dressed in a long hooded drab cloth pelisse, made at Aleppo and ornamented tastefully with broad black braid ... Mr Simeon R, the Hebrew dragoman of

the British Consulate at Jerusalem, was the third ... He was a stout, elderly man, with a ruddy face, bushy grey hair, and twinkling grey eyes. He was dressed in European clothes, but wore over them a large white *abai* or cloak made of goat's hair, and a broad-brimmed hat covered with white calico, and with white muslin wound round it and hanging down behind like a veil. He carried a brace of pistols ... (Rogers 1862: 278).

As this passage indicates, the changes in men's costume in Jerusalem follow a typical pattern of transformation, in which individual elements from a foreign tradition are added to the traditional dress, or particularly useful garments from the old traditions are retained and worn together with the new styles.¹⁰ In the case of men in Jerusalem, waistcoats and jackets were often worn together with the traditional *sirwal* or *libas*, or on top of the *qumbaz*. Or, as in the case of Mr Simeon R, described above, the '*abaya*', which was worn by virtually all social and regional groups in Palestine as a multi-purpose coat and blanket, was included despite his otherwise wholesale adoption of European clothing.

The 'head *kawass*' described by Rogers provides an important example of an occupation-specific costume. There were numerous men in Jerusalem whose occupation could be identified on the basis of their dress—perhaps the various clergy are the most obvious examples (pl. 20.3). A particularly visible example from the Muslim community was the *kawass* or dragoman who was employed by the European consulates to guide and protect their own employees and visitors¹¹ (pl. 20.4). As documented in numerous photographs, these men wore distinctive and lavishly decorated clothing, characterised particularly by the gold embroidery on the jackets and sometimes on the baggy trousers.

Although women's dress receives the lion's share of attention in most publications concerned with Palestinian costume, it is in fact quite difficult to identify the costume of the women of Jerusalem. While it is possible to generalise about the dress of men in Jerusalem based on men's clothing throughout the Arab world, the same is not true about women's dress in the city. Throughout the region, women's dress generally displays a far greater range of variety in fabric type, garment style and decoration than men's clothing, and thus communicates a great deal more

⁹ From the time of the Egyptian conquest of Jerusalem in 1831, and particularly after the Ottoman reconquest in 1840, Europeans became more and more involved in the political, economic, and social life of the city, and of the region more generally. The British consulate was established in Jerusalem in 1838, followed by the consulates of France, Austria, Prussia, Russia, Sardinia and Spain. An Anglican bishopric was established in Jerusalem in 1841, the Latin Patriarchate was revived in 1847, and the Greek Patriarchate moved from Istanbul to Jerusalem. The foreign communities were responsible for founding primary schools, technical schools, hospitals, orphanages, and printing presses, as well as businesses for profit. The increased influence of Europeans in the political and economic spheres was reinforced in the social sphere by the reforms made in mid-century by the Ottoman government, which extended greater rights to religious minorities within the empire.

¹⁰ See n. 5 for sources which discuss patterns of costume change in non-Western societies.

¹¹ While the occupation of a *kawass* could be readily identified on the basis of his dress, the same is not true of his religious or ethnic identity, since these very visible employees of the foreign consulates were not always Muslims, but could be Greeks or Arab Christians as well.

about the social status and place of origin of the wearer. On the other hand, recent scholarship on women's dress has suggested that the rather rigid distinctions which have been drawn in the past in describing women's dress from different villages and regions in Palestine have perhaps exaggerated the impermeability of these markers of regional identity and that regional differences in costume should be understood instead as fluid and shifting.¹²

Scholars of Palestinian women's dress divide the region into three main geographic areas: the north, central region and south. Costume in the north is generally described as being much more receptive to the fashion influence of Turkey, Lebanon and Syria, and in fact 19th-century descriptions of dress in this area reveal close similarities with the dress of Ottoman Turkish women, for example. This is, however, outside the parameters of our study and will not be considered further. Likewise, the dress of women in the sparsely settled south of Palestine is outside the bounds of our discussion. Jerusalem falls in the central region of Palestine, which is usually divided further into the coastal plain and the Judean hills. The Judean hills have four main regions, each focused on a particular town or village: Ramallah, Jerusalem, Bethlehem and Hebron, and it is this conjunction of town and village which traditionally influenced the dress of women in Jerusalem.

Women's dress in this region consisted of a number of layers, beginning with a white cotton underdress, which was sometimes embroidered. The dress worn over the underdress was the basic element of women's costume in this region, the *thub*. It was long, with a round neck opening and front neck slit. The sleeves were generally long and pointed, so long that they would have to be tied back to allow any mobility for the wearer. In some cases, sleeves were close-fitting rather than triangular in shape. The dress was full, with extra panels added down the sides for additional fullness in the skirt. The great variety in dress names for this basic garment reflects a corresponding variety in fabric type, the number of pieces used in constructing the dress, and its embroidered decoration. Another term, *jillaya*, can be used to refer either to a particularly extravagantly decorated *thub*, or to a kind of coat-dress, which was worn in some parts of central Palestine, but not apparently in Jerusalem. Most women would have owned a number of sashes or girdles to be wrapped around the waist of their *thub*. These could have a variety of names, *ishdad*, *hizam*, or perhaps most commonly, *zunnar*. The *zunnar* was a square piece of fabric often made of striped atlas silk, or plain-coloured silk, folded in half diagonally and wound around the waist. For additional warmth, a waist-length jacket with straight

sleeves, made of plain or quilted cotton, the *mudarabiyya*,¹³ could be worn over the *thub*. Alternately, women wore a straight, sleeveless woollen coat, called a *bisht*, which was usually made of striped wool and sometimes decorated with a different fabric at the shoulders or around the hem.

Bethlehem, Ramallah and Hebron each developed distinctive embroidery styles and fabric types which served to identify dresses from each region, as well as characteristic headdresses. Bethlehem in particular was an important fashion centre for the entire region, and had a strong influence on women's dress in Jerusalem. The women of Bethlehem, which was primarily a Christian village, were exposed locally to elaborately decorated church vestments and furnishings as well as to the uniforms of the Ottoman and European officials of nearby Jerusalem, all of which influenced their embroidery. In addition, Bethlehem, as a market centre and important tourist site, was relatively well-off, and its inhabitants better educated than those of the surrounding area. The women of Bethlehem were thus able to work for money rather than subsistence, and their embroidery, which was in high demand throughout the region, was sold by the piece in Jerusalem and elsewhere, to be incorporated into dresses made locally.¹⁴

The traditional dress of Jerusalem was apparently similar in general characteristics to the dress of women throughout the Judean Hills region, but instead of developing particular local styles in terms of fabric type, dress cut and embroidery, Jerusalem women borrowed freely from dress components in the surrounding area. Dresses from the Jerusalem region, for example, may therefore display Bethlehem-style embroidery and dress shape, while using fabric which would never have been considered for a dress actually produced in the Bethlehem area. The dress illustrated in col. pl. XIII, from Jerusalem, c. 1850, is made up of pieces of green and red silk, with gold silk used on the sleeves. Although a similar kind of dress, made in the same way, could have been found in Bethlehem, it would have had a different name, and would have had more extensive embroidery on the *qabba* or chest panel, as well as a panel of brocaded work at the back hem (Stillman 1979: 42). A second, later *thub* from the Jerusalem region is made of striped silk from Syria, reflecting the greater prosperity of Jerusalem and its surrounding villages (col. pl. XIV). It has the three green

¹² See Weir 1989: 17-22 for a discussion of these ideas, and the entire book for a sensitive and sophisticated analysis of the dress of a specific region over a period of decades.

¹³ Weir refers to this type of jacket as *mudarabiyysh* (Weir 1989: 152); however, Stillman points out that jacket terminology in the region is very confused, and that many different terms are used to describe the same basic garment (Stillman 1979: 36-7).

¹⁴ See Weir 1989: 127-38 for a more extended discussion of the importance of Bethlehem as a fashion centre, and the influence of Bethlehem-style embroidery on the surrounding region.

Ottoman Jerusalem

and red taffeta skirt inserts common in dresses from Bethlehem, as well as Bethlehem-style embroidery on the *qabba* and sleeves (Weir 1989: 96-7).

While head coverings were important costume elements for everyone, village and urban women differed in the degree to which they covered themselves, with urban women being much more heavily veiled than their village counterparts, who generally did not cover their faces. Women in Jerusalem generally wore a small cap, *taqiyya*, which could be embroidered and decorated with coins or sequins imitating coins. In the Jerusalem region, a veil or shawl, *khirqā* or *ghudfa*, would be worn over the *taqiyya*, and was made of cotton or linen, generally pieced from three lengths of fabric, and heavily embroidered. Festive veils would have been made of finer fabric, with more embroidery than those for everyday. Urban women, however, when dressing to go outside, would have worn a white sheet-like cloak, called *izar*, *habara*, or *amlaya*, with a separate piece of material veiling their face (pl. 20.6).

In the absence of very much visual documentation, and with few surviving garments which can be securely identified with the city itself, it is difficult to document fashion change among the women of Jerusalem during the 19th century. It is, however, possible to make a few generalisations. For many women in the Jerusalem region, the *thub* continued to be the basic element of their dress. The fabric chosen to construct the dress reflected changes both in style and fabric availability, and there were also changes in embroidery style, due again to fashion shifts, as

well as to the increased exposure of local women to European embroidery designs. The influence of Turkish fashion seems to have been minimal, since Turkish women were few in number and apparently had little contact with others. Jerusalem was never a cosmopolitan centre like other Ottoman cities, so that the pressure to modernise, which was apparent in other cities and which was a motivating influence in the adoption of European dress by Muslim women in those cities, would not have been as strong in Jerusalem. The pace of change was therefore much slower than in other urban centres of the empire, such as Istanbul, Beirut, Damascus and Cairo.

However, there were large numbers of European women in the city, who interacted socially with local women. The presence of the European women, as well as the shops which carried textiles and clothing items manufactured in Europe, and the influence of European-run schools and school uniforms on children, did allow a slow shift in costume among some groups of women in the city, generally those from wealthy, well-educated elite families. By the early 20th century, numbers of women had begun wearing European dress, and had abandoned the sheet-like outdoor cloak for the more modern and less voluminous Turkish style dark *çarşaf* and face veil (pl. 20.7). Nonetheless, significant numbers of women in Jerusalem and throughout the region continued to wear the traditional embroidered dresses, a fashion which has persisted among some groups until the present.

Pl. 20.1 Turkish governor of Nazareth, and other officials. Despite the fact that this photograph pictures an official from Nazareth, not Jerusalem, and from the turn of the century, it is useful in demonstrating the dress worn by Ottoman officials in Palestine. With the exception of the man in the far left, who wears a *qumbaz* and *hizam*, all of the men in the photograph wear some version of European dress, with the governor's costume being the most formal. European men, of course, would have worn hats with brims, not the *fez* or *tarbush*. (Collection of Eric Matson, held in the Library of Congress, Washington, DC. (he Matson collection consists of over 20,000 negatives from the American Colony in Jerusalem, an international religious community founded by an American family in 1881. Involved in a number of different activities, the Colony began a separate photographic department in 1898 for which a number of well- and lesser-known photographers worked. The photographs in the collection date from the turn of the century and the first few decades of this century, and the collection carries the name of the Swedish American photographer, Eric Matson, who took over the American Colony Photographic Department in 1934, which later became the Matson Photo Service.)

Pl. 20.2 Photograph entitled 'Street Merchants in Jerusalem', produced by Felix Bonfils, c. 1880. The Bonfils photography company was one of the most prolific and commercially successful in the Middle East. Based in Beirut, they travelled widely throughout the region to obtain photographs and opened shops in other cities to increase their markets. Most of their photographs of people are carefully controlled studio views (pl. 20.6, for example), and this view of three men, although taken out of doors reveals the same attention to the arrangement of the figures and props as their studio views. However, this photograph provides a good example of the dress of ordinary men late in the century. The two merchants each wear *sirwal* or *libas*, a *qumbaz* wrapped with a *hizam*, a European-style jacket on top of the *qumbaz*, and a *tarbush*. The man standing to the left appears considerably less well-off, and appears to wear only the *thub* wrapped with a sash, and perhaps knee-length *sirwal*, as well as a turban instead of a *tarbush*. Courtesy of the Fine Arts Library, Harvard College Library.

Pl. 20.3 Muslim religious men standing outside of the Khalidi Library in Jerusalem. Their religious status is indicated by their white turbans, as well as by their traditional costume: none of these men has, for instance, substituted a European-style jacket for their *qumbaz* or outer robe. (Collection of Eric Matson, held in the Library of Congress, Washington, DC.)

Pl. 20.4 'Russian *Kawass*', a postcard produced by the American Colony Jerusalem, before 1914. A studio portrait with painted backdrop and appropriate props which highlights the elaborate costume worn by the *kawass* or dragoman. The lavish gold embroidery on his jacket and shirt, extravagant sash, and weapons all would have rendered him immediately identifiable.

Pl. 20.5 Photograph of Silwan women (near Jerusalem), 1926-35. The woman wears a dress of striped ribbed silk, with long triangular sleeves, tied back in this photograph. She is standing to show the taffeta panel inset at the side of the skirt. The embroidered *qabba*, or chest panel, and a wrapped sash in a striped pattern of Turkish origin still produced today are visible beneath the baby. (Copyright Grace Crowfoot, published by kind permission of the British Museum, London.)

Pl. 20.6 A photograph produced by Felix Bonfils labelled 'Jewish Women in Street Costume', c. 1880. As was often the case with Bonfils negatives (and indeed, the negatives of other commercial photographers in this period in the region), this same photograph was also marketed as 'Christian Women', and 'Moslem Women' (Nir 1985: 149). In any case, the two women in the photograph demonstrate the typical street garb for urban women from different religious groups in 19th-century Palestine. They wear a large piece of fabric, which could be tied at the waist and thrown over the head like a hood, or held on the body like a cape or shawl. As the woman on the right reveals, a second piece of fabric, called a *mandil*, which was generally decorated in some way, was used to cover the face. (Courtesy of the Fine Arts Library, Harvard College Library.)

Pl. 20.7 A bread stall in Jerusalem, showing a woman wearing the black street veil, skirt and stockings of the early 20th-century modern women of the city. A second woman, to the left, seems to be wearing a more traditional kind of street covering, demonstrating the variety which has existed for at least the past century in how women choose to appear in public. (Collection of the Jerusalem and Middle East Church Association, Middle East Centre, St Antony's College, Oxford.)

Chapter 21

THE SONGS AND MUSICAL INSTRUMENTS OF OTTOMAN JERUSALEM

Claudia Ott

In this chapter, the songs and musical instruments of Ottoman Jerusalem, as well as information about the musical practice and the status of music there will be presented. Obviously, the limits drawn for the purposes of this study are hardly justified from a musicological point of view—only for Turkish military music would the Ottoman period be a plausible time limit historically. The boundaries marking the occurrence of songs, melodies, or instruments can hardly be identified with the borders of the urban area of Jerusalem. Moreover, in many cases they are not primarily regionally oriented, but run between social strata, villages and towns, and between nomadic and sedentary peoples. This makes it all the more important to place the material presented here within its proper context. This contribution can do no more than undertake an initial, and necessarily incomplete, inventory of existent records relating to Ottoman Jerusalem,*

I Instruments

Instruments dating from the Ottoman period in Jerusalem are now extremely rare. To my knowledge, complete collections are no longer in existence. According to information from a member of the Nashashibi family

* I am grateful to Dr Julia Männchen of the Gustaf Dalman Institute at the Ernst Moritz Arndt University of Greifswald, Germany, Dr Gunnar Lehmann of the German Protestant Institute of Archaeology, Jerusalem, and to Professor Amnon Shiloah of the Hebrew University of Jerusalem, for their support and co-operation. The translation is by Adelheid Baker.

(October 1993), the collection of the Nashasibi family was twice, in 1948 and 1967, looted and subsequently disappeared. Other private collections were more or less depleted through the sale of instruments abroad, especially to Denmark and Italy (information given by a shopkeeper in October 1993). None of the privately owned instruments shown to me was older than 50 years. In view

of this state of affairs, we have to limit ourselves to those instruments and collections of instruments that are already documented for the Ottoman period and can therefore be safely assumed to have originated in Ottoman Jerusalem.

For scientific and educational reasons, the Syrian Orphanage and the German Protestant Institute of Archaeology each initiated a collection of local musical instruments around the turn of the century. I found no trace of the collection of the Syrian Orphanage;

fortunately, four instruments of this collection were described by Edward Sachsse in 1927 (fig. 21.1).

A more comprehensive collection of musical instruments from Ottoman Jerusalem was that started by Gustaf Dalman of the German Protestant Institute of Archaeology. It was first mentioned in 1905 and, according to Dalman, comprised 'almost all musical instruments of the country' (Dalman 1905: 16). The catalogue that documents the revisions made in 1925 and 1939 lists 29

Pls. 21.1-3 Instruments from the collection of the German Protestant Institute of Archaeology, 1905.

instruments. One of them, a double clarinet (*arghul*), had already disappeared at the time of the 1925 revision. The remaining 28 were described in detail and illustrated by Sachsse in 1927. 22 of them definitely, or in all probability, originated in Jerusalem (fig. 21.2).

Apart from the drawings by Sachsse, photographs exist of the instruments, which are displayed here on two wooden chairs by the open door of the Institute on Ethiopian Road (probably in 1905) (pls. 21.1, 21.2, 21.3).

The collection of the German Protestant Institute of Archaeology, too, has been almost completely lost. Any traces that might have existed until 1966 have now disappeared since, in that year, the institute moved from the buildings of the German Lutheran Provostry in the Muristan, where it had been housed from the summer of 1924 to March 22 1966, to the area of Shaikh Jarrah (today Jami‘at al-Quds, Institute of Islamic Archaeology) (cf. Noth 1967: 109). Three instruments, namely two double clarinets (*zummarā*) and one double clarinet with drone pipe (*arghul*), are now at the Gustaf Dalman Institute, Greifswald (pls. 21.4, 21.5). Dalman himself probably took them there in 1921 after leaving Jerusalem for Greifswald, where he became a professor of theology. For this reason

they are not included in Sachsse’s description, for he worked on the Jerusalem collection in 1925. The three double clarinets are also illustrated in *Arbeit und Sitte in Palästina* (Dalman 1927-1941: vol. 6, table 39).

The only instrument known so far that bears the name of its manufacturer and the manufacturing date also formed part of this collection (see below, under *‘ud*).

I.1 Notes on individual instruments and their place in the musical life of Ottoman Jerusalem

For information on individual instruments we have to rely largely on reports from European travellers or diplomats living in Jerusalem, clergy and the like. However, these European authors only had access to a very small segment of musical life in Ottoman Jerusalem, namely public functions such as wedding processions, parades, military music, street music, and music played in the coffee-houses. They had no access to the private sphere of musical life,

especially the so-called classical art music, the music played by the dervishes, women's music and music in the *hammam* (bathhouse). Arab sources, on the other hand, give the impression of a rich private musical life, but do not contain any details regarding the use of individual instruments or the performance of particular songs. The emphasis will therefore be on the musical instruments used on public occasions in Ottoman Jerusalem.

The flute (*nay* fig. 21.2: 1)¹

Though, in general, *nay* is the name of the edge-blown flute made of reed (*arundo donax*), Dalman notes the term *shabbaba* (normally applied to the end-blown wooden flute here named *suffera*, fig. 21.2: 6), in contrast to *nay* in the

¹ On construction and playing technique, see Sachsse 1927: 88-39; cf. New Grove 13, 84-5, s.v. *nai*.

Aleppo area and *manjara* in Galilee (cf. manuscript catalogue of the Museum 137). Initially, the *nay* was indigenous mostly among the dervishes, but enjoyed great popularity also as an instrument of classical art music and popular dance music. In 1910 Paul Kahle heard it played as an accompanying instrument of a round dance (*dabka*) in Nabi Musa (Kahle 1913: 171-2). Pl. 21.6 shows such a round dance (in this case one with hand-clapping *sahja*) being performed in Nabi Musa (c.1905).

The double clarinets (*zummarā* and *arghul*, fig. 21.2: 2-5)²

According to Dalman, manuscript catalogue of the Museum 137, *nay* or *zummarā*, though not *mijwiz*, was the customary name in Jerusalem for the double clarinet, whose two pipes are of the same length and have finger holes. *Arghul* denotes the double clarinet, in which only one tube has such holes, while the other produces a drone sound. By lengthening the pipe up to 2m (Faruqi 1981: 18) this can be greatly lowered. The *arghul* now kept at the Gustaf Dalman Institute, Greifswald, can be extended to 52cm in length—according to Dalman even to 66cm (Dalman 1927-1941: 227)—this would mean that an extension piece has been lost. The *zummarā* (fig. 21.2: 5) is made from bone, as the ‘better’ examples generally were, according to Sachsse. Whether the bones are actually eagle bones as stated, could not be verified.

Since the double clarinet produces a loud and penetrating sound, its playing was especially popular in processions, parades and dances performed in the open. According to Abu ’l-Fath al-Dajjani (died 1070/1660), a jurist, double clarinets and drums were offered for sale on the occasion of a fair-like event on the Haram al-Sharif.

[One of the forbidden practices on the Haram al-Sharif is,] moreover, a mixed assembly of men and women on the 8th Shawwal. They call this the ‘Feast of the Faithful’ (*‘id al-abrar*), whereas it is really a feast of the devil and the wicked. They also call it the ‘Feast of my Lady Maria’ (*‘id sayyidati Maryam*), but it is the feast of the recalcitrant which causes much grief and sorrow. [...] At the assembly on this awful day, evil and ominous things happen which do not please God. What you see there, my brother, are men and women in groups and flocks, and with them are children clamouring and cavorting. [...] And street

vendors sell sweets and double clarinets (*zamamir*), and spinning tops (?) (*fara’ir*) and drums (*tablat*), and pictures and other things (Perlmann 1973: 287; cf. also Peters 1985: 497).

As suggested here, the clarinet is in most cases accompanied only by a percussion instrument, usually the small kettledrum (*naqqara*), less frequently by a bigger drum (*naqrazan*) or a tambourine (*daff*). It is thus the typical instrument at the head of a Muslim wedding procession:

At the piercing sound of a clarinet and the dull thud of a hand drum, the men, who are clapping their hands, march along at a measured pace’ (Neumann 1877: 56).

[... in the wedding procession, following the bridal canopy] walks a man beating a big drum, and several other men who accompany him with their piercing shawms,³ thereby greatly offending the ear of the Frank (Tobler 1853: 318).

² On construction and playing technique, see Sachsse 1927: 39-45, cf. New Grove 1, 572-3, s.v. *arghul*.

³ In German sources the double clarinet is usually given as ‘shawm’ (*Schalmei*).

Fig. 21.3 *Rabab*-player in a Jerusalem coffee-house (c. 1875) (Illustration from Ninck 1885: 171).

Processions held in connection with circumcisions were usually also accompanied by double clarinets:

The boy, dressed in his most beautiful clothes, his red cap decorated with coins, is placed on a horse which is preceded by a pillow covered with towels. Following are the schoolmates, singing and invoking God's blessing for the approaching event: thus the procession moves along through the town to the Omar Mosque, accompanied by the sounds of the drum and the shawm (Neumann 1877: 58; cf. also Tobler 1853: 316).

Whether it was the *zummarā* or the *arghul* that was played here cannot be determined. In pl. 21.7, on the other hand, which shows a dance performed at a wedding in Lifta near Jerusalem, an *arghul* with a drone pipe of some 75cm in length can be clearly distinguished on the right.⁴

The following two sources, which refer to the Nabi Musa pilgrimage and the opening of 'id al-fitr, also mention the 'shawm' and a percussion instrument. It is possible that this actually refers to the Turkish shawm (*zurna*) which came to Jerusalem with Turkish military music (on Turkish military music, see below) since the Ottomans participated in the organisation of both events.

Up front were the standard-bearers dancing, then some dervishes, barely dressed, ramming pointed irons into their bodies in a wild and fanatic manner such that the blood kept flowing, after them the playing the monotonous music of drum and shawm, with

Fig. 21.4 *Kamanja*-player in a Jerusalem coffee-house (c. 1830) (Illustration from Thomson 1872: 685).

the rear end formed by the long stream of the Muslim faithful, shouting and rejoicing (Tobler 1853: 485 on the pilgrimage of 1845).

In the year 1719, immediately after Ramadan, the Pasha opened the Bairam with a grand ride up the north-western hill outside the city; from there a great cacophony could be heard of shawms and tambourines (Tobler 1853: 315, quoted from Ladoire 1720: 385).

The fiddle (*rabab*, fig. 21.2: 7, 8)⁵

The *rabab* always has only one string. It is kept upright when played and rests on a spike. This may be of iron (fig. 21.2: 7) or is produced by lengthening the wooden neck (fig. 21.2: 8).

The *rabab* is suitable for being played indoors. It is the typical instrument of the coffee-houses and *hammams*. The best-known representation of a *rabab*-player, therefore, originated in a Jerusalem coffee-house (fig. 21.3). It first appeared in Lortet 1884: 242, after which it was reproduced in Ninck 1885: 171, and more recently in Ben-Arieh 1984: 45. The instrument was also played at the wedding celebrations in the home of the bridegroom:

The entertainments start off [late on Sunday afternoon in the groom's home (CO)] with the playing of violins, drums (*nakarah*)⁶ dulcimers (*santir*), and continue with singing, dancing' (Tobler 1853: 319).

⁵ On construction and playing technique, Sachsse 1927 48-50. Cf. New Grove 15: 521-2, s.v. *rabab*.

⁶ On construction and playing technique, see Sachsse 1927: 31, cf. New Grove 9: 785, s.v. *Kamancha*.

⁴ On this, see also the illustrations in Rothstein 1910, following 101.

The Persian spike fiddle or Persian violin (*kaman* or *kamanja*, fig. 21.2: 11)⁶

In contrast to the one-stringed *rabab*, the *kamanja* has three or more strings.⁷ It is documented several times for Jerusalem in Ottoman times. The earliest mention is found in a court record dating from 1017/1608, which prohibited the playing of the *kamanja* in coffee-houses (Ata'llah 1988: 256; on this, see below). The drawing of a *kamanja*-player in a Jerusalem coffee-house (fig. 21.4) was made by an American missionary, William McLure Thomson, whose report on Jerusalem, written in 1833, became a best-seller.

The lutes (*'ud*, fig. 21.2: 12, *qitar/buzuq*, fig. 21.2: 9 and *tambura*, fig. 21.2: 10)⁸

The *'ud* was one of the best-known instruments of the 'urban' environment, i.e., it was played mostly in private homes. Precisely for this reason, the *'ud* is rarely documented, for European travellers had no access to such occasions. In public, the *'ud* was heard primarily in Greek coffee-houses (on the strict separation between the coffee-houses of the various religious communities, see Hattox 1988: 96-7), according to Titus Tobler, while rather louder music could be heard from the Muslim coffee-houses, namely that produced by the kettledrum (*naqqara*) (Tobler 1853: 311). Inside the sound-box of the *'ud* shown here, fig. 21.2: 12, a paper label is affixed bearing the inscription

نقولا جريس القرعة ١٩٠٢ س مسيحية في القدس

niqūlā jirris al-qar'a 'in the year of Christ 1902 in Jerusalem' (cf. Sachsse 1927: 33). It is probably no coincidence that this mention of an *'ud*-workshop—the only one known to date for Ottoman Jerusalem—points to a Christian instrument-maker since, in his report, the American missionary William McLure Thomson mentions the special skills of Christians in playing the *'ud* and the related smaller lutes:

There [sc. in a coffee-house in the Old City of Jerusalem] were also players on the guitar, and one of them had a very large instrument of this kind, over whose chords his nimble fingers swept, at times, like magic. The notes are much louder than those of an Italian guitar. The Greeks, and especially the Albanians, manage this 'ood with the greatest

⁷ On the origin and history of this instrument from Iran, cf. Jenkins/Olsen 1976: 13.

⁸ On construction and playing technique, Sachsse 1927: 50-63, cf. New Grove 19: 306-7, s.v. *'Ud*; Faruqi 1981: 44, s.v. *Buzuq*; and *ibid.* 342, s.v. *Tambur*; Jenkins/Olsen 1976: 13 with illustration.

Fig. 21.5 Turkish military band at the head of a procession. (Istanbul, 1581). Left to right: clarinet (*zurna*), trumpet (*buru*), drum (*davul*), cymbals (*kasai*) (Illustration from Schweigger 1609: 177).

skill. They have a small kind, which they take with them in their extemporaneous picnics, and on the shady bank of some murmuring brook they will sit by the hour and sing to its soft and silvery note (Thomson 1872: 386).

The zither (*qanun*, fig. 21.2: 13)⁹

Like the *'ud* and *shabbab*, the *qanun*, is a typical instrument for music performed in the home, which is why nearly no references exist to it in the European sources. There is only one mention of a *qanun*-player in a coffee-house (Thomson 1872: 284).

The kettledrum (*naqqara*, fig. 21.2: 17-19)¹⁰

The *naqqara* is one of the instruments most frequently documented in Ottoman Jerusalem. It was played at wedding celebrations (Bonar 1866: 189) and private functions (Tobler 1853: 308-9) as well as during the Christian carnival season (Tobler 1853: 313-14) and, of

⁹ On construction and playing technique, see Sachsse 1927: 53-63, cf. New Grove 15: 488-9, s.v. *Qanun*.

Pl. 21.8 Three dervishes in the Old City of Jerusalem, around 1900. The central figure has a frame drum (*mazhar*) (cf. fig. 21.2: 22) (Photograph: Gustaf-Dalman Archive, Greifswald).

course, in coffee-houses (Tobler 1853: 311; Sepp 1863 1: 732). *Naqqarat* are played as a pair and struck with sticks so that it was not easy to carry them along on parades and processions. For this reason, the *daff* was usually played on such occasions. If, for some reason, one did not want to go without the sound of the *naqqara*, little tricks were used such as, for example, mounting the pair on the back of the person in front (Tobler 1853: 308) or—when they were part of a Turkish military band—on the back of a horse:

I had almost forgotten to mention their only martial music, namely a pair of diminutive kettle-drums, each perhaps a little larger than an English breakfast cup, beaten by short leathern straps, during which operation the performer holds the reins of his horse between his teeth. More than one such drummer might be found in each troop, and this music gave notice in advance to any village or town of their approach (Finn 1878: 170-1).

¹⁰ On construction and playing technique, see Sachsse 1927: 63-3, cf. New Grove 13: 36-7, *s.v.* *Naqqara*; Blades 1970: 223-6.

The *naqqara* shown here in fig. 21.2: 18 has a handle which serves as a special fastener. It was probably played by dervishes who wore it strapped to their bodies while standing (on this, see New Grove 1: 536, fig. 4).

The side drum (*tabl*, fig. 21.2: 20)¹¹

In all probability, the *tabl* shown here is an instrument of the Turkish military band. The form of the stick that Dalman and Sachsse associate with this instrument, however, differs from that of the stick used with the Turkish drum (*davul*) (fig. 21.5).¹²

In my opinion, the stick belonged to one of the *naqqaras* (fig. 21.2: 17, 18, or 19, see for comparison the illustration in Farmer 1937: 47). When, around 1850, Himly speaks of the 'sound of a harsh drum' during the procession to Nabi Musa: 'Several congregations of Syrians, Turks, and Arabs marched in a procession, following the sound of a harsh drum' (Himly 1860: 264), the 'harsh drum' could have been one comparable to that shown here. But *tabl* may also be a generic term for many kinds of drums (Faruqi 1981: 327; New Grove, *s.v.* *tabl*). Perhaps we are to understand it in this way when it is mentioned in connection with the procession to Nabi Musa, by Mustafa al-Siddiqi, a theologian from Damascus and traveller to Jerusalem, in the year 1122/1710:

... or every day, the poor used to descend to the place in great numbers with drums and flags (*bi 'l-tubul wa'l-a'lam*), and they had such enjoyment there on those days that even the most daring words would be inept to describe it appropriately (Siddiqi 12a, 4-10).

The goblet drum (*darabukka*, fig. 21.2: 21)¹³

In Ottoman Jerusalem, the goblet drum was considered an alternative percussion instrument for the *naqqara*, probably especially for the poorer people who could not afford the latter (Tobler 1853: 309; 319). As such, it is documented, for example, at a wedding ceremony, where

the playing of the double-kettledrum (*Nakarah*) and among the poorer people that of the goblet drum (*Darbukeh*) resounds throughout the solemn assembly (Tobler 1853: 319).

¹¹ On construction and playing technique, see Sachsse 1927: 66; on the type, cf. Picken 1975: 66-114.

¹² On this, cf. fig. 21.5 and the illustration of drumsticks in Picken 1975: 79 and the plate preceding p. 97.

¹³ On construction and playing technique, see Sachsse 1927: 64, cf. New Grove 5, 239, *s.v.* *Darabukka*.

William McLure Thomson, on the other hand, reports the playing of the *darabukka* in a coffee-house, but without mentioning the difference in its status to that of the *naqqara* (Thomson 1872: 386-7).

The tambourine (*daff*, fig. 21.2: 23)¹⁴

In contrast to the kettledrum (*naqqara*), the tambourine (*daff*) can be played without any problem while walking and dancing—which is the reason why it is typically used by dancing women. Sarah Johnson writes about an evening's dancing in the harem of the Bash-Katib in Jerusalem in 1858. After dinner, the highest-ranking wife asked for music and dancing:

A messenger was accordingly despatched for tambourines and dancing-women—for in the East dancing is considered far beneath any but the poorer class, who make it a trade, and charge a certain sum for their services (Johnson 1855: 217; cf. fig. 219).

At parades and processions, the *daff* was usually heard together with cymbals (*kasat*) as, for example, during the pilgrimage to Nabi Musa (Flüedner 1858: 82; Schulz 1852: 96; Prissac 1858: 152) and upon the reception of the caravan of pilgrims returning from Mecca:

When, in the Holy City, near the spring of 1846, a ceremonious welcome was to be given to the Mecca pilgrims, about eight men played tambourines and cymbals, one beat at every step, advancing slowly at first and beating likewise, then a little faster and then faster still, and finally as fast as possible, after which there was a pause (Tobler 1853: 309).

The frame drum (*mazhar/mizhar*, fig. 21.2: 22)¹⁵

The frame drum without cymbals, *mazhar* or *mizhar*, is the typical instrument of the dervishes and was, as such, also played in Ottoman Jerusalem, as pl. 21.8 shows. The music of the Sufi monasteries was inaccessible to European travellers and journalists, so that we have no eye-witness accounts. But we do have a report from 'Abd al-Ghani al-

Nabulsi about a Sufi *shaikh* who was renowned for his beautiful voice and enchanting songs. The *shaikh*, named Muhammad ibn al-Ghazzali, visited al-Nabulsi in Jerusalem and asked the latter's permission (*ijaza*) for his singing which was granted to him in the form of a spontaneously written poem (al-Nabulsi *Hadra*: 313).

The cymbals (*kasat* fig. 21.2: 14-15)¹⁶

Kasat are always used in combination with other percussion instruments, in particular the kettledrum (*naqqara*) (Kahle 1913: 171-2; Tobler 1853: 483-4) or the tambourine (*daff*) (Schulz 1852: 96; Tobler 1853: 309). In a single, very early, source, the report of the physician Leonhard Rauwolf (1535-96), they are mentioned especially as accompanying the Christian liturgy in the Church of the Holy Sepulchre:

After the meal, they took us up to the gallery (which is inside the dome directly above the Holy Sepulchre), to stay there for the night. But some oriental Christians were singing below in the church, with others murmuring to each other, making with their sweet-sounding cymbals, which are wholly made of metal and have the size of an Italian bale (*in der gröÙe eines welschen bales*), such a delightful pleasant sound that we watched and listened to them more than we slept. (Rauwolf 1583: 387).

Kasat are mentioned especially frequently during the pilgrimage to Nabi Musa:

First, a number of cymbal players and drummers (*Kâs* and *Nakârah*) followed three large, silky green flags decorated with inscriptions (Tobler 1853: 483-4).

A special entertainment was always provided by the arrival of pilgrims from a new village. They were welcomed with much ceremony by the dervish band (kettledrums and cymbals) and their flags [...] (Kahle 1913: 171-2).

The big kettledrum (*naqrazan*, fig. 21.2: 24)

The big kettledrum, which was strapped to the player's body, was a popular instrument in parades and processions, such as wedding processions (Tobler 1853:

¹⁴ On construction and playing technique, see Sachsse 1927: 64-6, cf. New Grove 5: 145. On the number of pairs of cymbals of the *daff* (5), see Sachs 1940: 247: 'Since to Arabian mathematicians five is the first so-called circle number, the five groups of jingling disks or rings in the frame were very probably the numerical expression of the circular form of the drum'.

¹⁵ On its construction, see Sachsse 1927: 64.

¹⁶ On construction and playing technique, see Sachsse 1927: 66.

318) and the pilgrimage to Nabi Musa (Himly 1860: 264). The kettledrum shown here is decorated with a painting on its membrane, which probably has an apotropaic significance. Compare, for example, the illustration in Jenkins/Olsen 1976, after p. 85, which shows a frame drum painted in similar fashion.

1.2 Turkish military music

The Turkish Janissary band (*mehter*) originally comprised a combination of drum (Turk. *davul*) and shawm (*zurna*), but by the 17th century at the latest, trumpets (Turk. *buru*) were added as well as kettledrums (*naqqara*) and cymbals (Turk. *zil*); a complete band had some 50-60 musicians (New Grove 19: 271-3). There are illustrations of Turkish military instruments in Schweigger 1609: 177 and Farmer 1937: 47.

Until the 1830s, the traditional Turkish composition of such bands is also documented for Jerusalem. There is evidence relating, in particular, to kettledrums (*naqqara*), shawm (*zurna*) and trumpet (*buru*):

At one time, Muslim (Turkish) pilgrims on their way to Mecca passed through the Holy City. In the year 1814, the entry of the Pasha of Damascus, who accompanied the pilgrim's procession, was especially magnificent. [...] Preceding the cavalry was a musical band with whistle flutes, drums and trumpets, whose men were vying with one another in producing dissonances; white, red, and green banners were flying before the Pasha himself. Then followed the core of the army, in particular the cavalry who fired shots for the pure enjoyment of it (Tobler 1853: 482, quoted from Light 1818: 176 ff).

12th May (1821?). This day marked the arrival of the new Pasha. He was announced between eight and nine in the morning by shouting and jubilations of the children and the firing of guns. All sheiks and effendis of the city had set out on horseback to meet him. Among the Beduin sheiks accompanying the Pasha as well as among the mottled cavalry were some peculiar looking characters. The whistle flute players were there, of course. Immediately in front of the Pasha rode several hand drum players (Wolff 1849: 113-14).

In 1858, Prisac writes about Turkish music being played at the citadel in the Old City. He had heard a shawm

and a flute (Prisac 1858: 152). The mention of the flute here could be taken as the first indication of the introduction of European musical instruments in the Turkish military band in Jerusalem.¹⁷ The trumpets that greeted Crown Prince Rudolf of Austria in 1881 on the occasion of his visit to the Ottoman *pasha*, upon entering the *pasha's* residence, may also have been European trumpets (Rudolf v. Österreich 1884: 128). What is certain, at any rate, is that the band's composition was already purely European around the turn of the century, when Otto Eberhard, a student of Gustaf Dalman, described the bandstand concerts given by the band every Friday in the new section of Jerusalem:

... otherwise the military is part of Jerusalem street life only once, when putting up barriers for the Easter festival. But on each Friday, the Muslim holy day, the band's ear-splitting sounds can be heard in the municipal park, a small garden along Jaffa Road, and when a big congratulatory reception is held by the Pasha on a Muslim feast day, the band assembles below his windows and plays '*So leben wir, so leben wir, so leben wir alle Tage ...*' [And thus we live, and thus we live, and thus we live every day ...], and the guns of the citadel fire salutes (Eckard/Zickermann/Fenner 1907: 102).

A photograph of such a bandstand concert (1904 or 1905) is to be found in a private photograph album of Gustaf Dalman at the Gustaf Dalman Institute in Greifswald (pl. 21.9). In the centre, two big brass instruments can be seen, a sousaphone on the left, and a tuba on the right.

The postcard (pl. 21.10) also shows the Turkish military band playing only European brass instruments.

II Songs

The songs of Ottoman Jerusalem may be classified into the following groups: urban, peasant and Bedouin. For the peasant and Bedouin styles, we also have to note the songs of the 'Jerusalem area', i.e. the villages and desert area surrounding Jerusalem. I will deal with the pilgrimage songs related to the Nabi Musa pilgrimage as a fourth group.

¹⁷ Another news item dates to about the same time (c. 1845), and notes that the Ottoman Pasha acquired a piano that had belonged to the late Anglican Bishop. Hirshberg 1995, manuscript version: 11.

II.1 Song texts¹⁸

The most important source for the song texts of Ottoman Jerusalem is Gustaf Dalman's *Palästinischer Diwan*, written in 1899-1900. For his collection of texts and melodies, Gustaf Dalman had enquired among 'the low-class people in the big towns, peasants, and Bedouin' since, in his view, these groups had best preserved the tradition. His informants in Jerusalem were a young Arab-Protestant carpenter and several patients at the Jerusalem leper asylum. Accordingly, love songs (*ghina*), performed in private houses for the entertainment of guests, occasionally with a circle dance (*dabke*), would reflect the 'popular urban Jerusalem style'. The first six of the eight songs Dalman recorded are antiphones with a refrain (*radde*) sung by the entire audience. The last two songs are strophic songs without refrain:

- 1 *Halalalaija halalalaija wa'-eni jalibnaija*¹⁹
'To me, to me, oh my eye, oh girl' (Dalman 1901: 230-2).
- 2 *Ja zenu zenu zenu* 'Oh his grace, his grace, his grace!' (Dalman 1901: 232-4).
- 3 *Albiba-lbiba-lbiba* 'Labiba, Labiba, Labiba!' (Dalman 1901: 235).
- 4 *Batat 'ejuni sauahir* 'My eyes stayed awake through the night' (Dalman 1901: 236).
- 5 *Bardu bardu bardu* 'You cold one, you cold one, you cold one!' (Dalman 1901: 237-8).
- 6 *Haigalu haigalu* 'So they said, so they said' (Dalman 1901: 238-40).
- 7 *Habibi marr uma sallam* 'My lover passed and did not greet me' (Dalman 1901: 241).
- 8 *Hubbi gamalak garahni* 'My lover, your beauty hurt me' (Dalman 1901: 241-2).

The 'peasant Jerusalem style' is documented in much more detail than the urban style. This includes, however, the songs recorded from the environs of Jerusalem. Best documented of all is the village of Lifta. In 1907, Dr Gustav Rothstein, the director of the Lyceum and a participant in Dalman's instructional course, documented a Muslim wedding ceremony in Lifta near Jerusalem, quoting, among others, seven songs sung by women performing a hand-clapping circle dance, two songs of the women sung during the colouring of the hands with henna, three songs of the men sung during the wedding procession (*zaffé*), one song of the men dancing the *dabke*, one song of the women serving the dinner and and one sung by the women during the procession of the

bride to the home of the groom (Rothstein 1910: 129-35).

Furthermore, there are another thirty song texts from Lifta, transcribed down by Sven Linder in 1912 (Linder 1952: nos 1, 7-11, 18, 23, 25-7, 32, 53-4, 56-8, 60-3, 70-2, 74, 81, 83, 85, 89). These song texts cover the various significant public events of village life like circumcision, wedding, burial, and working songs.

The same source gives three texts from Silwan (recorded in 1912), the first two of which are songs on the occasion of the circumcision of a boy:

- 9 *Balla ia sallabi uballa 'alek / usanni imuasak uhaffif idek* 'By God, my lovely one, by God upon you / sharpen your knife and have a facile hand' (Linder 1952: no. 2, cf. Dalman 1901: 172-3).
- 10 *Tahhiruli 'Isa taht fai ittin* 'Circumcise 'Isa for me in the shadow of the fig-tree' (Linder 1952: no. 3).

The third song from Silwan is a prayer for rain, making evident the peasant character of these songs:

- 11 *Ia sitti ia badriie / tiski zar' il-barriya* 'O mistress, O Badriye / water the seed on the land' (Linder 1952: no. 49).

Characteristic 'peasant style' songs are those sung during work in the fields, like the following example:

- 12 *Mengali ja men galah / rah lilhaddad galah* 'My sickle, oh who sharpened it? / he went to the smith and he sharpened it' (Dalman 1901: 4-5).

According to Dalman, the favourite song genre for 'peasant style' songs, was the '*ataba* verse (Dalman 1901: 3). '*Ataba* verses are built out of one or more four-lined stanzas, of which the first three lines rhyme with one another, while the fourth line rhymes with the paradigm '*ataba* ('reproach'). Their subject is often love; according to the legend recorded by Paul Kahle in 1911, the first '*ataba* verse was sung by a dying Bedouin to his wife, nicknamed 'Ataba. '*Ataba* songs became common from the 19th century on throughout the Middle East, but the huge number of fifty-two verses recorded by Dalman in the area (Dalman 1901: 65-80, 99, 155, 304) suggests that they were especially popular in and around Jerusalem. The following example represents the love theme.

- 13 *Talat nigmat b'ard eschschark jad'en hattu bilkalb talat darbat mi'den gabuli-lhakim ukal mazinn mazinn jetib min 'egruh ilhauaba.*
Three stars shine in the land of the East,
They dealt to the heart three heavy blows.

¹⁸ Gustaf Dalman developed a special transliteration system for oral texts in Palestinian dialect. For editorial reasons, no transliteration can be shown here. For the full transliteration see the sources.

They brought the doctor to me, and he said: I
don't think,
I don't think, that he will recover from the
wounds of love (Dalman 1901: 70).

Besides the *'ataba* genre, Dalman recorded one *imhaha* and four *imlala* songs as typical for the Jerusalem area. Both genres are sung by women only. *Imhaha* songs are four-lined stanzas, at the end of which the *zaghuta*, the quaver of joy, is set up. At the beginning of each line of the song, the joyous call *awiha* or *ahiha* or *ahah*, from which these songs took their name, is sounded.

14 *Hahiha*—*tmannetlak chajji 'aschatt ilbahr*
'öllijje
hahiha—*'amud min fudda u'amud erchamijje*
hahiha—*in rekibit ilchel tirkablak taman mijje*
win 'ötschat ilchel tiskiha mukarijje lulululululi
Hahiha, I wish you, my brother, an upper
room on the sea-side
hahiha, one pillar of silver and one pillar of
marble
hahiha, when you ride, eight hundred horses
may ride for you
hahiha, and when the horses are thirsty, may
the grooms water them
lululululululi (Dalman 1901: 306).

Imlala songs were sung by the women during their work in the vineyards around Jerusalem. According to Dalman, this song genre was proper to the Jerusalem area (Dalman 1901: xx). *Imlala* songs are characterized by the syllables *lele* or *lelo* inserted anywhere into the words. Thus, out of the verse *Ja hsereti scharrasch ilbattich fi libbu*—'O my disaster! The water-melon has grown roots in its pulp'—is constructed the following verse:

15 *Ja hsere-lele-ti scha-lele-rrasch ilbattich fi-lele-*
libbu (Dalman 1901: 26).

Generally spoken, for every stage of life—be it birth, wedding, or burial, be it the daily work on the fields, in the houses or in the village, be it private events, like farewell or welcome of a family member or other occasions—there were sung 'peasant style' songs, comprising an extremely rich tradition of various genres.

The 'Bedouin Jerusalem style' of the Ottoman period had many songs in common with the 'peasant style', especially the songs related to working with cattle and the *'ataba* verses. Characteristic for the 'Bedouin style', however, are the martial songs recounting and celebrating raids and battles between Bedouins. In Jerusalem Dalman recorded one martial marching-song (*hadi*) (Dalman 1901: 144) and two *'ataba* verses (Dalman 1901: 155), the first of which runs as follows:

16 *Za'ak ter ilhamam usah salman*
amir umin bani harfusch sallman
ja dillik ja ba'albak min ba'd salman
raddet midan lachjul il'edaba
The dove screamed and cried: Salman!
He was an amir and he rescued us from the
sons of Harfush
woe be to you, oh Ba'labakk, after (the death
of) Salman
Again you became a racecourse for the
enemies' horses (Dalman 1901: 155).

An independent group of songs are those sung during the pilgrimage to Nabi Musa. Since the starting point of the pilgrimage was Jerusalem, these songs may be considered as belonging specifically to it. The most detailed report on these songs dating from the Ottoman period was by Paul Kahle, a student of Dalman. During the pilgrimage in 1910, Kahle was able initially to record three stanzas of a song performed by Jerusalem women, the first stanza running as follows:

17 *Ahia zurna 'n-nebi musa bi 'ud en-nidd*
ahia ja bab en-nebi bannura
ahia jidwi dau al-'andil
ahia ja sa'adet min zar en-nebi 'r-rasul
*lu lu lu ...*¹⁹
Ahia, we pilgrimage to Moses the Prophet
with aloe incense!
Ahia, oh door of the Prophet which is like
crystal!
Ahia, the light of the lamps is shining
Ahia, oh happy is he who makes a pilgrimage
to the Prophet, the one sent by God! (Kahle
1913: 166).

There are various forms of the best-known pilgrimage song, *Ya zuwar Musa* ('Oh visitors to Moses'). Dalman gives three stanzas (Dalman 1901: 158-9). Kahle has recorded six stanzas (Kahle 1913: 169) and Canaan, whose record is still quite close to the Ottoman period, gives five (Canaan 1927: 210-11). Nevertheless, all versions correspond in the first stanza, which runs as follows:

18 *Ya zuwar Musa*
zuru bit-tahlil
zurna n-nabi Musa
'uqbal el-Halil
O visitors of Moses
Visit (the shrine) with exultation

¹⁹ The *lu-lu-lu* stands for the *zaghuta*, the typical joyous

We have visited the Prophet Moses
May it soon be (granted to visit) Abraham.
(Canaan 1927: 210, where marginal
divergences of the versions in the first stanza
are detailed in the footnotes).

Canaan gives another two pilgrimage songs from
Nabi Musa:

- 19 *'Ala bir Zamzam itwadda en-nabi* 'At the
well of Zamzam the Prophet washed himself
(ritually)' (Canaan 1927: 211).
20 *El-urs ma hu farhah* 'The marriage festival
is not a (real) joy' (Canaan 1927: 212).

II.2 Melodies

Direct, written or acoustic documents of music, such as
notes²⁰ or recordings, are not, or are no longer, available,
with two exceptions. Around 1900, Stewart Macalister
wrote down the improvised singing of a Jerusalem boy (*ya
lele, ya lele ...*) (Macalister 1900: 108, fig. 21.6).

The only acoustic document accessible to me was
the recording of an Arab song heard and learned from an
Egyptian theatre group in a theatre in Jerusalem around
1910 by an inhabitant of Jerusalem, Eliezer Tokatli, born in
1899 (fig. 21.7) (Recorded on tape, Jerusalem Music
Library, no. 7273).

The text of the song is somewhat
incomprehensible, which may be due to the time that
elapsed between the recording and the time when Tokatli
heard the song for the first time. Moreover, Arabic was not
his mother tongue. It may be understood as follows:

'Get away from their place!²¹ / Come to us! /
Hurry up, the two of us / love each other!'

III Social and legal aspects of the musical life in Ottoman Jerusalem

III.1 Music instruction

Traditional instruction in Arabian music was given without
written teaching materials (cf. Gerson-Kiwi 1962: 130), so
that we have no documents. Until 1903, there was no
music instruction in the elementary schools. In that year,

²⁰ The 35 melodies which Dalman included in the *Palästinischer
Diwan* explicitly did not originate in Jerusalem.

²¹ If *hawwli* has been misunderstood from *haww(i)di*.

Fig. 21.6 Song of a Jerusalem boy around 1900. Illustration

around 1910. Transcription from tape 7273 at the Music
Library of the National Library, Jerusalem.

though, the Greek school in Jerusalem was the first to
adapt its methods of instruction to the Western European
system and introduced one hour of 'singing' per week for
the first and second grades (Eberhard 1906: 104). Eliezer
Tokatli, who was a pupil in a Turkish school in Jerusalem
around 1910, remembers that the class was taught Turkish
songs and performed them to the Turkish governor
(recorded on tape, Jerusalem Music Library, no. 7273).
The first textbook for teaching music at school known from
Jerusalem was introduced only in 1921 by the principal of
the Normal School in Jerusalem after European teaching
methods had been adopted. It is based on an American
book of hymns which were sung with Arabic texts provided
by the poet Ma'ruf al-Rasafi (Shiloah 1979a). In Muslim
schools, on the other hand, there had always been intensive
instruction in Qur'an reading (Eberhard 1906: 96).

III.2 The legal status of music

On 17 Jumada II 1101/27 March 1690, the Naqshbandiyya
and Qadiriyya *shaikh* and Shafi'i jurist 'Abd al-Ghani al-
Nabulsi from Damascus set out on a journey to Jerusalem.
On the 16th day of his journey, he entered the Old City of
Jerusalem via the Damascus Gate, and he stayed in the city
until the 34th day of his journey, that is for 17 days, except
for an excursion to Nabi Musa (on the 22nd and 23rd
days) and one to Hebron (from the 25th to the 27th day).
Apart from his intensive programme of visiting Islamic
shrines, al-Nabulsi accepted numerous private invitations
and was consulted several times in his capacity as a jurist.
A detailed account of the answers given to the questions
put to him is contained in the diary of his journey, *al-Hadra
al-Unsiyya fi 'l-Rihla al-Qudsiyya*, which constitutes a
valuable source of al-Nabulsi's sense of justice. Moreover,

his diary contains interesting insights into the private musical life of Jerusalem to which European travellers had no access. Nabulsi mentions music in the *hammam* (*Hadra*: 173), in the coffee-house (*Hadra*: 241), in the street on the occasion of a wedding celebration, and at private dinners in the homes and gardens of Jerusalemites (*Hadra*: 179, 303). It seems that on such occasions the provision of musical entertainment, usually before dinner, was normal practice. Once, though, he was presented with something special:

He ['Abd al-Rahim Efendi] had invited a group of the best *mu'adhdhins* of the Noble Rock especially for us. They performed the sublime *maulid* [song of praise, originally in honour of the Prophet's birthday] in the form of praise poems dedicated to the Prophet (*bi'l-qasa'id al-nabawiyya*) and with superb chanting (*Hadra*: 180).

On several occasions during his journey to Jerusalem, al-Nabulsi expressed his views on the legitimization of music. The experience of some ordinary musical events prompted him to make a basic statement on the permissibility of music:

Then we heard women's voices ululating (*zaghalit*). They had assembled at this place for the communal, all-night wedding celebrations. We were enthralled by the perfect, beautiful music (*bi-kamal al-tarab*), which we had the privilege to enjoy by virtue of the blessing of our visits to the houses (*zawaya*) of the pious and noble poor. Afterwards, we wandered around the market with our brethren. There, we found a crowded coffee-house. Inside, all kinds of different songs and melodies were publicly performed (*wa-hum yu'linun bi-anwa' al-aghani wa'l-alhan*). Here again, our ears were perfectly enthralled and delighted.

Once before we have presented to some brethren our own interpretation of the law (*shari'a*) on the subject of listening to music (*al-sama'*) in the form of the following beautiful verses:

Listening to the sounds of flute
and string music (*sama'*²² *al-nay*²³ *wa'l-watar*)

²² The term *sama'* should be understood here as 'listening to music' generally, not merely in its narrow sense of 'Sufi chanting'.

²³ *Nay*—here in the sense of 'woodwind instrument' in general, cf. Faruqi 1981: 236 ff; 388.

Drenches the soil of the human
heart like fertile rain:

If there's evil in the heart, it will
make it grow

And misfortune will be its fruit

But if there's goodness in the
heart, its pleasant scent of
amber and fragrances will
spread throughout the land.

Thus, use your judgement and
enquire where you stand and
be

On your guard not to confuse
questions of the heart with
others!

For he who pleads in favour of
prohibiting [the enjoyment of
music], only wants to protect
him, who harbours evil, from
what may ignite the spark.

But he who pleads in favour of
permitting [the enjoyment of
music], contributes to guiding
the good-hearted one along
the right way, namely to
thought and remembrance
(*li'l-tidhkari wa'l-fikr*) (*Hadra*:
241-2).

Al-Nabulsi's judgment is thus a liberal one. He declares that instrumental music, not just vocal music, is permissible. His argument fits the patterns set by 'Ali ibn Hazm and al-Ghazzali—music is not objectionable as such, it only reinforces the inner tendencies already present in the heart (cf. Faruqi 1985: 16-17, 24; Shiloah 1981: 427). This type of argument is also used in al-Nabulsi's various treatises dealing specifically with the problem of the permissibility of music, especially in his *Idah al-Dalalat fi Sama' al-Alat* ('The Clarification of Proofs Concerning the Listening to Musical Instruments') (Shiloah 1979b: 291). The quotation also reveals, though, that music in Ottoman Jerusalem, especially the folk and art music that was not strictly religious, was by no means uncontroversial. Clearly, al-Nabulsi's Jerusalemite companions were offended by the music that could be heard from the coffee-house, since it occasioned him to comment formally on the subject.

The fact that music, particularly if performed in the coffee-houses, was considered problematic in Jerusalem and was subject, at times, to the imposition of severe restrictions, is also documented by a court record dated 4 Muharram 1017/20 April 1608. It tells us that some Jerusalem notables brought an action against the owners of some Jerusalem coffee-houses. Their complaint concerned two aspects which they believed offended against public

morality: the employment of clean-shaven waiters and the loud playing of musical instruments, namely of the lute (*'ud*), the Persian violin (*kamanj*) and the zither (*santir*), which did not cease even at prayer times. The complaint was allowed on both counts, and the judgment was as follows:

that as from today none of them will be permitted to do any of the above-mentioned things: neither shall they employ clean-shaven waiters to serve in the coffee-house nor any persons who play the above-mentioned instruments for entertainment in any way. (Ata'llah 1988: 256).

This judgment followed the trend of many previous and later judgments. Because coffee-houses were said to have a morally offensive 'atmosphere' and art music was performed there unconnected to a ceremonial context, they and coffee itself fell into disrepute among wide circles of Islamic jurists (Hattox 1988: 107-9). On the other hand, al-Nabulsi's report from Jerusalem proves that such objections could not ultimately stop the practice of music in coffee-houses.

III.3 The social status of musicians

The musicians of Ottoman Jerusalem were possibly organised in a number of guilds. Only one is known to date, which is that of the lute players, *darrabat al-'ud* (Ata'llah 1988: 284). In economic life, to the extent that it has been studied with respect to Ottoman Jerusalem, musicians as an occupational group rarely played a role. There are only a few references to religious 'musicians' in the Ottoman tax

registers of the 16th century. *Mu'adhdhins* are listed as a group several times, namely in the register no. 289, of the year 961/1553-4; 2 *mu'adhdhins* in Bab al-Qattanin; in the register no. 516 of 971/1562-3; *mu'adhdhins*, without mention of an exact number, in the quarters Sharaf, Bab al-Qattanin, Bab al-Hitta (Cohen and Lewis 1978: 85, 89). For the period 932-970/1525-6 to 1562-3, it is recorded that the revenue from tax on the Church of the Holy Sepulchre went into the funding of Qur'an reading at the Aqsa Mosque (Cohen and Lewis 1978: 95). But these entries do not necessarily infer that the musicians of Ottoman Jerusalem played a particularly active role. Their guilds were thus not destined to live on. Among the numerous clubs, societies, associations and professional organisations that were founded under the British mandate in Palestine from the early 1920s onwards, especially in and around Jerusalem,²⁴ not one was connected with music or musicians.

Witnessing the disappearance of Palestinian musical traditions due to the dominating influence of European technology and culture, the musicologist Eduard Sachsse already in 1927 demanded that what little had survived should be recorded and preserved: 'Phonographic recordings on a large scale are urgently required. For to date, we are faced with a complete vacuum in this respect' (Sachsse 1927: 22). The destructive influence of modern mass media on the musical culture of Jerusalem predicted by many scholars and travellers at the beginning of the century has now been confirmed. Perhaps the current activities of Palestinian musicians in Jerusalem, like the 'Jerusalem Center for Arabic Music' will give a new lease of life to traditional music in contemporary Jerusalem. It is to be hoped that, in this way, the rich musical traditions of Ottoman Jerusalem may also be revived.

²⁴ Mahmud Zayid, *al-Mausu'a al-Filastiniyya* 3: 179-280 counts 275 *jam'iyya*, 28 *rabita* and 163 associations called *nadi*.

Chapter 22

TWO OTTOMAN CEREMONIAL BANNERS IN JERUSALEM

Vera Tamari

The purpose of this short chapter is to review the two Ottoman banners (*bayariq*)¹ in the Aqsa Mosque Museum in Jerusalem² (pls. 22.1a and 22.1b) within the broader context of the annual *mausim* of Nabi Musa, during which these banners were carried. This study does not aim to repeat the valuable information on the *mausim* so vividly presented by the prominent Palestinian scholars, Dr Tawfiq Canaan (1927 and n.d.) (see Description B), Dr Kamal al-'Asali (1990) and Dr Subhi Ghosheh (1994). This chapter rather summarises the information in their various studies that pertains particularly to the different banners used for the *mausim*, of which the two Aqsa examples are perhaps the only extant examples of the Ottoman period.

The information on banners in the studies mentioned above has been corroborated by interviews carried out with knowledgeable Jerusalemites by the writer of this study. Those interviewed either participated in the

banner-bearing processions in the 1920s and 1930s, or have associations with the banners in one way or another.³ It seems likely that their first-hand accounts and the studies already described are the records closest to the Ottoman period⁴ and may be considered representative of a continuous religious tradition that, according to both chronicles and folk custom, dates back to the 12th century AD, when it was initiated by Salah al-Din after his reconquest of Jerusalem in 1187. Traditionally the procession was seen as a Muslim political response to the Christian celebrations in the form of processions held on Palm Sunday and Easter Day. To this day, thirteen Palestinian Greek Orthodox families of Jerusalem carry the banners designated to their families during the Holy Fire ceremony held on the Saturday preceding Easter Sunday, culminating in the rites in the Holy Sepulchre.⁵

The Nabi Musa celebrations continued to be observed until 1947. They often manifested strong

¹ The Arabic plural form of *beyraq*, a Turkish word meaning flag or standard. Synonyms are *'alam* (plural *a'lam*) used in both Persian and Arabic, and the Turkish *sanjak*, used mostly in Turkish-controlled areas. The term seems to have earlier been designated to a standard larger than a *beyraq* (J Calmard, s.v. *'alam* va *'alamat*, *Encyclopaedia Iranica* 1985: 785-90).

² General Ref. nos. 11 and 12, Inv. Specific nos. *qaf*/13 and *qaf*/14. See also the description in Description A.

³ These informants, to whom I would like to express my thanks, are: Ni'mati al-Imam (Umm Muhammad), whose mother and uncle embroidered and restored the two banners (see Appendix 2); Shaikh Dari Mujahid, drummer (*tabl*) and cymbal (*kass*) player at the Nabi Musa celebrations; Zainab al-Husaini (daughter of Hajj Amin al-Husaini; see note 5) and 'Aisha 'Abd al-Hamid al-Fityani, who, as a child, observed the

celebrations from the terrace of their house which overlooked the esplanade of the Haram.

⁴ Al-'Asali, who resorted to the official Ottoman records in his chapter 'The Maqam and the Mausim during the Ottoman Period' (1990: 91), mentions only the *sirr* or *kiswah*, the gold-embroidered cloth which covered the shrine of Nabi Musa itself. His only reference to banners in that chapter is a mention of 'large banners and drums' as described in an account by a German traveller in 1875 (1990: 97).

⁵ These thirteen Christian banners (*sanajiq*) are made of burgundy velvet with images of Christ, the Resurrection and the Virgin Mary (from an interview with the *mukhtar* of the Greek Orthodox Community, Mitri al-Tubbeh, in September 1995).

nationalistic dimensions,⁶ thus providing legitimacy to political expression in the shadow of the religious celebration. The celebrations were resumed again in 1987 after an interruption of almost forty years.

The banners of the *mausim* of al-Nabi Musa

The present tattered state of the banners in the Aqsa Mosque Museum in no way does any justice to the grand yearly event, when scores of banners (pls. 22.2 and 22.3) were carried as thousands of Muslim participants processed from Jerusalem towards the shrine (*maqam*) of Nabi Musa, south-west of Jericho. Descriptions of the event in all the sources already detailed depict colourful festivities which continued for many days, and which were deliberately planned to coincide with Christian celebrations during the week that preceded Easter, the climax being on Good Friday, the *jum'at al-'alamat* (Friday of the Banners), during which the banner-bearers gathered before proceeding to Nabi Musa.

The procession included religious and political dignitaries, such as the grand *mufti* and the mayor of Jerusalem. Other official delegates represented notable Muslim families of Jerusalem, and bearers of the prestigious banners designated to their families. Amongst them were the families of the Qazzaz,⁷ Disi,⁸ Yunis, Dajani, Husaini, Qlaibo, Bazbaze, Zayid, Tahhan and Qutub.

⁶ Since the 19th century, the *mausim* has been an important factor in developing a sense of national identity in the Palestinian people and later played its part in demonstrating strong opposition to the British Mandate and to Zionist aspirations in Palestine (Al-'Asali 1990: 99-100). The *shaikh* mentioned in note 2, Dari Mujahid, recited enthusiastically to me some of the *ahazij* (political songs) that were chanted in the processions, and especially those addressed to the Palestinian leader, the *mufti* of Jerusalem, Hajj Amin al-Husaini, until 1929. See also Ghosheh 1994: 43-4.

⁷ Hajj Naji al-Qazzaz, one of the bearers of his family banner, was the chief *mu'adhdhin* of the Aqsa Mosque, a position he inherited from his father during the Ottoman rule of Jerusalem.

⁸ Shaikh 'Atif al-Disi was a first-class player of the *tabl* and *kass*.

⁹ A question arises as to why it was that these particular families had the official banners rather than others, equally eminent, such as the 'Alamis, Nashashibis, Budairis, Khalidis, Nusaibehs and Ansaris who ranked amongst the oldest Muslim families of Jerusalem. It is known that some families had religious duties, including the Husainis, Qlaibo, Yunis and Bazbaze, who were considered *khuddam al-Nabi* (servants of the prophet), and who held a position in relation to the Maqam al-Nabi Musa; others were *ashab al-turuq* (singular *tariqa*—adherents of a Sufi order). It may also be that these designated roles resulted from a social or political struggle for power amongst the individual families, with the result that they had a monopoly over who might carry a banner; but this requires further investigation.

The privilege of carrying the five official banners of Jerusalem was traditionally associated with specific local families.⁹ The two banners of the Haram (*'alamat al-haram*¹⁰) were carried by the Qutub family, while the honour of bearing the Nabi Musa banner was reserved for the Husaini family. A representative of the Dajani family carried the banner of the Prophet Da'ud, while the privilege of being the main holders of the 'banner of the young men' (*bayraq al-shabab*)—who were from the Bab Hutta neighbourhood in the Old City—was shared between various families, including the Zayid, Kurd and Tahhan. There were other occasions than the procession of Nabi Musa when the official banners were raised. These were usually at the funerals of Jerusalem notables and dignitaries, as well as the occasional important wedding.¹¹

Beyond their responsibility for the Nabi Musa banner, the Husaini family were also considered to be one of the *khadam* (servants) of the Maqam al-Nabi Musa, and they held a key role in the celebrations overall. The official banner of Nabi Musa was kept in the Dar al-Kabira ('The Big House'), which was otherwise known as the Dar al-Bayraq ('The House of the Banner')—a property belonging to the Husainis in 'Aqabat al-Takiyya.¹² The banner was kept folded and wrapped in a silk *buqja* (a large scarf) when the official ceremonies were completed. It was from the Dar al-Bayraq that the official celebrations started, and where the other banner-bearers of Jerusalem gathered on *jum'at al-'alamat*, before they proceeded to the Aqsa Mosque to meet up with the rest of the crowds and those coming from different parts of Palestine. They then processed to Nabi Musa.

An established protocol (*zaffah*)¹³ governed the welcoming of the other two main banners of the *mausim al-Nabi Musa*—those coming from the towns of Nablus and Hebron (al-Khalil). The arrival of the Nablus banner on Thursday preceded by two days the banner from Hebron, which arrived in Jerusalem on Saturday. In each case crowds of Jerusalemites welcomed the banners as they arrived. It was a boisterous event, with *dabkaks* (a Palestinian folk dance) being performed in the street by parties of young men, accompanied by lively singing and

¹⁰ There is some confusion as to the exact identity of these banners. Canaan refers to the banners of the Mosque of 'Umar, of the Prophet Muhammad, and of the Sakhra (Canaan 1927 and n.d: 198, 213-14); in the interview with Shaikh Dari Mujahid, he mentioned the 'two Aqsa banners and the Sakhra banners', whereas Ni'mati al-Imam only speaks about the 'two Haram banners' which should probably be identified as those now displayed in the Aqsa Museum, and the subject of this study (see description below).

¹¹ See Graham-Brown 1980: 68 and fig. 62.

¹² The house, which was referred to by Zainab al-Husaini also as *al-Diwan*, is now all but abandoned, being occupied by a few tenants with no connection to the Nabi Musa event.

¹³ A dance ritual more usually associated with weddings.

mazzika (music) played on the *tabl* (drums) and *kass* (cymbals). The Nablus delegation, which arrived on horseback and in carriages, was met in Shaikh Jarrah, a quarter to the north of Jerusalem (see pl. 22.2). Participants in the ceremony were carried on each other's shoulders and danced with swords and shields (*saif wa tirs*), while the main banner-bearer rode a horse. In a similarly festive atmosphere, the Hebron banner was also welcomed. Its point of arrival was an olive grove near the train station, south of Jerusalem. To avoid friction and overcrowding, protocol, which set the particular days and locations for the arrival of the banners, and later their departure (*tal'at al-bayraq*, pl. 22.3) from Nabi Musi after the event was over, had to be strictly observed.

The bearers of many more flags streamed into Jerusalem from neighbouring villages and from other towns in Palestine. Banners from areas to the south of Jerusalem were brought from the villages of Lifta, al-Malha, Bait Safafah, and Qalonia. The northern villages included 'Anata, Hizma, Jaba' and al-Ram, while delegations representing the eastern villages came from Silwan, Abu Dis and al-'Aizarriyya, and they too carried specialised banners (Ghosheh 1994: 44).

Although crowds and parties also came from the main towns in Palestine, such as Gaza, Ramla, Lod and Jaffa, these were not represented by special banners for the occasion, although some carried '*udad*'.¹⁴ They were just a few of the thousands of onlookers who watched and cheered as each official group walked in the procession and performed their dances, singing and waving their banners. Traditionally some women too followed the banners, pinning onto them their colourful silk kerchiefs as votive talismans for healing or for good wishes.¹⁵

The banners came in a variety of colours and with different inscriptions,¹⁶ each of them with its own specific hue. The Haram flags were green (see description in Appendix 1), while that of Nabi Musa was green with a black centrepiece and with *la illaha illa Allah* ('There is no god but God') inscribed in gold thread on one side of the banner. On the other side there was the verse from the Qur'an *wa kallama Allah Musa taklima* (Sura of Women: 164: 'God spoke with Moses, discoursing with him'). The banner of Nabi Da'ud, which was carried by the Dajani family, was traditionally made of dark purple velvet. The *bayraq al-shabab* was burgundy in colour, while the Hebron banner was green with the inscription *la illaha illa Allah wa Ibrahim khalil Allah*.¹⁷ The Nablus banner was indigo-blue

and heavily embroidered in gold thread. The interview with Shaikh Dari Mujahid disclosed that the Qazzaz family carried more than twenty flags in a variety of colours. Normally religious phrases embroidered on the textiles formed the only decoration, although some also had embroidered crescents—the Ottoman symbol—around the inscriptions.

The staff (*zanah*) for each banner was topped by a crown (*taj*) or a crescent (*hila*), as the finial was termed generically, regardless of the shape or symbol it bore. Canaan classified these 'crowns' in three categories: (a) a spear-head shape; (b) those representing a hand; and (c) those derived from the shape of the moon or the representation of a celestial globe (Canaan 1927 and n.d: 204-5 pl. IV).

Description A

Description of the two banners in the Aqsa Mosque Museum (General ref. nos. 11 and 12, specific nos. qaf/12 and qaf/14)

The two banners in the Aqsa Islamic Museum are almost identical. Their original size cannot now be precisely determined because they have been heavily restored and re sewn to remove the torn areas. The present size of one of them is approximately 120cm in width by 100cm in height. Made of very fine silk fabric, they are both rectangular in shape with a narrow tube-like hem (10cm wide) sewn on one of the shorter sides of the banner to accommodate the wooden staff (*zanah*) which was inserted to allow the banner to be carried. The main field of the banner on both sides is a light olive green, with a smaller silk rectangle (approximately 65cm wide by 53cm high) of a darker shade of green appliquéd on either side of the central field of the fabric. These rectangles carry an elegant inscription in *thuluth* script with the words of the *Shahadah*: *la illaha illa Allah wa Muhammad rasul Allah*. The inscription is finely embroidered in gold thread (pl. 22.4 and col. pl. XV) using the raised satin stitch, popularly known as the *sarma* stitch, which was particularly popular in the Ottoman period from the 16th century onwards.¹⁸ Short gold fringes provide a finish to the banners on the remaining three sides.

Because the silk fabric is splitting, it was possible for me to examine the lining of the banners. This consists of raw white linen. It was also possible to examine closely the way in which the embroidery has been executed. The individual letters of the inscription have been cut out in

¹⁴ The plural form of '*idda*, the *tabl wa kass*, drums and cymbals.

¹⁵ This information comes from the interview with Shaikh Dari Mujahid.

¹⁶ Verses from the Qur'an, or the name of the saint (prophet) the banner represented. See Canaan 1927 and n.d: 201-3.

¹⁷ 'There is no god but God and Ibrahim [the prophet Abraham, patron of Hebron] is beloved of God.'

¹⁸ According to Berker (1990: 12) it was in the 18th century that the new *divah* technique—a satin stitch using gold or silver thread worked over pieces of heavy card—was introduced into Ottoman embroideries.

cardboard and glued in place to the reverse side of the cloth to form a rigid base over which the gold stitching was worked. This technique also meant that to some degree the embroidery is embossed.

The details of the stitching technique were described to me by Ni'mati al-Imam (Umm Muhammad, see note 2), whose late uncle and his sister-in-law had practised this particular embroidery technique. The uncle was Muhammad Sa'id al-Mughrabi, a tailor and calligrapher (*khattat*), and his sister-in-law, Kaukab Da'ud Arafat al-Qudwah, was the mother of Ni'mati; they had themselves restored, over sixty years ago, the original Ottoman banners of the Aqsa Mosque. According to Umm Muhammad, the original Ottoman embroideries had been worked in the Ottoman period by the Sisters of Charity, who reportedly lined the script with cotton tubing instead of cardboard backing; this had been applied by the uncle and mother of Umm Muhammad. The gold thread (*qasab* or *tir-tir*) was imported from Syria, as was the *sajak/sharashib* for the fringes. The gold thread used for the embroidery was particularly pliable, flexing easily to accommodate the curved contours of the letters.

The circular crowns (*taḥ*) of both the banners are also identical, and are made of heavy metal with a pierced inscription of the word *Allah* (pls. 22.5 and 22.6).

Description B

The following excerpts which describe the event are the passages directly relating to the *bayariq* as they were described by Dr Tawfiq Canaan in 1927. The extracts are taken from his *Mohammedan Saints and Sanctuaries in Palestine*.

The banner is handed over to the Mufti on a plate. After reciting a prayer, he unfolds the banner and it is fastened on its stick. The banner is made of green velvet, embroidered along the border with golden threads, and measures 200 x 140cm. A piece of black silk is sewn at the centre of each side bearing an inscription (the writing is also worked in gold thread). The flag is fastened to a long staff, called *zaneh* ending above in a golden crescent (1927 and n.d: 197).

The procession—which in the time of the Turks used to be accompanied by a military band and a guard of honour—moves slowly to the Mosque of Omar ... After the midday prayer is over, the procession leaves the mosque area ... The Grand Mufti, the banner bearer and the other servants of the Prophet

go ahead. As soon as they are out of the holy area they mount horses and move slowly through the prolongation of the Via Dolorosa, leaving the city by St Stephen's Gate (Bab Sitti Maryam). Due to the great number of umbrellas which are carried by members of the procession and the spectators, this day has been called *id esh-shamasi*, 'the Feast of the Umbrellas'. The *shabab* (young men) assemble in parties, and each one plays, dances and sings on its way. In the crowd many flags are carried, coming from different *awlia* of the city and the surrounding villages. Each flag has its adherents ... the banner of en-Nabi Dahud [*sic*] and that of the Mosque of Omar are always seen in the procession. They accompany that of the prophet Moses, until the procession reaches Ras el-'Amud, where the mayor of Jerusalem and the members of the municipality welcome it ... After refreshments are served, the banner is carefully folded and the dignitaries continue their journey in automobiles or carriages ...

All *saiyarat*¹⁹ leave Jerusalem for Nebi Musa with great pomp and monotonous music; the procession is headed by the banner. As soon as they pass Gethsemane they furl the banner and march slowly and quietly. As soon as they are in sight of the shrine of the Prophet they rearrange their group, unfurl the banner and begin the formal procession again (1927 and n.d: 197-99).

The ceremonies of Nabi Musa last for six days until Maundy Thursday (the Thursday before Easter Sunday) when 'the official return of the banners' takes place.

... As soon as the *siddari* of the Prophet reaches Ras el-'Amud the procession begins again. The different banners and the '*idad*' which had accompanied the banner in its departure from Jerusalem go out to welcome it back. The *bayariq* and musical bands of the *shiukh* el-Qazzaz, 'Atif, Abu Majid, Hasan, 'Ezariyeh and other villages together with the banners of en-Nebi Dahud, el-Haram, and *esh-shabab* of Jerusalem, Nablus and Hebron are to be seen ... The banners of Nebi Musa and Nebi Dahud are carried back to the places where they are kept the rest of the year.

¹⁹ Specific groups in the procession that have banners, horses, carriages and '*idad*'.

But the end of this day does not mark the end of Nebi Musa. On Friday the Haram enclosure is crowded with people celebrating *zeffet al-'alemat*, 'the procession of the flags' The banners of the Sakhrāh (Dome of the Rock) and those of Mohammed are carried after the midday prayer in a great procession from el-Aqsa to es-Sakhrāh. The Qutb family are in charge of this honourable duty. Midway, near el-Kas, they halt. The olive tree just beside the basin, known as Zeitunit en-Nabi is believed to become animated at this

time, when Muhammed and his *sahabeh* visit the mosque area and live in the tree. Under this tree the banners are held and it is believed that the branches bend down to honour them. A representative of the family el-Qutb ascends the *manbar* (marble pulpit) just above the stairs leading from el-Kas to the platform of the Mosque of Omar and receives the flags, which he wraps in a silken cloth (*buqdejeh*) (see above, the Nebi Musa *buqdejeh*) and carries back to their resting place in the Sakhrāh (1927 and n.d.: 213-14).

Chapter 23

AN OVERVIEW OF THE ISLAMIC ARCHITECTURE OF OTTOMAN JERUSALEM

David Myres*

No-one, wise Kublai, knows better than you that the city must never be confused with the words that describe it (Italo Calvino, *Invisible Cities* 1974: 51).

*Acknowledgements

During the two years that I lived and worked in Jerusalem for the Ottoman Jerusalem Project, checking and preparing for publication the surveys in the catalogue of buildings, and compiling the index of architectural details (part II, A Grammar of Architectural Ornament in Ottoman Jerusalem), many people, including large numbers of residents in the city, aided and supported me in my work. To all of them I owe a great debt of gratitude. I must thank individually the following, who, throughout the period of my stay, were patient and extremely helpful—Mr Adnan Hussein, the Director of the Administration of Islamic Waqfs in Jerusalem; Dr Yusuf Natsheh, the Director of the Department of Islamic Archaeology; Mr Khadr Salameh, the Curator of the Islami Museum and Library of the Haram al-Sharif; Mr Issam Awad, the Chief Architect to the Committee for the Restoration of al-Aqsa Mosque, and his staff; Mr George Hintlian, the Curator of the Armenian Museum, Jerusalem; Father Jerome Murphy O'Connor, Professor of New Testament at the École Biblique et Archéologique Française; Dr Marwan Abu Khalaf, the Director, the School of Islamic Archaeology, Jerusalem; Mr Andrew Petersen, the Medieval and Ottoman Survey of the British School of Archaeology in Jerusalem; Professor James W Allan, the Ashmolean Museum, Oxford; Dr Rupert Chapman, the Palestine Exploration Fund; Mr Martin Dow; and the staff of the Library of the School of Oriental and African Studies, the University of London.

My thanks go to the Council of the British School of Archaeology in Jerusalem for inviting me to participate in the Ottoman Jerusalem Project. I owe a great debt of gratitude first to Mr Richard Harper, the former Director of the BSAJ, and his staff, who put up with me for more than two years in the School in Jerusalem. Finally, for their patience and their faith throughout the three years of my involvement in the Project, my heartfelt thanks go to the editors, Dr Sylvia Auld and Professor Robert Hillenbrand. Oxford, March 1996

History

On 4 Dhu 'l-Hijja 922/28th December 1516, Jerusalem was captured by the Ottoman Sultan Selim I, and was incorporated into the Ottoman empire as a small provincial capital within the Sanjaq of Damascus (al-'Asali 1989: 200). The city had no particular economic or military value. From then, however, until General Allenby walked through Bab al-Khalil (Jaffa Gate) in 1917, it was to a greater or lesser extent to be a focus of attention for all Ottoman sultans. In particular it was central to Selim's son and heir, Sulaiman I, known as al-Qanuni (the 'Lawgiver'). As the third holiest city in Islam, after Mecca and Medina, the city was deeply enshrined in the hearts and minds of Muslims throughout the rapidly expanding empire and beyond. For centuries pilgrims had come to the city to pray at two of the holiest of Islamic shrines—al-Aqsa Mosque and the Dome of the Rock, the latter of which is the earliest surviving major Islamic monument, and is traditionally associated with the Prophet's Night Journey and Ascension.

The officials of the city, no doubt thankful in 1516 to have been delivered from the declining years of an exhausted Mamluk state, recognised the religious significance of the city in their symbolic gesture to their new masters when Selim visited the city some time later:¹

All the Ulama and pious men went out to

¹ Selim is thought to have visited the city soon afterwards on 25 Safar 923/15 March 1517 (Stephan 1938: 147, n. 4)

meet Selim Shah. ... They handed him the keys to the Aqsa Mosque and the Dome of the Rock. He then made presents to all the notable people, exempted them from the onerous taxes and confirmed them (Evliya Çelebi in Stephan 1938: 147).

The importance of the event was confirmed by Selim, who is said to have prostrated himself and proclaimed 'I am now the possessor of the first *qibla*!' (Evliya Çelebi in Stephan 1938: 147; St Laurent and Riedlmayer 1993: 76). To make absolutely plain the religious-political importance of the holy sites of the city, Evliya Çelebi states significantly that the Ottoman sultan alone could be the possessor of the House of Allah (Stephan 1939: 95).

The possession of the city, as with Mecca and Medina, was not just a blessing but was also a responsibility. Throughout the four centuries of Ottoman sovereignty over the city, the sultans—and other patrons—were to pay homage regularly to the city and the Haram al-Sharif (Noble Sanctuary)—the location of many of the holy sites—by restoring, adapting and adding to the shrines and other monuments there. By doing so they not only demonstrated their own piety, but preserved and protected their Islamic ancestry and heritage for future generations, as earlier sovereign powers had done.

As well as fulfilling their responsibilities as the custodians of the three holy cities, the work to improve the holy sites was also an element in a wider master plan to ensure that the predominance of Ottoman sovereignty was firmly stamped on their new dominions and subject peoples. As in all of the newly conquered lands—and in particular the major provincial cities such as Damascus and Cairo—the imposition of new administrative structures, centred in Istanbul, firmly established the Ottomans as the new masters. The building of new foundations and the embellishment of the holy sites was a particularly visible and symbolic demonstration of the new ruling authorities who could otherwise have seemed remote to the outlying, provincial lands of the empire.

These two factors combined to ensure that the three holy cities received more benevolence than other cities in the provinces (Faroghi 1994: 94). Indeed the scale of the works invested in them, and the fact that the new administration did not, in fact, confine the works to the holy sites, or simply to building religious foundations (as was the case in other provincial cities), suggests that Istanbul had a clear notion of what constituted a dignified pilgrimage city and one which would be an appropriate setting in which pilgrims could come and worship (Faroghi 1994: 111-12). As will become apparent, the imperial administration also aimed to improve the daily lives of the population of the city.

Sulaiman, who took the reins of power in 927/1520, was to pay particular attention to all aspects of the city's welfare. Evliya Çelebi, writing only at the end of the 11th/17th century, gives his version of the motivation behind the works:

When he became an independent king, the Prophet appeared to him in a 'blessed night' and told him: 'Oh, Sulaiman, you will attain the age of forty-eight and will make many conquests. Your offspring will not die out to the end of time. My kindness will always be extended to you. You should spend these spoils on embellishing Mecca and Medina, and for the fortification of the citadel of Jerusalem, in order to repulse the unbelievers, when they attempt to take possession of Jerusalem during the reigns of your followers. You should also embellish its sanctuary with a water basin and offer annual money gifts to the Dervishes there, and also embellish the Rock of Allah and rebuild Jerusalem.' Such being the order of the prophet, Sulaiman Khan rose at once from his sleep and sent from his spoils one thousand purses to Medina and another thousand purses to Jerusalem (Stephan 1939: 86-7).

Sulaiman was to fulfill the aspirations of the 'dream' during the first half of the 10th/16th century by carrying out a series of 'grand projects' that aimed not only to protect and preserve the holy sites, but also the city and its inhabitants. This in turn was intended to demonstrate the advantages of living under Ottoman rule to the population, after the years of economic and demographic decline at the end of the Mamluk period. As well as the restorations to the Haram al-Sharif in general, and the Dome of the Rock and al-Aqsa Mosque in particular, the three main components of the plan included the rebuilding of the city walls and the Citadel, and the restoration of the defunct system of channels and aqueducts supplying the city with water.

His first (rather undiplomatic) act on 18 March 1523 (van Berchem 1923: 403) was, however, to order the expulsion of the Franciscan community from the traditional site of the Tomb of David (al-Nabi Da'ud) on Mount Zion. The order was carried out in 930/1524 (Peters 1993: 222) and, despite the intervention of Francis I of France in 935/1528 (al-'Asali 1989: 206), a thorough renovation of the complex took place, with the conversion of the Crusader hall of the Coenaculum (traditionally believed to be the place of the Last Supper) into a mosque, with a minaret above (van Berchem 1923: 407 and n. 1; cat. no. 1). The adaptations included the addition of a new

domed chamber to the east end of the hall, and the installation of a simple semi-circular *mihrab* in the south wall. The typically Turkish, highly decorative *mihrab in situ* today was, I believe, not added to the mosque until after the end of the Ottoman period; evidence for this is found in a report dated 1920 by Captain Ernest Mackay, the Inspector of Antiquities for the British administration during the Mandate. His report states that 'just below the central window is a plain *mihrab*'.² Judging by the architecture of the surrounding buildings, considerable works were also undertaken on the courtyards and apartments around the hall.

The city walls had been in ruins since 1219 when al-Mu'azzam 'Isa was forced to destroy them for fear of further attacks by the Crusaders (Little 1989: 89; van Berchem 1923 1: 131-6). The Mamluks made no effort to refortify the city, apparently because during much of the period security in the region was relatively stable. However, by the end of the Mamluk period the Bedouin were taking advantage of a run-down administrative system and were raiding travellers in the surrounding country. They were recognised to be a threat to the security of the city, as were the Christian pirates who were known to have been operating along the coast (Burgoyne 1987: 59; Cohen 1989: 469).

The Ottoman works to refortify the city began with what remained of the Ayyubid citadel, which was renovated in 938/1531-2; the remains of the base of the Herodian tower to the right of the main entrance was restored and built up to be put to use as an arsenal and treasury (Evliya Çelebi in Stephan 1938: 154; Peters 1985: 482). Inside the Citadel, the existing Ayyubid mosque dating to 610/1213-4 was repaired and a *minbar* installed (al-'Asali 1989: 201). An inscription dated 1065/1655 on the present-day minaret of the mosque suggests that an earlier minaret had been built at the same time as the other restorations were being carried out (Walls and Abu'l-Hajj 1980: 9). A new *mihrab* was also installed in the battlements overlooking the outer moat (known as the 'Masjid al-Saif', cat. no. 27).

Work on the walls surrounding the city seems to have begun a little later, and, given the size of the undertaking, took considerably longer. The funds for the rebuilding of the walls were sent from Damascus and Istanbul, and raised also from tax revenues collected from the surrounding region (Cohen 1989c: 470-2). According to inscriptions on the walls and gates, the works lasted from 944/1537-8 until 947/1540-1, but it is probable that they were started before, and completed after, these dates

(Cohen 1989: 468). The work was carried out in a logical and orderly fashion; the section that was most topographically vulnerable—the north front—was completed first, followed by the east and west fronts. Five new gateways were installed over, or near, the remains of the medieval gates: Bab al-'Amud (Damascus Gate) (944/1537-8), Bab al-Sitt Maryam (Lion's or St Stephen's Gate) (944/1537-8), Bab al-Khalil (Jaffa Gate) (944/1538), Bab al-Nabi Da'ud (Zion Gate) (947/1540) and Bab al-Maghariba (Dung Gate) (947/1540-1). The new walls were punctuated with many towers, among which were the Burj al-Laqlaq (Tower of the Storks) (944/1537-8) located at the north-east corner of the city, and Burj al-Kibrit (Sulphur Tower) (947/1540-1), a short distance to the west of Bab al-Maghariba. Some of the names appear to have changed since the 11th/17th century: Burj Laqlaq, for example, was re-named 'the Tower of Rüstem Pasha' (Stephan 1938: 152). The south and south-eastern walls, founded on the massively-constructed Herodian foundations of the Second Temple period, appear to have been largely unaltered.

The rebuilt walls remain one of the abiding symbols of the Old City; they have, moreover, provided a bulwark that has prevented the city from being sucked into the late 20th-century urban expansion. Well into the 19th century, travellers to the city commented on their impressive height. This is not surprising as little of the city's fabric could be seen from the surrounding countryside except from the Mount of Olives. The impact of the walls was such that many, including Evliya Çelebi, took time to pace around the perimeter, counting towers and measuring the distances:

According to this calculation the circumference of the fortress is seven thousand and fifty paces. It has fifty-seven towers and seventy-three bends which command other walls. There are altogether four thousand and forty embrasures between the battlements of the wall (Stephan 1938: 154).

Broadly speaking, the line of the rebuilt walls followed that of the earlier medieval and Ayyubid periods. Bab al-'Amud is located on the site of the triumphal entrance into the Roman Aelia Capitolina. This gave the builders a good opportunity to construct the magnificent entrance one sees to-day from the much-used road to the north. Recent excavations at Bab al-Maghariba and Bab al-Khalil have also revealed that these gates and their adjoining walls were positioned over earlier medieval constructions. In contrast, the survey discovered evidence to suggest that the Ottoman wall was built on a new line in the north-west corner of the city. Immediately to the south

² Rockefeller Museum Archives, Box 78, Report by Captain Ernest Mackay, Inspector of Antiquities, OETA(S), 1/1/20: 58. I am grateful to the staff of the Rockefeller Museum for allowing me to spend so much time searching through these boxes.

of Masjid al-Qaimari (cat. no. 32 and see below), a large square structure—today used as a school—with walls which are approximately 3m thick, incorporates in the west and north walls three (possibly four) large loopholes, raised above floor level. The loopholes are approximately 3m tall and those in the west wall are located within the thickness of the city wall itself. This evidence suggests that the present school is built on the remains of a medieval tower—perhaps Crusader or Ayyubid—which had been previously ruined or destroyed. The Ottoman builders appear to have extended the west wall of the city north of this tower before turning to the east. Staff at the Department of Islamic Archaeology relate that during restorations of the school and the mosque ‘Crusader’ remains were found in the vicinity. This is possibly confirmed by the use of a number of marble columns running transversely through the base of the north wall of the school. This feature is known to have been a common method of strengthening fortified walls in the Crusader period. In addition, a piece of carved stonework is also to be found on site; to judge by its drilled foliate decoration, the stonework also has a Crusader provenance. But both pieces of evidence could equally relate to the re-use of materials, and before a final judgement can be made further investigation will be necessary.

By the time the walls had been completed, the security of the city and its inhabitants had been assured. The builders of the walls were perhaps less fortunate; it is said the two men in charge of the works were executed after the sultan discovered that Nabi Da’ud, newly rebuilt for the benefit of the Muslim population, had not been included within the city boundary (Stephan 1938: 151, n. 3).

During the 1530s, work had already begun on the system of aqueducts and channels which supplied the city with water. By all accounts, these had fallen into disuse, despite restorations carried out by Qa’itba’i during the last half of the 9th/15th century. Two existing reservoirs located at Qanat al-Sabil (Solomon’s Pools) to the south of the city were supplemented by a third pool, and they were all named after their patron (al-‘Asali 1989: 201). Birkat al-Sultan (named after the Mamluk Sultan Barquq), located immediately outside the city walls to the west of Bab al-Khalil, was also repaired (van Berchem 1923: 422). Water-bearing channels, both those already existing and new ones, were taken into the city from this pool; Joseph Ha-Cohen, a Jewish resident in the city in 944/1537, reported that ‘they ... extended the tunnel into the town lest the people thirst for water’ (in Peters 1993: 480). To complete the work at Birkat al-Sultan, a small fountain (*sabil*), with two troughs to provide water for animals (van Berchem 1923: 413), was built at the southern end. Five other fountains, all of a strikingly similar design, which were fed by the newly restored channels, were built in the name of the sultan within the city, mainly in the vicinity of the

Haram. Work on the water-channels continued throughout the 1540s into the 1550s despite documents from 948/1541-2 which record that Muhammad al-Çelebi al-Naqqash, believed to be the Ottoman official supervising the works to the walls and the water system, had reported that the system was already up and running (Cohen 1989: 471).

The six new imperial *sabils* were all built within a six month period from Muharram 943/June 1536 to the beginning of Ramadan 944/February 1537 (see van Berchem 1923: 412-27). The first, Sabil Birkat al-Sultan (cat. no. 4), discussed above, was built, as its name suggests, outside the city at the southern end of the restored reservoir. The next four, Sabil al-Wad (cat. no. 5), Sabil Bab al-Silsila (cat. no. 6), Sabil Bab al-Nazir (cat. no. 7), and Sabil Bab al-Sitti Maryam (cat. no. 9), were built in highly visible points around the Haram. Cohen (1989b: 2-3) has suggested that some may have occupied the sites of earlier fountains. The remaining fountain, Sabil Bab al-‘Atm (cat. no. 8) was built inside the Haram precinct at the northern end close to the gate of the same name. All the fountains except one functioned as points from which the inhabitants of the city could collect water for daily use. Sabil Bab al-‘Atm, the exception to the rule, was built as an ablutions fountain for use before prayer, a fact which is perhaps emphasised by the existence of a *mihrab* in its north elevation, which functions as the *qibla* wall of a small prayer platform built against it.

Although Sabil Bab Sitti Maryam (cat. no. 9) no longer has a date, it is clearly one of the group. An analysis of the shouldered arches over the flat niches in the recessed wall of each of the structures—so-called ‘Bursa’ arches (Goodwin 1971: 49) (see Grammar of Architectural Ornament, Arched niches, N2, N7) which are an Ottoman import—suggests that their design became more sophisticated as time progressed. The example on this *sabil* is the most ‘advanced’, which may indicate that it was the last of the six to be built (see Grammar of Architectural Ornament, Arched niches, N7). Its location on the east side of the city, furthest of all the fountains from the main supply of water and therefore probably the last to be constructed, gives further credence to this theory.

The works to the water supply system were designed to ensure that water would be available to all. However, even the new additions to the system could not prevent the city from suffering on occasion. A particularly severe drought in 1277/1860 left the channels dry and led to an endemic disease which swept through the city (Prag 1989: 41).

The work to repair the water supplies to the city appears to have been carried out for reasons that were as much religious as practical or secular. The channels all terminated in the Haram where they fed the new ablutions fountains. In addition to the Sabil Bab al-‘Atm, which has already been mentioned, a second, more prominently

located ablutions fountain was built by Sulaiman. This is known as al-Kas (the Cup), which comprised a solid marble bowl set over an octagonal pool with taps in each side, and was placed in the prime position between the two mosques on the Haram al-Sharif, a short distance to the north of Masjid al-Aqsa.

It was not until the other works around the city had been completed that the restorations to the Haram and the holy sites were undertaken. Some work had been done to the Dome of the Rock during 935/1529, when the stained glass windows around the drum had been repaired. Work in earnest, however, seems to have begun around the middle of the 10th/16th century. During the 1550s, the Haram precinct was cleared of all debris (Cohen 1989: 4). Evidence for the clearance is found in the bakery of the Khassaki Sultan complex (959/1552 see below), where a number of stones with incised arabesque ornamentation and fragments of inscriptions were built into the external walls. The fragments are known to have originated from the Mamluk foundation of the Madrasa al-Ashrafiyya, which had been partially destroyed in an earthquake a few years earlier in 952/1545-46 (Walls 1980: 199, n. 5; Walls and Abu'l-Hajj 1980: 29, nn. 87 and 88).

The most extensive restorations to the Dome of the Rock were started in the same year of 952/1545-6 (Walls and Abu'l-Hajj 1980: 21; al-'Asali 1989: 200). It is possible that for a short time this important work was under the supervision of the great Ottoman architect Qoja Sinan (Evliya Çelebi in Stephan 1939: 87; Blair and Bloom 1994: 220), for it is believed that he came to the city on the way back from his pilgrimage to Mecca in order to organise the craftsmen and artists engaged in the works on the building. During the restorations, the existing Umayyad mosaics around the outside of the drum and the octagonal ambulatory below were replaced with *cuerda seca* and polychrome underglazed tiles; tile mosaic and blue and white tiles were also used (Richmond 1924: 23-76; Atil 1987: 239; Blair and Bloom 1994: 220; Ch. 27 in this volume). In addition, the lower parts of the octagon were encased in marble cladding. Qubbat al-Silsila, to the east of the Dome of the Rock, was retiled a little later in 969/1561-2 (van Berchem 1925: 180-1). Despite the growing tile industry at Iznik during the middle of the 10th/16th century, the tiles are thought to have been made locally (Atil 1987: 24). Repairs to the leadwork covering the Dome of the Rock and the Aqsa Mosque were also carried out soon after 987/1579 (Heyd 1960: 157). Once the exterior of the Dome of the Rock had been completed, the doors were repaired (972/1564-5), and later two windows were re-opened (1006/1597-8) (Atil 1987: 21). There seems to have been some delay in the completion of the earlier work undertaken by Sulaiman (Necipoğlu-Kafadar 1985: 101, n. 38) because 'iron, steel, lead, copper, wood, and first-rate marble bought with government funds' for the purpose

were still in storage in 984/1576 (Heyd 1960: 156). The reasons for the delay are unclear. The leadwork used in the restorations to the domes of both the Sakhra and the Aqsa Mosque around 987/1579 is known, however, to have been imported from Istanbul (Heyd 1960: 157). Later requests sent to Damascus and Tripoli for artists and craftsmen suggest that there was a shortage of skilled artisans in the city (Heyd 1960: 156). If the delays are indicative, then it seems likely that Sinan's visit would have been made some time during the fifth and sixth decades of the century.

From the documents available, it is clear that other works were undertaken on the Aqsa Mosque. Very few inscriptions survive on the building, however, which document any work during the first century of Ottoman rule. Evliya Çelebi describes an inscription in the rotunda under the dome stating that it was restored by 'Sulaiman Khan', as well as other work undertaken on the prayer niche and *minbar*. These were apparently decorated with 'twelve kinds of glass of different, fine and iridescent colours' (in Stephan 1939: 82-3). Other works on the Dome were to continue until the end of Sulaiman's reign. The pavement around the Dome of the Rock was relaid with 'white unhewn marble' (Evliya Çelebi in Stephan 1939: 85). And, as noted above, the large marble basin, al-Kas, was positioned between the two mosques for use as an ablutions fountain (*şadirvan*) (Evliya Çelebi in Stephan 1939: 85).

Up to this point, the work in the city had been carried out with two clear purposes in mind. The general aim was to secure the city within the broader context of the empire by protecting it, and thus provide for the needs of the population. By doing so the Ottoman authorities also gained popular support. The second associated aim of the Ottoman sultan, which was more specific within the context of Jerusalem, was to secure his claim to be the custodian of the three holy cities of Islam.

The works that Sulaiman undertook were appropriate for another reason. The sultan considered himself, perhaps not surprisingly, as the second Solomon in the context of Jerusalem. The Dome of the Rock was after all on the site of Solomon's Temple. An inscription on Sabil Qasim Pasha (cat. no. 2) describes him as 'the Second Solomon among the Kings of the World' (Necipoğlu-Kafadar 1985: 39, and van Berchem 1925: 167, and nn. 1 and 2). Another *sabil* in Edirne, which was endowed by his wife Khassaki Sultan—or Roxelana, as she is more commonly known in the West—hails him as the 'Solomon of his Age' (Necipoğlu-Kafadar 1985: 103 and n. 39). Comparisons have also been made between the planning of the Süleymaniyye and the Haram al-Sharif; and the interior of his mausoleum has been compared to the interior of the Dome of the Rock (Stierlin 1985: 159). From this it is fair to suggest that the sultan was preoccupied not only with the city but also with his own notional, but no less potent,

links to it, and this goes some way to explain the extent of the works attributed to him. There is perhaps one further Solomonic link with the imperial work to be found in the city concerning the six fountains built after al-Kas. It seems curious that so much work should have been done to the system of channels and aqueducts which, even if requiring maintenance, are known to have been extensively restored at the end of the 15th century. As mentioned above, al-Ashraf Qa'itbai (r. 1468-96), as part of his work to consolidate his sovereignty over the three holy cities, is known to have ordered the restoration of the water supplies to the city in 874/1469 (van Berchem 1923: 338-43). This was a few years prior to the foundation of his monumental *sabil* in the Haram (887/1482) (Burgoyne 1987: 606; Bloom and Blair 1994: 93). In addition, Qa'itbai built two further fountains close to the *sabil* named after him (see below). Other fountains too were already in existence during the latter half of the 9th/15th century; Mujir al-Din alludes to one at the southern end of al-Wad Street, where the Stairs of the Fountain were located, and there seems to have been another at the northern end of the Haram.

Why therefore should six new *sabils* have been built? The rationale behind building the new fountains *could* have been simply to do with contemporary water requirements, or with the available space, or the position of existing water channels. There is, however, some textual evidence to suggest that the number of fountains to be built had been pre-ordained prior to their construction. Mujir al-Din's account of Jerusalem which, given the sultan's interest in the city, may well have been known either to him or to one of his advisers, could point to a significantly more symbolic reason which would have appealed to Sulaiman. Mujir al-Din states: 'there were in Jerusalem *six basins* (my italics) constructed by Hazqi I (Hezekiah)—one of the Kings of Israel ... three were in the town ... and the basins were made for the people of Jerusalem' (Sauvaire 1876: 189). The account does not, strictly speaking, concern Solomon. But it is concerned with a king of ancient Israel who actively bestowed his patronage on the city.

A mosque, known as the Kursi Sulaiman (Throne of Solomon, cat. no. 42), which is located against the east wall of the Haram, is another site traditionally associated with the builder of the Second Temple. It was built on the site traditionally believed to have been the place where King Solomon went to pray after he had completed the construction of the Temple (Evliya Çelebi in Stephan 1939: 81). The building is undated. However, there seems little doubt that it is a mid 16th-century foundation. The evidence is not to be found on its exterior, which appears to have been restored at a later date, but rather inside the building, which consists of a large hall leading to a *mihrab* in the south wall. The space is covered by two shallow domes. A narrow aisle flanks the main hall to the east and

this accommodates a huge 'cenotaph' which extends the length of the building. The shape of the domes indicates the Ottoman date of the building. Other details confine the dating to the first half of the 10th/16th century; situated above the *mihrab*, there is a cavetto frieze decorated with small arched niches carved with a leafy decoration. The frieze is identical to one found over the *mihrab* in the mosque of the caravanserai in the Khassaki Sultan complex (959/1552), and to my knowledge is not found on a frieze in a monument elsewhere in the city (although it is found on the voussoirs of the 16th-century Ottoman Bab al-'Amud). Moreover, the hood of the *mihrab* in the Kursi Sulaiman is plastered and has carved or moulded decoration (see cat. no. 42). This treatment of a hood is only found in one other monument in the city—the Mamluk Turbat al-Sitt Tunshuq (Burgoyne 1987: 507-12). It seems fair to suggest then that the Kursi Sulaiman too was begun in the period of Sultan Sulaiman; and even if no secure proof connects it specifically to the sultan himself, it is somehow nice to think that it was included in the *oeuvre* of works which possessed a Solomonic lineage.

The protection afforded by the walls, and the general resurgence of confidence that these and other building activities provided, were only one facet of a general reorganisation of the whole region under the new regime. Jerusalem, like all provincial towns and cities, was fitted into the highly centralised organisation of the Ottoman empire. It became an administrative capital within the province (*sanjaq*) of Damascus, by way of which all orders came from Istanbul. Jerusalem, however, was in an unfortunate position geographically because it was neither on a main trade route nor on the principal pilgrimage routes. Even though it administered a number of neighbouring towns—Hebron and Bethlehem in particular—it had little strategic or economic importance. Traditionally most of its economy relied on local commerce in olives, from which soap, oil, and other associated products were processed, and of course on fruit, vegetables, and meat for local consumption. In better times, when the threat of Bedouin attack was reduced, it also relied on the trade and taxes from pilgrims and other visitors to the city. It was therefore clearly in the interests of the new administration to see that the local economy was encouraged, for by doing so revenue was generated through taxes both from the local population and from the increasing pilgrim trade.

In fact the imperial works thus far completed did have the result of generating a new wave of optimism in Jerusalem. The new-found security of the city and the region around it encouraged a growing stream of pilgrims and other visitors. During the first half of the 10th/16th century, there was an increase in the population from approximately 5,000 to 16,000 in 961/1553 (Peters 1993: 205). As a consequence, there was an economic boom

which had the knock-on effect of a growth in building activities. This was particularly so in the markets (*sugs*), where trade expanded as a direct result of the increased security in the region, which in turn provided the necessary funds for their physical rebuilding and restoration. Evidence for such a boom is provided by the substantial restorations and additions to Suq al-‘Attarin (the Spice Market) in 973/1565, and to the monumental Mamluk foundation, Suq al-Qattanin, in 972-4/1564-6 (Cohen 1989: 6-7). Although documents have yet to be published, and a comprehensive survey of vernacular architecture in the city has not yet been carried out, these works must have been accompanied by building activities in the private residential neighbourhoods. It is possible that evidence for such activities can be found elsewhere; Behrens-Abouseif (1994: 272) has suggested that, soon after the Ottoman conquest of Cairo, the populace of the city preferred not to institute *waqfs* (often set up to evade taxes or to protect family fortunes), but chose instead to invest heavily in upgrading residential quarters. The prestigious house built by the Amir Bairam Jawish over his *ribat* (947/1540) and *maktab* (947/1540-1) (cat. nos. 11, 12 and 13)—the first securely-datable, independent Ottoman foundation to be built outside the Haram precinct—may provide local evidence of such private building enterprises in Jerusalem.

Having encouraged a growth in the local economy, the imperial administration was in a position to address other needs, particularly those of the poorer communities in the city. A large charitable complex, al-‘Imara al-‘Amira al-Khassaki Sultan, which was built in the centre of the city not far from the Haram, aimed to fulfil this requirement. The complex was founded in 959/1552 but the final *waqfiyya* was not drawn up until 964/1557 and seems only to have become fully functional—at least according to census records—some time before 970/1562-3 (Stephan 1944: 171 ff; Cohen 1984: 83-9). It was a new type of institution to the city and wholly Ottoman in conception. In Ottoman Turkey, since the latter half of the 8th/14th century (Blair and Bloom 1994: 134), the administration’s concern for the lower stratum of society and the poorer religious communities had resulted in the sultan (and other wealthy patrons) building large socio-religious complexes, known as *‘imara*, or later *külliye*. These prestigious undertakings had the additional benefit of providing highly visible evidence of the founders’ pious benevolence (Faroghi 1994: 94). The foundations were generally built in the context of a town or city and incorporated a *khan*, *madrasa*, mosque, clinic, the tomb of the founder or of a *shaikh*, and a soup kitchen, which distributed free meals daily to the poor. The complexes were generally built in the context of a town or city. A number were founded in Bursa and Edirne as well as in Istanbul, the most famous of which was the Süleymaniyye

complex built by Sultan Sulaiman in 957-64/1550-6. Their appeal to the people—and in particular to the many pious communities in the holy cities—meant that they were a particularly powerful means of generating support for the new administration. As a result, provincial cities around the empire also benefited from the building of these complexes, which were built in Mecca and Medina by Sulaiman and his wife at the same time similar foundations were being built in Damascus and Cairo (Faroghi 1994: 106).

The Khassaki Sultan complex, which is more generally known today as *al-takiyya*, was begun two years earlier than the more elaborate Süleymaniyye complex (962/1554-5) in Damascus but postdates the *külliye* constructed by Sulaiman for his wife in Istanbul which was completed in 1539.

The Khassaki Sultan complex in Jerusalem was the largest endowment in Palestine (Heyd 1960: 139) and was made possible only because of the founder’s intimate relationship with the sultan (Peri 1984: 47; see also al-‘Asali 1982: 9-25). An impression of the size of the foundation and the resources it required in order to function is given by an imperial document which relates that the complex was consuming half of the entire water supply of the city (Heyd 1960: 147). To meet the requirements of both the complex and the city as a whole, another water channel had to be built, the cost of which was met by Khassaki Sultan Hürrem herself.

The complex was built in and around the large Mamluk palace of al-Sitt Tunshuq which dates to c. 799/1388 (Burgoyne 1987: 485-503). The main elements of the *‘imara* complex were a *khan*, accommodation for a Sufi community, refectory, mosque, bakery, probably a bathhouse, and a soup kitchen, which distributed two free meals daily to the poor and to the Sufi residents. Other buildings were erected to support the main functions of the complex. The survey in this volume (cat. no. 15) is the first time that the complex has been fully published. As a result, a number of other elements mentioned in the *waqfiyya* have been identified (Stephan 1944: 171); these include the so-called ‘high praying place’ which in its planning resembles a *qibla iwan*, but which can also be equated to the Ottoman form of mosque which includes flanking spaces. A *sabil kuttap* was also probably built as part of the foundation. The ground floor of this ‘fountain-school’ formed a large water-storage tank, while the upper level provided a small loggia or schoolroom in which the children of poor parents were instructed in the Qur’an. Only one other example of a *sabil kuttap* is to be found in Jerusalem in the Mamluk Tashtamuriyya complex, which dates to 784/1382-3 (Burgoyne 1987: 460-75). Of note is the fact that the Khassaki Sultan example, although possibly a rebuilding of a Mamluk structure (Burgoyne 1987: 499) was the only one to be built in Jerusalem in the Ottoman period, for the

dynasty had a distinct predilection for such structures. In Cairo, for example, over a hundred are thought to have been founded during the 9th/15th and 10th/16th centuries alone (Blair and Bloom 1994: 92; Behrens-Abouseif 1994: 228).

The survey and subsequent research has also revealed that the complex probably incorporated the Ribat and Maktab of Bairam Jawish (947/1540; al-'Asali 1982: 20; cat. nos 11, 12). This was the first new foundation and, as it turned out, also the largest to be built by an 'independent' patron in the city, other than the imperial works. Although it was not fully understood in an earlier period this century, when van Berchem (1923: 430) thought it 'apparently insignificant', it remains one of the most important of all 10th/16th-century endowments. The foundation is located on both sides of 'Aqabat al-Takiyya which it spans by way of a bridge (*qantara*), and it contained a hospice for travellers (usually pious pilgrims) (*ribat*), and a school (*maktab*) for the teaching of Islamic law. The hospice consisted of a courtyard and at least five cells on a balcony overlooking it. The exact extent of the *maktab* is less clear, but it was probably centred on an earlier Mamluk foundation, al-Madrassa al-Mawardiyya, which was incorporated into the new complex (see below). The *maktab* extended to a series of chambers with decorated vaults which were loosely planned around a small courtyard on the north side of the street. A simple cross-vaulted chamber located at street level, to which the inscription for the *maktab* is fixed, now houses a tomb which, although unidentified, may be that of the patron of the complex. As briefly indicated above, the survey has discovered that Bairam Jawish also built for himself a splendid house with a second floor courtyard in a *qantara* over Tariq al-Wad (cat. no. 13). A previously unpublished inscription over the (now blocked-up) doorway to the residence confirms that it was built soon after 947/1540. Access to the house was originally from the courtyard of the Ribat. The house once had a splendid view up and down Tariq al-Wad, and, despite being well down in the valley, from the roof terrace it has a panoramic view of the Dome of the Rock. A pretty little *madrasa*, previously known as the Rasasiyya Madrasa (a reference to the lead sheeting used between the first seven courses of masonry in the elevation), which is located between the two complexes, has until now remained undated. All the architectural evidence suggested that it was a late Mamluk building, and that it was restored some time during or after the building of the Bairam Jawish complex. These observations were proved correct during 1995 with the discovery of the *waqfiyya* for the Bairam Jawish complex. The document confirms that the *madrasa* was called al-Madrassa al-Mawardiyya and that it was indeed renovated and incorporated into the Bairam Jawish complex in 940/1540.³ The combined surveys of Ribat Bairam Jawish,

Maktab Bairam Jawish, the Khassaki Sultan complex and al-Madrassa al-Mawardiyya have shown that the last foundation was probably a much larger institution than had hitherto been appreciated. The survey, and the existence of a number of decorative details, blocked up doorways etc., suggests that the *madrasa* once extended to the south into two connected courtyards. Confirmation will have to await further investigation. After it was incorporated into the Khassaki Sultan complex, the *madrasa* almost certainly came to be known as 'al-Madrassa al-Khassakiyya', a foundation which appears in legal documents in the 11th/17th century (al-'Asali 1982: 25).

Given the upward surge in the fortunes of the city during the first fifty years or so of the 10th/16th century, it is no surprise to find that many of the datable Islamic Ottoman monuments were founded during this period. Not all of them, of course, were imperial foundations. The wave of optimism that swept through the city and the region encouraged other patrons, usually those who had held, or still held, high office in the Ottoman administration or in the religious communities. It is also noticeable that most of the datable works are located inside the Haram. Within ten years of the conquest of the city, Qasim Pasha—perhaps the same Güzeldje Qasim Pasha who had been Governor of Egypt in 929/1522 and 930/1523 (van Berchem 1925: 167 and n. 1 and 2, 168)—built an ablutions fountain (*şadirvan*) in the Haram al-Sharif (933/1527) (cat. no. 2). Restorations were carried out on a *mihrab* on the present site of the small domed structure, Qubbat al-Nabi (945/1538-9) (cat. no. 10), for which a new dome was almost certainly also constructed (van Berchem 1925: 169, 171-3 and see below). Other domes too—including Qubbat al-Khadr (cat. no. 31) and Qubbat al-Arwah (cat. no. 30)—may have been built during the century (but see below).

Most of the non-imperial works in the Haram were concentrated on the upper esplanade, and to the western and northern sides of the enclosure. This was presumably because they were the most accessible and—bearing in mind that the foundations were as much about self-advertisement as piety—because they were also the most visible sides. This latter factor is particularly evident in the manner in which, as with their Mamluk predecessors, almost all the new foundations and restorations were accompanied by large inscriptions which, often in florid terminology, extolled the patron. Outside the Haram inscriptions were used in a similar fashion; Sulaiman's *sabils* and the new city gateways are cases in point. Even the smallest foundation had one. The early 12th/18th-century fountain, until now known as the Sabil Shaikh Budair—one

³ I am grateful to Dr Yusuf Natsheh for being kind enough to provide me with this information.

of the smallest independent buildings built in Jerusalem in the Ottoman period—has one of the most beautiful inscription plaques in the city.

The new atmosphere in the city during the 10th/16th century also resulted in the need to accommodate the burgeoning pious communities. The *waqfiyyas* of many of the Mamluk *madrasas* and hospices around the Haram had, through neglect, finally lapsed (Cook 1976: 204). However, as in other places where there had been a rich architectural past, practical needs, perhaps linked to an underlying moral obligation to preserve the Islamic heritage (Behrens-Abouseif 1994: 271-2), ensured that the earlier buildings were restored to use and occupied by religious communities (Peters 1993: 204). This was not the pattern in Jerusalem alone but prevailed in other provincial cities at the time, for example Cairo (Behrens-Abouseif 1994: 224).

New foundations were, however, also being built for the same purpose within the Haram. The largest body of new buildings was built against the western and northern sides of the upper esplanade in the form of fourteen small, two-storeyed cells (*khalwas*, *hujras* or *odas*—see cat. nos. 14, 16-17, 20-24, 34, 41, 46, 51-53). Only a few of them have foundation inscriptions: Hujrat Muhammad Amir al-Liwa' al-Quds (956/1549-50, cat. no. 14), Khalwat Qitas (967/1559-60, cat. no. 16), Khalwat Parwiz (967/1559-60, cat. no. 17), Hujrat al-Muhammad Agha (996/1588, cat. no. 20; for these, see also van Berchem 1925: 186-9).

The practice of building structures against the side of the upper platform of the Haram al-Sharif dated back to at least the Ayyubid period, with the building of the Nahawiyya at the south-west corner, and the cistern of al-Mu'azzam 'Isa (607/1210). It is possible that structures were also built during the Mamluk period, for Mujir al-Din seems to allude to cells being built on the east side of the Haram platform (Sauvage 1876: 118-9). A drawing dated 888/1483, which gives a view of the sanctuary from the east, clearly shows no cells on either the east or west sides (Creswell 1979: 90). Evliya Çelebi stated in 1072/1682 that on all sides of the Shrine of the Rock there were rooms belonging to 'forty *madrasas*' (Stephan 1939: 98). The text is ambiguous for the figure seems to suggest that he is including the Mamluk *madrasas* located outside the Haram to the west and north. However, within the context of the text, the 'Shrine of the Rock' could only apply to the upper esplanade. In any case, the buildings almost certainly functioned as accommodation as well as places for prayer and study for the various dervish communities in the city. Evliya Çelebi writes that in each of them lived 'pious people considered to be the wonder-working Dervishes. Some of them break their fast only once a week, while others may not have tasted meat for forty or fifty years' (Stephan 1939: 98). Their use appears to have continued in

a similar fashion throughout the Ottoman period for Wilson, writing during the 13th/19th century, writes that there were 'underground rooms [presumably the rooms on the lower floor] ... for destitute Muslim pilgrims who ate and slept at the Mosque's expense' (in Ben-Arieh 1984: 477-9). Catherwood states that 'one portion of these (*khalwas*) is devoted to the black pilgrims from Africa' (Bartlett 1850: 152). The clear inference from this is also that the Haram, even in the latter years of the Ottoman empire, still provided for those who made the pilgrimage to the city.

The similarities in planning, construction and architectural detailing shared by the dated and the undated *khalwas* suggest that they had common typological and architectural origins. Most are relatively humble structures, but one cell stands out from its plainer cousins. The so-called 'Mamluk Cell' (cat. no. 22), centrally located in the north colonnade, has earned its sobriquet from the extensive and elaborate use of red and cream-coloured stone and carved decoration. It is one of the most accomplished and beautiful monuments in the city. Until the present survey, it remained undated although it was clear that it had been built by a patron of considerable importance with finances to match. Its general appearance suggests that it could have been built during the Mamluk period, but the planning of the building is clearly Ottoman (see below). The architectural details also serve to support such a suggestion; the capitals and bases of the columns of the portico (although superior) share similarities with other Ottoman foundations in the Haram, the Qubbat al-Nabi (cat. no. 10) for example. The designs of the decorative cartouches on the south elevation bear a striking resemblance to other mid-10th/16th-century foundations including some of the cells but also, for example, those found in the south gateway to the Khassaki Sultan complex. Such details seem to confirm that the building dates from the late 10th/16th century or early 11th/17th century. Given the undoubted importance of the building, it is sad to find that there are no inscriptions remaining in the recesses clearly intended to house them. [Editor's note: see the catalogue entry, cat. no. 10, where Dr Yusuf Natsheh gives details of the relevant *waqfiyya* where the patron is named as Ahmad Pasha, and where the monument is dated to 1007-9/1598-1601].

Away from the Haram, the establishment of 'private' pious institutions during the 10th/16th century was less widespread. To a large extent this must be attributed to the fact that after the extensive building activities of the Mamluk period there was neither the space nor the need for them. The Mamluk patrons had almost entirely filled the neighbourhoods along the west and north sides of the Haram with their *madrasas*, hospices, markets, *khans* and baths (*hammams*), leaving few gaps in which to build during the subsequent centuries (Burgoyne 1987).

The Ottomans were great and innovative builders of mosques, particularly in the administrative centres of the empire. However, in Jerusalem there seem to have been only four new mosques built: Masjid al-Qaimari (cat. no. 32), Masjid al-Hamra' (c. 939/1532-3, cat. no. 3), Masjid al-'Imara al-'Amira al-Khassaki Sultan (957/1552, cat. no. 15) and Masjid al-Zawiya al-Qadiriyya (1043/1633, cat. no. 35). The focus of the Islamic religious community was the hugely potent presence of the Haram al-Sharif with the Aqsa Mosque and the Dome of the Rock. The presence of these great religious buildings, allied to the other factors already mentioned, must have reduced the requirement for more mosques. Masjid al-'Imara al-'Amira al-Khassaki Sultan and Masjid al-Zawiya al-Qadiriyya were both elements of larger complexes. Masjid al-Hamra' was an independent foundation, but nothing is known of its original form, for it was subsequently demolished. A minaret, which was probably built at the same time, survives to the present day (see below) but the mosque was replaced by an inferior structure, whose details point to a date some time during the last two centuries. Masjid al-Qaimari, which is located in the far north-western corner of the city, is also undated. On the basis of its design, however, it can probably be attributed to the 10th/16th century with some degree of certainty for it is typically Ottoman. It consists of a single unit, a domed space supported on semi-hemispherical squinches and deep wall arches, and has close parallels with early Ottoman mosques in Turkey—for example Orhan Gazi Cami in Bilecik (8th/14th century) (Goodwin 1971: 19). In spite of Sulaiman's assurances to Francis I, after he had converted the Coenaculum (al-'Asali 1989: 206-7), other Christian churches were converted into mosques, including the Church of St Agnes, which became the Jami' al-Maulawiyya (before 995/1586-7?) (cat. no. 19). A minaret was also built at this time, and the main door into the church was blocked by the installation of a *mihrab*.

If the building of mosques fell something short of expectation, the building of minarets made up for it. No less than five new minarets were built in the city during the 10th/16th and 11th/17th centuries—the minaret of al-Nabi Da'ud (930/1524, cat. no. 1), the minaret of al-Jami' al-Maulawiyya (before 995/1586-7, cat. no. 19), the minaret of al-Qal'a (938/1531-32?, cat. no. 26), and the minaret of al-Hamra' (c. 939/151532-316, cat. no. 3). The minaret of al-Nabi Da'ud was built soon after the conversion of the Coenaculum into a mosque. The minaret of al-Qal'a was also part of the works undertaken by the sultan to restore the site's mosque. Subsequently renovations were undertaken in 1065/1655 by Muhammad Pasha, but the extent of these works is not clear. Two earlier Mamluk minarets were also probably restored or completely rebuilt during the period—the minaret of Bab al-Asbat (769/1369-70; see Burgoyne 1987: 415) and the minaret of al-

Fakhriyya (745/1345; Burgoyne 1987: 270-2). Of the new minarets, those of al-Nabi Da'ud and al-Qal'a are both rooftop-mounted structures, while the one at al-Zawiya al-Maulawiyya adjoins the south-east corner of the converted Crusader church. In contrast to the others, the minaret of al-Hamra' is now, and appears to have always been, a free-standing structure independent of any other building. Indeed, to the author's knowledge, it is the only free-standing minaret in the city.

The locations of the newly-founded minarets give continued credence to Bloom's argument that while minarets in many instances—in the smaller towns at least—continued to function as high places from which to call the faithful to prayer, they also increasingly became symbols—or, as Hillenbrand has commented—'signposts' of Islam (Bloom 1989 and Hillenbrand 1994: 171). Both the minarets of Jami' al-Maulawiyya and Masjid al-Hamra' are located deep within the residential quarter of the Old City; they do not need the modern loudspeakers attached to them today, for they can be identified from a distance. The sites of the minarets of al-Qal'a and al-Nabi Da'ud suggest that in both complexes they were intended as much as symbols of Islamic sovereignty, aimed at travellers approaching Jerusalem, as 'signposts' for the resident community.

Hygiene, in keeping with the notion of a dignified atmosphere appropriate to the pilgrimage cities, was an important element in improvements made to the Holy City (Faroghi 1994: 111). The works to upgrade the system of aqueducts can be seen as a function of this. Baths (*hammams*) were also an integral part of the daily lives of at least the upper echelons of the inhabitants. Evliya Çelebi states that six were in use during the 17th century—Hammam al-'Ain, Hammam al-Shifa', Hammam al-Batrak, Hammam al-Sultan, Hammam al-Sitti Maryam, and Hammam al-Jamal (Evliya Çelebi 1935: 488; Horn 1962: 210). None of them seem to have been precisely dated. Hammam al-'Ain is known to have been built within the Suq al-Qattanin complex during the Mamluk period (Burgoyne 1987: 276) and Hammam al-Shifa', although incorporated into the same foundation, is thought to have predated it (Burgoyne 1987: 273). Hammam al-Batrak is believed to have existed in the 10th/16th century, while the present Hammam al-Sitti Maryam, located close to Bab Sitti Maryam, dates from 1296/1878, but is thought also to have existed in the 16th century in a slightly different location behind Sabil Bab Sitti Maryam. The history of the two remaining *hammams* is less well known.⁴

At the end of the 11th/17th century, Evliya Çelebi paints an optimistic picture of the city: 'Jerusalem has plenty of buildings. Its air is fresh and its water is sweet ...

⁴ I am indebted to Mr Martin Dow for providing these details at short notice. See his Ch. 33 in this volume.

The inhabitants ... numbered 46,000' (al-'Asali 1989: 211). Nevertheless, the two hundred years from the end of the 10th/16th century throughout the region was marked by the long slow decline to the end of the Ottoman empire. The reign of Sulaiman had been the apogee of Ottoman military strength. By the end of the 10th/16th century and beginning of the 11th/17th century, the imperial army had fought exhausting wars against the Persians and Hapsburgs and the empire was becoming too big to maintain effectively (Blair and Bloom 1994: 227; Cook 1976: 79-102). Despite its potent symbolism in Islam, Jerusalem slid into the backwaters of an increasingly uncontrollable bureaucracy. From time to time, it and the surrounding region became prey once again to Bedouin raiders (Peters 1993: 214). In general, the period can be characterised by the bitter internal strife between the various groups contending for power in Palestine, by the intricate relationships with the Sublime Porte and by the blossoming economic relations with the European powers. Administrative upheavals during the first decades of the 12th/18th century led to a deterioration both in security and in economic conditions which inevitably affected the local inhabitants (al-'Asali 1989: 206-10).

Palestine too suffered from its growing isolation from the centre of power and this led to maladministration and the corruption of local governors. This state of affairs reached its nadir during the late 18th century (Volnay in Peters 1993: 203). Ottoman officials and governors were usually only allowed to remain in office for a short time. This was particularly the case in Egypt (Bates 1985: 121-2) and was a deliberate policy by Istanbul to prevent the possibility of anyone gaining ambitions of autonomy within the increasingly fragmented outlying provinces. As a consequence, the prime aim of the governors during their few years in office was to take advantage of their position of power to farm taxes from the region and the local populace for the governor and officials' own personal gain (al-'Asali 1989: 215; Peters 1993: 214). These activities were particularly damaging to charitable foundations. The revenues which had accrued under the *waqf* system, and on which pious foundations primarily relied for the long-term maintenance of the buildings, increasingly became the focus of interest for officials. In theory the *waqfs* were immune to state intervention. However, as Peri has shown with regard to the Khassaki Sultan complex, officials managed to siphon off monies into their own coffers (Peri 1984: 47). *Waqfs* also suffered from the fact that much of the revenue was being used to pay for staff who on occasion outnumbered the people for whom the building had been originally intended. As a result the buildings were neglected (al-'Asali 1989: 214). Equally, the imposition of ever greater taxes on the local populace led to a deterioration in the welfare and material well-being of the inhabitants of the whole region for much of the century. Commerce became

increasingly controlled by foreign trading communities and in some areas became their virtual monopoly. The military and economic stagnation of the city was starkly illustrated in 1214/1799, when Napoleon by-passed the city in his march up the coast from Egypt to Acre (Ben-Arieh 1984: 105). The rapid decline in the local economy during the latter half of the 11th/17th and 12th/18th centuries resulted in local trade suffering, even though pilgrims continued to be a source of income (Peters 1993: 225).

Architecture

Evliya Çelebi, however, continued to be optimistic:

Although the city is small it has 240 *mihrabs*, 7 schools for the teaching of the Hadith, 10 for the Qur'an, 40 *madrasas*, and *zawiyes* for 70 Sufi orders ... There are 6 *khans*, 6 baths and 16 *sabils* ... and according to the *muhtasib* there are 2,045 shops and several markets in Jerusalem (al-'Asali 1989: 211).

The Haram continued to be a focus for both pilgrimage and prayer, and the *madrasas* around it appear to have been well used. The Haram itself employed huge numbers of staff (al-'Asali 1989: 213). However, the building of pious foundations both within the sanctuary and outside it during the 11th/17th and 12th/18th centuries became sporadic. As already explained, revenue and/or available income for such work was greatly reduced, and although there was a continued interest on the part of the sultans in maintaining and continuing to embellish the Haram, the buildings that resulted were in no way comparable to the great works of Sultan Sulaiman Qanuni. Ibrahim I is known to have carried out some restorations to the Dome of the Rock in 1052/1642-3. Indeed, during the 12th/18th century, there were at least four periods of restoration to the Qubbat al-Sakhra and the Aqsa Mosque. Ahmad I installed a 'richly gilt canopy ... the cover of which was a curtain studded with gold and jewels' to hang over the Rock (Evliya Çelebi in Stephan 1939: 92). Mustafa II ordered a restoration of the Aqsa Mosque under the supervision of Mahmud Efendi in 1114/1702-3 (van Berchem 1925: 439-41; Walls and Abu'l-Hajj 1980: 25). Under Ahmad III (1115-43/1703-30), works were carried out between 1133-4/1720-1. These included the replacement of the stained glass windows in the Dome of the Rock and works to the exterior of the building (St Laurent and Riedlmayer 1993: 77-9). Restoration work was also carried out to the *mihrab* in Qubbat al-Silsila in 1174/1760 (van Berchem 1925: 183). 'Abd al-Hamid I continued the work at the end of the 12th/18th century by carrying out further restorations on the Dome of the Rock

in 1195-5/1780-1 (Walls and Abu'l-Hajj 1980: 22).

During the 11th/17th and 12th/18th centuries the short tenure of the governors prevented them from undertaking grandiose building projects, and they were less inclined to continue promoting the symbols of Ottoman imperial power (Bates 1985: 122). The combined factors of the growing isolation of the city from Istanbul and the increasingly transitory nature of the regional and local administration seems to have resulted in local builders looking for inspiration in their surrounding environment. New foundations reflected the decorative influences of architecture from earlier centuries. In particular, a 'Mamluk revival' period occurred during the first half of the 18th century. The technique of using alternating colours of stone (*ablaq*)—red, white or grey—was frequently employed. In one instance (Sabil Mustafa Agha, more commonly known as the Sabil Shaikh Budair, dated to 1153/1740-1, cat. no. 48), horseshoe-shaped arches and a similarly profiled dome were incorporated into the design. The general economic *malaise* also seems to be reflected in the small size of many of the foundations. The state of the economy was perhaps also a contributory factor to the shape of architecture in the new pious foundations built in residential quarters. Al-Zawiya al-Qadiriyya (1043/1633, cat. no. 35) and al-Zawiya al-Naqshabandiyya (1025/1630, cat. no. 33), both dervish *tekkes*, were undoubtedly Ottoman in concept and organisation, but they were built in a 'dressed up' version of the regional vernacular style with close links to the domestic architecture of the city.

To judge by their numbers, the favourite architectural expression of piety during the period appears to have been free-standing *mihhrabs* (with associated prayer platforms, *mastabas*) and drinking fountains.

But the most characteristic foundations were small domed structures or *qubbas*. Although *qubbas* had been built from the earliest years of the Ottoman reign (see below), a number of new ones were erected and others restored during the late 10th/16th and 11th/17th centuries. Three of the late 10th/16th and 11th/17th-century *qubbas* were located on the upper esplanade of the Haram—Qubbat al-Nabi (cat. no. 11), Qubbat al-Arwah (cat. no. 30), Qubbat al-Khadr (cat. no. 31) and Qubba Yusuf (cat. no. 38). A fifth, Qubbat al-Mahd 'Isa (see Chapter 34) is found under the south-eastern corner of the Haram in a small mosque adjoining the great vaulted substructure known as Solomon's Stables. A sixth dome was built in the Coenaculum over steps leading down to the so-called Tomb of David. Qubbat Yusuf is known to have been built in 1092/1681; the others, however, are all undated (van Berchem 1925: 192).

All the *qubbas* give the appearance of fragility; they consist of a dome supported on slender columns—either four (Qubbat al-Mahd 'Isa), six (Qubbat al-Khadr) or eight

(Qubbat al-Nabi and Qubbat al-Arwah). These were invariably of marble and were surmounted by interlinking arches. The dome of Qubbat Yusuf is supported to the north on two columns and to the south on a solid wall decorated with a flat *mihrab* over a re-used marble inscription of Ayyubid provenance (van Berchem 1925: 23; Walls and Abu'l-Hajj 1980: 15).

The origins of these little structures can be clearly linked to contemporary Ottoman structures, for example those built over *şadirvans* in the courtyards of Ottoman mosques. Qubbat al-Nabi displays many similarities, for example, to the *şadirvan* at the Mehmet Pasha Cami in Istanbul built by Sinan (979/1571) (Goodwin 1971: 274-5). However, in Jerusalem there had already been a long history of such structures, most notably Qubbat al-Nabi and the Ayyubid Qubbat al-Mi'raj (597/1200-1). Setting aside the problems of identification dealt with at length by van Berchem (1925: 169, 171-3, 180; Le Strange 1890: 153-6, 164, 170-1), Qubbat al-Nabi, for example, is known to have existed in the 4th/10th century as a '... dome covered in lead sheet, and ... supported on marble pillars being without walls' (Muqaddasi, in Le Strange 1886: 43-4). It is fair to suggest that the texts in which these structures are described would have been available during the Ottoman period. The existence of Qubbat al-Silsila (Dome of the Chain), which had survived from at least the Fatimid (5th/11th century) and perhaps even from the Umayyad period (1st/7th century), was probably an influential factor in their design. In any case, as Hillenbrand has noted, canopies had been extensively used during the centuries of the early Christian period to mark a holy site where a 'theophany' had occurred: 'The form had in subsequent centuries come to symbolise sanctity or commemoration.' (Hillenbrand 1994: 19). The symbolism of the form was clearly understood in the Ottoman period, for all of the sites marked by a *qubba* are linked in one way or another to an Islamic tradition. This includes Qubbat Yusuf which was located on a site known in previous centuries as the 'Makam al-Nabi' (Nasir-i Khusrau, c. AD 1047, in Le Strange 1890: 158). Qubbat al-Arwah seems to have been named after the tradition which relates that the Temple was constructed by (evil) spirits (Evliya Çelebi in Stephan 1938: 155 and n. 1). Establishing firm dates for the *qubbas* in existence today presents something of a problem; but it is worth summarising the available information here.

The foundation date of the present Qubbat al-Nabi (cat. no. 10) is unknown. The pretty red and white stone *mihrab*, described by van Berchem as resembling a 'bath' set on the ground, has an inscription dated 945/1538-9 (van Berchem 1925: 173) but it seems as though a similar building was in existence when Mujir al-Din visited the city at the end of the 9th/15th century (Sauvage 1876: 112; van Berchem 1925: 171; Williams

1849: 148). Although the inscription does not mention a dome, it is almost certain that such a structure was built at about the same time as the *mihrab*. A pilgrim scroll dating from 1545, now in the Topkapi Sarai in Istanbul, shows a schematic view of the Haram with the Qubbat al-Nabi plainly in view (Atıl 1987: 9). Any suggestion that this might have been another case of mistaken identity can be discounted since Qubbat al-Mi'raj (the Dome of the Ascension) is also clearly shown. This structure is not, however, the one we see today, for in 1038/1672 Evliya Çelebi described the *qubba* he saw on this spot as 'a small dome ris[ing] over four slender columns' (Stephan 1939: 96)—the existing structure has eight. It seems then that the present structure must have been built after 1038/1672. Nabulsi, writing a few years after Evliya Çelebi in 1102/1690, mentions the *mihrab* but ignores the *qubba*, suggesting that the earlier structure had either fallen down or had been removed between the two visits (van Berchem 1925: 46 n. 4). It is interesting to note that the eight columns of the existing dome have two sets of four capitals of identical design. This evidence might suggest that the columns from the earlier structure were re-used in the *qubba* as it exists today. There is little else, by way of architectural clues, to suggest a date, except the condition of the stonework (which is quite rough) and the use of alternating colours of stone in voussoirs of the arches. A number of small structures built at the end of the 11th/17th century and the beginning of the next make use of decorative stone, and these features in the present Qubbat al-Nabi suggest that it was probably built not long after Nabulsi's visit. Two small inscriptions inside the dome record later restorations. One is dated 1261/1845 (Walls and Abu'l-Hajj 1980: 18).

The author is not aware that any new documentation in the *sijill* records has been found for the largest of the structures, Qubbat al-Arwah (cat. no. 30), which certainly existed when Evliya Çelebi visited the city (Stephan 1939: 103). Little about its architecture gives any further clue, for it is constructed with no significant decoration.

Qubbat al-Khadr (cat. no. 31) is also undated, and again to my knowledge documentation has yet to be found. However, the evidence suggests that even if this elegant little monument has been subject to the earthquakes of the last four centuries, its origins lie in the first century of Ottoman sovereignty in the city, and perhaps even earlier. Al-Suyuti, writing in 875/1470, describes very precisely a small dome on the site of the present-day structure (Le Strange 1890: 155; van Berchem 1925: 45, n. 5). By 901/1496 Mujir al-Din mentions the flat *mihrab* in the raised platform below the dome but fails to draw attention to the dome itself (Sauvaire 1876: 113), nor does any other writer or illustrator record it until about 1841. However, I have seen a lithograph dating to 1844 which shows the

qubba in plain view.⁵

Nevertheless, leaving aside the re-use of some particularly fine Crusader column capitals—which in themselves suggest an early date (for they would have been scarce by the 10th/16th century and in general such remnants were only used then)—other architectural detail, at least to my mind, conclusively suggests a date of the 10th/16th century (or earlier). The billet moulding around the arches, which had been used in a number of Mamluk monuments in the city (for example, the Salahyia Minaret of 820/1417–18; Burgoyne 1987: 517–18) is only ever found on monuments built during the first fifty years or so of Ottoman sovereignty in the city. Billet mouldings are used in friezes or string-courses on a number of the city gates (for example the Bab al-'Amud), and Sulaiman's fountains (Sabil Tariq al-Wad and Sabil Bab al-Silsila). As a hood-mould it is found in Jerusalem only as part of the early restorations of the Coenaculum and al-Nabi Da'ud (930/1524) and on Qubbat al-Khadr. The floral decoration of the raked cornice was also used only in buildings of the same period—for example at Khassaki Sultan and Bab al-'Amud. This moulding was not used in Jerusalem but *was* used in Tripoli during the Mamluk period—for example at Khan al-'Askar (8th/14th century) (Salam-Liebich 1983: 184, fig. 170) and in Aleppo at the Qaisariyya Miru (Salam-Liebich 1983: 212, fig. 188).

One of the finest examples of re-used Crusader capitals is found on top of the single column which supports the *qubba* in the Masjid al-Nabi Da'ud. No certain date is known for the structure, which is to my knowledge almost completely undocumented. Unfortunately no new evidence has come to light in the present survey. The use of red and cream-coloured stone in the voussoirs of its two arches was fashionable during the early 12th/18th century. The underside of the dome is moulded in plaster with a spiral umbrella-mould which bears, perhaps coincidentally, a striking similarity with the dome of Qubbat Yusuf (1047/1681). Qubbat Yusuf, as has been already mentioned, was also built on a site associated with 'al-Nabi' (which 'prophet' is not known), and this perhaps suggests that the dome in the Coenaculum is of late 11th/17th or very early 12th/18th-century provenance. But that must remain speculation until further documentation is found.

The last dome to be mentioned here is found in the Masjid al-Mahd 'Isa, which is located within the substructures under the south-eastern corner of the Haram adjacent to the great vaults called Solomon's Stables (Fergusson 1867: pl. IV). The site is traditionally thought to have been the place where the Virgin Mary and the

⁵ The origins of this print are unknown. However the following is printed at its base: 'Girault de Prangey, del. 1844 IMP, Le Mesier à Paris'.

infant Jesus hid from the slaughter of the children by Herod before they fled the city for Egypt (van Berchem 1925: 447-8; Schick 1887: 87). A large marble niche laid on its back constitutes the so-called 'cradle' over which the *qubba* is erected. Evliya Çelebi makes no mention of the dome itself and until this study, there has not been a thorough investigation of the structure. The *qubba* remains undated; however, as I show in Chapter 34, it did not exist in the 9th/15th century (Mujir al-Din in Sauvaire 1876: 103) and was built some time before 1249/1833 when Catherwood saw it (Bartlett 1842: 158). The combined documentary and architectural evidence also suggests that, like other such structures built in the Haram during the Ottoman period, it was the successor to an earlier structure standing on the site some six centuries earlier. The primary interest of this little building today is to be found in the painted decoration covering the superstructure and dome which is known to have been carried out in August 1898—shortly before the visit of Kaiser Wilhelm to Jerusalem—and, indeed, the evidence leads to the firm conclusion that it was painted for that occasion.

The various free-standing *mihhrabs* built around the enclosure of the Haram were cheap and easy foundations to erect. The aura of the site, however, invested them with sufficient religious symbolism and iconographic meaning to give them some significance. A number of examples were built during the Mamluk period, including the *mihhrab* of 'Ala' al-Din Basiri (about 800/1397?) (Walls and Abu'l-Hajj 1980: 17). Sulaiman had already built a small independent *mihhrab* outside the front gate of the Qal'a, probably at the time of the other restorations to the citadel (938/1531-2; Walls and Abu'l-Hajj 1980: 9, cat. no. 27). The niche was incorporated into the battlements of the glacis of the outer moat. Sulaiman had built another into the north side of Sabil Bab al-'Atm (van Berchem I 1925: 168, cat. no. 8). Nearly all the independent *mihhrabs* are undated. The first dated example comes nearly a century later in 1047/1637-8 (van Berchem I 1925: 191-2) with Mihrab 'Ali Pasha, and this was followed by one close to Sabil Sha'lan built by Yusuf Pasha (1061/1651?); a certain Ahmad Qullari, a military man, built another close to Bab al-Silsila against Mastabat al-Tin (1174/1760-1) (cat. no. 47). Like the earlier foundations, the Ottoman *mihhrabs* invariably stand either on or against the *qibla*-end of a raised prayer platform (*mastaba*; see cat. no. 55) and all follow the same general model of a semi-circular niche set into a free-standing stone structure. The *mihhrab* located under the (later) Iwan al-Sultan Mahmud II (cat. no. 50) is also undated but incorporates some interesting architectural details. It is built with alternating courses of deep red and white stone, and incorporates what appears to be a re-used scalloped hood dating perhaps to the Crusader period. Two hexagonal marble columns, which are intricately carved and topped by capitals of Ottoman

design, flank the niche. The details strongly suggest that the *mihhrab* was an early Ottoman addition to the Haram. A similarly designed *mihhrab* also once existed on the upper esplanade, immediately to the south of the Dome of the Rock. It was removed this century but is visible in a number of photographs from the 19th century (Richmond 1924: 59, pl. 60). The most decorated of the *mihhrabs* is, however, the Mihrab al-Sanaubar (the name was coined by the staff of the Department of Islamic Archaeology because of its site under pine trees). Although undated, it is plainly Ottoman; on each side of the niche there is an engaged column with the spindle capitals found on other imperial *mihhrabs* (Selimiye Cami, Edirne, Goodwin 1971: 265, pl. 253; Süleymaniyye Cami, Istanbul, Goodwin 1971: 230, pl. 221; Topkapu Sarayi, Istanbul 1971: 326, pl. 325). The only other example of this decorative feature in Jerusalem is to be found in the 20th-century *mihhrab* in the Coenaculum, already mentioned. Surmounting the semicircular niche are a number of rows of corbelled *muqarnas* niches, decorated with carved floral designs. Perhaps the most distinctive of the carvings are the naturalistic tulips and the little vases from which they sprout on the flanking sides of the *muqarnas*. Notwithstanding any discoveries made by Dr Yusuf Natsheh, these may suggest that the *mihhrab* either dates from the time of the so-called 'tulip period' at the beginning of the 12th/18th century, or closely thereafter. This has been described by Goodwin as an *entr'acte* between the classical and baroque periods in Turkey (Goodwin 1971: 364-5). The idea is perhaps confirmed by the similar use of flowers and vases in the shafts of the columns of the fountain known as Sabil al-Shaikh Budair (or Sabil Mustafa Agha, 1153/1740-1, cat. no. 48).

After the numerous fountains built in the first half of the 10th/16th century, no new *sabils* appear for nearly a century. However, in the one hundred and fifty years or so from 1627, seven others were to be constructed. All were built not by imperial decree but by local *shaikhs* or other notables, probably because, like the *mihhrabs*, the *sabils* were small in size and relatively cheap. This new phase of building fountains began with the restoration of Sabil Sha'lan (1037/1627-8; cat. no. 36) originally built by al-Malik al-Mu'azzam 'Isa in 613/1213-4, and subsequently restored by the Mamluk al-Malik al-Ashraf Barsbai in 832/1429 (Walls and Abu'l-Hajj 1980: 16). If this phase had been the last of the works to this simple little room—or cistern as it was once—it would have remained an unremarkable monument. However, some time after 1847 the plaster domed roof was replaced by a decorative ashlar umbrella dome topped with a stone ball (Ben-Arieh 1984: 153). The dome, which is baroque in style, seems to be unique not only in Jerusalem but in the region as a whole, for I have found no other example similar to it.

All the remaining fountains built thereafter were drinking fountains in the form of a kiosk or mounted basin.

The remaining six can loosely be termed 'three rhyming couplets' by virtue of their shared architectural style—Sabil al-Shurbaji (1097/1685; cat. no. 40) and Sabil al-Khalidi (in Daraj al-Wad; 1125/1713; cat. no. 44); Sabil al-Husaini (1137/1729; cat. no. 45) and al-Shaikh Budair (1153/1740-1; cat. no. 48); and the third pair, Sabil al-Bab al-Maghariba (undated but first endowed in 987/1579; cat. no. 18) and the earlier Mamluk well of Ibrahim al-Rumi (839/1435-36; Burgoyne 1987: 542-3). None are directly supplied with water via channels, although the last two are probably deliberately positioned over rock-cut cisterns under the Haram esplanade. Sabil Bab al-Maghariba is almost identical in design to the Mamluk *sabil* in every way except for the use of a raked cornice in place of a billet mould, and the use of an internal moulded umbrella dome instead of a simple hemisphere. Indeed, given that it has no dated inscription, it would be almost impossible to state with certainty that it is an Ottoman structure without the documentary proof of a relevant endowment.

Sabils al-Shurbaji and al-Khalidi are both in the form of a kiosk and are located at the junctions of main streets in the Old City. They follow the Turkish model from which water—and on religious holidays sherbert (flavoured water)—was distributed (see Wilson 1880: 40). Although one was built nearly thirty years after the other, they are built in an almost identical style with a recessed portal of red stone and windows with grilles. Sabil al-Khalidi is more decorated, with inset turquoise ceramic tiles and carved geometric ornamentation. It was perhaps possible for the patron to bear the extra expense of the decoration because probably only the portal was new; an existing structure is alluded to by Mujir al-Din in the 9th/15th century when he refers to the 'Stairs of the Fountain', located at the southern end of Tariq al-Wad (Sauvaire 1876: 160, 179). Sabil al-Husaini, which was once located against the north wall of the Ayyubid Masjid al-Nahawiyya in the south-western corner of the upper esplanade of the Haram, has been destroyed since the 12th/18th century, but its inscription survives in the elevation of al-Nahawiyya, as do traces of two arches, and the outline of the fountain base can be traced in the pavement. The visible evidence strongly suggests that the fountain would have had a similar appearance to that of Sabil Shaikh Budair (cat. no. 48) which is one of the prettiest buildings on the Haram. It is also one of the smallest, measuring a mere metre square and is in the form of a pavilion. The builder seems to have been inspired by the domes and arches of the Mamluk al-Is'ardiyya (760/1359, Burgoyne 1987: 368-79) on the north side of the Haram, for, like it, the Ottoman fountain is covered by a hemispherical dome supported on horseshoe-shaped arches and columns. As previously noted with reference to Mihrab al-Sanaubar, the columns are exquisitely carved with floral decorations and have capitals

reminiscent of those on a pulpit-like construction in St James Cathedral in the Armenian Quarter.

Other buildings were founded which indicate the continuing interest in patronage of sites in the Haram. On the upper esplanade, the small Zawiya al-Muhammadiyya (112/1700-1; cat. no. 43, also known as the Masjid al-Nabi) was founded a few metres to the northwest of the Dome of the Rock and Qubbat al-Mi'raj (Dome of the Ascension). The building was associated with Shaikh al-Khalil, who, as the name suggests, was from Hebron (Prag 1989: 115). This little domed building is unremarkable save for the fact that it is built over a room set within the depth of the upper esplanade. Much of the chamber is filled with a scarp of bedrock that shows clear signs of having been quarried at one end, perhaps in the Herodian period. Within the room there is a small *mihrab* that bears a striking similarity to one in the cavern under the Holy Rock. In 1138/1725-6, al-Dajani carried out restorations and additions to another cistern located under the esplanade a short distance to the south. The cistern had originally been built by al-Malik al-Mu'azzam 'Isa (607/1210-11) and had been subsequently restored in 792/1390 (Walls and Abu'l-Hajj 1980: 16). The extent of the latter works is uncertain but it seems likely that a room to the south of the cistern was added, and that at a later date the tiny domed room at esplanade level was also added (cat. no. 46).

During the 11th/17th and 12th/18th centuries, the Ottoman administration made little impact on the urban fabric in the rest of the city. Houses, shops, and other vernacular architecture which was needed to satisfy the domestic and commercial needs of the population probably continued to be built as and when space required. The various dervish communities housed in hospices, convents and monasteries continued to function—albeit in poverty. Until the 13th/19th century, Sufi and dervish communities are known to have been present in the city, and they continued to study and worship in and around the Haram in particular. Many—perhaps most, as has already been mentioned—had already taken up residence in existing monuments from earlier periods, as well as in the newly-built cells around the upper esplanade. Other types of foundation, however, continued to be built. Studies of *waqfiyya* documents in Cairo have shown that there was a general move away from accommodating Sufis in mosques and *madrasas* to custom-built *zawiyas* and *tekkes* (Behrens-Abouseif 1989: 160). A similar move occurred in Jerusalem; at least three new pious foundations—al-Zawiya al-Maulawiyya (before 995/1586-7, cat. no. 19), al-Zawiya al-Naqshbandiyya (1025/1630, cat. no. 33) and al-Zawiya al-Qadiriyya (formerly known as Afghaniyya, 1043/1633-4, cat. no. 35)—were completed between the end of the 10th/16th and 11th/17th centuries. All were located in the Muslim residential quarter to the north of

the Haram and were referred to as *khanqah*, *zawiya* or *takkiya*. The word *takkiya* clearly derives from the Turkish term *tekke*, which was applied to complexes in which Sufis lived, worshipped and studied (Behrens-Abouseif 1989: 27). These functions can easily be envisaged in al-Zawiya al-Qadiriyya where the foundation includes a series of small cells around two sides of a large courtyard, a large mosque raised up on a platform with good views south to the Haram, and a large communal hall (which, incidentally, bears a striking similarity to the Sufi communal hall in the Khassaki Sultan complex). Similar components can be found in the other foundations. All three are characteristically inward-looking in their planning with, in general, all the areas in the foundations reached from, and facing onto, a courtyard. At al-Zawiya al-Qadiriyya the whole compound is surrounded by a high plain wall which would have ensured both peace and privacy from the surrounding city environment. Entrance into the compounds is invariably through a discreet portal entrance (see below).

The abiding impression of travellers to the city during the 12th/18th and 13th/19th centuries was of a city in poor repair, badly maintained and apparently uncared for; the Comte de Volney writing in 1784 noted the 'destroyed walls, debris-filled moat ... its city circuit choked with ruins' (Peters 1993: 203). Bartlett (1867: 87 and 88) notes, for example, that Sabil Bab al-Nazir, one of the early monuments of Ottoman sovereignty in the city, and testimony to the stillborn bounteous years of the early 11th/16th century, was 'dry ... overgrown ... and ruinous ... trailing a caper plant'. Khassaki Sultan had also become 'ruined' and was occupied by 'the horses of the irregular cavalry service'. He did note, however, that free meals were still handed out from the soup kitchen. In 1833 the Governor himself loudly proclaimed that the Haram was in a 'dilapidated state' (Bartlett 1850: 150). Although many of the *madrasas* and mosques in the vicinity of the Haram had fallen into disuse by the beginning of the century, a number of dervish convents and a *khan* continued to function (Ben-Arieh 1984: 163).

During the 13th/19th century, poverty was apparent throughout much of the city. However, in spite of this, the Ottoman administration continued to be active caretakers of the holy shrines and the Dome of the Rock in particular, as St Laurent and Riedlmayer have demonstrated (1993: 76-84). Some restoration work and new additions to the Haram continued throughout the century. It was not just the practical needs of the monuments themselves, nor the continuing requirement to reinforce Ottoman control over the region, that lay behind the works. During the 13th/19th century, perhaps more than ever, there was also an apparent need to counteract growing foreign competition. Jerusalem increasingly

became the administrative capital of the region, not so much on account of its commercial or economic capabilities but as a result of the growing religious and political interest evinced in it primarily by European governments and religious institutions. Political, economic and social upheavals in Istanbul were having their effect on Jerusalem, particularly after the Tanzimat reforms of 1839 and 1856 under 'Abd al-Hamid and the Young Turks (Vogt-Göknil 1966: 149). But, above all, the century was to be marked by the growing European cultural, religious and economic penetration of the region, which was encouraged by Ibrahim Pasha during the short period of Egyptian rule after he took the city (as well as much of Palestine and Syria) in 1831 (Ben-Arieh 1984: 133-5). Egyptian control lasted only nine years and in 1840 the city reverted to Ottoman rule. But during those years Ibrahim Pasha sought to gain European support for his political and territorial aspirations in the region. Before 1831 the activities—and particularly the architectural activities—of religious minorities were discouraged using corrupt levels of taxation or by banning them outright. Ibrahim Pasha, however, in a radical move, granted equal rights to the religious minorities. As a consequence, European Christian and Jewish groups were able to come to the city and found new institutions from which they embarked on their missionary activities. The Russian, Latin, Greek, Armenian and Prussian churches created or reinstated bishoprics and patriarchates. At a political and administrative level, Western governments were allowed to establish diplomatic missions and to undertake consular activities, usually under the pretext of 'protecting' their nationals within the various religious groups. So great was this European influx that one area of the Old City, close to the Damascus Gate, became known as the Consular Quarter.

As the presence of European Christian and Jewish communities in the city grew, the Haram remained a haven of peace and Muslim sanctity. Indeed, almost certainly because of the infidel presence in the city, the Ottoman authorities increased their efforts to swell the numbers of Muslim pilgrims coming to the city (Ben-Arieh 1984: 135). By the same token, the Muslim community became increasingly protective towards the enclosure. Catherwood recalled in 1842 that, in 1833, he had dared to enter the site to carry out survey work. During the course of the visit he was discovered by occupants of the place and nearly lynched; he was saved only by the intervention of the governor, who was passing in the vicinity at the time (Bartlett 1850: 148-51).

After the works of Sultan 'Abd al-Hamid I in 1194-5/1780-1 (Walls and Abu'l-Hajj 1980: 21-2), a number of restorations, most of them minor, were carried out on the Dome of the Rock during the 13th/19th century. In 1233/1817-8 Sultan Mahmud II (1233/1817-8) ordered extensive repairs to the exterior of the building; the works

included repairs to the tiles and marble cladding, and a new portico was constructed over the south door (van Berchem 1925: 439-41; Walls and Abu'l-Hajj 1980: 22). Work begun in 1853 by Sultan 'Abd al-Majid to repair the exterior of the building (St Laurent and Riedlmayer 1993: 81) was completed in 1291/1874-5, after which Sultan 'Abd al-'Aziz restored the ceilings in the interior. In other areas of the Haram, works were carried out on existing structures. Hasan Agha repaired Bab al-Asbat in 1232/1816-17; and restorations and additions were made to the Mamluk Minbar al-Saif (Summer Pulpit) in 1259/1843 by Amir Muhammad Rashid (Burgoyne 1987: 319). In 1288/1871, radical alterations were made to the Masjid al-Maghariba in the south-western corner of the Haram (Williams 1849: 145). An eclectically designed doorway was installed in the east elevation and a large dome was built over the north end of the hall inside. The only new foundation to be built in the Haram during the 19th century was the Iwan of Sultan Mahmud II (1233/1817-18, cat. no. 50). The structure is a large, rather inexpertly shaped dome supported on four solid piers situated at the corners of the raised platform. Away from the Haram, restorations continued on existing pious foundations. Evidence can be found at the Zawiyat al-Wali Allah Abu Madyan located immediately opposite the Western (Wailing) Wall a short distance from the Bab al-Maghariba, where the restorations and adaptations of 1269/1852-3 seem to have included the addition of a series of cells to an existing foundation.

A sign of the continued significance of the Haram to the Ottoman administration in the face of foreign claims and intervention was amply and purposefully demonstrated in 1316/1898, when the German Kaiser Wilhelm visited the city. His support was becoming increasingly important to the Sublime Porte within the European political theatre, and to ensure that his visit was successful the authorities went to considerable lengths to tidy up the city—or at least those parts that were to be seen by this important visitor. The section of moat between the Citadel and Bab al-Khalil was filled in to enable the Kaiser to make his highly symbolic entry into the city on horseback. The streets were cleaned and decked with flags, and the houses along his route painted with limewash. In the Haram the arcades on the upper esplanade, as well as the north front of al-Aqsa Mosque, were plastered and painted (see Wilson 1880 I: 49). The results were reported in acid tones by Conrad Schick (1899: 116-8). The decorative paintwork was still in existence until at least 1924 (Richmond 1924: 22-3, pl. 14; see also Raven 1929: 17-18). All the work was probably undertaken in August 1898, a few months before the Kaiser was due to arrive. This can be said with some certainty since the recent discovery of a painted inscription on the back of Qubbat al-Mahd 'Isa, which was renovated for the visit. The signature

of a Christian artist Theophanes, and his (probably Muslim) assistant is dated August 1898 (see Chapter 34). The decoration is the only painting known to have survived to the present in the Haram from that particular visit. In keeping with the period, the design is characteristically architectural, with *tromp l'oeil* panels and floral motifs.

One of the least conspicuous Islamic restorations outside the Haram al-Sharif was the installation of a new entrance gate at the Masjid al-'Umar, which is situated a few metres to the south of the Holy Sepulchre. The date of the restorations is unknown to me, but it is probable that the work was done some time during the 12th/18th century. Inconspicuous it may be, but insignificant it is not, for the gateway is unexpectedly an almost precise replica of Sabil Bab al-Silsila. The rose window and the other decorative features—including the portal frame and volutes—of the fountain are all faithfully reproduced. Added decoration is provided by the use of alternating red and white courses of stone. The reason for using the *sabil* as a model seems to originate from the relative positions of the fountain and the Mosque of 'Umar. The Sabil Bab al-Silsila is located immediately opposite one of the main gates into the Haram. The gateway to the Mosque of 'Umar is about two metres away from one of the main gates into the courtyard leading to the Holy Sepulchre. As well as providing an attractive entrance to the mosque, the imitation of the *sabil* seems to have been used as a highly visible reminder by association of the primacy of Islam over Christianity.

It is, then, even more extraordinary to find that the *sabil* is again replicated, rose window and all, in the east doorway into the Masjid al-Muhammadiyah in Jaffa. The exact date of this doorway is unknown to the author. But at the beginning of the century, between 1228-30/1812-14, Abu Nabbut, the governor of the city, is known to have restored the mosque, and it is possible that the doorway formed an element of the works at that time (Kark 1990: 19-20). Here the use of the *sabil* as a model should probably be seen as a reminder of the Haram in Jerusalem rather than as being a symbol of religious predominance.

After the Egyptians lost the city in 1840, the reinstated Ottoman administration was not in a position to rescind the relaxations made by Ibrahim Pasha. As the European, and to a lesser extent the American, presence increased in the city, so their building activities gained momentum. Consequently, from 1840 there was a building boom both within and without the walls. New neighbourhoods or colonies were built to the north and west of the city by Christian and Jewish immigrants; the Russian Compound, the German and the American Colonies, as well as other Anglican and Protestant institutions, were all constructed at this time. During the 1860s and 1870s, schools, hospices, monasteries and churches were erected in large numbers. To the east of the

city, wealthy Arab families built new residential neighbourhoods, particularly in Wadi Jauz in the Shaikh Jarrah Quarter. Towards the end of the 13th/19th century and into the next, the building activities were as much a function of the political agendas of Western governments as of the need for new living space. The so-called 'Eastern Question', which had become bound up with the rights of the various Christian groups with regard to the holy sites, allied to the increasingly pressing demands for Jewish settlement in Palestine, encouraged the construction of more and more settlements in and around the walls. The growing nationalistic rivalry between the political sponsors of the Christian churches was reflected in the architecture of the new buildings: Italian *palazzi*, and churches of both English and Russian Orthodox type, proclaimed sovereignty over their individual plots of land.

It is beyond the remit of this book to look in any further detail at the building activities outside the walls of the city. However, the new styles—and in particular the new methods of construction—were to have a lasting effect on the shape of new buildings within the walls, even those in the Muslim neighbourhoods. This was particularly so in the building of new secular monuments. One of the major factors that influenced the later 19th-century building boom was the completion of the road from Jaffa in 1285/1868, and of the railway in 1310/1892 (al-'Asali 1989: 235-7). Better communications made it easier to import new types of material and construction methods to the city. External walls became thinner, and flat ceilings with wooden (later iron) floor joists covered with wooden boarding began to replace labour-intensive vaults and domes. As a consequence, traditional flat roofs gave way to ones that were pitched and hipped and covered with red clay tiles. Floors incorporated multi-coloured tiles laid in geometric patterns. The external decoration was increasingly influenced by a simplified Western neo-classicism; walls were usually punctuated with simple pilasters which supported rectangular string-courses. Door-openings came higher and had rounded arches; windows, ranged regularly along elevations, also increased in size. Both types of opening were usually surrounded by a simple rectilinear frame and surmounted by a round or segmental arch (see, among others, Kroyanker 1993: 37-47). Restorations to earlier buildings can often be identified by this detail. The 13th/19th-century windows and door-frame on Sabil Sha'lan are but one example. The contrast—indeed, some would say, incompatibility—between the new modes of building and those which had been initiated during the reign of Sulaiman Qanuni was starkly illustrated in 1907 when an unlikely-looking clock-tower was balanced on the Jaffa gate on the orders of 'Abd al-Hamid. Constructed of bright white stone, the tower was an unfortunate attempt by the sultan to demonstrate Ottoman municipal reform. The offending clock-tower was

removed by common consent of the populace and the new British administration after 1917 (St Laurent and Riedlmayer 1993: 82).

The planning and organisation of foundations built in the new European manner were also plainer and more regular. The new courthouse (Da'irat al-'Adliyya), which was built soon after the foundation of the first Jerusalem Municipality (*Baladiyyat al-Quds*) around 1289/1872, reflects many of the new traits. The courthouse and its associated offices were located in the southern side of the Khassaki Sultan complex after the buildings had been sequestered by the governor as the new seat of the Ottoman administration. The new building is almost exactly square in plan and consists of a series of four vaulted galleries ranged around a central courtyard. The south elevation is centred on a round-arched doorway, surrounded by a simple incised rectangular frame. On either side of the door a series of pilasters and round-headed windows are regularly spaced in regimental style across the elevation. The other offices are covered with pitched roofs and clay tiles.

Other European-style buildings were built within the walls of the city. These included a large formally-planned school just inside Herod's Gate, later to be converted into the new Museum of Antiquities in 1901 (St Laurent and Riedlmayer 1993: 81, fig. 7). The exterior of the building displays many of the features of the courthouse, although they are more elegantly expressed. The elevations are divided by a series of regularly-spaced pilasters, and a string-course separates two floors of round-headed arches. The classicism of the building is emphasised in the north elevation by a gabled portico. A similar set of features can also be found on the Dar al-Mamluk, located in the so-called Consular Quarter of the city close to Bab al-'Amud (Chapter 25, app. 25.1). The house was built by a wealthy Muslim trader, probably around the middle of the century. This building also illustrates another practice of the 13th/19th century—it has a painted ceiling. Although not common, and certainly the preserve of the wealthy, this feature is to be found in a number of other buildings in the city. The ceilings were usually timber-panelled in a decorative way, some times—as at Dar al-Mamluk—with a central cupola recessed into the roof-space. The panels were painted with borders of floral bouquets which surrounded a field of plain or more simply decorated panels. The cupola was often painted dark blue with gold stars in imitation of a night sky. The ceiling in the Dar al-Mamluk is the only one known to have survived in a house within the walls of the city, although other examples can be found outside the walls in the American Colony and the Dar al-Sharqiyya (Orient House), both of which are located in the Shaikh Jarrah Quarter (Chapter 30).

Some explanation is needed of the factors—other

than those relating to economics, society and politics—which influenced the way in which buildings were constructed during the four centuries of Ottoman rule. As already explained, Ottoman architecture has to be seen in the context of the imperial system from which it took its name. It will become clear from the descriptions of buildings in the catalogue of this book that the architectural monuments display a wide diversity of style, while the local vernacular in Jerusalem and the region developed its own uniform language. Possible reasons for the uniformity of the vernacular architecture will be discussed later.

The diverse nature of the monuments is primarily a reflection of the fact that the new building activities were undertaken in a city which, for all its rich architectural history, had subsequently been reduced to provincial isolation (Bates 1985: 121). At the same time, it had been absorbed into an empire with a highly centralised bureaucracy through which all imperial projects were organised and administered. The distance from the centre of power, however, made it extremely difficult for the execution of these imperial works to be supervised directly from Istanbul; the actual work on site was the responsibility either of officials who had been engaged locally, or, equally likely, those who had been brought in from Syria or Egypt. More generally, the long period of Ottoman sovereignty over the city—which saw the transition from an atmosphere of optimism in the 10th/16th century to one of decline, economic adversity and maladministration during the following two hundred years, and finally to the increasingly prevalent European influence in the 13th/19th century—was also to have its influence on the style of architecture.

Buildings constructed during the eighty years of the 10th/16th-century imperial rule were almost entirely Ottoman in concept, and often in technique. This may seem something of a bold statement to make. The Old City of Jerusalem, even when the visitor knows that much of what is visible was built during the Ottoman period, is not at first sight ‘typically Ottoman’, or even Turkish. The carefully-planned and regularly laid out complexes found in, for example, Bursa, Edirne and Istanbul were not built in Jerusalem during the century, although similar complexes were built in Damascus, for example the Süleymaniye complex (Blair and Bloom 1994: 201); the mosques and *sabil-kuttab*s built in Cairo with accompanying courtyards and porticoes are also not found in Jerusalem, although there is such a formally-planned, ‘typically Ottoman’ foundation in Acre, where the Great Mosque was built by al-Jazzar in 1196/1781. The characteristic eloquence and virtuosity of the architecture found in Turkey is lacking in Jerusalem; there is little of the obsessive concentration on domes, arches and windows, or on the structural achievements inherent in the great mosques of Turkey.

But outward appearances can be deceptive. Many

of the early structures in Jerusalem do clearly reflect the styles of architecture prevalent in Ottoman Turkey at the time. The introduction of cylindrical shafts for minarets almost overnight is a case in point, as will be discussed below. The reasons for the introduction of ‘Ottoman’ architecture at a general level are self-evident, given the wish of the administration to spread imperial hegemony throughout the region. The mechanisms by which it was possible to achieve that process are relevant to an analysis of the architecture. In the highly centralised administration of the empire, the responsibility for imperial undertakings rested with the office of the imperial chief architect (*ser mi‘maran-i hassa*) at the sultan’s court in Istanbul, which consisted of a full department of architects (*cema‘at-i mi‘maran-i hassa*) devoted to the planning and design of imperial projects (Bates 1985: 122). Imperial projects in the provinces would also have come under the control of the office and its chief architect (*bash mi‘mar*). For much of the 10th/16th century, this office was held by the greatest of all Ottoman architects, Sinan (1491/2–1588; Bates 1985: 124). The degree to which the office and its director were directly involved with individual projects in the provinces has been a matter of some debate. It has been suggested that Sinan drew or supervised the plans of every important new building not only in Istanbul but all over the empire too (Goodwin 1971: 108). Sinan was certainly involved in the planning, for example, of the Süleymaniye complex in Damascus (962/1554), which displays all the characteristics of the imperial style (see, for example, Blair and Bloom 1994: 221, fig. 278). But even here, where the Turkish influences are clear, Sinan is not thought to have been involved in the actual building of the complex, leaving it rather to a local practitioner (Blair and Bloom 1994: 220 and n. 28). Sinan is also known to have relegated the building of a complex in Aleppo for the Governor Husrev Pasha to a subaltern (Bates 1985: 122 and n. 8).

Despite the fact that architectural projects in Jerusalem have appeared among those attributed to Sinan, there is no hard evidence to suggest that he was ever directly involved with the planning of any of them, except perhaps the renovations to the Dome of the Rock. Evliya Çelebi—but he was writing a century later—says Sinan was sent by Sulaiman ‘together with the required material’ to ‘embellish the Rock of Allah and rebuild Jerusalem’, and that, on his way to Mecca, he stopped in Jerusalem to organise the architects and artisans for the restorations to the Dome of the Rock (Stephan 1939: 86; Peters 1993: 204). The date of his visit to the city is not known. The problem is simple: Sinan could not have been everywhere (Cerasi 1988: 88). Between 957/1550 and 965/1558, he was at the height of his career and directly engaged in a large number of projects spread over the area of modern Turkey and the eastern Mediterranean, the most important of which was the ambitious Süleymaniye complex in

Istanbul (957-64/1550-7, Necipoğlu 1985: 94-5, n. 4). Because of Jerusalem's status within Islam, the city was of prime symbolic and religious importance to the sultan; but it was still a small provincial city in the outreaches of the empire, a mere administrative centre of the *sanjaq* of Damascus (Peters 1994: 207). Any major works that were to receive the direct attention and 'mark of Sinan' (Kuban 1982: 64) were more likely to be found in the larger cities where the status and rank of the architect—and thus the patronage of the sultan or his wife—were of more than token importance.

Since Jerusalem was a third-tier administrative capital, the orders for the imperial works—and perhaps the drawings too (Behrens-Abouseif 1994: 224)—came from Istanbul via Damascus. The responsibility for the work was then passed to officials, whose duties would have included the financial arrangements, as well as the works themselves. Cohen has discovered, for example, that the supervision and financial administration for the rebuilding of the walls and the water system—and perhaps the Khassaki Sultan complex itself—was undertaken by an Ottoman official, Muhammad Çelebi al-Naqqash (Cohen 1989c: 470-2). In another instance, a document from 987/1579 states that the chief architect (*mi'mar-başı*) in Damascus, a man called Da'ud, agreed to undertake restorations to the Dome of the Rock and al-Aqsa Mosque, and that the lead for the roof, which had been sent from Istanbul, was to be sent on to him in Jerusalem (Heyd 1960: 157). The organisation of minor structures in the Haram seems to have been managed in a similar manner. The little building founded by Yusuf Agha (1092/1681, cat. no. 39), a eunuch in the imperial palace in Istanbul, was built on his behalf by an associate who was a pilgrim by the name of 'Ali, presumably with the aid of the local authorities (van Berchem 1925: 192).

If the supervision of the new projects was often the responsibility of Ottoman officials, the construction and the detailing was left to builders from the region, and this was reflected in the architecture. The recruitment of the masons and craftsmen for the imperial projects in the capital was centrally organised (see Bates 1985: 125). However, for imperial works in the provinces, as well as those projects which were initiated locally, the craftsmen were invariably either local or, as was often the case on the larger projects, from the surrounding region. Projects in Mecca and Medina were built by qualified masons and craftsmen from Syria and Egypt (Faroghi 1994: 96; Bates 1985: 125, n. 43). In his account of Jerusalem, Evliya Çelebi states that 'all the master builders, architects and sculptors available in Cairo, Damascus and Aleppo' were sent to Jerusalem to undertake the work ordered by Sulaiman Qanuni (Stephan 1939: 87). A similar instruction was issued in 972/1564 ordering the Beglerbeg of Damascus to send 'builders, carpenters and others' to

help with the construction of the Khassaki Sultan complex (Heyd 1960: 143; al-'Asali 1989: 16). In addition to the local builders—who at the beginning of the 10th/16th century would have been accustomed to Mamluk practices, in particular after the projects of Qa'itba'i (see Burgoyne 1987: 589-612)—the experience and practices developed within such a collection of craftsmen would inevitably have had an influence on individual buildings. As a consequence, Ottoman architecture in the provinces was often marked by distinct regional architectural styles (Cerasi 1988: 89). The point is illustrated by a number of mosques in Cairo, Damascus and Aleppo that were built in the Mamluk style during the first two centuries of the Ottoman period, as were foundations which are demonstrably Ottoman but influenced by local building techniques and styles (Behrens-Abouseif 1994: 222-3). In Jerusalem such a fusion of imperial and regional and local influences is found throughout the whole period.

Apart from the tiles of the Dome of the Rock (Chapter 28), the strongest 'Turkish' Ottoman influence on the form of buildings in Jerusalem is demonstrated by the two new mosques, Masjid al-Qaimari (undated, perhaps 10th/16th century, cat. no. 32) and Masjid al-Zawiya al-Qadiriyya (1047/1633-4, cat. no. 35) for neither type of domed construction had been built in Jerusalem before the 10th/16th century. Masjid al-Qaimari, which has recently undergone extensive renovations, seems to be the only example in the city of the single-unit domed mosque. The interior comprises a single room covered by a large dome supported on broad semi-hemispherical squinches. The dome rests on a local form of octagonal zone of transition, in which the corners of the main structure below are cut away. The result has close parallels with single-unit domed mosques in early Ottoman Turkey, for example the 8th/14th-century Orhan Gazi Cami at Bilecik (Goodwin 1971: 19). The use of the dome and squinch is also found in the smaller interior of the North-Eastern Khalwa of Ahmad Pasha, located at the north end of the North-Eastern Colonnade in the Haram (cat. no. 23, known now as the Translation Office; undated, but probably 1598/1601). The mosque in al-Zawiya al-Qadiriyya is the largest new mosque to have been built during the period. A rectangular interior is covered by two large domes separated by a transverse arch. The interior space, although lacking the flanking areas found in Turkish design, seems to have close parallels with mosques of the latter half of the 9th/15th century, for example that of Mahmut Pasha Cami in Istanbul (869/1464; Goodwin 1971: 110-12) or the Gedik Ahmet Pasha Cami in Afyon (877/1472; Goodwin 1971: 138-9).

A similar level of Turkish Ottoman influence can be seen in the planning of the small *khalwas* around the upper esplanade of the Haram. Although the cells were nearly all built by different patrons, they follow a similar

format. All comprise two storeys with the upper floor at the level of the upper esplanade. None of them has a connecting staircase between the two levels, which would seem to suggest that the two floors had separate functions. The lower levels, usually consisting of one or two barrel-vaulted rooms, probably functioned as stores or sleeping quarters for pilgrims, or the staff of the Haram. The upper levels face onto the upper esplanade and are slightly raised above it. They usually consist of a single domed or vaulted room. In the majority of cases this room was supplemented by an entrance porch and in at least three instances there is a third room located behind the porch. These spaces provided the main areas for worship and study, and probably also functioned as dormitories. Window-niches situated only a little above floor level would have ensured that the interior was kept ventilated, but they also functioned as seats or as stands on which to cool terracotta water jugs (this is a practice which continues to the present day). To the front of six cells, there is—or was once—a three-bayed portico supported on columns on a raised platform. Here the Sufis would have prayed or studied in the shade away from the oppressive heat of the Haram (Goodwin 1971: 17). Most of the porticoes have either been destroyed or renovated during subsequent centuries; the interiors too have suffered change. It is not difficult, however, to see the similarities between these structures and the early mosques of Ottoman Anatolia, for example, the Hacı Özbek Cami at Iznik (734/1333), and they probably functioned in much the same way (Goodwin 1971: 17).

The combination of Turkish planning tempered by local or regional building methods is most apparent in the 10th/16th-century imperial work in the city. This is best illustrated by examining in detail two building types: the *sabils* and the minarets. The portal form of Sulaiman's *sabils* was a model probably without precedent in Jerusalem prior to the 10th/16th century. It was not, however, (as has been claimed) by any means unique to Jerusalem (Rosen-Ayalon 1989: 605). The door or window form of fountain was firmly rooted in the Ottoman tradition, having been passed down from the Saljuqs of Rum (Ünsal 1970: 110). Examples can be seen in Istanbul at the Davud Pasa Cesmesi (890/1485; Yuksel and Mimar 1983: 242 and fig. 365 R). It is perhaps no coincidence then that Sabil al-Wad is strikingly similar to a portal at Gazi Ahmet Beg Medrese, Peçin (777/1375), which has been described by Goodwin as 'in the Selçuk manner' (Goodwin 1971: 29). An almost identical form can be seen at the Muradiyye complex in Manisa (994/1586, Goodwin 1971: 317, fig. 316). The form continued to be used during the subsequent centuries, for example at Top Hane (1145/1732; Gabriel 1962: 32, pls. 30-35). Other examples suggest that it was not unique to Anatolia. There is a small Mamluk fountain built by Muhammad Mubarakshah al-'Ala'i known as 'Ain

al-Tina (816/1413) in Tripoli which bears a striking resemblance to the fountains in Jerusalem, and others have been found in Aleppo (Salam-Liebich 1983: 260, fig. 182). The etymological or symbolic reason why the form of door or window should have been used does not concern us (but see Mostafa 1989: 33 and throughout). However, given the importance attached by Ottomans to providing water not just for religious purposes such as ablutions but also for civic and communal purposes (Ünsal 1970: 73), it is perhaps not surprising that a simple portal door or window—which could easily be fitted into the urban streetscape—should be considered appropriate as a form for the *sabil*. Of course, the first of Sulaiman's *sabils* was not in the city but outside the walls. However, here the structure had to be fitted into the narrow space between the Hebron road and the drop into Birkat al-Sultan (see cat. no. 4). There is a close similarity between the position and location of Sabil Birkat al-Sultan and another later structure built by Pasha Koprulu in 1300/1882 on a bridge in Edirne (Ayverdi 1972: 478, pl. 828 R).

Both Mamluk and Ottoman influences become somewhat confused by their joint roots in the Saljuq architecture of the 13th and 14th centuries. Sabil Birkat al-Sultan and Sabil Bab al-'Atm (cat. nos. 4 and 8, pl. 15) can be considered as the blueprints for the other fountains, which contain considerable quantities of re-used architectural elements (see below). Both have frame mouldings which terminate close to the ground in circular volutes (*mims*) on each side of the portal opening. Both have pointed arches decorated by chevron (zig-zag) voussoirs and both possess rows of stalactite (*muqarnas*) decoration which is finished with a shell-like motif in the tympanum. The resulting composition clearly has associations with Mamluk portals and, as already explained, with pre-Ottoman Saljuq forms. The Turkish influences are unmistakable. The chevron arch was certainly used in Jerusalem prior to the Ottoman period. The shouldered or 'Bursa' arch, mentioned above in relation to Sabil Sitti Maryam, was wholly Ottoman in origin.

If the basic concept behind the fountains was Ottoman, some of the details were clearly provincial, and, in particular, Syrian. On Sabil Bab al-Silsila, Sabil Bab al-Nazir and Sabil Bab al-'Atm (cat. nos. 6-8), engaged columns are carved into the leading edges of the portal frame. The column is divided into a series of elongated colonettes decorated with small niche capitals. In addition, the colonettes are plaited half-way up their lengths. A similar design can be seen in a niche over the outer gateway of Bab al-'Amud. This design has been described as local in origin (Rosen-Ayalon 1989: 604 and fig. 37.17), and as attributable to the influence of the Crusader columns which are re-used, for example, in the north elevation of the Ayyubid al-Nahawiyya on the south side of

the upper esplanade of the Haram. But in northern Syria precisely the same designs were used in monuments as early as the 8th/14th century, and this practice continued elsewhere in Ottoman times (944/1537-8; Creswell 1923: 134-9). Such evidence suggests that while the use of this type of engaged column may originally have come from medieval architecture, it had already been assimilated into the decorative vocabulary of Ottoman masons, and more particularly—and this is the point—those from the Levant.

It is easier to see Ottoman and provincial influences combined in the ablutions fountain of Qasim Pasha (933/1527; cat. no. 2), which is the only example in Jerusalem of the canopied *şadirvan* found in the courtyards of *madrasas* and mosques in Ottoman Turkey. There are examples elsewhere in Palestine, but built later—at the Mosque of al-Jazzar in Acre, for example. The form can be traced back to the 9th/15th century in Turkey (Goodwin 1971: 144) but continued to be popular, for it is reported by Evliya Çelebi that Murad IV (1033-50/1623-40) installed a canopy over the ablutions fountains of Selim I and Bayezit in Istanbul (Goodwin 1971: 172). In general, the dome and roof of the loggia in Ottoman *şadirvans* form a single canopy over the fountain itself. In Sabil Qasim Pasha, however, the builders have made a conscious decision to continue the walls of the storage tank above the roof of the loggia, which has possibly been raised since it was first built. It is possible that the builders of the fountain were inspired by Qubbat al-Silsila to the east of the Dome of the Rock—it is perhaps no coincidence that Catherwood, in 1842, described Qubbat al-Silsila as ‘a building resembling a fountain’ (Bartlett 1850: 152).

The form of the Ottoman minaret is as idiosyncratic as the *tughra*. The style can be seen as a development of those built by the Saljuqs of Rum in the 7th/13th century (Hillenbrand 1994: 161-5). They enjoyed a particular popularity with the Ottomans, being used with a single-mindedness that resulted in the breathtaking achievements of the two or four ‘pencil’ structures to be found at the mosques and complexes in Istanbul and Anatolia. In Cairo and Damascus, following the Ottoman conquest, the shape of the minaret quickly changed from the square ‘Syrian’ tower to the cylindrical shaft. And so it was in Jerusalem. It is on the basis of this observation and its similarity to Minaret al-Maulawiyya that Burgoyne came to the conclusion that the Bab al-Asbat minaret is an Ottoman restoration (Burgoyne 1987: 415-7). All of the Ottoman minarets in Jerusalem are mounted on simple square plinths, with the top corners chamfered back to the base of the shaft. At the minaret of the Qal‘a (the Citadel; cat. no. 26) the chamfers are convex in shape, but this may have something to do with the fact that the west side of the shaft rises flush with the tower below. The plinths in new structures are in general solid, with the entrance to the internal spiral staircase located at the base of the shaft. At

al-Jami‘ al-Maulawiyya the plinth is so high that the entrance is almost halfway up the structure and has to be reached from the second-floor *zawiya* located on the roof of the mosque. It was a wise precaution to have a solid base for any such structure, but in Jerusalem it was especially important in minarets because the city was and still is prone to earthquakes, which perhaps goes some way to explain why the Jerusalem minarets are somewhat stumpier than their Turkish counterparts. The tops of the towers all have single-stage balconies running around them, carried on corbelled *muqarnas* supports of varying degrees of sophistication. The minaret of al-Hamra’ (cat. no. 3) is the most accomplished. Its date, however, is unknown, although the cylindrical shaft almost certainly assures its Ottoman date, for only two minarets of this form are known from the Mamluk period, and both those are in Aleppo (Burgoyne 1987: 416). Decorative features on the Jerusalem minarets are kept to a minimum. Above the balconies, the towers are surmounted by ashlar domes protected on the exterior with plaster, and a copper (minaret of al-Qal‘a) or stone finial (al-Manara al-Maulawiyya) provides the finishing touch. Domes, and ashlar ones at that, are not normally associated with Ottoman minarets, which throughout the rest of Ottoman territory were usually finished with the cone which is their trademark. In the case of Cairo, Behrens-Abouseif (1994: 252) has suggested that the ubiquitous use of the cone was probably the result of an exchange of craftsmen with Istanbul. There can be no doubt that this was also the reason in Damascus, where, in line with true Turkish practice, Sinan erected two slender minarets in the Süleymaniyye complex. In these cities, and as close to Jerusalem as Nazareth, the cone was a dominant feature of the city skyline, and proved a powerful symbol of Ottoman sovereignty (Wilson 1880 2: 37, 143-4). It is surprising, then, that the practice appears to have been almost entirely ignored in Jerusalem, except for one example, namely when the top of the minaret of Bab al-Silsila was restored with a cone some time after 952/1545, to be removed in 1894 (Burgoyne 1987: 244, pl. 35.5 and 63.13). The Ottoman minarets of Jerusalem have curious external profiles which might suggest later restorations: the tower at the Qal‘a, for example, has a particularly pointed profile. An explanation for the stone domes might be found in the suggestion that the Ottomans were unfamiliar with such structures (Behrens-Abouseif 1994: 252). If the construction of the towers was left to local craftsmen, who would have been less experienced in the use of wood, stone domes may have been built and covered with a conical top to meet the requirements of the Ottoman overseers, and were subsequently replaced with a layer of plaster. Thus even if the main influence behind the minarets was Ottoman, once again the method of construction was primarily local.

A similar theme can be found in the planning and execution of other works outside the Haram where, even if

the underlying concepts of the institutions are Ottoman, the limitations of the sites and the need to use local craftsmen and masons moulded the architecture inconspicuously into the existing fabric of the city. The concept and planning of the Khassaki Sultan complex (cat. no. 15) is demonstrably Ottoman, for example, but the architecture, like that of some of the other imperial works in the city, is plain and solid, relieved only by the occasional decorative flourish (see below). Similarly, other new religious institutions were plainly Ottoman in origin, but invariably the architecture is a 'dressed-up' form of the vernacular found throughout the city—and indeed the region. This is demonstrated at al-Zawiya al-Qadiriyya (cat. no. 35) and the Maulawiyya compound (cat. no. 19), whose entrance is a narrow doorway hidden in a back-street.

The inspiration for the architecture of the city gates appears to be Syrian in origin; as already noted, very distinct similarities can be seen between the gates and citadels of Damascus and Aleppo. The clearest similarities can be seen in Bab al-ʿAmud—the finest of the gates, and, indeed, one of the finest Ottoman monuments in the city. The outer elevation is almost identical, in its decoration to the outer elevation of the citadel at Aleppo. Many of the same decorative elements are to be found in other 10th/16th-century imperial work in Jerusalem, including the projecting bosses. The latter are found, for example, in the *khan* of the Khassaki Sultan complex and the machicolated bastions on the corners of the gate towers are identical to those found at the Citadel in Damascus (Wilson 1880 2: 162). As well as the inscriptions, which are placed at the most visible vantage points on the gates, the walls were decorated by a large number of circular bosses carved with either geometric or floral designs. Similar decorative and constructional characteristics on the gateways and walls can be identified in the south gatehouse and the *khan* of the Khassaki Sultan complex, which perhaps suggests that the same builders—and perhaps the same supervisor, Muhammad Çelebi al-Naqqash—were responsible for the work (Chapter 36).

The new gates were all designed along similar lines. An outer entrance with iron-clad gates leads through into a high tunnel with a left-hand turn. This goes against the traditional right-angled bend of medieval fortifications which exposed the weaker, unshielded, side of the enemy. But by the 10th/16th century, guns and not arrows or spears were used for the attack and perhaps this factor influenced the design of the gates. Curiously, Bab al-Nabi Daʿud does have a right-angled bend, but this may perhaps be explained if it had been anticipated that defenders would have to fight for Nabi Daʿud from *within* the city. Bab al-ʿAmud, Bab al-Khalil, Bab Sitti Maryam and Bab Nabi Daʿud have large outer gateways, while Bab al-Maghariba and Bab al-Zahra (Herod's Gate) had small

postern-like entrances in one side of the projecting tower (the existing wider arches were opened during the British Mandate).

During the Mamluk period, elaborate funerary architecture, tombs and mausolea provided a means of celebrating both the lives and the charitable works of major patrons in the city, and also allowed such notables to be buried close to the third holiest site in Islam. Many such structures were built on the roads leading down to the Haram, in particular ʿAqabat al-Silsila, where passers-by could look into the chambers and pay homage to their forebears. During the Ottoman period funerary architecture, both in Jerusalem and in Cairo, for example (Behrens-Abouseif 1994: 229, 261) became more restrained (see below). The mausoleum in the Khassaki Sultan complex is the only foundation in the city to have emulated the earlier foundations. The mausoleum is undated and nothing is known of the man claimed by Nabulsi to be buried there, one Shaikh Saʿd al-Din al-Rusafi. The building is an independent structure comprising a dome and eight-sided drum supported on a square chamber. The architectural evidence suggests that it may have been built later than the Khassaki Sultan complex, which would perhaps make sense given that there was a large Sufi community in the complex for whom a building of this type would have been a fitting epitaph for an important member of the community (Chapter 35). [Editor's note: for a different opinion, see Dr Yusuf Natsheh's analysis, cat. no. 15, where he opines that that the tomb was constructed before the complex].

It seems, however, that during the Ottoman period the desire for such elaborate monuments in Jerusalem seems to have diminished; only four tomb chambers have so far been identified. One of the main reasons for this was that relatively few new pious foundations were built during the first two centuries of the period, which in turn may have been a result of the fact that Ottoman governors and pashas never stayed long enough in the city to die there (Behrens-Abouseif 1989: 27). The few tomb chambers that were built are usually simple vaulted spaces, located on the ground floor as, for example, in Maktab Bairam Jawish. At al-Zawiya al-Maulawiyya the chamber, which houses a collection of four cenotaphs, is located at the back of the compound, hidden away in a small vault below courtyard level. The tomb of Hajj ʿAli Rukhiyyun, who died in 1271/1854 (author's notes) is also located in the courtyard, presumably because there was not enough space for it inside the tomb chamber. This was, incidentally, the only inscribed cenotaph of the period found by the author in any of the monuments, though there are must be others. A third, and similar, tomb chamber is found under the 11th/17th-century palace al-Sarayi al-ʿIyafi al-Matbuli which adjoins the Bairam Jawish complex (cat. no. 29). As

a result of 'archaeological' activities by local residents, little of the contents of the tomb or the burial chamber under the room survive. (These activities have also uncovered in the same chamber a large, circular, ashlar cistern.) It seems likely that this tomb chamber was built and was posthumously occupied by a Mamluk patron who was responsible for an unnamed and undated foundation that previously existed on the site (see van Berchem 1923: 431). Alternatively, given that no tomb has been identified for the patron of al-Madrasa al-Mawardiyya immediately opposite, one wonders whether it was not the patron of that complex who was buried here. Sitt Tunshuq is, after all, buried on the other side of the road from her great palace (Burgoyne 1987: 485-512).

The building techniques used for construction of the buildings followed long-held practice in the city. The basic building material was stone; walls invariably consisted of two outer layers of dressed masonry of varying degrees of fineness of finish, filled with a rubble and plaster matrix. Walls were of almost uniform thickness, irrespective of the building type. Many of the simpler constructions—those without intricate detailing or elaborate decoration—would have been covered in a coating of white or off-white lime-wash or plaster render. This is a fact that is rarely noted even in scholarly works and can hardly be appreciated today with walls almost invariably presented as exposed rough rubble. Early accounts, however, confirm its use. Evliya Çelebi observed that 'the buildings within this town are of masonry; there are no wooden constructions at all. Yet the doors are made of wood. The houses are covered with lime ...' (Stephan 1938: 156). The practice continued throughout the subsequent centuries; Mark Twain, writing in the 13th/19th century, described the houses as being built of 'strong masonry, white-washed or plastered outside' (Osband 1989: 136). In contrast to the sometimes drab, stripped down perception that we have today of buildings with exposed stonework, the urban landscape of Jerusalem during much of the period should rather be envisaged as smoother and certainly lighter, perhaps in a similar style to towns and villages in the Aegean, for example, which have continued to lime-wash, or paint the exteriors of their buildings. As a result the narrow alleys and passages, which sometimes appear dark today, are likely to have been filled with reflected light from above, while at the same time providing the necessary shade from the midday sun. Lime-rendering and lime-washing, as any conservationist knows, had little to do with decoration, for all that it was often a convenient medium. Lime served the practical purpose of protecting the masonry from the elements, including the annual heavy winter rains of Jerusalem. During the later years of Ottoman rule, when the economy was debased and maintenance costs too high, the visible reality was more likely to have been buildings covered with a patchwork of render and exposed stone as

one can often see today in cities like Cairo (Behrens-Abouseif 1985: 72, pl. 22; 79, pl. 26).

Domes and arches are above all the characteristic elements of Turkish Ottoman architecture. During the first century of the Ottoman period in Jerusalem a large number of domes were constructed, particularly in the Haram. Mark Twain, writing in 1286/1869 after a visit to Palestine, recalled 'It (Jerusalem) is knobbly with countless little domes as a prison door with boltheads. Every house has from one to half a dozen of these white plastered domes of stone, broad and low, sitting in the centre of, or in a cluster, upon the flat roof ... (it is) the knobbliest city in the world, except Constantinople' (Osband 1989: 136).

In general domes were constructed of a rubble and mortar matrix which was plastered inside and out. The outer skin was made thicker and coarser to resist the effects of exposure to the weather. In a good many instances this external plaster was later replaced by stone tiles which were more hard-wearing. In three instances the domes were constructed of solid ashlar stones cut and keyed to shape (Sabil Qasim Pasha, the kitchen at Khassaki Sultan and the North-Western Khalwa of Ahmad Pasha or the 'Mamluk' cell, cat. nos. 2, 15, 22). None of the elaborate decorative stone dome structures found in the Mamluk buildings were used. Nor was the Anatolian Ottoman preoccupation with the use of lead to cover domes generally encountered in Jerusalem. The exceptions were in the domes of the Aqsa Mosque, Dome of the Rock, Qubbat al-Nabi, Qubbat al-Mi'raj, Qubbat Yusuf, Qubbat al-Silsila and Sabil Qasim Pasha which all appear to have been clad in lead. Most lead had to be imported from abroad—in one instance at least directly from Istanbul (Heyd 1960), which made the material expensive and gave it a prestige that made it suitable for use only on special buildings. In general Mamluk domes had a pointed profile (with a slight horseshoe return) (Burgoyne 1987: 91). Usually, however, Ottoman domes were rounder in profile, even on occasion almost hemispherical, as at Masjid al-Qaimari (cat. no. 32), the cells around the upper esplanade of the Haram, and the restored north end of Masjid al-Maghariba. Other examples had a shallower profile, as for example Kursi Sulaiman (cat. no. 42), a form which was also found in Cairo (Behrens-Abouseif 1989: 27).

Most domes in the city, as Twain noted, were mounted directly onto a flat roof terrace; all the cells around the upper esplanade are of this type, as are the domes found over the majority of vernacular houses. The earlier practice of building the dome up from a faceted stone drum, which had a small window-opening in each side, although found in only a few instances, continued into the 12th/18th century. This combination of drum and dome is found at the east end of the Crusader hall of the Coenaculum, and over the kitchen and mausoleum in the Khassaki Sultan complex. Another example, perhaps

dating to the 11th/17th century, is to be found in the Saray al-‘Iyafi al-Matbuli on ‘Aqabat al-Takiyya. In some monuments (but more usually in vernacular architecture) an intermediate form of drum was formed by chamfering the upper corners of the exterior of the main reception room at first- or second-floor level just below the dome (see Grammar of Architectural Ornament, Corbelled buttresses). The dome over Masjid al-Qaimari is supported on such a structure. Strictly speaking, this cannot be termed ‘a drum support’ since all the sides are not the same length. In point of fact this form of construction, whose origins are unknown to me, was primarily a practical method of reducing vertical structural loading at the corners of the building. Hanging or corbelled buttresses on the external walls provided extra support domes’ structures (see Grammar of Architectural Ornaments, Corbelled buttresses). Similar buttresses were also used on the front elevations of buildings, for example the Ribat Bairam Jawish; they were built to provide lateral support to transition arches located between two vaults in the interior of the building. Consequently, the buttresses are a good indicator of the type of internal space situated behind an otherwise plain exterior. Buttresses were used only rarely during the Mamluk period (Burgoyne 1987: 90) and it seems curious that they should have been introduced by the Ottomans. However, their use may be explained by the fact that, in general, the walls—usually around 750mm thick—were thinner than Mamluk walls. It is perhaps worth mentioning that this dimension corresponds almost precisely with the standard Turkish unit of measurement, one *arsun*, which equals 757mm in modern terminology.

Transition zones between vertical walls and domes tended to be in the form of pendentives buttressed by wall arches, as in the mausoleum mentioned above. The type of corbelled *muqarnas* found in many Mamluk monuments was never used in the Ottoman period to make the transition between walls and domes. Squinches, a feature often found in Mamluk architecture and also in Turkish Ottoman architecture as a dome support, were also used, but once again mainly in the 10th/16th century. Both Masjid al-Qaimari and the North-Eastern Khalwa of Ahmad Pasha (the Translation House, cat. nos. 32 and 23) have semi-hemispherical squinches. The two chambers of Hujrat Muhammad Amir Liwa’ al-Quds are not exactly square, and as a result similarly scallop-shaped squinches are supported on shallow wall arches. The three-tiered squinches in Qubbat al-Mahd ‘Isa are unusual, not merely for their use so late in the period, but also because the design is reminiscent of Ayyubid or Mamluk squinches.⁶ As

far as I am aware, these are unique to Ottoman architecture in the city.

Fewer domes were built as the centuries passed. In our survey, approximately fifteen monuments included domes during the 10th/16th century, seven in the 11th/17th, one in the 12th/18th, and two in the 13th/19th centuries. Clearly these figures must primarily relate directly to the number of monuments built; they certainly do not take into consideration the large number of domes used in domestic buildings throughout the city. They do, however, reflect a decline in the use of the dome, in preference for the vault, and, later, for modern flat ceilings.

As a general rule, the local use of barrel or cross (groin) vaults, which were popular throughout the Mamluk period, continued in all but the most important chambers (see Grammar of Architectural Ornament, Vaults). It was the practice to use a barrel vault in the most basic rooms, and these are thus often found in ground-floor storage rooms both in private houses and in public monuments. Examples are found in the ground-floor rooms of the cells around the upper esplanade of the Haram. Cross vaults are generally pointed in section and are found throughout domestic spaces and in those monuments located in the residential quarters of the city, for example al-Zawiya al-Qadiriyya. As in the Mamluk period, they were normally employed over square spaces, usually with projecting supports in the corners which either rise from ground level or from corbels in one of the adjoining walls. This latter practice also allowed for cross vaults to be used over rectangular spaces. Sometimes two cross vaults separated by a transverse arch cover a longer area. In the south gatehouse of the Khassaki Sultan complex, a simple cross vault is made unique by the introduction of a small petal-shaped incision in the groin at the junction between the fold and the wall support (cat. no. 15).

Folded cross vaults with an eight-sided drum and domelet at their apex, which were common during the Mamluk period (see Burgoyne 1987: 90-1) (see Grammar of Architectural Ornament, Vaults), were only found in one instance. This is in the Sufi refectory in the Khassaki Sultan complex where four vaults are supported on a central pillar. The Mamluk practice of occasionally leaving the central cupola open to the sky was not continued into the 10th/16th century. The exception is found as ever in the bend in Bab al-‘Amud. In most cases a domelet was used at the apex of the vault and these come in a wide range of sizes. One general characteristic of Ottoman vaulting in the city is, however, the increasing use of moulded patterns in the plaster lining on the underside of the dome. Spirals, lozenges, circles and fanned umbrella moulds can all be found, with a great number of variations on the theme. The trend can be dramatically (and rather prettily) demonstrated by plans of the series of rooms which are believed to have formed the Maktab Bairam Jawish (cat.

⁶ This assumes that the squinches have not been re-used, which they may have been.

no. 12). One of the rooms has the most unusual feature—perhaps unique in Jerusalem—of a central domelet, from the apex of which is suspended a spiralling pendulum of plaster. Occasionally, particularly in the last hundred years of Ottoman rule, other patterns were continued into the main areas of the vault below the domelet, as, for example, in an upper room of the 13th/19th-century house, Bait al-Mamluk, where a series of geometric patterns are incised into the plaster around the ceiling (Ch. 25, app. 25.1). At other times, the patterns were used to cover the interior of an entire dome, as in the so-called Sabil Bab al-Maghariba (cat. no. 18), where the dome is moulded with deeply incised folds, giving it the appearance of a partially unfurled umbrella. There are a few complex variations on the theme. The domical vault over the main space in the North-Western Khalwa of Ahmad Pasha, the so-called Mamluk Cell (cat. no. 22), is a geometrically-planned series of haunched vaults arranged around the walls, on which a large umbrella dome is supported. The design is almost identical to one found in a lobby of the Mamluk al-Madrasa al-Muzhiriyya (885/1480-1; Burgoyne 1987: 579-88, fig. 62.5 and fig. 62.10). A similar example can be found in the western chamber of the *qibla iwan* in the Khassaki Sultan complex.

Arches were usually pointed and are found throughout the period in a diverse range of shapes and sizes. The most concentrated use of arches is found in the porticoes and domed structures in the Haram. Most of the cells on the north and west sides of the upper esplanade of the Haram once had arched porticoes situated on raised platforms in front of them. Although a number of the porticoes have been repaired or restored and still exist, it is difficult to be sure of the original form of the edifices when they were first built.

In Jerusalem it is rare to find the ogival arches used in many Ottoman foundations closer to the centre of power. Those that were in the city generally date to the 10th/16th century. The three most typical examples of this feature can be seen in the small portico of the Ottoman Hammam al-Sultan located at the junction of the Via Dolorosa and Tariq al-Wad (Chapter 33, pl. 33.2, 33.3). Other examples are found used as relieving arches over windows, which was a common practice in Istanbul as, for example, at the Hadim Ibrahim Pasha Mosque (958/1551; Goodwin 1977: 104). The west elevation of Khalwat Bairam Jawish Pasha (cat. no. 34) has a relieving arch of this type, as does another located in a small courtyard adjacent to Maktab Bairam Jawish at first-floor level. Horseshoe arches are rare. Two blind arches located on the outer elevation of Bab Sitti Maryam are probably the earliest examples, and are unusual, for they are the only ones with gadrooned (or pillow) voussoirs. Three other arches of the same shape support the domed portico in front of the North-Western Khalwa of Ahmad Pasha, the

Mamluk Cell (cat. no. 22). The dome over the 12th/18th-century Sabil al-Shaikh Budair (Sabil Mustafa Agha, 1153/1740-1; cat. no. 48) is supported on three similar arches constructed of red and white stone which are distinctly Mamluk in style. Other arches have a profile generated by the centre of the radius situated above the spring of the arch, but pointed at the apex. Qubbat al-Nabi (cat. no. 10), the porticoes at Khalwat al-Ghazali (more properly the Madrasat Ahmad Pasha of 1013/1604, cat. no. 25), Ribat Bairam Jawish (cat. no. 11) and al-Zawiya al-Qadiriyya (cat. no. 35) are obvious examples (see Grammar of Architectural Ornament, Portals). Trefoil arches are rare and their use is confined to the 10th/16th century. The north portico of the Khassaki Sultan complex is a case in point. A blind trefoil arch is also found in the south elevation of Dar Bairam Jawish and in the west elevation of the North-Western Khalwa of Ahmad Pasha (see Grammar of Architectural Ornament, Arches and portals). Flat arches, in which the voussoirs are keyed to form a lintel-like structure, were also built during the 10th/16th century. An example is again provided in the portico of the northern gatehouse of the Khassaki Sultan complex. The North-Western Khalwa of Ahmad Pasha has what appears to be a unique example in Jerusalem of a Florentine arch, in which the intrados is horseshoe-shaped, while the extrados has a pointed profile.

Pointed arches were some times embellished by carved decorative patterns on the voussoirs. Chevron (or zig-zag) arches were used for porticoes in early Ottoman Turkey, for example the Orhan Gazi Mosque in Bursa (740/1339; Goodwin 1977: 58) but they are also found in Mamluk foundations in Jerusalem. One example is the Turba of Baraka Khan (663-79/1265-80; Burgoyne 1987: 111 throughout). In the Ottoman period, pointed arches were primarily used in the 10th/16th century. They are found, for example, in Sabil Birkat al-Sultan and Sabil Bab al-'Atm (cat. nos. 4, 8), as well as Ribat Bairam Jawish (cat. no. 11). Occasionally, however, their use continued into the 11th/17th century as in Qubbat Yusuf (cat. no. 38) and the restored portico of al-Zawiya al-Naqshabandiyya (cat. no. 33). Gadroon (pillow) arches were a local remnant of the style inherited from the Mamluk, Crusader and Ayyubid periods; as far as I can ascertain, they do not represent an Ottoman import, although they are found in the Orhan Gazi Mosque in Bursa (Goodwin 1977: 58). Bab al-Nabi Da'ud has two blind gadroon arches around loopholes flanking the outer gate. The portico and all the windows around the mausoleum in the Khassaki Sultan complex are decorated in a similar fashion, and so is the arched recess in the south wall of Qubba Yusuf, which dates to the latter half of the 11th/17th century. A typically Syrian flourish is found in the arches of the south gateway of the Khassaki Sultan complex and Bab al-'Amud, where the voussoirs are

carved with a running frieze of small niches with a leaf-like pattern. The design seems to have been imported after the Mamluk period from Lebanese and Syrian buildings.⁷ As I have suggested in relation to the Qubbat al-Khadr and the Khassaki Sultan complex, this design is not found in use after the 10th/16th century and that is one reason for suggesting that Kursi Sulaiman is a 10th/16th-century foundation. In many of the vernacular buildings around the city, the segmental arches over doorways into houses were decorated with small roundels with geometric designs carved into the voussoirs. Sometimes there is a single roundel in the keystone, but more often there is a second and third example located in the voussoirs on either side.

Away from the carefully designed monuments, the uniformity apparent in the thickness of walls is also to be found in the construction of windows and doors. Rooms at ground-floor level were used primarily as storage or stabling areas. Thus, until the 13th/19th century windows located lower down on external walls were invariably small rectangular openings, providing ventilation to the rooms behind. Windows giving onto the upper floors were larger and positioned either singly or in pairs, and they were also incorporated into oriel windows, which projected on stone corbels over the street below. The corbels are invariably curved at the outer end and often sit two or three on top of each other. Some times the oriels would be made of wood, as in a number of house located on Tariq al-Wad, but more often they are solidly constructed of stone. Pairs of windows are usually separated by a simple stone mullion or some times by a column, as in the double window over the south gateway to the Khassaki Sultan complex. Relieving arches, which bear the load of the masonry above windows or doors, come in a range of different shapes and sizes, but usually they are simple arches which are often incorporated into the masonry above the lintels of windows (see Grammar of Architectural Ornament, Window lintels/arches). Some times a roughly constructed round arch spans the width of paired windows. The windows would have provided the principal means of ventilation during the summer months. However, smaller ventilation holes located above the main windows served the same purpose at other times. The holes come in a wide variety of shapes and sizes, varying from star shapes to slits and roundels to 'eye-brow' shaped slots (see Grammar of Architectural Ornament, Window lintels/arches). During the 10th/16th century, the top of the slit was often in the form of two quirked ogival profiles meeting at the apex. This latter shape of arch was new to the city, as far as I am aware. Examples can be found at the Sokullu Mehmet

Pasha Mosque, Istanbul (961/1554; Vogt-Göknil 1966: 78). There is often a simple carved *fleur de lys* motif above the slit-shaped openings. By the 13th/19th century, classical mouldings, or revivals of hollow square mouldings, surround the more common round variety. During the 12th/18th and 13th/19th centuries, round-headed windows, with arches often constructed of only three keyed stones, became common.

During the Mamluk period, windows had been made secure by the addition of a metal grille which was built into the sill, lintel and projecting jambs. With one or two exceptions, Ottoman grilles are both less solid and less finely crafted than those of the earlier period (see Grammar of Architectural Ornaments, Grilles). One or two of the cells around the upper esplanade of the Haram have bars of a comparable size with carefully forged junctions (as for example the North-Western Khalwa of Ahmad Pasha, cat. no. 22). Generally, however, they seem to have been threaded through holes built into the thickness of the strut. *Mashrabiyya* (the wooden trellising that allowed ventilation while preserving privacy) survives in one or two rare instances in vernacular architecture, but for the most part it has given way to modern metal shuttering; it is therefore difficult to assess how widely used this feature was used.

Portals and doorways (see Grammar of Architectural Ornaments, Portals) had been one of the most eye-catching elements of Mamluk foundations, particularly in the narrow streets around the Haram (see Burgoyne 1987: 92-3 and throughout). The largest of all the portals built during the period is the north gateway into the Khassaki Sultan complex. The entrance is covered by a trefoil arch (as already described) and, like the Mamluk portals, has a frame mould terminating close to ground level in circular volutes. During the Ottoman period generally, however, both massive doorways and the exquisite decoration associated with them almost vanished. Most formal entrances, even in the early 10th/16th century, were reduced to a small doorway in a recessed arch with a stone bench on each side for a guard to sit on. Otherwise the practice of publicly advertising the wealth and standing of the original founder was abandoned. The doorways at Ribat Bairam Jawish, al-Zawiya al-Naqshbandiyya (restored later) and al-Zawiya al-Qadiriyya (cat. nos. 11, 33, 35) are all of this type. The reasons for this restraint in their design are unclear but may (as discussed earlier) reflect the comparative scarcity of money available to spend on lavish decoration. It may also have been due to a wish for comparative anonymity in an increasingly unstable city after the end of the 10th/16th century, in which the close confines of a *zawiya* or convent became a welcome form of protection. Dervish foundations were poor communities and the continued use of flamboyant decoration may also have come to be perceived as inappropriate.

Muqarnas stalactites, commonly found in the

⁷ For example in Tripoli at Khan al-'Askar (8th/14th century) (Salam-Liebich 1983: 184, fig. 170) and Aleppo at Qaisariyyat Miru (Salam-Liebich 1983: 212, fig. 188).

earlier Mamluk period in the tympana of portals and arches, were used only in earnest on a small number of monuments—for example, Sabil Birkat al-Sultan, Sabil al-Wad and Sabil Bab al-‘Atm (cat. nos. 4, 5 and 8)—although they are also found in the corbelling of minarets, for example the minaret of al-Hamra’. They follow the Syrian/Egyptian style of pointed niches which are in contrast to the peculiarly Ottoman rectilinear type found in, for example, column capitals (see below). The practice of decorating the backs of porticoes in this way seems to have gone out of fashion and not to have been used again in the city. Instead tympana were generally left flat and, apart from an inscription plaque, unadorned. In the north elevation of Bab al-‘Amud and the east elevation of the North-Western Khalwa of Ahmad Pasha, the rectilinear Ottoman style of *muqarnas* has been used to decorate the top of a shallow window recess. But the most accomplished example is found in Mihrab al-Sanaubar, which probably dates to the early 12th/18th century (cat. no. 54). Here the *mihrab* niche is surmounted by a series of corbelled rows of *muqarnas* using Syrian curved niches.

In the same way, the elaborate form of decoration known as *ablaq* which was used in the portals and elevations of the earlier Mamluk buildings was almost entirely abandoned. This technique of alternating courses or decorative features such as voussoirs of arches in different coloured stone had been one of the distinctive features of the Mamluk period in Jerusalem. It had also been used in Turkish Ottoman architecture since at least the early 9th/15th century, for example the mosque of Yügüç Pasha at Amasya (832/1428; Goodwin 1971: 77) and was often used in the great imperial mosques of the 10th/16th century. During the same period in Jerusalem, however, the use of *ablaq* was rare, even in the new imperial or independent foundations. The exception is the North-Western Khalwa of Ahmad Pasha which owes its popular name, the Mamluk Cell, to its use. Unique in Ottoman Jerusalem, the little cell is a gem of great beauty and extraordinary craftsmanship. Despite one or two later restorations it remains arguably one of the finest pieces of Ottoman decorative architecture in the city. On the east elevation a rectangular panel is inlaid with star-shaped pieces of red stone, an example of stunning technical virtuosity. This is surrounded by an exquisitely carved cartouche of woven hexagons. There are also traces of inlaid turquoise ceramic tiles in the panel and an identical panel survives, hidden away and perfectly preserved, in the interior east wall of the antechamber. Other decorative details include joggled voussoirs over the windows looking to the south. There is another example of *ablaq* in the joggled voussoirs of Madrasat Ahmad Pasha (Khalwat al-Ghazali, cat. no. 25) but this is of a lower quality.

The east side of a bridge (*qanatir*) in the Bairam Jawish complex, which has alternating courses of red and

white stone, probably illustrates the concern felt by successive Islamic patrons not just for the buildings themselves but also how they fitted into the surrounding context. This suggestion, made by Robert Hillenbrand (author’s notes), makes sense for in the distance, framed by the bridge and the sides of the street, are the decorated façades of the Dar and Turba of Sitt Tunshuq, and the Madrasa al-Mawardiyya. Later, a number of minor foundations (Qubbat al-Masjid al-Nabi Da’ud, Qubbat al-Nabi, Mihrab ‘Ali Pasha, Sabil al-Shurbaji, Sabil al-Khalidi and Sabil Mustafa Agha—cat. nos. 1, 10, 37, 40, 44, and 48) were constructed with a combination of grey, cream and red stones, used in general only in the voussoirs of arches. In what appears to have been a revival period, the use of *ablaq* is used to greater effect in the north elevation of a bridge house which spans Tariq al-Wad (Wilson 1880: I, 26). A distinctively Ottoman feature of this elevation is the presence of blind ogival arches over the windows, which also have alternating coloured voussoirs and are apparently the only examples of such arches which incorporate the *ablaq* technique.

Other architectural decoration during the 10th/16th century displays both the influence of the centralised Ottoman style and that of the provinces. The designs of column capitals found in the *qubbas* and porticoes of the cells around the Haram vary a good deal, and often differ from column to column. In contrast, the bases are often very similar. Qubbat al-Arwah (cat. no. 30) also, for example, has eight capitals of differing designs. The two southern capitals are of a curious ovoid shape, the closest parallels to which are to be found in the bases of columns in the Summer Pulpit (see Grammar of Architectural Ornament, Column capitals). Qubbat al-Khadr (cat. no. 31) equally has six different capitals, including re-used Crusader *spolia* (see below), while Qubbat Yusuf (cat. no. 38) uses column bases for capitals (see Grammar of Architectural Ornament, Column bases). The reason for this disparity is probably that these fragile monuments were ruined by one or other of the frequent local earthquakes; any lost or broken capitals were later replaced with whatever could be found, or made, at the time. The column capitals of Qubbat al-Nabi (cat. no. 10), as has already been mentioned, can be seen almost certainly as evidence for this hypothesis. In general however, designs which incorporate rows of rectangular niches around the circumference of the capital are Ottoman in origin. Those in Qubbat al-Nabi and a number of other monuments bear striking similarities to designs found in the Bayezit II complex in Edirne, for example (891-95/1484-88 Goodwin 1971: 142, fig. 133; Vogt-Göknil 1966: 20) or the complex by the same founder in Istanbul (964/1556 begun c. 1500—see Goodwin 1971: 168-72; Goodwin 1977: 86, pl. 30). The most accomplished examples in Jerusalem are to be found once

again in the portico of the North-Western Khalwa of Ahmad Pasha, which also has smaller decorative motifs incorporated into the niches (see Grammar of Architectural Ornaments, Column bases). A capital with a deeply incised triangular design in the double window over the portico of the southern gatehouse of the Khassaki Sultan complex is also remarkably similar to examples in the Bayezit II complex in Edirne (817-22/1414-84) (Goodwin 1977: pl. 82; Goodwin 1971: 78-82, pl. 75).

The Mamluk tendency to use decorative geometric patterns and inscription plaques carved in stone continued into the early Ottoman period, but on a much reduced scale. Most decorative detailing of this sort was restricted to providing a light touch on a heavy structure. Complex geometry underlies the design of the circular bosses which project from the city walls and on some of the buildings within the Khassaki Sultan and Bairam Jawish complexes. Roundels are also to be found in the North-Western Khalwa of Ahmad Pasha, and in the north elevation of Iwan al-Sultan Mahmud II (cat. nos. 22, and 50). Cartouches on the front elevations of the cells in the Haram were articulated with a hexagonal woven design that seems to be Mamluk in origin. Others have chevron patterns, like those in the south entrance to the Khassaki Sultan complex, or the south elevation of the North-Western Khalwa of Ahmad Pasha. Bands of counterchange joggling are found around the shafts of a number of the minarets. Impost stones, from which arches spring, were often carved with one or two rows of shallow arches. They are almost always of curved form, but in one instance in Maktab Bairam Jawish (cat. no. 12) they are the Turkish rectilinear type (see Grammar of Architectural Ornament, Corbel brackets).

Carved decoration was to become increasingly fluid in its design as the period progressed. A small corbel in the otherwise plain south elevation of al-Zawiya al-Qadiriyya (cat. no. 35) is a small but fine example of this development. Decorative carving was also to become less geometric and more representational. Floral designs were used from the earliest years of Ottoman sovereignty, even if they were heavily stylised. Some of the bosses on the walls of the city and in the *khan* of the Khassaki Sultan complex include large petals radiating from a small central flower. Hood-moulds and voussoirs in the same monuments also incorporate running friezes of arched niches delicately carved with leaf-like designs. In the south elevation of Khalwat al-Qitas (cat. no. 16) there is an extraordinarily intricate trefoil-shaped carving, which includes flowers and leaves, located over a window. The design of this particular piece originates in similarly-shaped plaques placed above doorways in Turkey, for example over the Soup Gate of the Fatih Mosque in Istanbul (begun 1463; Goodwin 1971: 124, pl. 116) or the remarkable 'antique' plaques in the *namazgah* at Gelibolu (Goodwin 1971: 141, pl. 132). A

close inspection of some of the metal cladding on the doors of Bab al-'Amud reveals a number of flower designs impressed into the iron. Floral designs were to become increasingly realistic particularly after the so-called Tulip period in Ottoman Turkey at the beginning of the 12th/18th century (Goodwin 1971: 354). Mihrab al-Sanaubar and Sabil al-Shaikh Budair (Sabil Mustafa Agha, cat. nos. 54, 48), as already mentioned, included carved patterns of tulips standing in vases. During the 13th/19th century, keystones in arches often had a leafy design projecting from them. In the south wall of Qubbat Yusuf (cat. no. 38) there are carved flowers which still bear traces of polychromy, applied possibly during the latter half of the 13th/19th century on the occasion of the visit of Kaiser Wilhelm to the city in 1898.

In a number of monuments, the need for decoration is met by the incorporation of re-used stones—or even whole building elements—into their structure. The practice was particularly widespread in 10th/16th-century buildings, presumably when such materials were available in larger number. Materials from ruined structures, or entire buildings, were adapted to fulfil the needs of new building projects, whether they were monumental religious complexes, like Khassaki Sultan, or lower down the scale, like domestic housing. This was an inevitable outcome of the continuous requirement to adapt and re-organise the dense urban fabric within the protective confines of the city walls. It was also an easy means of Islamisation. Even before the imperial Ottoman building programme got under way during the first half of the 10th/16th century, the city had had a long history of re-using existing materials. This was primarily a matter of practical considerations of cost, labour and availability. The conversion of the Crusader church of St Agnes, the re-use of the extant foundations of the city walls and the integration of Dar Sitt Tunshuq into the new Khassaki Sultan complex, as well as the Damascus Gate, are ample demonstrations of the Ottoman willingness to take existing buildings and adapt them for their own needs. The re-use of building materials lying around the city fulfilled the need for such materials, and in doing so reduced the cost of the new enterprises. This was particularly the case in such large projects as the rebuilding of the walls, where stones dating from earlier centuries are regularly found. A Greek inscription is used in just such an *ad hoc* fashion—and incidentally upside down—in the north face of Bab al-Zahra (Herod's Gate). A Roman—or perhaps Hellenistic—decorative stone is used as the lintel of an arrow slit close to the same gate. The debris found around the Haram was cleared and some pieces of the ruined *madrasa* of al-Malik al-Ashraf Qa'itbai (887/1482) (Burgoyne 1987: 589-605) found their way into the bakery in the Khassaki Sultan complex (Walls-Abu'l-Hajj 1980: 29 and n. 88, and see Chapter 36). The scarcity of some materials made it vital

that elements of earlier buildings were used. Marble, for example, had been popular throughout the Ayyubid and Mamluk periods but it was invariably taken from earlier structures (Burgoyne 1987: 89). All of the columns in the building—or rebuilding—of the *qubba* structures are almost certainly in re-use. Other pieces of *spolia* were used as markers. The placing of a single piece of red granite—a stone not found in the region—at the base of the south column in Qubbat al-Khadr (cat. no. 31) was clearly intended to operate as a simple form of *mihrab* to indicate the *qibla*, or direction of prayer.

The integration of highly decorative elements of earlier, usually Christian, buildings could simply be read as another instance of cost-cutting. An almost complete medieval rose-window—probably Crusader—was incorporated into Sabil Bab al-Silsila (cat. no. 6), as was an equally complete archway, with beautifully carved floral bosses, at Sabil Bab al-Nazir (cat. no. 7). Here, and at Sabil al-Wad (cat. no. 5), engaged columns with leafy capitals of either Crusader or Ayyubid origin have been built into the sides of the arch. At least two of the troughs are almost certainly sarcophagi and may be Byzantine in date. The Crusader *spolia* probably came from the Coenaculum, or from the headquarters of the Hospitallers close to the Holy Sepulchre. It is difficult to marry cost-cutting of this sort with the importance of the projects. Given the programmatic nature of Sulaiman's Solomonic aspirations, however, the re-use of material was perhaps

employed in the mistaken belief that they were iconographically representative of the Temple period, and therefore entirely appropriate. On the other hand, and this is the usual argument, it is possible they were used as symbols for the predominance of Islam over the earlier occupants of the city. The use of a column capital, of unknown provenance, as a step outside Khalwat Qitas and Khalwat Parwiz (both 967/1559-60, cat. nos. 16, 17) and also as a step up to a prayer platform on the west side of the Haram, can be seen to support the argument. The use of decorative *spolia* in a highly visible manner was not limited to the most important sites but also in the humblest of structures. A number of the raised prayer platforms in the Haram incorporate large carved blocks, positioned on the most visible side of the platforms, usually at a corner.

The preceding pages can hope to provide only a brief introduction to the Islamic heritage of the Ottoman city of Jerusalem. It is possible to present only a few of the conclusions reached during the time spent on the project. Any *lacunae*, or blatant mistakes, are my own. Subsequent research by Dr Yusuf Natsheh or Mr Khadr Salameh during their studies of the *sijill* records will have brought to light new information unknown to me at the time of writing. In any case, the detailed chapters and the descriptions of the buildings themselves which follow will provide a more thorough insight into the Islamic architecture of Ottoman Jerusalem.

Chapter 24

STARS, ROSES AND INTERLACE: ARCHITECTURAL DECORATION IN OTTOMAN JERUSALEM

Sylvia Auld

The style of architectural decoration produced in Jerusalem under the Ottomans is less dramatic than it was under their Mamluk predecessors. Where the Mamluks primarily relied on *ablaq* and *muqarnas* to decorate their buildings (Burgoyne 1971: 1-31 and 1987: 89-97), the Ottomans tended towards the use of carved stone roundels or small areas of intricate interlace. The use of *muqarnas* continued but it was less three-dimensional, for the most part consisting of single or double bands which acted as a framing device, although in the earlier 16th-century monuments—three of the *sabils* erected under the patronage of Sultan Sulaiman (cat. nos. 4, 5, 8) for example—larger areas of *muqarnas* were used to fill the niche hoods (pl. 24.1) (*note*: unless otherwise indicated the photographs herein are by the author). The transition in taste is neatly demonstrated by al-Madrassa al-Mawardiyya (cat. no. 28, more commonly known as the Madrasa Rasasiyya from the use of lead plates to bond the courses of masonry; Burgoyne 1971: 23-26 no. 9, figs. 18-19, pl. XIXb). This impressive façade, which gives onto 'Aqabat al-Takiyya, consists of bands of white limestone, red marble and a single, central course of black basalt—a use of coloured stone which is echoed in the *ablaq* joggling over the windows and doors. These are all typically 'Mamluk' features. The central recessed panel, which houses the portal, is capped by a scalloped hood and to either side of it there are panels of *muqarnas*. But it is not stalactite *muqarnas*, consisting instead of four tiers of shallow lanceolate niches. There is an area of stalactite *muqarnas* but it is hidden inside a room on the first floor, which once served as a mosque. The bands of shallow *muqarnas* niches are decorated in the upper arched section with an abstract

palmette that could also be interpreted as an open 'hand of Fatima'.¹ The device, as Canaan (1927: 204) explains, was 'common in popular superstition ... met with in magic formulas and popular medicine.' Its use may, therefore, have been originally intended as a talisman or amulet, to bring blessings on the building or to ward off evil.

The arch over the main opening of the Damascus Gate (Bab al-'Amud) (pl. 24.23) is framed with a series of lanceolate niches. A comparable band frames the archway over the south portal of al-'Imara al-'Amira (the complex known as Khassaki Sultan, cat. no. 15) (pl. 24.2) and another runs across the north façade. The niches are found again acting as the 'capitals' of columns, both on the 16th-century *sabils*, where the panels at the sides of the recess continue across the tops of the attached colonettes (pl. 24.3), and, more clearly, on some of the small Ottoman monuments on the Haram al-Sharif. On these they form capitals in the more orthodox sense. This is demonstrated by the columns of Qubbat al-Nabi (cat. no. 10) (pl. 24.4) and, more dramatically, those in front of the North-Western Khalwa of Ahmad Pasha (cat. no. 22, dated 1007-9/1598-1601) (pl. 24.8).

This charming building deserves an entire chapter devoted to its decoration, for it is quite the richest of the period. It is as eclectic as al-Madrassa al-Mawardiyya, using 'Mamluk'-style *ablaq* and *muqarnas* details that earned it

¹ See Canaan 1927 (reprint n.d.): 204-5, pl. IV nos. 6-7, where a similar pattern is used as the finial to the staff (*za'na*) to which ceremonial banners were fastened. A brass amulet in the shape of an open hand, inscribed with Qur'anic texts, is in al-Aqsa Mosque Museum, Jerusalem.

the nickname of the 'Khalwa al-Mamlukiyya', and borders consisting of trefoils enclosed in split palmettes, reminiscent of Iranian manuscript illumination and metalwork over joggling on the windows to the west (pl. 24.6) and north (pl. 24.7).² The north window also has a cornice of *muqarnas* niches and the west window has two star-polygon roundels set in the cusps of the trefoil apex. The significance of these will be discussed below. In addition, the building features colour. The rose and white stone of a plaque to the east still has traces of turquoise ceramic inlay in the points of the star-polygons (pl. 24.5), while the inlay of the porch of the main entrance is still intact. This rare survival of colour in Jerusalem recalls similar use of coloured paste in contemporary Damascus, where inlaid details occur on the entrance of al-Madrasa al-Salimiyya and al-Takiyya al-Sulaimaniyya. Were all the details once similarly coloured by paint? The question is discussed more fully below.

The firm date for the North-Western Khalwa of Ahmad Pasha to the turn of the 16th century, provided by Dr Natsheh's discovery of the relevant *sijill* (97: 312, cat. no. 22), adds emphasis to the use of *muqarnas* as column capitals and bases (pl. 24.9), as already discussed. The crisp carving and crystalline stone recall the restrained elegance of work for the court in Istanbul and Edirne (see, for example, Goodwin 1971: 203, pl. 192; 228, pl. 219 and 230, pl. 221; 240, pl. 228). In the Khalwa, neither capitals nor bases fit the columns they adorn. Moreover, the column 'base' is in truth another capital, which has been inverted. Were they then imported? The question cannot be answered with certainty. The niches are either set as a single chamfer at the corner, or are stacked in diminishing numbers over each other to form a deeper bevel, or they surround the column-head as a cornice (pls. 24.8, 24.9). Each niche is crisply outlined in a deeply cut groove.

Qubbat al-Khadr (cat. no. 31, dated 1249-82/1833-65) also has a cornice of single niches. The use of *muqarnas* on these small monuments, which date from the end of the 16th to the 19th centuries, is indicative of the popularity of this type of decoration. It became so widespread that it can virtually be seen as a 'signature' for the Ottoman provenance of the buildings on which it appears, sometimes in unexpected places. On Tariq Barquq, the corner of Zawiya Qadiriyya is bevelled to allow the easy passage of loaded animals as the street turns sharply. At the head of the chamfer, three small *muqarnas* niches, undecorated apart from the sharply angled apex and a break across the centre, are flanked by a small area of foliate arabesque (pl. 24.10). The deep groove running

down the middle and the one which surrounds each niche are typical of 17th-century work in the city. The use of shadow to emphasise a motif was already used by the stone carvers of the Mamluk period as found on the Ashrafiyya and Sabil Qa'itbai, to be discussed below, but behind this there lies the so-called 'International Timurid' style. The decoration at the corners of the chamfer on al-Zawiya al-Qadiriyya is part of this movement. Another detail, this time within the Khassaki Sultan complex, is contained within a cusped cartouche and consists of an arabesque wholly in the Iranian mode (pl. 24.11)—compare, for example, a metal doorknocker on the Shrine of Ahmad Yasavi, a binding of a *Mathnawi-yi ma'nawi* of Jalaluddin Rumi³ or, in the Ottoman period, lobed medallions on tiles from the tomb of Sultan Selim II.⁴

Carved stone decoration was becoming popular in Jerusalem by the end of the Mamluk period—witness the Ashrafiyya and the rebuilt Sabil of Qa'itbai,⁵ which in this instance reflect contemporary Cairene taste. Influences from Egypt were not the only ones at work in Jerusalem in the earlier period, however, for the Dar and Turba of Sitt Tunshuq, dating to c. 790-800/1388-98, already demonstrate the presence of an Iranian style. The Turba has a carved stucco design of fleshy vegetation in the scallop of the *mihrab*, while the eastern portal of the Dar has a large panel of geometric interlace which terminates in an ambiguous flourish of birds/split palmettes in the four corners (Burgoyne 1971: 12, fig. 7, pls XIIb and XIIIb-XIVa).⁶ Both the Ashrafiyya and the portal of the Dar al-Sitt Tunshuq are important, for they bear directly on one of

³ Lentz and Lowry 1989: 208, fig. 68; and cat. no. 38.

⁴ Atasoy and Raby 1989: figs. 411, 412, 413, 416 and 417 all display a similar lobed medallion.

⁵ The Ashrafiyya Madrasa was begun in the name of Sultan Khushqadam by Amir Hasan ibn Tatar al-Zahiri sometime after Jumada II 869/February 1465 and continued under Sultan Qa'itbai, as recorded in the inscription now under the portico of the Bab al-Sakina which carries the date 1 Rabi I 875/28 August 1470, completed 887/1482, and was seen during its construction by Felix Fabri. It has intricate relief-carved octagons in the vault centres over landings 1 and 5 (Burgoyne 1987: 604-5 figs. 63.12 and 63.13). The Sabil was rebuilt for Qa'itbai in Shawwal 887/November-December 1482 according to Mujir al-Din (Burgoyne 1987: 606) and has a dome encrusted with carved stone vegetal tendrils bearing split palmettes which are organised in an intricate interlocking arabesque, as well as a wide band of carved vegetal zig-zags on the south-west engaged corner shaft and geometric strapwork on the north-east corner shaft. The form of the dome as well as the decoration is clearly derived from the contemporary Cairene style (Kessler 1976: 4; Burgoyne 1987: 91 and n. 17) but the rather clumsy work probably demonstrates that it was undertaken by local rather than imported craftsmen (Burgoyne 1987: 609).

⁶ See too Burgoyne 1987: 487 pl. 48.2 and 509 pl. 49.11. The panel also appears in Bourgoin 1873: pl. 11 fig. 51. The Dar al-Sitt Tunshuq is dated to c. 790/1388 and her Turba to before 800/1398 (Burgoyne 1987 nos. 48 and 49).

² Compare the border on small inlaid brass jugs in London (British Museum 1969 6-20.1) and Tehran (Iran Bastan Museum 9772), both illustrated in Komaroff 1992: 115 nos. 38 and 40.

the great imperial edifices of 16th-century Jerusalem—al-‘Imara al-‘Amira of the Khassaki Sultan (cat. no. 15). The palace of the Lady Tunshuq was incorporated into the ‘Imara and stones from the Ashrafiyya, which was damaged in an earthquake in 902/1496, were used in the fabric of the complex, in a building running east-west along the ‘Aqabat al-Takiyya. Indeed, one explanation for the relatively undecorated façade of the north gateway of the ‘Imara is that the highly decorated portal of the neighbouring palace was used for the Ottoman complex.

The portal of the ‘Imara is decorated by carved stone roundels in a mode unlike its earlier neighbours (Dar al-Sitt Tunshuq and al-Madrasa al-Mawardiyya) although it also has a narrow band of shallow *muqarnas* niches used as a framing device, discussed above. As well as the two portals of the ‘Imara, the street wall has two star-polygon roundels (fig. 24.1) (*note*: all the motifs are sketches of the underlying designs, rather than accurate, measured drawings of the roundels as they now exist), which lead the eye down towards the Haram al-Sharif by way of Bab al-Nazir. The northern portal has a curiously awkward five-petalled open-flower device (fig. 24.2) above the door, from which hangs a suspension ring (presumably for a lamp), and there is another large roundel with an interlaced eight-petalled flower device to each side of it, with a further small whorl incised into the stone (pl. 24.12, fig. 24.3). The position of this 5-petalled device demonstrates its importance—above a lamp over the gate and below an inscription which doubtless named the royal patron. This inscription (now lost) was featured in a rectangular frame of linked hexagons, with an inner frame which terminated in ogees (see Burgoyne 1971: 18–39, fig. 11 and pl. XVIb). The main, southern, entrance to the complex is similarly marked out by roundels; on the street façade there are three, two with twelve-pointed star-polygons with different centres—one floral, one stellar (pls. 24.2, 24.13)—to left and right and in the middle an open-flower device, once again immediately over the door itself (pl. 24.14). This example is a more complex variation on the theme, and is directly in line vertically with a central boss. Inside the porch there are no less than nine of these open-flower roundels with different detailing at the centre of each—either a simple boss surrounded by a plain fillet (fig. 24.4), or a hexagon, or a six-petalled flower.

The open-flower motifs are reminiscent of the naturalistic blooms familiar from mid 16th-century Ottoman ceramics⁷ and are quite different from the more formal, decorative flowers found in earlier Timurid and

Mamluk artefacts, which are always more obviously based on an underlying geometric design. By the end of the 15th century, a fashion for chinoiserie arabesques, which had flourished in Timurid Iran, was also popular in Ottoman Turkey.⁸ The style featured large ‘naturalistic’ blossoms set into a tightly coiled stem. But the Ottoman ‘naturalistic’ style is different from the earlier Iranian and Egyptian versions. Both the earlier styles had tended to be based on variations of the lotus blossom, both full-face and in profile. The increasing freedom of expression does not disguise the inherent symbolic nature of the blooms found in this Timurid and Mamluk work.⁹ But it is noticeable that 16th-century Ottoman taste takes on the chinoiserie of the Timurid court and then develops them further, beginning a tendency towards naturalism. The bookbinding of the illustrated history of Sulaiman the Magnificent, the *Süleymanname* (Atıl 1986: 81–83),¹⁰ the transcription of which concluded in 965/1558, includes formalised lotus blossoms (*hatayi*) set against scrolling bands of clouds and

⁸ See Lentz and Lowry 1989: 208–210 for a discussion on the *haft qalam* (seven scripts) idiom in Timurid wood-carving, based on the work of the *kitabkhana* artists. Similarly, the taste for deeply incised designs laid one over another is to be found in the later 15th-century carved masonry domes of Cairo, already mentioned above (Kessler 1976). On this taste in Turkey, see Atasoy and Raby 1989: 76, where Raby uses the terms *rumi* for the abstract, geometrically arranged Islamic motifs of Western Asiatic origin, and *hatayi* to distinguish the scrolling Ottoman floral elements inspired by the chinoiserie taste. He uses the term *rumi-hatayi* for a specific style popular in the court of Mehmed Fatih in the 1460–1470s. In Mamluk Egypt, Chinese-style lotus blossoms had been popular on 8th/14th-century metalwork. See, for example a basin of c. 699/1330 made for Sultan Nasir al-Din Muhammad (London, British Museum no. 51.1–41) or a Qur’an box of c. 730/1330 (Cairo, Museum of Islamic Art no. 183) (Atıl 1982: nos. 26 and 27). They had also featured in contemporary and slightly later Qur’anic illumination (see for example James 1988: cat. nos. 29, 30, 32, 65).

⁹ The point is vividly illustrated by a cloud collar point of c. 1400–1450 (Lentz and Lowry 1989: 194, cat. no. 96). The drawn design sets mythological beings—an angel, a *qilin* (Chinese mythical deer), a dragon and a crane mounted on a tortoise—in a fantastic landscape at the centre of which is a large lotus blossom shown both in profile and full-face, flanked by wind-blown bamboo shoots. Above, Chinese cloud trails surround the angelic being and below, under the tortoise, a carp swims in the turbulent water. The association of fantastic animals and landscape with the lotus underlines its own mythological connections; for a discussion on the origins of the lotus and its appearance with animals, see Rawson 1984: 64–88.

¹⁰ The *Şahname-i Al-i Osman* composed in Persian verse by Fethullah Arif Çelebi, known as Arifi, was the first illustrated official history of the Ottoman house, and used Firdausi’s *Shahname* as a model. Volume V of the work was the most important, being devoted to the history of the Sultan. It was illustrated by five artists, and its transcription was completed in mid-Ramadan 965/late June–early July 1558; it is held in the Topkapı Palace Museum, AH 1517, and has been published by E Atıl (1986).

⁷ See, for example, Rogers and Ward 1988: 192–3 no. 132, Çinili Köşk 41/55, a dish dated to the later 16th century, or Rogers and Ward 1988: 194 no. 134, British Museum OA 1969.7–21.1, a dish of a similar date. The most comprehensive treatment of decoration on Iznik ceramics is to be found in Atasoy and Raby 1989.

arabesques, but also has developed *hatayi* blossoms, serrated leaves and over-lapping floral motifs that look forward to the fashion for *saz* leaves and naturalistic botanical specimens that were to become so prevalent in the following generation. The illustrations in this book are equally a mix of stylisation and naturalism. In folios 37b-38a, *A Meeting of the Divan-i Hümayun*, for example, where the tiles and floor covering are shown tilted towards the spectator and are static and strictly geometric, the gardens of the second courtyard of the palace are shown in 'correct' perspective and with trees of recognisable species—various conifers (the *pinus* varieties), juniper, cyprus, cedar, and deciduous, which are probably plane trees. By contrast, the clumps of flowers set into the lawns are identical but for colour—they each consist of three spikes of formalised stems, bearing red, yellow, blue or orange flowerheads. The illustrator (called by Atil 'Painter A') portrays similar trees in another pair of folios (108b-109a), showing the siege of Belgrade. Here again carefully observed specimen trees are set into the formalised banks of the River Danube, which are studded with clumps of unidentifiable flowers. Developed Ottoman 'naturalism' is based on the study of real, botanic specimens, although the blooms are usually symmetrically arranged and are idealised. The tendency is already established in a lacquer binding of c. 1540 where the doublures and flap are adorned with rose plants, tulips, flowering prunus, violets, dianthus, and iris (Rogers and Ward 1988: 80, cat. no. 24a).¹¹

In Jerusalem, there is little evidence of the love of flowers in the Ottoman court that led to the phenomenon of tulipomania (*Laleh Devri*) which flourished in the early 18th century.¹² Already by 1554 Busbecq, the horticulturist ambassador of the archduke of Vienna to the Ottoman court in Istanbul, who imported tulips, lilacs and hyacinths into an avid Europe, wrote 'Turks cultivate flowers with great care and do not hesitate to spend for a particularly beautiful blossom a considerable sum, though otherwise they are thrifty people.'¹³ Ceramic tiles were also exported to Europe where they had a high reputation. An order for 16th-century tiles is known to have been received

from Vienna; they were shipped from Istanbul via Venice (Gervers-Molnár in Fehér (ed) 1978: 365). Although panels of tiles with naturalistic flowers do not still exist¹⁴ in Jerusalem, a late example of the fashion is to be found on a curious *mihrab* on a *mastaba* in the Haram al-Sharif, known as the Mihrab al-Sanaubar (cat. no. 54) (pl. 24.15). It has been 'restored', or rebuilt, with an 'incorrect', top-heavy *muqarnas* cornice. Floriate roundels flank the apex of the niche in the northern façade and a whorl is cut into the keystone. The individual niches of the *muqarnas*, which face in the direction of the *qibla*, are carved with individual flowers among which a carnation, tulip and hyacinth can be recognised.

To return to the roundels in the Khassaki Sultan complex in Jerusalem (figs. 24.2, 24.4, 24.5), the question as to the derivation of these prominent five, six and eight-petalled motifs must be raised. The number five is noticeably unusual; it is more common to have a division into an equal number. This makes it possible that the five-petalled version may reflect a botanical specimen as inspiration. The Turban Buttercup or Scarlet Crowfoot (*Ranunculus Asiaticus*, in Arabic *sharquq al-nu'man*) has five petals; it is easily confused with the common anemone (*Anemone Coronaria* or *Anemone Hortensis Fulgens*; in Arabic *barquq*)—which grows prolifically in Palestine and has six petals—and with the Pheasant's Eye or *Adonis Annua*, which is equally common and has eight or more petals (Polunin and Huxley 1965: nos. 25, 27, 30 and 32). All are found in the region, can be a strikingly brilliant scarlet, and appear in early spring.

In a different medium, the closest parallel to the architectural feature of the open-petalled Jerusalem roundels so far discovered by me is on a mosque lamp dating to c. 1560-80 in the British Museum (no. G.1983.122, Rogers and Ward 1988: 208 no.155; Atasoy and Raby 1989: fig. 768) (pl. 24.16). Here the rosettes are fashioned with three superimposed layers of six open petals and have a six-petalled floral centre. They are displayed on a plain white ground between much larger roundels filled with a six-pointed star of the familiar *khatam sulaiman* form, discussed below. Another multilobed and multilayered floral device is found at the centre of a deep, rimless dish dated by Atasoy and Raby (1989: fig. 454) to c.1575, which was found at the bottom of a well in

¹¹ Rogers and Ward (1988: 80) comment on this remarkable botanical display that it is 'the first appearance of florists' flowers in Ottoman court art'.

¹² Compare, for example, the panel on the north-west wall of the Rüstem Pasha Mosque, Istanbul (Seherr-Thoss 1968: pls. 130-131) or a panel to the left of the *minbar* in the Söküllü Mehmed Pasha Mosque (Seherr-Thoss 1986: pl. 134). On the tiles of the Rüstem Pasha Mosque, see W B Denny in Fehér (ed) 1978: 269-75.

¹³ A possible reason for the motivation for the new style is explored by Raby (Atasoy and Raby 1989: 233) who suggests that symbolism may provide an explanation, with a reference to Busbecq's report that the Ottomans 'believe that the rose sprang from the sweat of Mahomet ...'

¹⁴ Before the 1967 occupation of the Old City, a small tiled edifice stood within the moat of the Citadel, below the main eastern gateway. Unfortunately I did not record the details and it has since disappeared during the extensive 'restorations' of the Qal'a. As I recall, the tiled panels depicted trees and were a late derivation of those found, for example, in the Sultan Ahmet Mosque, Istanbul (see Seherr-Thoss 1968: pl. 137). On the use of trees in ceramic tiles of the 16th century, see Atasoy and Raby 1989: 223.

Aleppo.¹⁵ The relative rarity of the device makes its appearance on a carpet fragment (col. pl. XVI) now in the Museum of al-Aqsa Mosque all the more surprising. The carpet, which must have been large, is believed to have once been in use in the Aqsa Mosque.¹⁶ A repeat pattern of six-petalled flowers covers the red ground. The flowers, now badly faded, were originally blue or green with a yellow centre. Could it be 16th-century? Further research is necessary to determine its origins.

The six-pointed star-polygon, made from two interlocking equilateral triangles and known as the *khatam sulaiman* ('Seal of Solomon' or 'Star of David') (fig. 24.6), with which the floral motif under discussion appears on the mosque lamp in the British Museum, is one of the more 'natural' of geometric forms. Anyone using a set of compasses will soon chance upon the six-part division of the circumference, and, by joining alternate points, discover for themselves the geometric basis of the device. It has been long believed to have apotropaic powers,¹⁷ and seems to have been popular in the time of Sultan Sulaiman,¹⁸ to judge by its appearance on the city walls of Jerusalem and as a background design in contemporary manuscript painting.¹⁹ Its association with the open-flower

motif may be significant. The two appear again, both independently and combined, on the city walls (figs. 24.6-24.11), as well as on a tile of similar date and provenance (Madina Collection, New York, inv.no. C.161; Atasoy and Raby 1989: fig. 100). An anonymous mid 16th-century Venetian woodcut²⁰ (pl. 24.17) shows Roxelana (the Khassaki or Haseki Sultan, also known as Hürrem Sultan, the patroness of the Jerusalem complex and the favourite of Sulaiman Qanuni, later to be his wife) wearing a jewel at her throat in the form of a five-petalled flower, while her undergarment or chemise is embroidered with open flowers with five and six petals; her gown has alternating crescents and lozenges. She is described on the woodcut as '*La piu bella e piu favorita donna del gran Turcho dita la Rossa*'. It would seem, then—not only because of its appearance here, but also because of the frequency and position of its appearance on the city walls and building—that the open-flower motif may be a personalised device of the Ottoman rulers.²¹ This supposition is increased by the appearance of a similar roundel over the portal of Roxelana's complex in Istanbul, the Haseki Külliye, which is the first work attributed to Sinan in the Ottoman capital (Goodwin 1971: 204-6). The position of the flower motif is particularly striking—as in Jerusalem—for in each case it appears in the prime position, and in close proximity to the name of the ruler-patron.

The more complex form of the open-flower motif in Jerusalem, over the southern portal of the 'Imara, has seven layers of twenty-four petals creating a shallow chrysanthemum-like blossom (pl. 24.14).²² This is reminiscent of the different versions of the motif which decorate Haseki Hürrem's Türbe at the Süleymaniye in Istanbul. Although the multiple examples directly associated with Haseki Hürrem, as already discussed, might seem to indicate a personal connection with the motif, it is not so straightforward. Similar (albeit even more complex) flower-roundels appear in connection with

¹⁵ Now in the Antaki Collection, Aleppo. The motif is surprisingly uncommon, although the inevitable loss of large quantities of ceramic wares makes any sweeping statement unwise. Somewhat similar layered blooms appear, for example, on a cylindrical tankard of c. 1550 in the Calouste Gulbenkian Museum, Lisbon, inv. no. 834 (Atasoy and Raby 1989: no. 362) and on a deep dish with a gently foliated rim of c. 1545-50, in the Musée de la Renaissance, Château d'Ecouen, inv. no. Cl.9419 (Atasoy and Raby 1989: no. 370). The decoration on the tankard consists of delphinium, tulip and lily plants; the leaves and thorns on the stem of the ten-petalled flowers under discussion would point to its identification as a rose.

¹⁶ Mr Khadr Salameh, Director of al-Aqsa Mosque Museum and Library, gave this as his opinion in a conversation in February 1998. The carpet has no accession or inventory number, and its provenance is equally unrecorded.

¹⁷ See for example the talismanic shirt of white linen (TKS 13/1133, Rogers and Ward 1988: 175-77 no. 111), which is covered with magic squares both back and front, and with an Arabic inscription for Şehzade Selim in which he is named (although he only acceded to the throne in 1566) as co-ruler with his father Sulaiman-Qanuni. There are two Seals of Solomon to either side of the neck opening which spell Selim's name by including one letter within each of the small triangles in the points of the stars. The shirt is dated 972/1564-5.

¹⁸ The two motifs are found in conjunction on a hexagonal tile in the Madina Collection, New York, inv. no. C161, dated by Atasoy and Raby to c.1520 (1989: fig. 100).

¹⁹ I have explored elsewhere (Auld 1997-8: 467-79) the coincidence of the appearance of the Seal of Solomon, its use on Ottoman artefacts, and its appearance on the mosque lamp. See too Milstein 1995; on the wider associations of the Biblical Solomon in Islamic thought and more particularly with Sulaiman Qanuni see Necipoğlu-Kafadar 1993: 109-34 and Soucek 1976: 73-123.

²⁰ Published by Mathio Pagani, Venice c. 1550, British Museum 1878.7-13.4166 illustrated in Rogers and Ward 1988:17 fig. 4b. Roxelana's gown is mistakenly described by Rogers and Ward p.51 as decorated with 'alternating crescents and stars'.

²¹ A similar multi-layered device of eight petals is found in the *tabhane* courtyard of the Fatih Complex in Istanbul (1463-70) on rectangular piers in the centre of the open side of the double-domed east and west *iwans* (Goodwin 1971: 125-26).

²² The form of the roundel can be compared to a similar image on Iznik pottery. See, for example, a 16th-century dish, British Museum OA 1969.7-21.1, no. 134 in Rogers and Ward 1988: 194, or a dish c. 1550-70, British Museum G.1983.48, Rogers and Ward 1988:197, no. 139, where similar flowers appear in the cavetto. A dish dated c. 1560-80, British Museum G.1983.100, Rogers and Ward 1988: 209-9, no. 156, has a bole-red seven-petalled flower in the centre. Rogers and Ward comment that 'The concentric rosette design, rather exceptionally, has analogues in a number of later sixteenth-century Bursa silks.'

Sultan Sulaiman himself—in Istanbul on his Türbe (pl. 24.18), and on the Süleymaniyye. They are also found on the portal niche of the Takiyya Sulaimaniyya in Damascus,²³ as well as on one of the Ottoman forts specifically built by Sulaiman to protect the Darb al-Hajj al-Shami (the Syrian pilgrimage route).²⁴ The fort in question was constructed at Ma'an in 1531 on the orders of Sulaiman-Qanuni, who was continuing the work begun by his father, Selim I. Not only was the fort constructed at this time, but also a storage system for the precious water provided by a Roman reservoir 3km away (Petersen 1989: 100, 114). Above the main entrance to the fort, now blocked up, there is a large limestone roundel with a central boss. A similar roundel appears in the centre of an octagonal frame formed by two interlocking squares. The concave space between central boss and fillet circumference is, in each case, filled by multi-layered and many-petalled flower motifs. Between the two roundels there is a modern copy of an inscription recording the work of Sulaiman-Qanuni (Jaussen and Savignac 1909: 75).²⁵ In the same year a fort was constructed at Qatrana, also in modern Jordan (Petersen 1989: 100, figs. 8, 16). Although the machicolations are similar to the one at Ma'an, the gateway is decorated not by roundels but by spherical bosses, similar to those found on the city walls of Jerusalem, where the Damascus Gate also has a machicolation similar to the two forts. These similarities point to an important element in the message communicated by the decorations—one of Ottoman supremacy. But beyond this, they also point to a connection between the Ottoman capital and her provinces in the design of the architectural decoration.

Only one other building of the 16th century in Jerusalem is decorated with carved roundels, as far as I am aware, although there are later, 19th-century examples of private dwelling houses with simplified geometric patterns

incised into the walls, as, for instance, on a *qantara* house in St Francis Street, while occasionally more complex detailing was used. Close to Nabi Da'ud on Mount Zion, for example, a building has a well-executed star-polygon over the double window-opening, below which, to each side and immediately above the windows themselves, there is a cusped frieze, crisply outlined by a groove (pl. 24.19). From it depend two carved discs and four extraordinary tusk-like spikes, which are perhaps a distant shadow of the trumpets that featured on certain Mamluk blazons. It is possible that the roundels on the 16th-century building mentioned above are to be read not as associated with the house in question—the Dar Bairam Jawish (cat. no. 13)—but with the street on which it is sited. The house is a *qantara*, a bridge over Tariq al-Wad, where it meets the 'Aqabat al-Takiyya and Bab al-Nazir Street, which leads into the Haram al-Sharif. The roundels are placed at the apex and to each side of the arch leading under the *qantara*, and in relation to the window above it. They consist of versions of the now familiar open-flowered device (pls. 24.20–24.21) and an eight-pointed star-polygon (pl. 24.22). They closely resemble the roundels already discussed on the Khassaki Sultan complex (figs. 24.2, 24.4–24.5), which is located nearby, and in particular one of the two roundels on the wall in 'Aqabat al-Takiyya leading down to Bab al-Nazir. Their position—on a thoroughfare leading to the sanctuary at the heart of the Holy City—may be significant.

The siting of the decorated roundels on the walls and gates of the city, as well as on these monuments, is particularly interesting and is illustrated in fig. 24.26. Details are given in Appendix 24.1. It is noticeable that the roundels appear at prime locations, associated with openings or architectural features. It has been cogently argued by Dr Jane Jakeman in her doctoral thesis, *Abstract Art and Communication in 'Mamluk' Architecture* (1993: 137–48), that the use of the star-polygon motif should be seen as more than merely ornamental.²⁶ She has noted that the device appears on portals, on doors of mosques, and at the entrances to *iwans*, on cenotaphs, on *mihrabs*, and in the opening pages of Qur'ans. She has concluded that 'it

²³ A drawing of the niche is found in Wulzinger and Watzinger 1924: fig. 24. Although it is only a sketch, the multilobed and multilayered style of the two roundels, which are placed to either side of a central *muqarnas* detail within a stepped frame, are carefully indicated. It is worth mentioning too that an 8-pointed star-polygon is placed directly above the doorway into the Takiyya Sulaimaniyya minaret.

²⁴ The Darb al-Hajj was altered in the 16th century to follow the edge of the desert because of the problem of security posed by attacks on the Hajj pilgrims by bandits. Used as an alternative to the King's Highway and known as the Tariq al-Bint (after a daughter of Selim), its location meant that protection of the sources of water became vital; see Petersen 1989: 97–99. It is tempting to see the interest of Sultan Sulaiman in the problem as yet another fulfilment of his role as supplier of water to the pious thirsty. See the discussion on the Jerusalem *sabils* by Natsheh in this volume, Ch. 36.

²⁵ It is not now possible to be sure of the precise arrangement of the original decorative elements at Ma'an because of extensive repair work.

²⁶ I am most grateful to Dr Jakeman for assisting me in access to her fascinating thesis. The use of the star-polygon as a decorative device in similar positions was known in Palestine before the Mamluk period. It is found, for example, on the pulpit made in Aleppo that was commissioned by Nur al-Din Zangi and placed in al-Aqsa Mosque in 1187 by Salah al-Din as one of his first actions on the retaking of Jerusalem from the Franks (van Berchem 1927: 393–402; Herzfeld 1943: 57–59). It also features on the doors of a similarly inlaid wooden *minbar* dated 1092–3 in the Great Mosque in Hebron. The continuity of practice into the Ottoman period is demonstrated by the doors of the Süleymaniyye, Istanbul (Goodwin 1971: 231, pl. 222), which, incidentally, are also prominently adorned with geometric interlace bosses.

seems to have been emphasised at particular locations accompanying a particular action, that of embarking on a new undertaking or activity, of entering a different spiritual state, including death as a transition to another existence' (Jakeman 1993: 143). It is, she thinks, 'intended to accompany that activity and to influence its outcome'. In other words, in her opinion the star-polygon acts as a talisman. Her findings certainly concur with the analysis of their appearance in Jerusalem—at the city gates—where they are particularly prominent on the Damascus and Jaffa Gates (figs. 24.15, 24.18–24.19), on portals (figs. 24.3, 24.23), over windows, on roadways leading to the Haram al-Sharif (fig. 24.1), and at the entrance to a major Muslim cemetery (figs. 24.9, 24.14). A similar interpretation of the *khatam sulaiman* device as a talisman, as discussed above, adds another layer to her suggestion for the role of the star-polygon.

There are some 120 carved stone roundels on the walls of Jerusalem (see Ben-Dov 1983: 87–118, especially 99–100 where roundel motifs are illustrated) as well as custom-cut blank roundels, bosses, sections of column laid horizontally within the fabric, and items of *spolia* like the lions of Baibars that flank St Stephen's Gate (Lion's Gate, Bab Sitti Maryam) (pl. 24.23). Perhaps, like the re-used church rose window incorporated into the Sabil Bab al-Silsila (cat. no. 6) (pl. 24.3) and decorated moulding on the Sabil Bab al-Nazir (cat. no. 7), the use of artefacts of defeated predecessors were intended as a tangible symbol of Ottoman sovereignty.²⁷ As we have seen, the specially carved Ottoman decoration on the city walls is particularly prominent around the main gates to the city that survive more or less in their original state—Damascus Gate (Bab al-'Amud) (pls. 24.24–24.25), Herod's Gate (Bab al-Zahra), and Zion Gate (Bab Nabi Da'ud, pl. 24.26). Sadly Jaffa Gate (Bab al-Khalil) and Dung Gate (Bab al-Maghariba) have been reconstructed so many times that it is impossible to be sure of their original appearance, although a photograph of 1870 shows Jaffa Gate in the later 19th century and one of 1958 shows the Dung Gate before its most recent restoration (pls. 24.27–24.28).

The roundels also appear at prominent points in the circuit of the walls—on the towers such as the Burj al-Laqlaq (Tower of the Storks; figs. 24.6, 24.13), one close to the site of the Crusader Tancred's Tower (Qasr Jalut) by the New Gate (fig. 24.7) and others, unnamed (see fig. 24.26; figs. 24.10, 24.16–24.17, 24.21). Here too, as at the gates, there are prominent carved stone bosses placed at strategic

points to catch the eye (fig. 24.26, pls. 24.23–24.24, 24.26–24.27). It is notoriously difficult to recapture the aesthetic of a previous age, particularly as no written evidence or analysis has come down to us. But it is at the very least possible to state with confidence that the use of carved stone denoted conspicuous consumption, underlining the wealth and prestige of the patron. Sometimes the bosses project from the centre of a roundel (pl. 24.30). Several frames are made up of a series of small circles, reminiscent of the typical Sasanian 'pearls' (pl. 24.31). The number of 'pearls' and intermediary 'petals' seem arbitrary²⁸ and perhaps indicate a local craftsman who was copying a model and was unaware of the basic rules governing strict geometric pattern.²⁹ Another type of 'frame' consists of a whorl, and yet another at the Zion Gate has six interlaced petals. Some bosses are unframed. On the interior face of Damascus Gate there are three bosses set like jewels around the plaque that originally held an inscription which would have named Sultan Sulaiman as patron (pl. 24.29). Curiously turban-like in appearance, the bosses are carved with complex star motifs. These geometric knots leave the central star and surrounding hexagons and kite-shaped lozenges as concave negative shapes, read with comparative ease as dark shadows (pl. 24.11). Other bosses display a whorl reminiscent of a folded turban or knotted rope (pl. 24.30), or a design based on the Anatolian *rumi*—for example the one on Sabil al-Wad (cat. no. 5). It is indicative of their importance that similar bosses are shown above the sultan's throne in a miniature of the *Presentation of gifts to Sulaiman the Magnificent on the occasion of the circumcision of his sons Bayazid and Cihangir in 1530* ('Arifi, f. 412a). In this illustration the sultan's throne is on a raised dais in a small domed kiosk. In another miniature of the same manuscript (f. 360a),³⁰ which shows *Sulaiman receiving his Grand Admiral* (kapudan-i derya) *Haireddin Barbarossa*, the sultan sits on a gold chair in front of a pavilion. The architectural detailing is carefully portrayed, from marble columns with triangular 'leaf' capitals to a porphyry revetment in the spandrels. Over each column there is a disc with what appears to be a star-polygon motif. The two immediately above the sultan are shown as red, the two to

²⁸ They vary from 29 to 40 'pearls' round the outside with an intervening band of 14 to 20 daisy-like 'petals'.

²⁹ Whether or not there was a mystical connotation to number and proportion is debatable. For an introduction to the underlying geometry in Islamic pattern, see El-Said and Parman 1976.

³⁰ 'Arifi, *Süleymanname* dated Ramadan 965/June 1558 copied by 'Ali ibn Amir Beg Shirvani (Topkapu Sarai H.1517, f. 412a). The manuscript has been published by Atıl 1986. The miniatures under discussion are featured there as nos. 35 (186: 168–9, and 40 (1986: 178–81) and are also illustrated in Çağman and Tanındı (trans. and ed. Rogers) 1986: pls. 153 and 154.

²⁷ The use of *spolia* is discussed in Auld 1997–8: 467–8; Dr Jane Jakeman examines in her thesis (1993) the use of Pharaonic fragments in the architecture of 14th-century Cairo. Her work focuses on the rise of sufism in the city at that time and analyses the consequent effect on contemporary aesthetics.

either side as blue. The typical 'flat' execution of the scene does not allow a three-dimensional interpretation so it is not possible to say whether the discs are relief roundels or bosses, but their appearance in close proximity to the sultan may well be significant, particularly because bosses were used to decorate the Treasury of the Topkapi Sarai, previously used by the sultan as a *selamlık* or suite of reception rooms, and on the great doors of the Süleymaniyye Mosque (Goodwin 1971: 231, pl. 222). If it is right to associate the person of the sultan with architectural bosses, then their presence on the Jerusalem walls may have served to indicate that the rebuilding work was an imperial commission. But equally the bosses may have indicated that the city was under Ottoman 'protection'.³¹ In either case, the colour and gilding as portrayed in the miniature paintings would seem to point to the stone bosses—and perhaps also the roundels—in Jerusalem having also once been coloured in some way. This topic is discussed more fully below.

Only two extant bosses do not feature the pattern of star-interlace, and these are both associated with Sabil Tariq al-Wad (pl. 24.1). One is set into a band of scrolling stems, above the cornice of the *sabil*; it is decorated with a geometric 'y' interlace based on a hexagon once described as a 'swastika', and was popular as a background pattern on metalwork from the Jazira in the golden age of Mausili inlaid brass.³² Circular cavities in the fabric of the fountain reveal that there were once four other bosses, now lost. One remains in the centre of the hood of the arched opening, and this is decorated with a four-part *rumi* motif, a pattern of split palmettes that divide and meet again to form dart-shaped petals (compare fig. 24.17). This type of *rumi* arabesque was popular from Timurid times and was used throughout Anatolia to decorate everything from metalwork to carpets.³³ A similar form of the *rumi* is to be found on either side of the north portal to the Khassaki Sultan complex, but here it forms an eight-pointed star-

polygon around the central eight petals of a flower (pl. 24.12, fig. 24.3). This is reminiscent of a version of the motif decorating the frontispiece of a Qur'an made for Sultan Sulaiman in Istanbul dated by colophon to 930/1523-4, which alternates eight- and four-fold devices (Rogers and Ward: 1988: 66-7, no.14). Where only four dart-shaped split-palmette frames are used to surround a trefoil, the result is a cruciform motif. It is this that features on the *sabil* boss, but it is also found in two versions on roundels on the city walls (pl. 24.33, fig. 24.17).

The decorative roundels on the walls are varied in design and are particularly interesting. Set too high to be easily read, they are nonetheless highly visible and deliberately sited to be so. Many of the designs are reminiscent of the motifs found in Qur'anic frontispieces, as has been already mentioned, and they may therefore bring with them an aura of the holy and have a talismanic function. The motifs they feature were certainly not new even to the Mamluks, but are found, for example, on earlier woodwork.³⁴ Even the interlocked squares already described in connection with the fort at Ma'an and which appear again on Burj Laqlaq and the east wall of Jerusalem (fig. 24.13) are found on an early frontispiece of a Qur'an possibly executed in Syria c. AD 900.³⁵ But in two versions of the Jerusalem roundels, the interlocked square frame surrounds an eight-pointed star-polygon (Ben-Dov 1983: 100, bottom right). Star-polygons are highly favoured as a motif. A version at Damascus Gate (Bab al-'Amud) develops outwards to contain small, irregular hexagons between its ten points (fig. 24.15)—an adaptation of the twelve-armed star-polygon pattern used so extensively in later Mamluk Qur'ans from the time of Sultan Sha'ban (1363-76).³⁶ One roundel has a version of the ten-armed star-polygon which terminates in a petal-like scalloped frame (fig. 24.1). The colour—predominantly blue and gold—of the Qur'anic illumination is breathtaking.

³¹ The bosses, reminiscent of the royal turban, might in this case operate like the Roman imperial portraits at city gates, say, or like the images of Justinian and Theodora in S. Vitale, Ravenna. Equally they might act like the Cross or Lamb in Byzantine churches, where the symbol was a visible sign denoting that the ultimate patron of the building was God. On Sinan's use of the architectural language of the Byzantine Empire, see G Necipoğlu-Kafadar 1993.

³² It is found, for example, on the upper band of the so-called Blacas Ewer, which is signed by Shuja' ibn Man'a and was made in Mosul 649/1232 (British Museum, London OA1866.12-29.61). The hexagonal 'swastika' device also appears on the ewer in a band running round its belly. Because of the associated images and the long history of the device, it is seen as having astral connotations (Allan 1982: 61).

³³ For Timurid carpets see A Briggs 1946: 146-59 and for metalwork see L Komaroff: 1992. The Ottoman examples are innumerable, but see for example Rogers and Ward: 1988: figs. 14, 15a, 24a, 62, 66, 80, 110; Goodwin n.d: pls. 51, 88.

³⁴ See, for example, the *mihrab* from the Mausoleum of Sayyida Ruqayya dated 1154-60, Museum of Islamic Art, Cairo, the *minbar* of Nur al-Din b. Zangi once in al-Aqsa Mosque, and a Fatimid *minbar* in the Great Mosque at Hebron. See note 26 above.

³⁵ Chester Beatty Library, Dublin Ms. 1406. Here too the device acts as a frame for a roundel. No suggestion is intended that the stone-mason who carved the Ottoman roundel knew of this manuscript, but the Roman origins of the motif may be significant. It continued a familiar motif into the Byzantine period; for example see the frontispiece to the Byzantine copy of Dioscorides' *De Materia Medica* made for Princess Juliana Anicia, dated c. 512, National Library Vienna.

³⁶ See James 1988: 147 fig. 98, the frontispiece f.2r of a Qur'an probably produced in Damascus in 1338-9 and James 1988: 188 fig.131, f.1v of a slightly later Qur'an from Cairo dated 1356. Both examples predate the 'classic' Qur'ans of the star polygon group which culminate in the Qur'ans made for Sultan Sha'ban (1363/76) and his mother, or for officials of his realm. See James 1988: figs. 132, 134, 136, cats. 28, 29, and 30.

This is the place to return to the question of whether or not the roundels too were once coloured. No trace of paint remains,³⁷ but Ottoman Damascus is renowned for its coloured paste inlay,³⁸ and in Jerusalem too coloured inlay still exists in the North-Western Khalwa of Ahmad Pasha, dated 1009/1601 (cat. no. 22). It seems highly likely that the roundels which are now blank—at least those cut and set in deliberately eye-catching positions (see Appendix 24.1 and fig. 24.26)—were once capped by plaster which was then coloured, or gilded.³⁹ It is also possible that they were covered by ceramic discs fashioned to resemble semi-precious stone or marble.⁴⁰ The blank roundels on Sabil Birkat al-Sultan, for example, are worked less finely than the rest of the masonry block on which they appear. Perhaps the rougher surface provided an anchor. Colour would have rendered the carved stone patterns easier to see and was popular in contemporary architecture in Istanbul and Anatolia, as shown by the use of ceramic tiles.⁴¹ The use of colour in association with the person of the sultan is particularly vivid in the *Süleymanname*, as already discussed, and the striking colours of Iznik ceramics and contemporary textiles point to a world where colour was much appreciated. It was, after all, the reign of Sultan Sulaiman that in the 1550s saw the introduction into ceramic manufacture of the most eye-catching colour of all—red bole—and areas on ceramic vessels that now appear white were once gilded. It is known too that ceramics were deliberately fired to imitate stone such as porphyry, which had not been quarried for centuries and which had had imperial connotations from before the time of Constantine (Atasoy and Raby 1989: 90, 244).

Open flowers of different kinds appear frequently on the carved roundels, either as a motif in their own right

(figs. 24.12, 24.21), or as a scalloped frame to a central boss (pl. 24.28), which in one instance (pl. 24.32) is itself an open flower surrounded by concave petals. Small six and eight-petalled flowers are set within the cusped terminals framing an inscription at the main gate of the Qal'a, an unnamed 'tower' (no. 3) to the south of Burj Laqlaq, and 'tower' 22 (fig. 24.22). The last two examples have been relocated—one, to the east of Herod's Gate (Tower 22, Appendix 24.1), has been set into the wall vertically; the other, which is now no longer associated with an inscription, is set close to the base of the wall (Tower 3, Appendix 24.1). Occasionally a scalloped roundel is now blank (pl. 24.34). One example is in a prime position, set above the apex of the arch at St Stephen's Gate (Bab Sitti Maryam); there is now no way of knowing if they were always undecorated, for, as discussed above, they may once have been painted or gilded. One version of an open flower appears at the centre of an eight-pointed star-polygon, which is shown as a series of zig-zags floating in the space created by another, larger eight-pointed star (fig. 24.20). Another version has six petals that are left blank as the centrepiece of a complex 'daisy' with sharply outlined petals. This particular motif (fig. 24.21) is far and away the most naturalistic of all those appearing on the walls, as much for the three-dimensional way in which it has been cut as for its botanical accuracy. And yet there is still an echo of the lotus flower in the way the daisy-petals have been carved, as if the concept of the lotus—so universally popular in Mamluk Egypt from c. AD 1300-1500—overlays the depiction of any six-petalled open flower.⁴² Yet there is no appearance of the lotus blossom as such among the varieties of roundel designs on the Jerusalem walls.

The same blank six-petalled flower appears in one roundel at the central of a six-pointed star which is based on the *khatam sulaiman*. Cinquefoils are set in the interstices between the arms of the star-polygon and the outer frame (fig. 24.10). And another is found in a similar position in a roundel on Burj Laqlaq (fig. 24.6). The *khatam sulaiman* appears in a purer form on the inside of Bab al-Zahra (Herod's Gate) (fig. 24.8). This gate has been altered on more than one occasion and it is not certain that the roundels with the device are now in their original position—or, indeed, even if they are original. It is possible that, like the modern examples which now surmount the interior façade of Jaffa Gate, they are later 'copies' of 16th-century work.⁴³ There are two versions—both with a

³⁷ Colour does not remain either on Mamluk roundels, but the evidence of Mamluk glass and metalwork, as well as the painting known as *Reception of the Ambassadors*, c. 1488-96, Paris, Louvre no. 1157, suggests that it was once prevalent.

³⁸ See, for example, the inlaid decoration on the entrance to the 16th-century Mosque and Madrasa Salimiyya.

³⁹ Atasoy and Raby note, for example, that whole areas of the tomb of Bayezid's son, Şehzade Mahmud, in Bursa, the tiles of which dated to 912/1506-7, were gilded (Atasoy and Raby 1989: 90).

⁴⁰ F. 360a of 'Arifi's *Süleymanname* (Atil 1986: 168-69), which shows Sulaiman the Magnificent receiving Barbarossa Haireddin Pasha, presents the sultan in front of an arcade in the third courtyard. In each spandrel there is a 'stone' disc—two shown as blue-green, two as red. The red roundels are perhaps intended to represent porphyry, while the others may be marble.

⁴¹ The examples are too well known to list in detail, but see Seherr-Thoss 1968: pls. 123-24, 129-131, 133-34, 136-37. The use of colour in architecture was of course not new—witness for example the brickwork of the Ulu Cami at Eski Malatya of 645/1247 (Seherr-Thoss 1968: pl. 107-8) or the brilliant blues and greens of the tiles in the Karatay *medrese* of 650/1251-52 (Seherr-Thoss 1968: pls. 117-118).

⁴² The examples are too numerous to quote, but see Atil 1982: nos. 19, 25, 26, 29, 35, 40 and compare, for example, the 16th-century dish in the British Museum, BM OA 1969.7-2.21.1 where a central lotus is surrounded by open daisies or chrysanthemums (Rogers and Ward 1988: 194, no. 134).

⁴³ I am grateful to Dr Yusuf Natsheh for this suggestion.

central triangle subdivided into four small equilateral triangles in the central hexagon (pl. 24.35, fig. 24.8). One version has trefoils pointing inwards from the frame between the points (Ben-Dov 1983: 100 third row right). Yet another version amalgamates the *khatam sulaiman* with the open flower by surrounding each point with a part circle (fig. 24.11). One such example on the cemetery wall near St Stephen's Gate (fig. 24.9, ii on fig. 24.26) extends the arms of the basic triangle to form kite-shaped lozenges which meet in the centre; another, very similar version has a central star (Ben-Dov 1983: 100, second row right). In this second version, the kite-lozenges are cut away to allow deep shadows to form the star motif. The use of shadow to enhance legibility was well understood, for several roundels and bosses have grooves that follow the lines of the pattern in outline. The same phenomenon appears on two large roundels in the voussoirs of the arch surmounting the main entrance to the Qal'a. They both bear twelve-armed star-polygon motifs round a central twelve-pointed star that develop outwards to enclose irregular hexagons and five-pointed stars (pl. 24.36, fig. 24.23). The outer arms are cut by a zig-zag band that weaves its concentric route round the main motif to form yet another band of hexagons and half-stars. The roundels appear in the prime position to either side of the restoration inscription which names the 'Great Sultan and Magnificent Emperor ... the Second Solomon' (van Berchem 1922: 146-7, no. 45; Hawari, Ch. 32). There are traces of coloured plaster here, but this must be discounted for it is in all probability modern, perhaps originating in the preparations for the visit of Kaiser Wilhelm in 1898.

It has been suggested to me⁴⁴ that the roundels may have served not only to announce the imperial Ottoman hegemony, but also that the city was holy—that they may have acted in some way like the Qur'an frontispieces they closely resemble. It is possible to take this subtle idea further. Inside the city, as on the north façade of the Khassaki Sultan complex, and on the north and south façades of the Dar Bairam Jawish, they may have served as markers on the route to the Haram al-Sharif. It is not possible to substantiate this idea in full detail, but it lends extra piquancy to the discovery that the small fountain formerly known as Sabil al-Shaikh Budair (cat. no. 48) has pilasters carved with vases, carnations, tulips, roses and chrysanthemums (pl. 24.37). These appear only

on the *qibla* side, while those to the north have a more sober, geometric design. So much care has been taken to decorate this exquisite small fountain that the undersides of the niches of the *muqarnas* capital have little flowers as terminals, in much the same spirit as similar capitals at the Süleymaniyye in Istanbul. The Jerusalem fountain is dated to 1153/1740-41 in an inscription naming the patron as Mustafa, governor of Jerusalem and the builder as 'Uthman Beg al-Fikari. The panel includes a reference to the waters of Paradise (see cat. no. 48). It adds credence to the speculation that the foliate columns also refer to the heavenly gardens.

Another example of intricate decoration may be equally significant. A triangular cartouche is carved above the door to the *khakwa* on the Haram platform, identified by inscription as constructed in 967/1559-60 by Qitas Beg (cat. no. 16). It is likely that the cell was built either for teaching or for recitation of the Qur'an. The carved panel recalls, both by its shape and its motif, details of manuscript illumination,⁴⁵ or a stamped leather book-flap (James 1992: 28-29, no. 5). The carving of the panel is similar in technique to some of the roundels on the walls, and is even closer to the spandrels on the corner chamfer of Zawiya al-Qadiriyya, already discussed—a deep groove follows the line of the design, adding legibility by means of deep shadow.

If it is right to see some special significance in the choice of place and pattern in the carved stone decoration in Jerusalem in the early years of Ottoman rule, then it seems probable that later the meaning was lost. Houses in subsequent periods were decorated with engraved whorls, stars, and geometric patterns, cut into the fabric of the wall itself. These were not imperial commissions or sites of piety—they are ordinary houses for ordinary (if well-off) citizens. It is possible, however, that a remnant of the old meaning remained. Perhaps the designs were intended to bring blessings on the inhabitants or to ward off evil—or to commemorate a particular event. Modern houses, where the owner has recently completed the *hajj*, are painted in celebration. Perhaps the engraved ornaments on the domestic houses were executed for a similar reason. If so they reflect in more ways than one the carved stone roundels that probably once glittered like jewels on the walls and monuments commissioned by the 'Second Solomon' and his consort.

⁴⁵ See for example James 1988: 196, fig. 138 for a margin decoration, or James 1992: 140-41, no. 37. See too James 1992: 242-3, no. 60. The latter illustrates folio 1b of a single-volume Qur'an from Istanbul, dated by colophon to 985/1577. The intricate frame to the text breaks into the surrounding paper with arabesques framed in a triangular gold scallop.

⁴⁴ By Dr Avinoam Shalem in a seminar at the Fine Art Department in Edinburgh University—my thanks to him for his suggestion.

ARCHITECTURAL DECORATION: APPENDIX 1

The following is a list of the 16th-century decorated roundels, bosses and blank roundels to be found on the walls of the city al-Imara al-Amira (the complex of Khassaki Sultan), the Dar Bairam Jawish, the Qal'a (Citadel) and the *sabils* commissioned by Sultan Sulaiman-Qanuni. They are marked by symbols on fig. 24.26, which accompanies this appendix and should be used in conjunction with it: \triangle denotes a boss, \odot a decorated roundel, and \circ a blank roundel. The present locations are not necessarily the original ones, because there have been many subsequent repairs and alterations, especially to the gates.

The Gates

The gates are marked by letters A-[H].

- A** *Damascus Gate (Bab al-Amud)* 944/1537-38 (exterior façade pl. 24.24, photograph dated 1941, interior façade pl. 24.25, photograph dated 1935) (inscription detailed in van Berchem 1923: 438, no. 120)
- Main NW façade exterior **5 bosses**; 1 lost from within the blind arch over the entrance, where a hole shows the original position); 1 over the apex of the arch; 1 over the window slits to left and right of the entrance
- Main NW façade **4 decorated roundels**—to left and right, an 8-pointed star-polygon with regular hexagons contained within the outer arms and a central flower are at each extremity; the inner pair, immediately flanking the gate, are 10-pointed star-polygons containing irregular hexagons in the outer arms (fig. 24.15).
16 blank roundels—these are carefully placed and appear to have been specially carved. Were they once faced with a different stone, gilded or painted? See the discussion in the accompanying chapter.
- E and W façades **1 boss** between the upper and lower window slits.
- Interior A photograph of 1935 (pl. 24.25) shows that, within the arch, there was a centrally-placed panel for a dedicatory inscription (now lost).
1 boss is set at the apex of the inner arch, above the panel.
2 decorated roundels appear, 1 to each side of the panel, each with a 6-petalled flower.
3 blank roundels are set to each side of the outer arch, 1 in each spandrel, and 1 above the apex.
- SW façade **1 blank roundel** set above 2 window slits.
- B** *Herod's Gate (Bab al-Zahra, or Bab al-Sahira)* (fig. 24.27).
- Exterior: **1 boss** above the central window. Above this, there was N (main) probably a second, now missing, at the centre of the façade decorated roundel (see below).
- 1 decorated roundel**—this is a 16-petalled flower motif surrounded by a frame of 'Sasanian' pearls. The centrepiece is missing and may have once held a boss.
- 2 blank roundels**—these are to left and right of the central window.
- E façade **2 bosses**—1, a geometric knot, is set within the blind arch over the panel that once contained an inscription. The frame of the panel terminates at each side with a trefoil. Another boss is centred above the machicolation. These elements, together with an inscription panel, usually decorate a main façade; this would indicate that the gate was originally entered from the side, in the same way as the Jaffa Gate (pl. 24.27).
- 1 decorated roundel**: an 8-lobed flower with a scalloped frame, is placed between two projecting, undecorated, segmental triangles in relief, which act as 'spandrels'. A hole above may indicate a lost boss.
- W façade **1 blank roundel**.
- Interior **3 decorated roundels**—1 is centred above the arch over a panel which once presumably contained a dedicatory inscription. It is an 8-pointed star-polygon (fig. 24.20). To left and right, placed just below the panel, two roundels contain versions of the *khatam sulaiman* device (fig. 24.8).
1 blank roundel is placed above the window.
- C** *St Stephen's Gate (Bab Sitti Maryam, Lion's Gate)* 945/1538-39 (pl. 24.23, photograph dated 1870) (inscription in van Berchem 1923: 439, no. 122).
2 bosses; fig. 24.28. 1 is at the apex of the inner arch and 1 is centred at the level of the cornice above the top of the machicolation.
4 decorated roundels are found flanking the main arch. An 8-petalled geometric 'flower' is placed between the pairs of affronted lions; to each side, one course below and immediately to left and right of the outer lion, there is a multi-petalled rosette.
9 blank roundels—above the machicolation there is a blank roundel set into a frame split at the cardinal points. A small blank roundel is set at the apex of two blind arches on each side of the machicolation. The position and size of these roundels suggest that they may be reworked bosses. A larger blank roundel is placed under each of these arches; another is at the apex of two dumb-bell slit embrasures. Centred, below the machicolation, is a blank 8-lobed 'flower'. Within the arch above the entrance (which has been altered) there is a panel for a dedicatory inscription (now lost), with a blank roundel to each side of it.
- D** *Golden Gate (Bab al-Rahma wa Bab al-Tauba)* (closed).
1 boss placed in the centre of a large blank framed roundel, centred between and above the two arches, which each contain an empty niche for an inscription plaque.

5 blank roundels—3 are placed immediately above the double-arches; another blank roundel is placed over each of 2 slit window embrasures (pl. 24.30).

E *Dung Gate (Bab al-Maghariba)* 947/1540-41 (pl. 24.28 dated 1958) (inscription in van Berchem 1923: 442-3 no. 129)

2 decorated roundels: 1, above the apex of the pointed arch, is a concave 8-petalled flower framed by an 8-lobed flat fillet. In the centre there is a flower-like boss. Blank segmental triangles in relief flank the moulding which defines the arch. Within the upper section there is a panel for an inscription. Below this, immediately above the opening, there is a roundel, very worn, with a *khatam sulaiman*.

F *Zion Gate (Bab al-Nabi Da'ud)* 947/1540 (pl. 24.26, photograph dated 1857; fig. 24.29) (inscriptions in van Berchem 1923: 441-2, nos. 126, 127).

3 bosses (originally 6)—3 bosses, now missing, once marked the centre of decorated roundels (see below). There is 1 above each corbel-like structure. A photograph dated 1857 (pl. 24.26) shows a 'knotted rope' boss above the entrance below an inscription panel, and the other bosses were then still *in situ*.

5 decorated roundels—1 is set immediately below the machicolation at the apex of the pointed arch at the level of flanking 'corbels'; roundels with 'knotted rope' motifs are to each side of the central entrance; 1 8-petalled 'flower' motif is above the arched window embrasures to each side of the entrance. The mouldings of the arched apices are surmounted by flat, segmental triangles in relief which repeat the profile of the arch.

G *Jaffa Gate (Bab al-Khalil)* 945/1538-39 (pl. 24.27, photograph dated 1870; fig. 24.30) (inscriptions in van Berchem 1923: 439-40, nos. 124, 125).

A 19th-century woodcut (Steckoll 1968: pl. 1) shows Jaffa Gate from the inside. It is not possible to see the details, but the image includes a semicircular machicolation over which is placed a decorated roundel, and there is an inscription panel within the blind arch over the entrance. A roundel is shown to each side of the entrance at the level of the springing of the arch. Projecting corbel stones are also shown to either side of the apex of the arch, two courses below the machicolation. The city wall blocks the area now used as a roadway. A photograph of 1870, pl. 24.27) shows the gate from the exterior. It was entered from the NW.

Exterior NW (main) **1 boss**—a geometric interlace forming an 8-pointed star-polygon is set immediately below the machicolation and above the apex of the arch. The boss is surrounded by a frame of 'Sasanian' pearls. A window slit originally also appeared to each side of the machicolation

2 decorated roundels: there is 1 to each side of the entrance, at the spring of the arch. Each consists of geometric interlace emanating from a central 6-

pointed star-polygon. The interlace transcribes double kites and hexagons (fig. 24.18).

3 blank roundels—1 is above an inscription panel within the blind portion of the inner arch, another is set to each side of it.

SW
façade
Interior
of gate

3 blank roundels—1 is set above, and 1 to each side immediately below, a window slit.

1 boss—is in the centre of a decorated roundel with a central 8-point star-polygon.

2 decorated roundels—1 is above an inscription panel which has an unusual frame of 'Timurid' *rincaux* bearing trefoils. The roundel consists of a 4-part *rumi*-motif. Another, similar, roundel is placed above the arched opening to the slit window.

Interior
façade

(Much renewed)

3 decorated roundels—1 is set above an unusual semicircular machicolation, and consists of a 5-pointed star interlaced with another, with concave sides, from the points of which trefoils emerge. The word 'Allah' is inscribed at the centre. 1 roundel is set to each side of the entrance at the springing of the arch, both with a 4-part *rumi*-motif, as above. An inscription panel appears in the blind inner arch.

[H]

New Gate (Bab al-Jadid, Bab 'Abd al-Hamid) 1887.

Built by Sultan 'Abd al-Hamid II to provide access to the new suburbs, the only decoration consists of heavy, rusticated masonry.

The Towers

The towers are given Roman numerals.

1 *Stork Tower (Burj al-Laqlaq)* 945/1538-39 (fig. 24.31) (col. pl. LVI) (inscription in van Berchem 1923: 438, no. 121).

N façade **1 boss** which is placed at the centre of a large decorated roundel, see below.

5 decorated roundels are located 6 courses above the lowest level of decoration, described below, of 3 blank roundels. The outer roundels (1 and 4) to left and right consist of 4-part *rumi*-motifs. Roundel 2 (reading from the left) is an 8-petalled flower; Roundel 3 is a whorl reminiscent of a turban. 1 large roundel, a 20-petalled rosette with a 'Sasanian' pearl frame and a central boss, appears above the slit window embrasure.

6 blank roundels—these are both custom-made and deliberately placed. In each case, the circle is in relief against a square masonry block. 3 are set in a single course and form the lowest level of decoration; a further 2 blank roundels are placed to either side, of and in the course above, the large decorated roundel with a central boss described above; 1 blank roundel is placed centrally immediately below the crenellation.

E (main) façade **7 decorated roundels**—4 are in the course below dumb-bell slit window embrasures. Roundel 1 (to the left or south) contains a *khatam sulaiman*, with a 6-petalled flower at the centre, within a plain fillet frame (fig. 24.6); Roundel 2 has a similar plain fillet frame and has two interlocked squares forming an 8-pointed

star enclosing an 8-petalled flower (fig. 24.13); Roundel 3 contains an 8-petalled daisy-like flower with an 8-petalled central rosette; Roundel 4, to the north, in all respects resembles Roundel no. 3. To each side of the central arched window embrasure, and at the same level, there is a slit window. Above each there is a large decorated roundel with a central projection; the motifs in both consist of a 16-petalled flower, each petal framed by a rounded fillet moulding, and the centre forms a 16-part flat-faced boss. Above the apex of the arch there is an inscription panel and, two courses above, centred, there is a prominent roundel in a fillet frame with an 8-petalled flower. Each petal is concave to derive benefit in legibility from the strong sunlight and contrasting shadow.

4 blank roundels—here again the blanks have been cut to order. Three blanks form the lowest level of decoration, as on the north façade. The fourth appears above the dumb-bell window slit within the arched embrasure.

S façade **1 decorated roundel**—as on the east façade, this is located above the slit window and is of similar design—a 16-petalled flower with a projecting central boss.

3 blank roundels. 1 is in the same course as those described above in the main façade; 2 others appear at the level of the 4 decorated roundels also described above on the main façade.

2 *Unnamed.*
No decoration.

3 *Unnamed.*
Here there are clear signs of rebuilding. Set into the wall, near the base, is a stone bearing a carved trefoil with an additional small 6-petalled flower (fig. 24.22). The stone, which resembles those flanking the Ottoman inscription on the main entrance to the Citadel (see below), has been placed vertically rather than horizontally, so that the trefoil points upwards. See too Tower 22 below for a similarly misplaced carved stone.

3 decorated roundels—these are placed three courses above the stone described above. Roundels 1 and 3 consist of 4-part *rumi* motifs (fig. 24.17). Roundel 1 has a small 4-petalled flower at the centre. Roundel 2 is badly weathered—the central part is missing—and its frame is formed of ‘pearls’.

1 blank roundel is centred, 5 courses above the decorated roundels, between two slit window embrasures.

4 *Unnamed, close to St Stephen’s Gate.*
1 boss, centred.

5 blank roundels—2 are placed below the boss; 1 surmounts a small window opening; 1 appears over each of two window slits.

As the wall nears St Stephen’s Gate, each window slit is marked by a blank roundel over it, 3 in all.

5 *Sulphur Tower (Burj al-Kibrit) 947/1540-41 (inscription in van Berchem 1924: 442 no. 947/1540-41).*

NE façade **1 blank roundel** is between 2 slit windows on the same course as those described below.

SE (main) façade **3 blank roundels:** a central slit window has the dedicatory inscription panel below it; below this again there are 3 blank roundels, with 2 slit window embrasures between them.

SW façade **1 blank roundel**, as NE façade.

6 *Unnamed.*
No decoration.

7 *Unnamed* (close to the remnants of a square Ayyubid tower built in 1212 and dismantled by order of al-Malik al-Mu’azzam ‘Isa in 1219).

5 blank roundels—2 blank roundels flank a slit window set below a projecting corbel centred at the top of the tower. 3 further blank roundels are placed to either side of, and between, two slit windows below a dedicatory inscription plaque.

8 *Unnamed.*
2 bosses—1 is set above a ‘corbel’ with, below it, a slit window; the other is in the centre of a large, blank roundel.

2 decorated roundels both with the same interlaced 6-part motif, reminiscent of antique guilloche, are set above a panel for a lost inscription. Immediately below there are 2 slit windows.

9 *Unnamed.*
3 window slits but no decoration.

10 *Unnamed.*
7 blank roundels—1 is above a window slit on the north and south side façades; on the main, west, façade, overlooking Birkat al-Sultan, there are 2 blank roundels in the upper section with a single window slit between them; below there are 3 blank roundels set above 2 window slits.

11 *Unnamed.*
3 blank roundels—all 3 are in the main, west façade, set between 3 window slits which are arranged 1 above, 2 below.

12 *Unnamed.*
2 blank roundels set above and below a central window slit.

13 *South Tower of Citadel.*
Undecorated, although 4 re-used column sections are visible in the fabric of the wall. These each have a different circumference and protrude from the wall in an apparently random way, for there is no pattern to their position. It is seems clear, therefore, that these sections were used for technical rather than decorative or propaganda purposes.

14 *Unnamed.*
3 blank roundels— 3 roundels are set below a window slit with, above, a projecting square stone adorned with an 8-petalled rosette in a scalloped frame.

- 15 *Unnamed.*
1 **blank roundel** set above a window slit.
- 16 *Unnamed.*
A new inscription panel is centred over a window slit. There are no roundels.
- 17 *Unnamed.*
1 **blank roundel** set over a window slit.
- 18 *Tower close to Tancred's Tower (Qasr Jalut).*
NW façade (main) 5 **decorated roundels** set at two levels. The lower level consists of (1, left) a 6-petalled flower with small petals between and behind each main petal, and with another 6-petalled rosette at the centre; (2) a *khatam sulaiman* with a hexagon at the centre and small 'leaves' (fig. 24.7) emerging from each obtuse angle; (3) as (1) but without the secondary, outer layer of petals. Above are 2 decorated roundels, both with 4-part *rumi* motifs.
- NE façade 3 **blank roundels**—1 above, and 1 to each side of, a window slit.
- SSW façade 3 **blank roundels**, as above.
- 19 *Unnamed.*
No decoration.
- 20 *Unnamed.*
1 **boss** set directly below 2 blank roundels.
4 **blank roundels**—1 set high in the wall at the level of the crenellations; 3 blank roundels are at a lower level with 2 window slits between them.
- 21 *Unnamed (staggered)*
2 **plain 'nipple' bosses** on each SW step of the façade of the 'tower', set above a decorated roundel over a window slit.
2 **decorated roundels**—each is an 8-petalled rosette formed from intersecting half-circles, round a central concave-sided square.
- In each case, the decoration faces towards, and is visible from, the Damascus Gate.
- 22 *Unnamed 944/1537-38 (inscription in van Berchem 1923: 437, no. 119, shown at A on his fig. 69).*
Main north 3 **bosses**—1 (broken) is in the middle of the central decorated roundel on the façade at the lower level of decoration (see below). A geometric **knot** is to either side of the blind arch (see below) above a window slit, set within an 14-petalled rosette with a 'Sasanian' pearl fillet.
Another boss may have once filled the centre of a roundel with an 8-petalled flat-faced flower above the apex of the arch.
8 **decorated roundels**—at the lowest level, close to the present street, there are 2 roundels with *khatam sulaiman* motifs, 1 to either side of a damaged whorl with a broken central boss. The *khatam sulaiman* in

each case has a 6-lobed flower at the centre, and a half-palmette between each of the 6 points at the frame (fig. 24.10). 4 courses above these roundels, there is an inscription panel. Set above this there is a carved stone, decorated with a small 6-petalled rosette and a trefoil. This has been incorrectly placed after restoration work and originally would have acted as part of a decorated frame—compare Herod's Gate and the main gate to the Citadel. It is a pair to the one found within the fabric of the wall (fig. 24.22) described under Tower 3 above. To either side of this stone, at the same level, there is a decorated roundel, each with a 6-petalled 'daisy' round a central 6-lobed flower (fig. 25.21). To either side of the blind arch in the upper level there is a decorated roundel with a 14-petalled flower set within a 'Sasanian' pearl frame, and with a knotted boss at its centre, placed in each case above a window slit. A roundel with an 8-petalled flower is set at the apex of the blind arch.
1 **large blank roundel** is set above a window opening within the blind arch described above. There is an undecorated projection at the centre of the roundel, which should be compared to similar discs on the Golden Gate and Tower 8 to the west of Zion Gate.

- W and E façades 2 **blank roundels**—1 in each side façade.
- 23 *Unnamed.*
2 **decorated roundels**—1 set immediately below 2 window slits; in each case they consist of a 12-pointed star-polygon, formed of two interlaced 6-pointed stars, around a central 6-petalled flower.
2 **blank roundels**—in each case, they are set above the window slit described above.
- 24 *Unnamed.*
Undecorated.
- 25 *Unnamed.*
2 **decorated roundels** set at the same level as the dumb-bell base and to each side of a window slit. To the left there is a 6-lobed flower with another at its centre; to the right there is an 8-petalled flower with another at its centre, and small subsidiary 'petals' between them at the frame.
1 **blank roundel**, above the window slit.

The Walls

The walls are cut at regular intervals by window slits. At irregular intervals column sections have been set transversely through the fabric, but as this is for structural rather than decorative purposes (see Burgoyne, Ch. 31) these are not listed here. The main wall is otherwise largely undecorated, with two noteworthy exceptions: (i) to the north of Jaffa Gate, and (ii) close to the location of the Gate of the Tribes (Bab al-Asbat), which no longer exists, at the northern entrance of the Muslim Cemetery.

(i) North of Jaffa gate A blind arch contains an inscription panel—now replaced by one in Hebrew. Corinthian capitals mark the spring of the arch.

5 blank roundels—1 to each side of, and 1 above, the inscription panel, and 1 in each spandrel. Above the apex of the arch there is a ‘corbel’, decorated on its outer face with an 8-petalled rosette within a scalloped frame, and with a stone sphere resting on it.

(ii) Muslim Cemetary **5 decorated roundels** from left to right, starting close to St Stephen’s Gate—No.1 is above a window slit, a 6-pointed star (*khatam sulaiman*) around another, secondary 6-pointed star. To the left, there is No. 2, a roundel with a *khatam sulaiman*, the points converging at the centre to form darts (fig. 24.9). Around the points of the star, lobed frames form a 6-petalled flower. No. 3 is decorated with two intersecting squares to form an 8-pointed star polygon (fig. 24.14). Within this, there is another star polygon, the tips of which cut the sides of the squares at the middle point. A small 8-pointed star-polygon is formed in the centre. No. 4 is set above a window slit and consists of a 6-pointed *khatam sulaiman*, the points converging at the centre to form darts (as in No. 2 above). No. 5 is badly worn, but it is just possible to make out a 16-pointed star-polygon similar to those found at Damascus Gate.

The Sabils

The fountains are marked on fig. 24.24 with the letters a-f.

a *Sabil Birkat al-Sultan* 943/1536 (cat. no. 4; inscription in van Berchem 1923: 412-13 no. 110).

2 blank roundels are set in the spandrels of the arch. The circular projection is finely cut, as if to offer a toothed grip for an addition, while the remainder of the block is smooth. A zig-zag moulding frames the arch. Two layers of small *muqarnas* niches act as ‘capitals’ at the springing of the arch—the upper layer has 7 lanceolate niches to each side, with alternating motifs of vertical striations and a foliate upper section; the 8 lanceolate niches of the lower level are identical, each with a motif of 5 ‘petals’. The hood of the arch has a central stalactite *muqarnas*. The lowest course has 6 flat, broad niches; this level acts as a sort of dado to the *muqarnas* proper above. Here the lower level has plain lanceolate niches with stalactite attachments at the corners; the apex is formed of 3 plain niches below a scalloped hood.

b *Sabil Tariq al-Wad* 943/1536 (pl. 24.1) (cat. no. 5; inscription in van Berchem 1923: 413-14, no. 111). **2 decorated roundels** (two others are now lost). 1 is set outside the frame of the fountain, and is probably in re-use. It consists of a 6-pointed star of the *khatam sulaiman* profile, but is more reminiscent of the hexagon-based geometric interlace found widely on metalwork.⁴⁶

⁴⁶ See, for example, the ‘swastika’-like roundels on a penbox dated 680/1281, signed by Mahmud ibn Sunqur, British Museum OA 1891.6-23.5, or on a wallet in the Gambier-Parry Collection, no. 209. For a discussion on the motif see Baer 1983: 127-33.

Within the arch, in the *muqarnas* hood, there is a large boss, called here a roundel to distinguish it from the Ottoman bosses; it has a 4-part *rumi* interlace design through which another emerges to form an 8-pointed star, but it is now worn. Other roundels were once in the spandrels (see van Berchem 1920: pl. xciv, no. 111). The inscription panel is set into the lowest of three levels of *muqarnas*.

c *Sabil Bab al-Silsila* 943/1537 (pl. 24.3) (cat. no. 6; inscription in van Berchem 1923: 414-15, no. 112).

A photograph on the title page of Wilson 1865 shows the fountain with **3 decorated roundels**. 1 appears at the apex of the arch. It is shown as an 11-petalled rosette, but as this irregular number of petals is most unusual, the drawing is probably inaccurate. A roundel is also shown to either side at the spring of the arch (the right-hand one is missing). The sketch of the surviving roundel indicates that it probably contained a geometric motif. Modern replacements give the information that the fountain is a *waqf* of the Haram al-Sharif. The spandrels contain re-used acanthus scrolls, and the arch, where the inscription panel is placed, has a re-used rose window in its upper section. A zig-zag moulding frames the arch, which terminates in a *muqarnas* moulding. The water-trough is also in re-use, being originally an antique sarcophagus.

The roundels were lost by 1939, when the fountain was photographed by Elia Photo Service (no. 198) as they already were in an earlier but undated photograph, copyright the American Colony (pl. 24.39).

d *Sabil Bab al-‘Atm* 943/1537 (cat. no. 8; inscription in van Berchem 1923: 415-16, no. 113).

Undecorated triangles in low relief mark the spandrels, and there are 4 tiers of *muqarnas* within the apex of the arch. The decoration otherwise relies on crisp, high-relief moulding and elaborate capitals and columns.

e *Sabil Bab al-Nazir* 943/1537 (cat. no. 7, inscription in van Berchem 1923: 417-18, no. 115).

Low-relief triangles mark the spandrels. The decoration otherwise consists of elaborate mouldings and decorative bosses in re-use. An octagon, which is set above the inscription panel and surrounds a 12-petalled rosette with a central boss, dominates the inner arch.

f *Sabil Bab Sitti Maryam* (cat. no. 9).

The remnants of triangles in low relief mark the spandrels. There are no bosses, no roundels and no *muqarnas* in the hood. The inscription panel survives, but the inscription itself is lost.

KS *Al-‘Imara al-‘Amira (Khassaki Sultan)* 959/1552 (cat. no. 15).

North façade **3 decorated roundels** over the doorway within the arch of the portal. The angles of the door are moulded and finished with incised arabesques (pl. 24.12). The roundels to left and right are identical, filled by an

octagon with concave sides, each point bearing a trefoil. Woven through this is a swathe of palmettes (fig. 24.3) The centre is filled with an 8-petalled flower. The central roundel is a 5-petalled, 3 layered flower (fig. 24.2) placed immediately above a hook from which, presumably, once hung a lantern. There are two further roundels, carved into the corners of the stones with the left and right hand roundels. These are small 12-spoked whorls. In the course above the decorated roundels there is the frame of an inscription panel. It is now covered by a modern sign, Burgoyne (1971: 17-20, n. 7, fig. 13 and pl. XVIb) shows that the inscription was originally set within an inner panel that terminated in ogees. A narrow band of lanceolate *muqarnas* niches with foliate decoration within the upper arches acts as a cornice.

Wall on 'Aqabat al-Takiyya **2 decorated roundels** are to the east, that is on the all of the complex as it descends the street towards al-Haram al-Sharif; (i) is a roundel with a 10-pointed star-polygon where the points extend to form looped 'petals' (fig. 24.1) and (ii) is a geometric interlace forming a star-polygon, with trefoils borne on the points of the secondary motif; here the centre is marked by a subsidiary 'flower'.

South façade (main) **1 boss**—a geometric interlace forming an 6-pointed star is set immediately over the apex of the arch within the moulding which forms the frame (pl. 24.14). The moulding is formed from a series of lanceolate *muqarnas* niches, each with an exterior incised palmette. Originally the moulding terminated in shell-like additions between the niches. Four only remain—one at the apex of the arch, two to the west, one to the east.

4 decorated roundels—1 is in the centre, immediately above the apex of the arch (pl. 24.14). This is a complex, multi-layered and multi-petalled rosette. To each side of the arch there is a roundel of geometric interlace forming a 12-pointed star-polygon, similar to those found on the main façade of the Damascus Gate (see above).

The upper level of the façade has been rebuilt. Above the double window over the portal there is a moulding with a twist over each keystone. In between the twists there is a roundel with a geometric interlace forming a 10-pointed star-polygon.

Interior **9 decorated roundels** which are placed within the entrance porch. On each of the walls to left, right, and facing the portal, there are 2 roundels with a 6-petalled flower, with varying centres (fig. 24.4). Above the archway into the courtyard, centred above a (modern), inscription there are 3 roundels with 6-pointed star-polygons.

BJ North façade *Dar Bairam Jawish* 947-70/1540-62 (cat. no. 13)
5 decorated roundels, 1 decorated octagon—the octagon, which contains a multi-petalled, multi-layered open-flower motif in the centre of a frame of 8 twists, is located directly above the apex of the archway over Tariq al-Wad, immediately south of Sabil Bab al-Nazir. 2 roundels, each with a complex design based on the 4-part *rumi* motif, are to either side of the octagon. All three are difficult to see because they are partially obscured by a modern protective grille (pl. 24.22). A 6-petalled, multi-layered open flower roundel and an 8-petalled variety are placed above, to either side of the arched apex of a recessed window niche over the central octagon (pls. 24.20, 24.21). Another, similar, roundel is set to the west.

South façade **3 decorated roundels, 2 decorated octagons**—the roundel, which is similar in design to the 4-part *rumi* examples described on the northern façade, is placed centrally above the apex of the arch over the street. A smaller octagon is set two courses lower to each side. Above, a recessed panel terminating in a trefoil blind arch frames a window. To each side there is a decorative roundel, again based on the 4-part *rumi* motif.

Q *The Citadel (Qal'a)*

Main façade **2 decorated roundels**—these flank the arch. Each is a complex, geometric 12-pointed star-polygon, the outer sections of which contain hexagons (fig. 24.23). Both show traces of red, yellow and blue paint. This is probably of 19th-century origin. There are three inscription panels; the lowest is set in a panel with ogival terminals, which enclose an 8-petalled flower set within a scalloped frame. From the tip of the ogee sprouts an elaborate trefoil with a small 8-petalled flower to each side.

Chapter 25

LIFE IN 19TH-CENTURY JERUSALEM

Susan Roaf

Between the years 1800 and 1900 Jerusalem experienced changes that were almost to drag the city and its inhabitants from the medieval era into the modern world. These critical developments, which occurred largely during the latter half of the 19th century, owed much to the dual influences of the decline of the Ottoman empire and the rise of the city as a crucial pilgrimage centre for the Christian, Jewish and Muslim faiths.

Affairs in the Ottoman empire had generally reached a low ebb by 1800. By then Jerusalem had already been under Ottoman rule for almost three hundred years, and while the comment of one 19th-century observer that 'beside their thorough repair of the city walls between 1536 and 1539 the Turks had neither built nor encouraged any building in the city' (Schick 1884/5: 264-76) is seriously exaggerated, it is interesting as a gauge of contemporary views. The whole region had become increasingly unstable politically when in 1798 Napoleon invaded Egypt and then Syria. Although his campaign ended in a fiasco before the walls of Acre, it had done much to destabilise the area. The Ottoman government was deeply unpopular in Palestine. From 1808 to 1831 Jerusalem experienced a series of riots and uprisings leading to bloody retribution from the élite Turkish Janissary troops. The Greek revolution in the Balkans of 1821 had repercussions for Jerusalem, where the population was aroused against the Christians, who were accused of conspiring with the Greeks. In 1824 a larger uprising occurred when the Neophytes objected to paying ten times the usual tithes and taxes. The local regional governor who was based at Damascus sent out 2,000 troops to quell the insurgents, who surrendered only when artillery fire started to fall indiscriminantly on the

city from the Mount of Olives (al-'Asali 1989: 222-3).

By 1831 Jerusalem was the main town in the Ottoman administrative sub-division (*sanjaq*) which, with the *sanjaq* of Nablus, was united under the administrative rule of the governor of the *sanjaq* of Acre. The government of the district of Jerusalem was dominated by the civil (*mutasallim*) and the military (*qa'imaqam*) commanders of the city and the chief accountant (*mubashir*) (Robinson 1841 2: 82). These offices were responsible for collecting and supplying taxes to the sultans, some of whom spent huge sums of money on personal luxury and gave themselves up to the pleasures of the harem. Their continuous need for money led to the sale of public offices, bribery as an institution, crippling taxation and extortion.

Ibrahim Pasha, the commanding general of the Egyptian ruler Muhammad 'Ali Pasha (late 1760s-1849), marched into Syria and occupied Jerusalem in 1831. For nine years his presence brought a degree of peace and prosperity to the city before the European powers, interested in ousting Egypt from Syria, helped the Turks to overthrow the government of Muhammad 'Ali in Palestine in 1840 (Ben-Arieh 1984: 111).

Ibrahim Pasha restored equilibrium to the city with his avowed policy 'that the inhabitants (of Jerusalem) should be assured of their security and tranquillity, this being one of the most important elements in a war of conquest' (Hofman 1975: 312). At this time Jerusalem was still considered a 'small and backward town' (Kark 1986: 46) that 'from her ancient high estate ... has sunk into the neglected capital of a petty Turkish province' (Robinson 1841 2: 81). Christians had been forbidden to erect new structures without permits, which were difficult to obtain,

and those structures that did exist were pitifully small. The city itself abounded in vacant buildings—ruins were everywhere (Schick 1884/5: 264-76). Ibrahim Pasha's arrival in the city opened the way for renewed building activity which persisted even after his expulsion from the city (Schick 1884/5: 264-76). During his occupation, he built two barracks within the city walls, and one windmill outside them (Avitsur 1986: 232).

Ibrahim Pasha encouraged foreigners into the city and in March 1839 the first foreign consulate in the city was opened. The first consul was the British official William Tanner Young, who was followed in November 1845 by James Finn and his wife Elizabeth, who were to remain in Jerusalem for seventeen years (Hyamson 1939 1: ix). In 1842 the German consulate was established and in 1843 the third consulate to be established was that of the French.

After the return of the Ottomans to the region in 1840 it was Jerusalem that evolved into the capital of central and southern Palestine. The situation continued to encourage building development in the city. Not only did the Ottoman government continue to liberalise policies of land ownership for non-Muslim residents of the city but taxation processes were also improved, as was the city's political and administrative organisation (Ben-Arieh 1984: 111-14). Gaza and Jaffa were by then permanently attached to the *sanjaq* of Jerusalem and until 1858 that of Nablus was also under the authority of the Governor of Jerusalem (Scholch 1989: 238).

In 1838 the population of Jerusalem was reckoned to be 11,000 (Robinson 1841 2: 85). The next period saw a huge expansion in population—from around 12,000-14,000 people in 1840 up to 18,000-20,000 in 1860 (Ben-Arieh 1975: 53).

Foreign travellers at the time wrote about Jerusalem in a variety of ways:

the town (has) a peculiarly gloomy and melancholy appearance, enhanced by its deserted state, for the population is thin, and but very few persons are seen in the streets, excepting in the bazaars ... (Edgerton 1841: 17).

This lack of people in the city was also noted by Robinson (1841 2: 81), 'we now find a population of scarcely as many single thousands dwelling sparsely within her walls.' Others were more critical of the city with 'its narrow, filthy, ill-paved streets ...' (Lindsay 1858: 244). The city lay entirely within its walls at that date 'with only its dome-roofs swelling above the time-stained and lofty walls' (Lynch 1850: 402); its rapid encroachment into the adjacent countryside began only in the 1860s. Jerusalem nestles in a landscape of hills and valleys dominated by the

Mount of Olives to its east. Once inside the city gates, which were shut each night at sundown, travellers passed into the network of streets of shops and houses interspersed with half-ruined uninhabited houses, cultivated plots and mounds of rubbish.

Some travellers, however, seemed more impressed with the place:

From the descriptions of Chateaubriand and other travellers, I had expected to find the houses of the city miserable, the streets filthy, and the population squalid. Yet the first impression made upon my mind was of a different character; nor did I afterwards see any reason to doubt the correctness of this first impression. The houses are in general better built, and the streets cleaner, than those of Alexandria, Smyrna, or even Constantinople. Indeed of all the Oriental cities which it was my lot to visit, Jerusalem, after Cairo, is the cleanest and most solidly built. The streets indeed are narrow, and very rudely paved, like most of all cities in the east. The houses are of hewn stone, often large, and furnished with the small domes upon the roofs which have been already mentioned at Hebron, as perhaps peculiar to the district of Judea' (Robinson 1841 1: 329).

The Old City is still predominantly built of the stone, quarried traditionally from the locality (Canaan 1932: 228). It is the presence of this stone in the warren of streets and alleys, together with the distinctive style of building, which gives Jerusalem its unique character. In essence the city has retained much of its 19th-century appearance.

Olin records in 1840 that the walls facing the streets were usually windowless and that if there were any windows, they were usually on the second floor and provided with wooden or iron gratings (Olin 1843 2: 132-36). The *mijwiz* window was typical of the older houses of Jerusalem and was constructed of two-windowed openings beneath a relieving arch which were separated by a stone pillar. Other small circular or semicircular, lozenge and loop-hole windows were also common at that period. Also typical of the upper rooms of these houses are the projecting timber windows with their latticework shutters often open on three sides to catch the passing breezes. Unfortunately they were not well designed to keep out the wind, for even within these houses the inhabitants were exposed to the whims of the elements:

Friday 4th July, the wind rose suddenly at midday, and was so violent that I was obliged

to have all the casements closed, and even then the curtains were blown about, and papers fluttered through the rooms, yet the heat was intense (Rogers 1862: 328).

Edgerton, who visited the city at that time, described her lodgings thus:

The interior of the houses is equally unlike anything else. The doors of the rooms are so low, that we constantly give ourselves blows on the head, forgetting the necessity of stooping. You emerge from a narrow passage into a court, then up a steep short staircase into another open space, then up a staircase into a sort of terrace, off which are the rooms. Mr Young has kindly lent us a house containing three rooms ... My room is pleasant, with immensely thick walls with gothic windows, which are even glazed, and a door opens upon the terrace. The walls are arched in a peculiar way, and almost universal in this country; the furniture, a table, two chairs and a bedstead, as at Ramala; we provide the rest (Edgerton 1841: 17).

The house described is reminiscent of the numerous *haush* houses in the warrens of alleys in the heart of the Old City. A *haush* complex has a single courtyard accessed from such an alley and accommodates a number of different families on two or three floors. Conditions in the complexes were cramped and Olin records that only in the 1840s were toilets beginning to be built in the corners of the courtyards for the use of all the families (Olin 1843 2: 132-36).

These primitive privies were well described by Canaan who claimed that they gave those areas of the house a permanent stench (Canaan 1933: 44-6). In another corner of the courtyard the household rubbish would be piled, which was usually collected once a week and taken through the Dung Gate to the Tyropoeon Valley with the aid of donkeys (Ben-Arieh 1984: 27).

The age of such buildings is impossible to determine, representing as they do the accretions of generations of builders across the centuries. One such complex measured by students of the School of Architecture at Oxford Brookes University in 1994 (see Appendix 25.3) shows distinctly how the lower barrel-vaulted ground-floor rooms were very different in type from the various family rooms on the floors above them, and similar in form to stable structures. These store-rooms and stables with their massive walls were lit and ventilated by small window-like shafts in their roofs which gave onto the floors of the courtyards above. The rooms on the two

floors above have narrower walls and are roofed with a range of different vaults from barrel, to cross or disc-vaulted constructions (Canaan 1933: 10-18).

Within the rooms are a range of small niches (*khazana*) for storage. In houses of a later date these were fitted with shelves and wooden doors. There are also larger niches (*raksa*), 2-3m wide and 40-60cms deep, which are used for the storage of bedding. In some houses a seat is constructed beneath the windows with a small built-in cupboard beneath. Smaller *raksa* were used to store the boxes in which household linen was kept and other smaller cupboards were built to house the *ghaliyan* or water pipe. Other storage space was provided higher up in the angles of the arches where small cupboards were built in which to safeguard valuables. External walls also have niches for the suspension of kerosene lamps or, in the houses of the rich, to contain small water pitchers to quench the thirst of passers-by (Canaan 1933: 10-20).

The atmosphere within these complexes is confined and shaded, and even in the heat of summer the rooms on the lower floors remain cool.

The vaulted stone chambers in which we were received were cool and pleasant even at midday, and so furnished as to combine Oriental and Western luxuries. In the deep arched recesses and broad window-seats soft cushions were arranged on divans, and loose muslin drapery floated from open windows, fanning the air; glowing Turkey carpets and Egyptian matting covered the stone floors' (Rogers 1856: 35).

Beyond the *haush* complexes around the Haram were neighbourhoods of larger single-family houses such as the one described below by Mrs Finn, the British consul's wife, in 1857. The house was situated near the Damascus gate by the Tyropoeon Valley, which is almost at the lowest level of the city. The house was well built with a pleasant garden:

The house was a large one and thoroughly oriental, built around a large courtyard, the lower rooms set apart as store rooms, the upper ones reached by open stone staircases and open corridors, pleasant enough in fine weather, but in winter exposed to every shower and wind that blew (Finn 1929: 172).

But the Finns had not anticipated the health risks associated with their location on low ground and close to an open drain. At last they moved in 1858 to the extreme north-west corner of the city.

It was a small house but well situated and the only one we could get. At the front there were two doors, one leading into the kitchen and the other into a dark passage ending in a stone staircase to the terrace above the kitchen. Opening from that terrace were two pretty good rooms over the lower part of the building. At the end of the terrace was a tiny chamber meant for a kitchen; it had a large open chimney but no fireplace. Beyond that were a small room and two stone stairways, leading the one to the flat roof of the two rooms and the other to a good bedroom over the small end room. From this a good prospect was obtainable over the city wall to the country beyond, northwards. It was no easy matter to pack ourselves and our furniture into so small a house, but the change immediately told for the better upon our health (Finn 1929: 186).

This house is very similar to the one, recorded by the Oxford Brookes team, which is located at the corner of the Tariq al-Shaikh Rihan and Tariq Bab al-'Amud (see Appendix 25.1). We believe the house was rebuilt in the 1850s. The main street door is flanked beneath its arch by two stone seats and a rope-pull rings a bell for attention in the first-floor courtyard. The door opens to a small hall where the household rubbish is collected prior to its weekly disposal. Beyond are the stables and storerooms and the front wall of the water cistern. To the right rises a sharp flight of steps to the first-floor courtyard in which are located a raised stone basin, the cistern well head with its pulley and bucket, and a small, open water-storage tank of stone. Off this court are the small rooms housing the kitchen and store room where the slaves of the house slept until the middle of the last century. Beyond lie the doors, steps and halls leading to the main living rooms which are occupied by various members of the extended family—a father and his two sons and their families.

We gain some insight into life in these houses in the 19th century from descriptions by contemporary writers. In 1855 Miss Rogers described the furnishings of two houses in which she stayed. The first was a simple house:

The room in which we sat was very simply furnished. It was nearly square, the floor was of stone, and the walls were whitewashed; on a broad high shelf running round three sides of it many articles of native crockery and earthenware, drinking cups, jars, lamps, &c. were ranged. A mat of reeds, a carpet about as large as a hearth rug, and several pillows or

cushions were on the floor; a large red box, with brass hinges and ornaments served as the wardrobe of the family; the red cradle, a large metal basin and ewer, and a few small coffee cups, on a low stool or stand, of inlaid mother-of-pearl and dark wood, garnished the room; in a deep arched recess, opposite the door, a number of mattresses and wadded quilts were neatly piled up; for in genuine Arab houses no bedsteads are used, and consequently no rooms are set apart expressly for bedrooms; mattresses are spread anywhere, in the various rooms and courts, or on the terraces, according to the season, or to the convenience of the moment; and the beds and bedding are rolled up and put away during the day in recesses made for them. Thus, with a pretty good stock of mattresses and *lehaffs*, a large amount of guests may be entertained any night at a moment's notice. The room was well ventilated by two large square openings, near the ceiling, opposite to each other, one being just above the door, and the other over the recess for the mattresses (Rogers 1862: 47).

The second was a far grander establishment:

Narrow mattresses were ranged all around the chief room of the harem where I was received, and the floor was covered with matting. The ceiling was vaulted, and all the windows, which looked out onto the public places, were blocked up, so that the light only came from the door and the window which opened onto the half-covered private court. Mattresses, pillows, and wadded quilts were piled up in an arched recess, and a thin muslin curtain was drawn in front of it. Two red boxes and a red cradle stood at one end of the room, and a charcoal brazier with all the requisites for making coffee and preparing narghiles were close to the door. A large embroidered camel-hair cloak, and a sword, gun, and spear were hanging against the white cemented walls. Coffee flavoured with ambergris, and delicate sherbet made of almonds and rose-leaves were handed to me (Rogers 1862: 353).

It was not uncommon for women to smoke a hookah or water pipe which Miss Rogers described as 'the Oriental panacea' (Rogers 1862: 285). When the master of the house joined his ladies he was entertained:

The lord of the harem sent word that he would ... enter ... When he appeared the wives and the women servants immediately rose and stood deferentially till he was seated, then as they assumed their seats, they saluted him by touching their foreheads gracefully with their hands. He seemed very kind and gentle to all his family ... His children unconsciously proved to me that they were accustomed to being caressed by him, for they clustered around him lovingly ... (Rogers 1862: 354).

Such salons would serve as living rooms during the day and as bedrooms at night. Miss Rogers spent the night in a harem in the 1850s and was surprised to find that 'all the ladies, and children, and servants, and slaves were to sleep in the same room with me!' She slept on five mattresses piled on top of each other (her brother had once had the honour of sleeping on seven) and others slept on single mattresses on the floor. Two narrow hammocks about a yard long were unrolled and hung in ropes from iron hoops in the ceiling. The hammocks were made of strong palm-frond stems with coarse canvas stretched over them. To these the two swaddled children were strapped and covered with a tent like structure of mosquito net. Miss Rogers was also surprised to be much kissed and the centre of considerable attention during her evening in the harem (Rogers 1862: 230-1).

A slave in the house was afforded an honoured position if he or she were lucky. One Arab city notable claimed that 'When I have money to spare I lay it out on a house, a slave, a diamond, a fine mare or a wife' (Kark 1986: 55) which shows how great an investment a slave could be. This image of buying slaves as a boost to a household is reinforced by the obvious expense of the outfit of the slave described below.

The child was always attended by a laughing, merry-looking African slave girl, gaily dressed in yellow or crimson, with gold coins around her neck, large rings—each a potent protector from magic—on her fingers, bracelets of glass on her black bony arms, and tinkling ornaments round her ankles. She wore at the back of her head a shallow red cloth *tarbouche*, with a long blue silk tassel, secured by a gilt crescent. On the side of her broad nose a fine turquoise appeared. It was set in silver. She greatly admired her young mistress, and seemed to regard her as her especial property, as something very precious, which she delighted to caress, to embellish, and to protect. (Rogers 1862: 381).

Slaves were a feature of Jerusalem households until well into the 20th century, although not all would have had such a fortunate role to play in the daily lives of Jerusalem notables.

Life around the house would begin early. Breakfast may have consisted of a porridge of bread, milk, sugar and oil for the children while the adults ate bread and cream and coffee (Rogers 1862: 234). Tasks around the house were allocated according to wealth, status and sex. The grinding of wheat was, for instance, the job of the humblest and youngest female slave or hired servant, and no male would demean himself to do such degrading work (Canaan 1931: 17). The women of the household would share the jobs around the house such as food preparation, cooking, washing, baking bread or collecting water. For the very privileged women, attending to beauty treatments and the children took up a considerable amount of time. The clement weather meant that for most of the year, within the safety of the walls of the house, people could move freely about their daily tasks from inside to outdoors, taking full advantage of the available daylight.

Only at night was there a need to alleviate the darkness. To do this oil lamps were commonly used. Until around 1880 these were an indispensable utensil in every household. The oil lamps varied in size, shape and the number of wick nozzles. They were known by the name of *sirij*, *dau*, *misba* and *nau'asib*. The first name is the most recent and the last name refers only to the smallest kind, which normally gives only a faint glimmer of light. The wick (*fiila*, *sifafa*) is made of cotton threads or cotton cloth. The oil lamp is normally an oval shallow earthenware vessel with sides turned slightly inwards and pointed at one end. It is either open like a saucer, or its upper surface is closed in, leaving two openings, a large one through which the vessel is filled with oil, and a smaller one for the wick. The simplest lamps have one wick, but there were lamps with several openings from which wicks protrude. Richer peasants used to have metal lamps with several nozzles that were set on a high metal candlestick. Around 1880 the European paraffin lamp (*qandil kaz*) generally took the place of the oil lamp (Canaan 1931: 15-16). Wick-tongs or snuffers were used to extinguish paraffin lamps but were not necessary for oil lamps.

The lamps in guest rooms were customarily kept burning throughout the night to indicate respect and status. Wealthier people too would usually sleep in rooms lit by the flicker of a lamp to keep away the evils of the dark (Neil 1913: 67-76). In villages, lamps were also kept burning all night in the reception rooms (*diwawin*) of the chiefs (Canaan 1931: 23). In the homes of Europeans, Western lamps with glass shades were common in the latter half of the century and when great occasions took place the streets and buildings would be lit with cressets (Rogers 1862: 291). These were iron baskets containing pitched

rope, wood or coal that were burnt for light. Usually, however, people walking through the streets at night carried lanterns (Stewart 1857: 308).

In Jerusalem the lamps would have been predominantly filled with olive oil, while the Bedouin of the desert often used butter to light the lamps as it was more plentiful in their camps. During the First World War when olive oil was scarce, many people used sesame oil (*sirij*) which was cheaper and more readily available but gives off a slightly disagreeable smell. A few grains of salt were often put into the olive oil to improve the light, and, some believed, to cause the wick to absorb the oil more slowly as a matter of economy (Canaan 1931: 16). The oil lamps were raised in an elevated place either on shelves or often on small clay brackets fixed to the wall.

In richer households, or for special occasions, candles (*sami*) were used. They were either *sami nahl* made from beeswax or *sami sahm* made from animal fat. The former were more expensive and highly esteemed and both types were used in candlesticks (*sama dana*), or stuck on a wall bracket.

Keeping warm in winter was also a challenge if the weather was extreme, because the airiness of the apartments made them difficult to heat. Living rooms were heated by burning charcoal in small stoves or stone fireplaces. In 1833 a traveller stressed that the only fuel used in Jerusalem was charcoal bought from the Hebron district, but in fact wood was also bought from that region, carried on camel back, and then carried to individual houses on the heads of women. Fine wood for furniture was imported from Constantinople or Izmir, and building wood too came from abroad (Ben-Arieh 1984: 29).

If an evening party was being held the men would assemble either outside in the courtyard in summer or in the guest house (*madafa*) in winter. In both spaces a large fire was made which, besides giving light and warmth, was used for boiling coffee. The fire would burn brushwood or dried thistles and often in the winter green olive-wood was burnt (Canaan 1931: 16).

Of all the structures in the city it was the domes on the skyline of the city 'that lent Jerusalem its eastern character' (Orelli 1859: 115). Pitched roofs and chimneys were nowhere to be seen in Jerusalem—not on aesthetic grounds, but because there was a shortage of wood for heating and building purposes in the later 19th century. Every house had at least one dome over it, and many had two or three, depending on the number of their rooms. Paxton in the late 1860s believed that domed roofs were built because they afforded greater protection from the rain (Paxton 1939: 134). Robinson on the other hand attributes this type of construction to the shortage of beams needed for the flat roofs (Robinson 1841 1: 327-29). Orelli too attributed this manner of building to the scarcity of wood and the need to prevent rain-water from collecting on roof-

tops. He also noted that these domes insured coolness in summer (Orelli 1859: 111-26).

Roof-tops could also be walked on and were used as outdoor living rooms, particularly on summer evenings and on warm winter days. They often afforded panoramic views of the city and were the scene of considerable social activity (Ben-Arieh 1984: 26). The domed roofs were paved in stone to facilitate water collection from them (Luncz 1876: 17-18), but this practice had the added advantage of making them more useful as living areas and work spaces.

Provision was made on roofs for the curiosity of the inhabitants of the harem. Sections of the parapet walls of the roof were constructed with tiers of staggered earthenware pipes in them 'through which fair dames can look abroad without being seen' (Stewart 1857: 269). These pipes also channelled the breezes to refresh those seated or sleeping on the roof.

These roofs were not designed to withstand the heavy snowfalls to which the city is occasionally subject and sometimes they collapse beneath its weight. In March 1854 'very heavy snow fell and lasted for ten days ...' (Finn 1929: 117) and when 'the snow continued at intervals and it was more than a month before it was melted in the sheltered positions. It had to be shovelled off all the roofs' (Finn 1929: 167) in order to prevent their collapse.

It is interesting to note that Jerusalem had an ice-house as recorded by Mrs Finn:

When the youngest Finn girl got sunstroke in 1862 she had such a high fever that the doctor said: 'The only thing to be done is to send out of town for some snow to apply to her head.' The Greek priest Nikephori had stored away a quantity of snow in a pit in winter. Such a thing had never been done before, but the snow saved our child's life (Finn 1929: 230).

If snow was an inconvenience, rainfall was the life-blood of the city. The water supply was almost entirely dependent on the collection of the winter rainfall which in the years of 1860-66, for example, averaged only 19.86 inches per annum (Wilson and Warren 1871: 20; Chaplin 1883: 8-40).

Almost every private house in Jerusalem of any size had at least one water cistern and some had several. These were excavated in the soft limestone on which the city is built, usually to a depth of between 12-20ft, and were often lined with waterproof plaster (Ben-Arieh 1984: 74). Water was collected in the rainy season in a network of pipes and gutters from the roofs and courtyard floors and stored in the cisterns until needed. The cisterns were often barrel-vaulted with a round opening at the top in the pavement floor. Others were sometimes built up with stonework above, and furnished with a curb and wheel for a bucket, so

that externally they had the appearance of an ordinary well. With proper care the water in the cisterns remained pure and sweet throughout the summer and autumn. In this manner most of the houses and the public buildings were supplied with water in normal years.

Every cistern had to be cleaned once a year and the water collection areas kept free from debris. To this end the roofs and terraces of the houses were well swept, and the water from them made to pass through wire gauze or some simple filtering apparatus before entering the cistern (Wilson and Warren 1871: 22). When they were not kept clean the cisterns were a source of disease. Often cracked linings allowed sewage to seep in and even the rain water itself was frequently dirty and disease-bearing. Animals and rubbish would fall into the cisterns and by the time the next rains arrived the organic content of the water was frequently very high (Ben-Arieh 1984: 93-4).

Because the cisterns of Jerusalem could not supply all the wants of the city, water was brought in considerable quantity during the summer from fountains further afield. The main source was 'Ain Yalu in Wadi al-Wird, several miles south west of Jerusalem. The water was transported in skins on the backs of asses and mules and sold for a trifle for drinking to those who preferred it to cistern water. It was even said that one of the Jerusalem baths was supplied with water in this way during part of the season. A few wells outside the Damascus Gate were popular but contained poor water (Robinson 1841 1: 482). In 1855 most of the wells dried up, causing extreme distress. Even the Well of Job in the Kedron valley fell to a low level and soldiers were put around it to protect the water. The Jews suffered most severely (Finn 1929: 110, 150).

There were also large rainwater collection pools in the city, such as the Birkat al-Mamilla, 700 yards west-north-west of the Jaffa Gate, and the Pool of Hezekiah within the city walls. The latter was built of stones set in cement with steps at the corners. It was 96.3m by 61-66.4m by 5.5m deep. These pools were filled with rainwater in the winter and had dried out by mid-summer (Robinson 1841 1: 484, 352), although it was commonly believed that the Pool of Hezekiah was fed by subterranean conduits from a source outside the city, or a spring. There is also some evidence to suggest that a seasonally-supplied natural spring was used as a source of water near the Haram, and one was known to exist in the house occupied by the French consul in Bezetha during the mid-19th century (Robinson 1856: 245-47). The city was also served by an upper and lower aqueduct from Solomon's Pools, some 11.5km as the crow flies from the Old City. These aqueducts were up to 22km long and crossed the Valley of Hinnon, entering the city at a point north of the south-west corner of the walls (Robinson 1841 1: 390). Once inside the city the aqueduct was linked via channels and ducts to the Haram and various of the other innumerable

water-storage tanks (Robinson 1856: 247).

Even the largest of these reservoirs could fill after heavy rain. 'In this year (1851) the Upper Pool on the West of Jerusalem was quite full of water; such a sight had never been seen before ...' (Finn 1929: 94). That year Solomon's Pools, too, were for the first time full of water (Finn 1929: 97). In 1857 Miss Rogers records after heavy rain in March 'Solomon's pools, which, only a few days before, had been the safe and favourite play-grounds of Meshullam's children, were all quite filled in less than four hours' (Rogers 1862: 291).

This dependence of the city on sporadic rainfall created many serious problems for the inhabitants of the city for the first three-quarters of the century. No less serious were the problems presented by its poor sewage systems. Although there were sewers under the Old City they did not function properly for the first half of the 19th century. It was only at the latter end of the century that the authorities had them cleaned out and established a proper urban sewage system (Ben-Arieh 1984: 90). In 1864 Dr Chaplin wrote that not one house in fifty had its cesspool connected to the ancient drains (Schmelz 1983: 121-26). Only after the heaviest rains was sewage seen to discharge from the mouth of the old sewer in the Valley of Kedron (Ben-Arieh 1984: 90). This sewer was described by Robinson:

A low arch here (at the Dung Gate) forms the present outlet of a large sewer from the city. This was pointed out to us in 1838, as the sewer by which some of the Fellahin, in their siege of Jerusalem in 1834, passed in and got possession of the city. Another large subterranean passage originating above the upper fountain that was followed some 600 feet under the city by Dr Barclay in 1853 was also thought to have been a large sewer but was empty of all contents at that time (Robinson 1856: 250).

In the streets, which were unevenly paved with stones of different sizes, there was often a narrow channel down the centre which served horses and camels for rubbish and sewage. Pedestrians used the upper levels of the street on either side of the sunken channel. The channels were sometimes two feet deep. It was common for sewage to run down street drains and Mr Finn in 1858 complained twice to the Pasha about the open sewer near their house in the Tyropoeon Valley near the Damascus Gate (Blumberg 1980: 281, 283).

Rubbish and excrement left openly on the streets were only part of the health hazard in the city (Hofman 1975: 318). Perhaps a worse problem was the rubbish discarded on open ground around the city. Contemporary

descriptions of the filth abound. To get to the Church of the Knights of St John in 1855, Miss Rogers 'climbed over a dust heap, where vegetables and dead bodies of dogs and cats were rotting, where flies and fleas were regaling themselves, and half-naked, wretched-looking children were playing and munching melon parings'. In the same year she describes the north-east Muslim quarter: 'The patches of open land within the city are, in some places, used as drying-grounds for indigo-dyed linen; while others have become public dust-heaps or dunghills' (Rogers 1862: 26). Rain reacted badly with the rubbish:

... the effects of such floods soaking into the heaps of filth with which the streets abound, and drawn out again in a poisonous miasma by the heat and the sun, may well be conceived to be most injurious to health. Accordingly I found that few who had resided there any length of time had escaped the pernicious effects of fever and ague. During the heat of summer the town becomes so unhealthy that the Europeans are obliged to remove to a distance from it, and selecting some grove of olive trees, to pitch their tents and live under canvas (Stewart 1857: 305).

This rubbish had been accumulating for centuries and Wilson wrote in 1865 that :

Over the whole ground occupied by the present city of Jerusalem there is a large accumulation of rubbish, which attains its maximum in the valley running down from the Damascus to the Dung Gate, where it is not less than 50 to 70 feet deep, and in places more than this. Where the Armenian gardens are situated, near the Citadel, there is from 25 to 30 feet of rubbish, and in other places more or less (Wilson 1865: 56).

On the west of the street leading to the Damascus Gate, where a house had been torn away, and excavations were made for the purpose of laying new foundations. They had dug a hole like a well nearly fifty feet deep; and at this depth had found substructions and an arch (Robinson 1856: 183).

The very poor situation in the city concerning water, sewage, rubbish and the poor and unhygienic living conditions led to considerable health problems for the inhabitants of the city. In 1837 Jerusalem suffered from a cholera epidemic (Gilbert 1985: 10) and in 1838 the city succumbed to the plague and was shut up from 18 May to

the beginning of July (Robinson 1841 1: 369). No one went in or out of the city and fresh provisions were only sold to the inhabitants across a double fence with a gap of some six feet between the inner and outer lines of people (Robinson 1841 2: 320). The city also suffered from the plague in 1839 and 1840 and was shut up during 1839 for the month of March (Robinson 1841 3: 71). This situation was exacerbated because the chronically ill were also contained within the city walls. It was not until 1876 that the leprosy colony, which was situated within the Zion Gate and numbered thirty to forty inmates, was removed in part from its position inside the Old City to the German-run leper colony outside the Jaffa gate. It was not until the end of the century that all lepers were removed from the city (Ben-Arieh 1984: 98-101).

It was no wonder that with such conditions and the lack of medical facilities, the city was disease-ridden and suffered continuously throughout the 19th century from epidemics of cholera, fever, malaria and dysentery (Ben-Arieh 1984: 94-5). The appalling conditions in the city led many to escape its walls for the hot summer months, including the ill-fated Mrs Finn, the wife of the British consul who lived in Jerusalem for fourteen years and lost three children in this time. 'From the month of March onwards we were afflicted by very much illness. Mr Finn was seriously ill and so were all the children, and this lasted until we were able to get away to the tents' (Finn 1929: 178). A solution was found and the family moved to a house in the extreme north-west of the city, close to the city wall. It was elevated and had splendid views from the top floor of the whole country, the Mount of Olives, the Bethlehem Plain and the distant Hebron Mountains (Finn 1929: 186) as described above.

Second Half of the 19th Century

In the latter half of the 19th century a wave of developments was to sweep through the city and these vastly improved living conditions within the walls.

Lynch wrote (1850:16) that 'The Muhammedan rule, that political sirocco, which withers all before it, is fast losing the fierce energy which was its peculiar characteristic, and the world is being gradually prepared for the final dismemberment of the Ottoman Empire.' From the resumption of Ottoman rule in 1840 until the First World War, Jerusalem was governed by a series of *pashas* who at the beginning of this period gave priority to amassing personal wealth and exploiting their power. The situation was, however, to change in the coming decades because of a number of different factors.

During the Crimean War (1853-56) a building boom occurred within the city. Within one decade twenty-four building projects were completed within the walls. By

the end of the 19th century there were around a hundred and forty Christian schools, hospitals and convents inside the walls alone (Schölch 1989: 233). Robinson, who had first visited Jerusalem in 1838, returned in 1852 and recorded his impressions:

The city, like the whole country, had long since reverted to the direct sway of the Sultan; and the various civil and political reforms of the Ottoman Empire had here also been nominally introduced. A powerful foreign influence has been brought in, and was still exerted, by the establishment of the Anglo-Prussian bishopric and the other enterprises connected with it. The erection of the Protestant Cathedral on Mount Zion, as part and parcel of the English consulate; the opening of the Jewish consulate on Zion, under the auspices of the English mission; and likewise of the Prussian hospital; the establishment of schools, and the introduction of agricultural labour in connection with them; all had served to increase the circulation of money, and to stimulate the native mind to like efforts. The convents had erected several large buildings, and established schools; and there was a process going on in Jerusalem of tearing down old dwellings and replacing them by new ones ... There were at this time more houses undergoing this transformation in the Holy City, than I had seen the year before in six of the principal cities of Holland. As a natural result, there was more activity in the streets; there were more people in motion, more bustle, and more business (Robinson 1856: 160).

The population of Jerusalem was reckoned to be 11,000 in 1838 (Robinson 1841 2: 85). The city expanded from a population of around 12,000-14,000 people in 1840, to 18,000-20,000 in 1860, 30,000 in 1880, 40,000 in 1890 and 65,500 in 1922 (Ben-Arieh 1975: 53). The city grew from 699 *dunums* in 1841 (a *dunum* is a third of an acre), largely within the walls, to 4,130 *dunums* in 1917, of which over three-quarters were outside the Old City (Kark 1986: 46). As the Ottoman authorities placed increasing importance on Palestine during the course of the 19th century, Jerusalem emerged as a provincial capital with a privileged status. By the end of the Ottoman period in 1917, Jerusalem was a main urban centre in the region.

The power of the *pashas* from the middle of the 19th century onwards was gradually weakened as they were deprived of the authority to inflict capital punishment, and

they themselves could be tried and punished for abuse of power. They were appointed for limited periods of time, often only a year, and the *mulla* who also acted as chief judge or *qadi* in the city also served only a three-year term. Ottoman officials also began to be assisted in city administration by the city council (*majlis*) which was composed of 14 elected members from the leaders of the different communities in the city (Ben-Arieh 1984: 113).

As a result of the Ottoman reforms undertaken after the Crimean War (1855-56) significant changes occurred in the political and administrative structure of the city. In 1858 all the houses in Jerusalem were numbered in large Arabic numerals and recorded with the name of their owners and occupiers (Rogers 1862: 385). In 1863 the first municipal institution was formed, the Baladiyya al-Quds. It was a small establishment at first, consisting of six members and a mayor and deputy mayor, with a consultant physician and an engineer with wide-ranging powers to build and to demolish, to supervise roads, services, health, safety, and public records, and to levy some taxes like those on carriage drivers. This institution gradually gained more responsibility, taking over more duties including jurisdiction over the city treasurer and police. The municipality instituted many improvements including the building of clinics, hospitals, theatres, museums and parks. The increasing activity of the municipality highlighted the previous inactivity of the Ottoman regime which had very little interest in the development of Jerusalem (Ben-Arieh 1984: 122-24).

The growth of the population and the size and political influence of Jerusalem in the latter quarter of the century were closely dependent on the enormous growth of economic activity in the city. This was a direct result of the liberalisation of policies under the later Ottoman administration and the influx of three categories of newcomers into the city—Christian and Jewish immigrants from Europe and some from America; Arab (Christian and Muslim) and Jewish immigrants from the Middle East and North Africa; and Arabs and Jews from towns and villages in Palestine (Kark 1986: 50).

In 1856 Barclay noted the great increase in the Russian presence in Jerusalem. After the Crimean War, the Turks were seeking closer relations with the Russians, who were pouring gold into Jerusalem (Barclay 1856 2: 164). By 1864 the Russians had built a complete compound that included three hospices for pilgrims, a hospital, a consulate building and a cathedral to which they later added a bishop's palace in 1879 (Ben-Arieh 1986: 73). The wealth that such institutions brought was reflected in the fact that from the late 1860s houses in the city were being enlarged and new ones were being built within the walls (Schölch 1989: 234).

While agricultural and industrial activity did not increase appreciably in the region (Baer 1975: 495), some

industries—like the tanneries and slaughter-houses which had been inside the city—were relocated outside the walls in 1880 (Ben-Arieh 1984: 98-101). Other important industries within the city walls were soap production (particularly in the first half of the 19th century—Cohen 1989: 61-89), and silk production. The latter experiment had been begun in the 1840s and 1850s but was abandoned in the 1860s (Schölch 1989: 235). There was also a small dyeing industry which produced the indigo blue used for the garments of the peasantry, and a cottage industry for the embroidery of jackets (Finn 1929: 53), as well as the well-established sesame processing industry (Dalman 1964 3: 239).

Transport greatly improved in the latter half of the 19th century. In 1867 the Ottoman authorities began work on the first carriage road between Jaffa and Jerusalem, and by 1868 this was completed (Kark 1990: 46-73). Then in 1892 the Jaffa to Jerusalem railway was inaugurated (Elath 1975: 415-22). Both of these developments encouraged the stream of pilgrims who yearly grew in number (Ben-Arieh 1986: 368-69). In 1870 there were already between 10,000 and 20,000 pilgrims a year visiting the city and by 1910 this figure had reached 40,000. The Ottoman administration also built a network of roads linking Jerusalem to other towns in central and southern Palestine, further encouraging pilgrim travel in the Holy Land (Schölch 1989: 237). Only at the beginning of the 20th century was a diligence service introduced between neighbouring towns. Horses and camel trains remained the usual means of transport (Baer 1975: 497). The Transjordan railway, which had been built by a German named Meissener and opened in 1904 (Pick 1990: 193), brought a new era of international trade to the whole region.

As a result of the improved economy and transport facilities in the city, the import of goods increased from the 1860s. These consisted in the main of building products, cotton goods, flour, sugar, coffee, rice and tobacco, and the availability of different products in the shops increased. Exports from the city included oranges, soap, sesame and wines.

The improved transport systems also benefited the building industry, and new techniques were introduced from abroad. In 1883 a member of the American Colony noted:

There are at the present time more than one hundred buildings going up, all of stone, and most of them carefully cut stone. The new method is to use iron girders to support the ceiling. This is then covered with French tiles instead of the older more picturesque dome roof (Vester 1988: 77).

The building boom in the city from the middle of the century onwards in turn benefited the surrounding towns and villages. There was full employment for lime-burners and quarry-men and long lines of camels could be seen approaching Jerusalem with heavy loads of lime and stones. In the early 1890s, around three hundred and fifty skilled building craftsmen were counted amongst the seven hundred and twenty-nine artisans, traders and entrepreneurs in Bethlehem, most of whom worked predominantly in Jerusalem (Schölch 1989: 235).

In 1891 the extent of the building boom in Palestine was reflected by the fact that for the first time building materials were included in the top three imports through the port of Jaffa. No less than 61,500 tons of timber were imported and 28,000 tons of iron. Timber also figures as one of the top three imports in the years 1892, 1893, 1911 and 1912 (Gilbar 1990: 196).

There remained, however, one perennial problem—the scarcity of land within the city on which to build (Layish 1975: 530). The plots on which Jerusalem's houses were built may be categorised mainly as: *mulk* (freehold), *miri* (absolute ownership by the state) or *waqf* land, that is, land that belonging to a Muslim religious foundation. Within the old city walls much land belonged to a *waqf* and could not be sold or converted into private property except in exceptional cases where other plots were offered in exchange. The purchase of *mulk* land was also difficult, as it was divided among many different owners as a result of Muslim inheritance law. The policy of the Ottoman regime with regard to *miri* lands was inconsistent and in some cases these lands were given as gifts (Kark 1991: 18-19; Layish 1975: 530).

Most of the built-up land in Jerusalem, including the sites of mosques, monasteries and public buildings, was *waqf* endowed, administered by the Muslim religious endowment foundation, or by pious foundations of the various community groups. There was comparatively little land that was privately owned. If a landowner died without a male heir, his land became the property of the community (Ben-Arieh 1984: 121) although in some instances women could be the inheritors of parts of the estate, or controllers of the estate (Layish 1975: 530). The problem, however, does not seem significantly to have slowed the rate of development within the city until 1907, when a law was passed prohibiting the construction and enlarging of homes, or the addition of storeys without a permit (Ben-Arieh 1984: 125). This was tantamount to the first planning restrictions in the Old City, and was possibly the result of the shortage of available space for development after over half a century's building expansion.

With these developments came considerable improvements in the daily life of the city. By 1880 no longer were the gates of towns shut at sundown, which brought to an end the obstruction of trade and the

imprisonment of inhabitants within the walls. In Jerusalem the sanitary department was put in the charge of a German physician, and building affairs in the hands of a German architect. In the 1880s the decision was taken to supervise sanitation, dig new sewers and repair and pave the city streets. This work was accomplished by the mid-1890s (Ben-Arieh 1984: 124). The paving of streets and the installation of a sewage system started in the 1870s, and the sewage system was expanded continuously until 1914. One great change was that in 1882 all the rubbish was being accumulated in the Pool of Bethesda, which was then filled in and planted as a public garden. By that date already a large portion at the east end had been levelled (*PEFQS* 1882: 3).

The water supply remained one of the major concerns of the municipality. From the 1890s the streets were sprinkled with water—at least during periods when dust became too much of an annoyance. Public conveniences were built and a regular garbage collection was introduced (Schölch 1989: 240). It was not, however, until 1926 that Jerusalem was provided with a pumped water supply—at a cost of £63,000 to the government of Palestine. It was supplied with water from 'Ain Farrah, a copious spring to the north-east of the city. Some years later a larger source was tapped at Ras al-'Ain near the coast and pumped up the 2,700 feet to supply the growing city (Vester 1988: 207).

In the 1850s Lucifer matches arrived in the city (Stewart 1857: 281) and these proved to be only the first of many advances in lighting. From the 1890s thousands of kerosene lamps were installed to light the streets of the Old City, as well as in the houses. These lamps were first imported from across the Atlantic but later came in from the Black Sea port of Batum. The new oil, kerosene, was introduced in 1866/7 and was more refined than olive oil. It burned without fumes or soot and so was better for domestic use (Ben-Arieh 1986: 407); moreover it was two-and-a-half to three times cheaper than edible olive oil (Avitsur 1975: 490).

It was not until the Ottoman period had ended, after the First World War, that the lux light, a pressure lamp, became widely used. In the years before the war plans were discussed to introduce electricity to the city (Schölch 1989: 240) but it was not until the 1920s that an electricity supply finally arrived in the city. In HM Report of 1925 there is no account of the use of electricity in

Jerusalem although the activities of the Jaffa Electric Company and the Palestine Electric Corporation in Haifa and Tiberias are documented (HM Report 1925: 47). By 1927 it was reported that 'Many temporary permits for small plants were granted in Jerusalem and several quarters are now lit by electricity' (HM Report to the Council of the League of Nations on the Administration of Palestine and Transjordan 1927: 64). By contrast, Damascus and Beirut had been supplied with electricity for tramways and lights by the end of the Ottoman period in 1915 (Baer 1975: 496).

There were a few disadvantages to the development of the city. As the population of the city increased rapidly in the latter half of the 19th century, fuel for burning became more difficult to procure. Mrs Finn wrote in the early 1860s that there was a great scarcity of charcoal in Jerusalem; this was the only fuel used for cooking purposes, or even for warmth, in most houses.

We always burnt wood which the peasantry brought in, blocks of olive wood, or roots still found in the ground on the mountains from great old oak trees. These roots had great solid knobs of wood and formed splendid fuel; I have known a tree root to furnish nine camel loads of wood. For the ovens they bring in sticks of brushwood and in the summer wild flowers and plants (Finn 1929: 177).

The Europeanisation of the city continued apace.

European clothing is now common both with men and women, and many of the latter may be seen dressed in the latest Paris fashions ... Even the red fez is not obligatory on non-Mussulman Government servants. European furniture, chairs, sofas and tables, are now common (*PEFQS* 1880: 187-88).

However, when considered as a whole, perhaps a small degree of Europeanisation was a low price to pay for the liberation of the city and the lives of its inhabitants from the meagre and unhealthy conditions that existed within its walls in the early decades of the century, under the indolent eyes of its Ottoman rulers.

APPENDIX 25.1

BAIT MAMLUK

(figs. 25.1-25.5, pls. 25.1-25.6)

The Bait Mamluk occupies one of the most fortunate positions in the Old City of Jerusalem. It is situated on the corner of Tariq al-Shaikh Rihan—which leads down to the main square in front of Damascus Gate—and a small alley leading up to Tariq Bab al-'Amud. The house stands in an elevated position 2,489 feet above sea level, some 178 feet above the houses in the valley of the Bab al-'Amud district to the west. Directly to the south of Bait Mamluk is the site of the residence of the British consul from 1858. The advantages of the location with its fine view and fresh, healthy air was dwelt on in some detail in her diary of the period by Mrs Finn, the wife of the then consul. The location of the house was included in the British Ordnance Survey map of 1865, which shows the position of the bridge rooms over al-Tariq al-Shaikh Rihan.

Over the entrance to the house is an imposing vaulted arch within which an unglazed ornate metal fanlight is surrounded by a stone moulding with a zigzag pattern. On each side of the entrance there is a bench or *mastaba*, some 75cm in height. The door itself is made of metal and in the upper left hand corner there is a slit for mail which appears to have been made at the same time as the door.

This door opens onto a narrow hall with stairs leading directly off it to the right. Opposite the front door there is a second opening onto what now appears to be a corridor, but this is obscured from view. A timber screen has been erected opposite the main door and at present this whole area is used for storage. A vaulted room to the right has two doors leading out of it in the south-eastern corner. These rooms were probably originally used for animals and storage. The household refuse is left on collection days at the base of the staircase immediately inside the front door against the wall, from where it is collected.

The stairs lead up to an asymmetrical courtyard. In its centre there is a stone pedestal basin which now contains plants, but which was originally used as a water basin. Off this courtyard are situated the main domestic quarters of the house. They feature the three different zones which are typical of the larger houses in Jerusalem. The first zone is that of the *salamlik*, the public rooms used by the male members of the family to entertain; this zone in the Bait Mamluk is situated to the south of the court in the bridge rooms (*qantara*). The second zone contains the private living rooms of the family or *haramlik*, with different rooms for each of the men of the family, their wives and their children, or for each different wife of the owner of the house. The main family rooms are to the west of the courtyard and are on two floors. The third zone comprises the domestic quarters—kitchen, store-rooms, servants' rooms and bathrooms. These are all situated to the north and east of the courtyard. To the east of the first floor of the bridge are two closed rooms which we were unable to survey but their favourable location with an aspect to the east and breezes from the valley would have made them pleasant; probably they acted as living rooms for the family as well as for guests.

The bridge rooms predate 1865 when, as already stated, they are shown on the British survey map of the city. In the centre of the first floor of the bridge, a corridor leads from the courtyard to a dog-legged flight of stairs which gives onto an open courtyard on the second floor. This in turn is surrounded by parapet walls

and has a single large room to the west. In the northern parapet wall of this upper courtyard, above the apex of the corridor arch, there is a small window which provides a view of the lower court from the roof. An upper section of this wall was built as a later addition; this includes a triangular construction of ceramic tubes which allows air movement through the parapet wall, whilst maintaining privacy for the women seated or sleeping on the roof or in the courtyard below.

The single room leading off this upper court is the second floor bridge room. The door into it is framed by a fine arch supported by well-formed pillars with simple capitals. The walls of the room have deeply recessed cupboards and windows. Its ceiling consists of a single dome at the apex of which there is a single six-sided star surrounded by similarly-sized stars located on the flanks of the dome.

On the east side of the first floor of the bridge there are two doors for rooms. There were no keys for these at the time of the survey. Opposite these there is the lower guest room of the bridge. The door of this room has a simple architrave, indicating that it is of lower status than the room above. This would make sense, for the room above would have not only the finer view but would, in all but the hottest times of the year, be more comfortable, for it is exposed to the winds and open to the winter sunshine. When the weather was very hot, this upper room would be less comfortable than the room below, for its four walls and roof are exposed to the heat and a high level of solar reflection from the terrace floor to the east. In such weather the first floor bridge room would be the more comfortable, for—while still exposed to any breeze there is from the cooler valley—it is shaded from the worst of the sunlight by the building above.

The floor area of the first floor room is identical to that above, although the window and cupboard arrangements vary considerably. The ceiling of this room is constructed of two vaults of different sizes but the same height. This double vault was necessary because the floor above must have been built at the same time, and the headroom necessary to build a single dome over the space—available on the floor above—was lacking. The elegance of the design and the skill of the builder is indicated by the position of the windows in both rooms in relation to the resolution of the downward force of the arches, the roof construction in both rooms, the external street elevation and issues of natural lighting. The gracious proportions of the room within are enhanced by a pair of traditional Jerusalem arches, which are—typically—crowned with a single circular vent below the apex of the conjoining arch.

It is interesting to note that, in the two main bridge rooms, there are fairly large windows which also face onto the courtyard in which the ladies and servants of the house would have moved and sat. As with the Via Dolorosa, there appear to have been lines of sight from the *salamlik* to the *haramlik*, unless curtains were used, or the ladies were confined to their quarters because male visitors were in the house.

The other main rooms accessible from the courtyard are the large living rooms to the west of the court. The lower floor of these two rooms has a double-vaulted ceiling and, to judge by the thickness and use of recesses and windows, this may well be contemporary with the bridge rooms. The room above it, however, which is reached via an antechamber and steps to its east, appears to be of a later period. The walls are much narrower, and its windows, including the *mashrabiyya*, are in a later Ottoman style—but the give-away detail lies in its ceiling. This flat timber ceiling is built in an identical style to that in one of the

grand rooms at the American Colony Hotel, which can be dated to post-1870. It thus appears that around 1875-1880, during the great building boom in the city, a second floor was added to Bait Mamluk. At the same time the windows in the room below were replaced to match those above. This would explain why the window proportions on the courtyard façade are dissimilar to those of the bridge rooms, and why the style of the *mashrabiyyas* is unique. These two western rooms off the court are now used as family rooms.

The other quarters of the house have more humble proportions. The hall and three rooms to the east of the house are a suite of family rooms, as are the two rooms in front of them. The WC is to the west, in the centre of the house. On the eastern corner of the courtyard there is a small domed room, which appears to have quite a complex history. No wall in this room is straight. The walls contain a number of niches sunk into the thickness of the wall. It has high-level windows which not only allow light into the room, but also ensure that hot air rising in the room can easily escape. Originally this may not have been used as a living room as it is today. There is a rough door cut through the north wall of the room into a small room, which has a floor raised two steps above the adjacent corridor to the west, to which it is

linked by a well-formed door. The doors indicate that originally this small room was not linked to the room to the east, but was entered from the corridor. Originally it may have functioned as a kitchen.

To the east of the courtyard is located a second well-proportioned room which is now kept locked. It was apparently a store-room, and served also as a room where the household slaves lived until the 1920s, when they were granted freedom from servitude. The locked rooms in the house result from the inheritance practices in the city, whereby a number of children can inherit a property and retain their rooms whilst living elsewhere.

Rainwater is collected from the roof of this most easterly room and feeds through a basin-like feature to the south east of the courtyard into a water cistern below. The actual well-head of this cistern is in the north of the courtyard and is raised some 1.20m above the floor of the court. Attached to the wall nearby is a hinged triangular metal arm which can be swung over the well-head, and to which a rope and bucket are attached so that the water can be drawn when required. A single step has been constructed on the west side of the well-head to make drawing water easier for shorter people.

APPENDIX 25.2

SESAME MILL

(figs. 25.6-25.10, pl. 25.7)

The building is located to the north of al-Harat al-Maidan at an elevation of 2,488 feet above sea level. It is situated behind a pair of shops facing south onto the street. One of these shops retails the sesame oil. The main hall of the sesame mill is approximately 12.5m long by 8m wide and 4.5m high. The space is lit by three high windows, and now by strip neon lighting. The mill hall was originally divided into six bays, each with a cross-vaulted arch. The south-east bay, however, has now been walled off to form a separate store-room.

The raw sesame seed is delivered in nylon bags (*kis*) into the mill hall via a double timber door in the east wall. The seed is then stored in a store-room to the south of these doors until it is required for processing. The oven is located in the western half of the north wall of the mill hall in a cross-vaulted room. The second processing hall is situated to the south-west of the main hall in which the separation process is carried out.

The method used for the processing of the sesame seed consists of seven stages. The majority of the processes appear to have been undertaken by a single operator.¹

1. The sesame seeds are soaked to loosen the husks (*khasharhu*).

¹ In the local Arabic terms quoted below the transliteration is intended only to approximate the sounds.

2. The seeds are then placed in the husker, where they are stirred to separate the husks from the seed.

3. The seeds are then scooped up in a *juni* (*ufi*) or shallow woven basket, and placed in water-filled basins (*haud*) which are c.1-1.5m high and roughly of the same proportions in cross section. In these basins, the inner seed (*lub*) is washed and any remaining husks are removed. The seeds may be washed three or four times in succession to ensure that they are completely clean and well-soaked.

4. The seeds are then drained by lifting them out of the water and transporting them in water-permeable woven baskets and placed in the oven (*firm*), which is heated by burning kerosene taken from a 50-gallon drum above the oven.

5. After part-roasting, the seeds are removed from the oven and placed in a walled bin to the west of the oven, where they are raked and cooled.

6. Once cool, the part-roasted seeds are scooped into the hoppers (*makhan*) above the mill-stones (*hajar siwan* or *hagar*) and are then ground. During the roasting process, not all the water is removed from the sesame because the grinding process results in a relatively liquid paste which runs out from between the stones. This sesame paste (*tahini*) is collected and stored in tins (*tanaki*). This paste is either sold as it is or it is further refined.

7. If pure sesame oil is required, this paste is then poured into the separator (*ahjani*), in which a motorised arm stirs the paste gently until the pure oil (*sijij*) rises to the top, leaving a thicker paste below. The oil is then placed in a ceramic bowl in the shop in front of the mill. This bowl is 1.2m deep, set into the shop counter (*jurum*). The oil is sold out of it in pots or containers brought by the customers, weighed out on scales (*mizan*?) on the sales counter.

APPENDIX 25.3

A TYPICAL JERUSALEM HAUSH

(figs. 25.11-25.14)

The *haush* complex described here is situated at an elevation of 2,415 feet above sea level, in an alley to the north of Tariq Bab al-Hadid in the Harat Bab al-Silsila neighbourhood. The alley is virtually in the same form today as it was when it was recorded on the British Ordnance Survey map of 1865. The alley leads to seven houses, of which six were recorded by the student team from the Oxford Brookes University in 1994, funded by special grants from the British Academy and The World of Islam Festival Trust. The house on the extreme south-east corner of the alley had already been surveyed previously by the team from the British School of Archaeology in Jerusalem for the publication *Mamluk Jerusalem*. In the south west of the alley lies an area of rubble where two houses stood until destroyed by a bomb in the 1976 war. The date of the houses is impossible to determine, but each of them shows evidence of continual growth and adaptation over a very long period—certainly many centuries. Each house now has more than one family living in it, although in several of them the current occupiers claim to be descendants of earlier owners of the building. The laws of inheritance in the Old City are complex and are based on a system of sub-division in which successive descendants inherit proportions of a property according to *shari'a* law.

The system of extending homes appears to work in piecemeal fashion and is often hazardous. In many areas of the plans there are very small tolerances between the back of one niche and the beginning of another in the house next door. Two instances were reported where an energetic occupant had taken a hammer to a wall and gone through it into an adjacent room of the neighbouring house.

Each of the houses follows a similar pattern. At the level of the alley, narrow entrances lead into a hall, corridor or courtyard. Off these spaces are located the monolithically-walled, poorly-lit and ill-ventilated rooms which may originally have been used for animals, storage, service rooms and servants. These ground floor rooms are typically covered with a rough barrel- or cross-vaulted ceiling. A number of the rooms have light-wells running through the ceiling into the floor of the courtyard above to provide them with some light and fresh air. The need for extensive storage space is demonstrated by the fact that, on a number of occasions in the 19th century, the city was quarantined within its walls for several months because of contagious diseases. The decision to do so was taken on the spur of the moment in order to prevent the health hazard spreading beyond the city limits. Equally, in times of civil unrest or war there would have been a need for plentiful supplies in store.

A narrow stair links these ground-floor areas with the rooms of the first floor. These rooms were used as family living spaces and also, in some cases, for entertaining. In some of the larger houses it is possible to see that there may once have been separate flights of stairs for men and their women and children, while in other houses anyone entering the upper floors would

have shared a single stairway. These arrangements shed much light on the houses and society of pre-modern Jerusalem. Clearly this was not a city of great wealth. The more affluent cities of the Near and Middle East—such as Baghdad, Damascus and Isfahan—would, in the 19th century, have had sufficient space in the houses to allow for dual entry to ensure complete separation of guests and members of the family. Moreover, space within the city was at a premium, for it was not until the 1860s, probably at least a thousand years after this quarter of the city was first settled, that housing spread to any extent beyond the city walls. Thirdly, it suggests that there was a certain freedom or ease of relationship between the sexes that did not exist in many other Middle Eastern cities, where the separation of the sexes was achieved in numerous ways in the local architecture, and remained absolute. In more recent years at least, the separation of the sexes in Jerusalem would have been achieved by arrangement rather than by design.

It is noticeable, however, despite the previous statement, that the largest and finest of the houses to the very west of the *haush* probably also had, as a second courtyard, the space occupied by the first-floor courtyard dwelling to its southeast. Evidence for this rests on a number of features. The barrel-vaulted basement store-rooms for both houses are very similar in proportion and construction. The vaults of the first-floor rooms that surround the first-floor courts are also very similar. The exception is the room above the alley, which has more ornate vaulting and is likely to have been a later addition. This provides a tool by which to judge the dates of the other vaulted rooms in the *haush*. Those with simpler cross vaults are probably earlier than those with more elaborate vaulting.

This would mean that the original house, entered through double gates, would have included the original entrance of the house to the east after the first gate, and the gate-keeper's rooms after the second gate. The extensive store-rooms were in the basement below the ground floor of the houses. To the north, at ground-floor level of the west court, the stables were probably located, and these needed no steps to enter them. The east court may have been the area for the servants or possibly for the *haramlik*, while to the west the courtyard had a wide, pleasant terrace in front of the north-facing summer rooms. To the north of the court, the south-facing winter room had a larger than usual window to catch the low winter sun, and its west walls were exposed to the sun by means of a terrace to the west of the room. The room to the east of this court on the first floor does not appear to be original, as it is built across the original arches of the south-facing façade of the court. This upper room would have been open to the cross breezes which are particularly delightful in the spring and autumn months.

Thus, embedded within the confines of this *haush*, there is a large and important house apparently of the medieval period—though it must be admitted that methods for dating such structures have yet to be established. From the nature of the vaulted roofs surveyed to the east of it along the alley of the *haush*, it is possible to deduce that this fine house predated the other rooms of the other houses on the upper floors surveyed by the Oxford Brookes team.

APPENDIX 25.4

HOUSE ON THE VIA DOLOROSA¹

(fig. 25.15-25.16)

The house is situated at an elevation of 2,455 feet above sea level, in a prime location in the commercial heart of the Old City of Jerusalem on the south side of Via Dolorosa. The house is a fine example of a dwelling that evolved over the centuries to serve the needs of a wealthy family. It is currently home to a number of different families who occupy either single rooms or groups of rooms around the building complex. The rooms illustrated in fig. 25.14 lie at the heart of the complex and are aligned roughly north-south. This block is three floors high, although access to the basement—which is likely to have housed the stables and animal pens—is now closed off.

The house is entered from the Via Dolorosa via a pair of low wooden doors and up three stairs into a narrow, 9m-long, private alley between other houses. At the end of this alley on the left, another pair of double doors leads to the rooms of one household. Continuing on under an arched gateway and up a step, the alley widens to give entrance to another house on the right, and a flight of steps ahead. To the right of the staircase, the ground slopes down to a blocked-off recessed entrance, which probably led originally to the basement stables and ground-floor stores of the house above. Originally, all the dwellings located off this entrance would have been associated with the main household family.

Seven steps to the south lead up to a landing, from which a flight of three, and then thirteen, steps to the west lead up to the first-floor living rooms. A further flight of five steps off this landing leads around the north-east corner of the building to a narrow court, which has two rooms opening off it to the east; a door to its west opens to the ground-floor room of the main house. To the south, this court narrows into a short alley, from which a second door opens to the west into the second of the

vaulted ground-floor rooms. Three further doors to the east open into other rooms, which are now in multiple occupancy.

To the south of the main building, four further steps lead to an upper court, from which three further doors open. On the south wall of the building, a disused flight of steps leads up to what would have been the domestic (rather than the guest) entrance to the house. These southern rooms were probably the kitchen and servants' quarters of the house, while the large ground-floor rooms of the main block were the *haramlik*. However, the occupants of the *haramlik* would in this case have been visible from the staircase which ran up the *salamlik*, unless some form of screening—perhaps with a curtain—was employed. The ceiling of the *haramlik* is constructed of a series of three rectangular cross vaults supported on piers. The room is light, with a double window in the centre of its north side, and a single window in the east and south walls. The room has been divided in more recent times by an ill-fitting wall which cuts across the cross vault to form two living rooms. The kitchen and bathroom which serve these are across the narrow court.

At their apex, the stairs leading to the *salamlik* opened onto a terrace which originally led to an attractive garden to the west. In recent years, this has been walled off to form a vine-covered smaller terrace with benches and plants in pots. At the south end of this terrace, four steps lead to an upper terrace, to the east of which is the main door and vestibule of the *salamlik*. These are now occupied by a separate family. This delightful space has a decorative inlaid stone floor. An ornate entry arch in the first bay leads to a cross-vaulted chamber, which in turn leads to the main *salamlik* room, the bedchamber and its antechamber. At the top of the original servants' staircase, a cupboard-sized room has been constructed off the vestibule.

The rather tortuous approach to the first floor rooms is an excellent preparation for the spatial surprise which greets any visitor to this house entering the apartments of the *salamlik*. After the confined spaces of the Old City streets, and the narrow lane and stairs leading to this room, the experience on entering them is elevating, for the main chamber has fine high proportions, a perfectly circular dome, a light and airy feeling produced by its well-proportioned windows, and the beautiful stone floor referred to above. These rooms, to judge from the very different architectural proportions enjoyed by the main chamber and by the adjacent domed bedchamber, with their classic Ottoman proportions, are of a later date than the rooms below.

¹ The house is currently known by the name of the occupants, Dar al-Shaikh Yasin al-Bakri. I am grateful to Dr Yusef Natsheh for this information.

Chapter 26

THE DOME OF THE ROCK RESTORATIONS AND SIGNIFICANCE 1540-1918

Beatrice St Laurent

‘When Jerusalem was in the possession of the Circassian Mamlukes all the *ulema* and pious men went out to meet Selim Shah in 922/1516. They handed him the keys to the Mosque al-Aqsa and the Dome of the Rock of Allah. Selim prostrated himself and exclaimed: “Thanks be to Allah! I am now the possessor of the first *qiblah*”.’¹

Evliya Çelebi thus describes the Ottoman takeover of the city of Jerusalem by Sultan Selim I. Selim’s claim to possession of the ‘first *qibla*’ signals Ottoman awareness of the significance of Jerusalem, its place in early Islam and the importance of that legacy to Ottoman claims of religio-political hegemony over the Holy Land and the Hijaz. When Selim entered the city, he ‘passed the documents of Umar, which were in the possession of the Greek and Frankish monks [*sic*], over his face and eyes and gave them the Royal Writ (*hatt-i sherif*) confirming to the monks the contents of the documents, to wit, that they were exempted from paying taxes and that the Anastasis was their praying place as heretofore’ (Stephan 1938: 147). Selim thus saw his role in a continuum with earlier Islamic rulers of the city, maintaining the policies established by the Caliph ‘Umar when he captured Jerusalem in 638.

There is a myth that there was little development and growth under Ottoman dominion in Jerusalem. The

four centuries of Ottoman rule from 1516 to 1918 are viewed as an unbroken slide into neglect and ruin rescued by the benevolent intervention of western Europe beginning in the 19th century. In fact, the 16th century begins a long period of calm, and moderate but steady growth of the urban centre in the walled city of Jerusalem, which was part of the Ottoman province of Damascus. With Damascus as the capital of the region, Jerusalem was a city administratively and economically in the provincial hinterland. But Jerusalem was the religious centre of the lands of early Islam and thus immensely important religiously as the first *qibla*, the third holiest city of Islam after Mecca and Medina, and a centre of Islamic pilgrimage on the route to Mecca. The aim of this chapter is to put forward an alternative view of active Ottoman Muslim engagement with Jerusalem and its monuments from 1517 to 1918.

It has been stated that there were no major restorations to the Dome of the Rock after that of Sulaiman Qanuni in the mid-16th century. Scholarly statements such as those made by Oleg Grabar, indicating that there were no major restorations to the Dome of the Rock after Sulaiman, occur for several reasons, among them that the author in question has not examined the later substantial documentation of the building’s alterations or that the changes after the 16th century cannot be considered as truly Ottoman or as significant for the building’s history. This lacuna could even point to a conscious avoidance of the topic for political reasons (Grabar *EP*² 1980). For to demonstrate that there have been major efforts to restore and preserve the building demonstrates a continuity of maintenance from the time of construction in 692 to at

¹ Stephan 1938: 147; al-‘Asali (1989: 200) indicates that the Ottomans entered the city on 28 December 1516 (4 Dhu ‘l-Hijja 922) and that Selim visited the city two days later; he stayed until 1 January 1517.

least the end of the Ottoman Empire, a point of view that may not coincide with contemporary nationalist views and aspirations for the future of the site.

These later restorations of the Dome of the Rock, the Haram al-Sharif, and of the city of Jerusalem as a whole are posited as part of a continuum that began with Ottoman claims over the territory of early Islam in the early 16th century and ended at the beginning of the 20th century when, in 1918, Jerusalem was ceded to Britain, thus ending the four centuries of rule over the Holy City by the Ottomans. Two major reasons emerge for monumental preservation projects in Jerusalem. First, restorations to architectural monuments are politically motivated, and are initiated as part of larger programmes by the central government in Istanbul, the provincial administration, or local government to assert or reassert control in the region. Second, they result from competition with other religious groups and foreign powers for primacy in terms of monuments within the city of Jerusalem.

Jerusalem was the first *qibla* or direction of prayer for Muslims; and later the Prophet changed the direction to Mecca, the birthplace of the revelation. The Dome's form is that of a commemorative structure—a double-ambulatoried octagonal building covered by a double-shelled gilt wooden dome—a form utilised in earlier Christian structures in the region of Bilad al-Sham. The commemorative form of the building provides one of the possible reasons for the Dome's construction. The Dome may have been built by the Umayyads in their newly acquired northern territory as an alternative for pilgrimage to the Ka'ba in Mecca. The commemorative form of the structure suits the ritual requirements of circumambulation and thus Jerusalem, already respected as the first *qibla*, consolidated its role as the third holiest city of Islam and the spiritual capital of the Umayyad empire. The inclusion of the crowns of the Byzantine and Sasanian empires in the mosaics prominently situated in between the windows of the drum of the dome provides another possible reason for the construction of the building, for it united under Islamic dominion the two great empires of Byzantium and Sasanian Iran which had previously dominated the region. The Dome was thus a suitable monument for testifying to the sovereignty of Islam in the region; it dominated the cityscape and competed in form with the major Christian monument of the city—the Holy Sepulchre—and united the three religions of the book (Judaism, Christianity and Islam) on a site sacred to all three.² The construction of the Dome was thus identified as

a strong religio-political statement establishing the city as a centre of religious pilgrimage and proclaiming the sovereignty of Islam in Jerusalem. In this way, Jerusalem was established by the Umayyads as the spiritual capital of Bilad al-Sham.

The late Umayyad and 'Abbasid dynasties began a long process of major additions and restorations continuing through the Mamluk period—including the construction of the Aqsa Mosque. The 'Abbasids constructed at least one of the *qanatir* or arcades—the south-eastern one—and effected repairs to the Dome, with four bronze plates originally placed on the lintels above each entrance which included inscriptions with Ma'mun's name and the date 831. Two 10th-century historians, Ibn al-Faqih in 903 and al-Muqaddasi in 985, indicate that the building was covered with marble and mosaics and that the dome was of red gold or gilt brass plates (for these references, see Le Strange 1965: 36-9). The Isma'ili rulers of Egypt, the Fatimids, who wrested control from the orthodox Sunni 'Abbasids, effected many changes on the Haram, including the construction of some of the arcades (*qanatir*) leading to the upper platform, and the reconstruction of the south east area of the platform, and its substructure, known as Solomon's Stables. In 1022, the Fatimid Caliph al-Zahir undertook the rebuilding of the dome of the Sakhra after an earthquake, redecorating and gilding the interior with the typically Fatimid decor of which part survives to the present; he also recovered the dome with lead and, in 1027-28, repaired the mosaics, which are dated by an inscription set in the mosaic.³ During the Crusader period, the Dome was converted into a church and paintings were added to its walls as well as to the interior of the Dome of the Chain. John of Würzburg reports in c. 1160 that, to the west inside the Dome—then a chapel dedicated to St. James—there was a painting of Christ with an inscription stating 'My house shall be called the house of prayer' (Peters 1985: 317). In 1173, during the Crusader period, 'Ali al-Harawi (whose family originated in Herat, though he himself was a native of Aleppo) states that there were two paintings on

Creswell 1969; van Berchem 1927, and van Berchem and Ory 1982; Grabar 1959: 33-62, and *EP*. This reflects a partial list of Grabar's publications on the subject. More recently, Myrian Rosen-Ayalon and Michael Burgoyne have dealt with the significance of the plan of the Haram, and the early decoration of the Dome of the Rock; they carry the architectural history of Jerusalem forward into the Mamluk period. See Rosen-Ayalon 1989, Burgoyne 1987. Both Priscilla Soucek and Nasser Rabbat discuss the pre-Islamic significance of and references to the site. See Rabat 1989: 12-21, and for the Solomonic associations of the Dome of the Rock see Soucek 1976: 73-123.

³ Thackston 1986: 32; according to Nasir-i Khusrau 'all of the roofs and domes were covered with lead.' The decor of the interior of the dome is dated by inscriptions on several beams; see van Berchem 1927: 261-74, nos 220-222.

² The earlier phases of the Dome of the Rock's religio-political history have been extensively studied and published by a number of notable scholars. Among these are the works of KAC Creswell, Max van Berchem, and Oleg Grabar; these focus on individual monuments and their interplay. See

the interior of the Dome, one of Solomon opposite the stairs leading to the cave and also one of Christ covered with jewels (Le Strange 1965: 51-2).

The Ayyubid Kurdish Sultan Salah al-Din reconquered Jerusalem for Sunni Islam in 1187, and re-dedicated the Haram by purging all structures of Christian imagery, constructing new buildings and restoring others. An inscription in the cupola indicates that he regilded the interior dome decoration (Le Strange 1965: 54). In the 14th and 15th centuries, the Mamluks of Egypt dominated what was probably one of the most brilliant periods of construction on the Haram and in the Old City of Jerusalem, establishing a strong regional building tradition and style that persists to the present day. Sultan al-Nasir Muhammad in 1318 sponsored the re-leading of the exterior dome and other buildings on the Haram, and the regilding of the dome's interior decoration (Le Strange 1965: 55). The Mamluk Sultan Baibars restored the mosaics of the Dome of the Rock in the late 13th century, including those of the east portal. Sultan al-Malik al-'Adil Kitbugha (1294-97) also repaired the mosaics. In 1318-19 Sultan al-Nasir Muhammad restored and regilded the interior of the dome. An inscription in the cupola dates this restoration and identifies the sultan. In 1447 Sultan al-Malik al-Zahir Jaqmaq rebuilt a part of the roof over the octagon following a fire started by someone chasing pigeons with a candle (Burgoyne 1987: 76-8). Mujir al-Din reports in 1496 that there were two domes—one on the interior that was painted and gilded, and one of the exterior that was covered in lead (al-'Ulaimi 1973 2: 18). The final Mamluk renovation was in 1509-10, when al-Malik al-Ashraf Qansuh al-Ghuri renovated the lead of the outer dome (Burgoyne 1987: 76-8). New construction, and the many restorations on the Haram, demonstrate the desire of successive rulers from new dynasties to mark their presence. One of the clearest examples is that when the 'Abbasids succeeded the Umayyads, the Caliph Ma'mun had his name inserted into the large Kufic inscription. This probably replaced the name of 'Abd al-Malik, the Umayyad Caliph who had built the Dome in 692—the date was left intact. What better way to indicate sovereignty?

Like the 'Abbasid, Fatimid, Ayyubid, and Mamluk rulers before him, Sultan Selim I embellished the city in small ways by restoring and adding to its edifices. It was in the reign of his son and successor, Sultan Sulaiman Qanuni, however, that the Holy City underwent renovations on a major scale. Sulaiman's symbolic appropriation of Jerusalem, by redecorating its most famous Islamic shrines in the Ottoman manner and enclosing the city within massively rebuilt city walls, is the best known Ottoman contribution to the built form of the third of Islam's sacred cities. Moreover, throughout the entire Ottoman period of 1517 to 1918 there was active Ottoman engagement with Jerusalem and its monuments.

Sulaiman's first projects were related to urban renewal projects, the first of which was the revitalisation of the water supply line leading from Solomon's Pools outside the city to the Sultan's Pool; the ultimate aim was to supply the cisterns of the Old City and the Haram al-Sharif. Between 1537 and 1552, Sulaiman completed one of his major efforts, which was the complete rebuilding and restoration of the city walls. These were built over ruins of earlier walls, and new gates with L-shaped entrances connected the major streets of the city.⁴ The purpose of this project was not so much to bolster the defence of the city but rather to preserve it, to restore the historical walls, beautify the city and bring the old urban core back to its original splendour.

Sulaiman's major project on the Haram was the restoration of the Dome of the Rock. Between 1545 and 1552, he replaced the exterior mosaics on the drum of the dome with glazed tiles and a large tiled mosaic inscription; and later extended this decoration to the lower walls of the octagon.⁵ The large inscription band that runs along the top of the drum is from Surat *al-Isra'* (Quran 17: 1-20) and ends with a date of 951/1545-46 in small numbers under the last word (van Berchem 1927: 233, no. 239). According to another dated inscription originally in the tympanum above the outer north door of the Dome but now removed, Sulaiman later (in 958/1551) extended the tile decoration to the lower walls of the octagon. The panel is signed 'Abdallah of Tabriz', indicating that Persian craftsmen produced the tiles. It thus took seven years to complete the tile-work on the Dome. In addition, a tile inscription above the *mihrab* of the Qubbat al-Silsila, dated 969/1561-62, suggests that tiles were produced on the Haram for at least another ten years.

The large, square decorative tiles covering the drum and the octagon measure about 19cm square; thicker oblong tiles were employed as framing devices, containing the more decorative square tiles. The oblong tiles are blue, yellow and black and are made of a coarse beige clay. The palette includes cobalt, turquoise, brown/black, white and yellow, and the decorative repertoire includes a variety of floral motifs, among them the lily and lotus, and a cross design. The types of tiles found on the Dome dating from this period are *cuerda seca*; a type that imitates *cuerda seca* but includes only a black outline around individual forms;

⁴ Sulaiman did not follow the original wall in the south. The section surrounding Mount Zion, which had been included in the earlier walled city, was deliberately excluded from the 16th-century project.

⁵ Michael Meinecke 1988: 257-360 documents Sulaiman's programme for the city. See also Duncan 1972: 64 and following. For a partial list of the Ottoman monuments in Jerusalem see Burgoyne 1976 and al-'Asali 1989: 200-201. The information given here concerning the restorations of Selim I and Sulaiman is from Meinecke's article.

monochrome; underglaze; and four-colour glazed tiles. A large inscription band runs around the top of the octagon, covering the parapet. The tiles used in this inscription of Surat *al-Ya Sin* (Qur'an 36) are of the four-colour glazed variety, which include green and turquoise for decorative elements. The inscription itself comprised three rows of square tiles, contained above and below by decorative tiles.⁶ In all, there were about 45,000 tiles covering the monument.⁷

Some of the large square tiles resemble the decorative tradition of Bursa tiles of the 15th century.⁸ Other tiles bear no relationship to Ottoman tile production of the period and may have been inspired by the designs and motifs of the mosaics that originally appeared on the exterior of the building.⁹ The tiles were first coloured, glazed, and fired and then cut to size and bevelled with one or two holes drilled in each side to hold bronze pins that joined the tile to its neighbours. The tiles were then set against a thick bed of mortar, the latter keyed to the stone wall by means of bronze ribbons fixed with marble wedges into holes cut into the masonry backing. Similar bronze ribbons fixed to the pins set into the edges of the tiles bound the revetment to the plaster ground. The oblong tiles and glazed bricks were usually pierced through, suggesting that they were threaded with wire to hold them in position, and plaster was placed behind them to hold them in place. The technique employed in the large inscription band running around the top of the round drum of the dome is tile mosaic, a technique that was not used in Ottoman tile production after the early 15th century. Tile mosaic was normally used in Persia, which suggests that the artisans who crafted this elaborate inscription were originally from Persia—although of course, tile mosaic was frequently used in Anatolia from the early 13th century. The mosaic inscription was composed in panels on the ground. A design was drawn on a bed of the required curvature; then tile pieces of the necessary hues, trimmed to an appropriate shape, were placed face down onto it, and plaster was run over the

surface of the reverse of the tile. When dry, these curved sections were lifted in place, joined together by bronze pins, and the sections were fastened to the masonry by grouting and liquid plaster.

The tiles were probably produced *in situ* in the Haram al-Sharif. A report published in 1946 suggests that the tiles were made in a building known as the Najara vaults or the Madrasa al-Farsiya, which used to be adjacent to the Aqsa Mosque but which was demolished in 1939 during restorations to the Aqsa Mosque. Wasters and remnants of tiles that closely resemble the original tiles of the Dome were found together with remnants of the mosaics that originally covered the exterior of the Dome.¹⁰

Sulaiman replaced the metal or marble window grilles of the Umayyad period with typical Ottoman stained glass windows and exterior tile grilles.¹¹ The typical Ottoman window includes small pieces of coloured glass set into a wood-framed plaster armature. The square cut-out tile grilles of the exterior wall served as an additional filter for the brilliant light to the cool interior of the Dome. According to two inscriptions which appear over the west and east entrances, the doors of the Dome were repaired in 1564/5 (van Berchem 1927: 339-40, nos. 241-242). At the same time, the eight windows of the octagon were provided with new inner panels (van Berchem 1927: 329-33, no. 238). The exterior of the structure was thus totally altered and given a new Ottoman character.

One possible reason for the repair of the Dome at this time could have been damage caused by the earthquake of 1545, which toppled the belfry of the Holy Sepulchre and prompted a repair to that building.¹² However, if the tiling of the drum was complete in 1545—the year of the earthquake—it could not have been begun and completed in one year (van Berchem 1927: 333-35 no. 239). Thus, the decision had already been made to tile the Dome well before the earthquake. It has been suggested that the tilemakers were brought to Jerusalem from Persia

⁶ The tiles of the original *Ya Sin* inscription were replaced in a later restoration of 1875. The originals survive in the Islamic Museum. Little is known of the original decorative tiles which appeared above and below the inscription itself.

⁷ Megaw 1946, Part I, Section 1: 10 provides this figure for the total tile count, made prior to the removal of all the tiles in the 1960s.

⁸ For Bursa tile production of the 15th century, see St Laurent, unpublished paper on the Green Mosque and its inscriptions. See also St Laurent, *Ottomanization and Modernization. The Architectural and Urban Development of Bursa 1839 to 1914*, unpublished doctoral thesis for Harvard University 1989.

⁹ Some of the original mosaics survive and are displayed in the Islamic Museum of al-Aqsa Mosque. The as yet unpublished research on the Ottoman tiles of the Dome of the Rock by Julian Raby and John Carswell will contribute greatly to our knowledge of the tiles of the Dome of the Rock.

¹⁰ Megaw 1946, Appendix 5: 1, and Appendix 5: 5, indicates that, when the building was destroyed, the debris from it, including the tiles and wasters, was buried in pits on the Haram. One of these pits was excavated in 1946 in the course of rebuilding the east steps to the Upper Platform. The tiles, pottery and wasters are typical of the 16th century and are thus considered to be from the Najara vaults. This analysis contradicts that of Richmond who considers the tiles produced in this building to date from the 18th century, although there is no evidence to indicate that tiles were not produced there in the 18th century also.

¹¹ The recent regilding project of the Dome afforded an opportunity to view the space between the grilles and the stained glass. Holes in the original stone wall suggest that the building originally had metal or marble grilles, perhaps similar to those of the Great Mosque of Damascus.

¹² Van Berchem 1927 suggests the earthquake as a possible cause. See Vincent and Abel 1914-26: 286 for the reference to the damage to the Holy Sepulchre.

in 1543 and that they set up their workshop in the Najara vaults. These craftsmen were a separate group from those that had left Persia after the Ottoman conquest of 1514 and thus they were not influenced by the Iznik tradition. Over a period of ten years they developed and refined the technical aspects of their craft. After the Dome project they may have moved to Damascus to complete projects in that city.¹³

The skin of tiles on the exterior of the Dome of the Rock and on other monuments in the holy cities of Mecca and Medina were the stamp of Ottoman imperial identity in the lands of early Islam at a time when the Ottomans sought to establish Sunni Ottoman hegemony in a period of intense conflict with their heterodox Safavid neighbours (Necipoğlu 1990: 154 and 1985: 92-117). Furthermore, the tiles declare Sulaiman's connection to the Biblical Solomon and his Temple in Jerusalem. Sulaiman is thus proclaiming himself the Solomon of a new Ottoman imperial age in the Holy City. Other smaller Ottoman structures appear on the Haram, notably small subsidiary domed buildings along the north and east periphery of the upper platform between the *qanatir* or arcades. Also in 1555, the Ottomans granted permission for a Christian restoration of the Holy Sepulchre; Sulaiman established relations with the French king, granted French subjects religious freedom and gave the Latin clergy custody of the Christian holy places. Thus began the process of foreign intervention in Jerusalem, a process that escalated during the next three centuries of Ottoman rule (Jeffrey 1919: 34).

In the period following the Ottoman defeat at Lepanto in 1571 by the members of the Holy Alliance, the Empire suffered great military and territorial losses in the Balkans and Russia, including the retreat from Vienna, until the peace of Karlowitz in 1699. During this time of difficulty for the Ottomans, the French renegotiated a new version of the Capitulations in 1673. The Christian communities of Jerusalem struggled amongst themselves for control of religious monuments in Jerusalem as well as attempting to wrest further independence from Ottoman central authority. For Jerusalem, the peace of Karlowitz won the right of Austria to speak for Christian interests.

Though this was a period of changing fortune and struggle to maintain central control, the care and maintenance of the Haram and its monuments in Jerusalem remained of primary concern to the government. In fact, the archives document the restoration and preservation of the region's three main Islamic pilgrimage sites—Jerusalem, Hebron and Nabi Musa. During the late

16th and 17th centuries, the Dome of the Rock was restored at least three times—by Sultan Mehmet III (1597), Ahmet I (1603), and Mustafa I (1617). Support for religious institutions and thus restoration projects remained dependent on the *waqf*, at a time when the administration of the endowments was exploited and financially overburdened (al-'Asali 1989: 214). In 1597, new windows were added to the lower parts of the south-east and south-west walls. Two marble inscriptions originally placed on the south-east and south-west walls are dated by chronogram and name the *qadi* of Jerusalem, who probably supervised the project (Megaw 1946 Section I: 18; van Berchem 1927: 340-42, nos. 243 and 244). Evliya Çelebi mentions no major restoration programme during the 17th century, though he does say that Ahmet I 'had a richly gilt canopy made, the cover of which was a curtain studded with gold and jewels. The corners were fastened with silken cords, thus covering the Holy Rock' (Stephan 1938: 92-3). There was also a restoration during the reign of Sultan Ibrahim I in 1642-3, though nothing whatever is known of the details. There was, until 1875 or perhaps even as late as 1894, an inscription naming Sultan Ibrahim on two panels fixed to the top of the iron grille of the rotunda; but it does not survive (Megaw 1946: 18; van Berchem 1927: 342-3, no. 245). Very little is known about 17th-century restorations. Fortunately, much more is known about the 18th-century restorations.

Significantly, beginning in 1705 and continuing until 1780, there were at least four major restorations to the Dome of the Rock and al-Aqsa Mosque. It is recorded in the archives that there were restorations in 1705 and in 1720-21 for Ahmed III (1703-30); in the autumn of 1742; in 1754 for Mahmud I (1730-54); and in 1780 for 'Abd al-Hamid I (1774-89).¹⁴

The most important of these is the major restoration of Sultan Ahmed III in 1720-21, which is recorded in a document in the Turkish National Archives in Istanbul and includes orders, accounts and inventories dated between 1720 and 1736.¹⁵ Tax revenues from Jaffa and Tripoli paid for two-thirds of the cost. The document lists all the materials for the project, which were from different parts of Anatolia and the Black Sea region. These were shipped from either Istanbul or Izmir to Jaffa for transfer overland by oxcart (*kanlı*) to Jerusalem. Even the

¹³ The above information is noted in Megaw 1946 Appendix I: 12. Megaw also suggests (p.10) that these same artisans went to Damascus in 1554 to make tiles for Sulaiman's mosque in that city. Megaw also points to the possibility that the tilemakers may not have come directly from Persia but could have come via Damascus or some other city.

¹⁴ With the exception of the 1720-21 restoration, Oktay Aslanapa notes both the 18th- and 19th-century repairs in 1989: 15-18. Al-'Asali 1989: 220 notes the restorations of 1705, 1752 (which I believe is the 1742 restoration) and of 1780.

¹⁵ Göyünç summarises the contents of this document in 1983: 327-33. The document is in the collection of Basbakanlık Arsivi: Maliyeden Müdevver Defterler, No. 7829. Andras Riedelmayer has transcribed the entire document from the Ottoman original. It is this transcribed text which is consulted for the details.

wheels (fifty pairs) and wooden axles (120 in number) for the oxcarts were made in the Tophane foundries of Istanbul, shipped to Jaffa and attached to carts constructed in Jaffa (Document 7829: 15).

First, Osman Efendi, the former *defterdar* of Damascus and later al-Hajj Mustafa Efendi, former first deputy imperial treasurer (*sikk-i evvel defterdari*), were put in charge of the project, with the title of superintendent of construction (*bina emini*). The importance of the positions that they had held indicates the significance of the Jerusalem project (Rashid Mehmed Efendi 1282/1865, 5: 130–32). Local workers were hired to execute the project. Work began on 28 May 1721 and lasted until 3 February 1722, a total of 252 days. Two-thirds of the entire cost of the project came from the revenues of the tax farms of Jaffa and Tripoli.

The initial pages of the document list the kinds of wood sent for the restoration of both the Aqsa and the Dome of the Rock. The wood was from a wide variety of locations including the heavily forested region of the Black Sea, Inebolu and Izmit. Repairs are specified to each building and the particular woods that were to be employed in the repair are also mentioned (Document 7829: 12–14 of the *defter* includes the inventory and repairs).

The inventory of materials purchased for the project includes numerous pigments and clay body ingredients, namely items that are normally used in painting and in the production of tiles. Some of the colours are ochre, orpiment, Persian green, saffron, dark blue (*laciverd*), and vermilion. Included also are pine gum resin, glue, mastic, juniper gum, size, and materials to be used in the repair of painted areas of the interior (Document 7829: 19). Sponges, clay and tools for ceramic production are also in the inventory (Document 7829: 19). Also listed in the inventory are packets of gold leaf and silver leaf, English red lead, French red lead and white lead, all in small quantities and no doubt used for repairs (Document 7829: 19). The fact that there were boxes of tiles listed in a later inventory (dated 1734) of leftover materials suggests that at least some of the tiles were restored at this time. The fact that the raw materials were shipped to the site indicates that the tiles may have been produced on site somewhere in Jerusalem. On the other hand, tilemakers are missing from the lists of craftsmen, so the matter awaits further study. A large amount of lead was also purchased for use in the repair of the exterior of the dome or domes. European—'Frankish'—marbles appear on the inventory list in sufficient quantities (30 *dhira'* or 23.73m.) to suggest the repair of dado walls of either the exterior or interior (Document 1729: 14).

The stained glass windows of the drum of the dome were all replaced at this time. Different kinds of glass, plain and coloured, are enumerated by number per window. Two kinds of window are specified: twelve

ordinary windows; and a more elaborate window for the *qibla* wall using a larger number of small pieces—400 per window—of the 'Persian' type, with more colour. Two types of glass were allotted for the ordinary windows; small coloured glass at 200 pieces per window, 2,400 in all, at ten *akçe* each; and 1,000 plain and middle-sized pieces of glass per window for a total of 12,000 at 11 *akçe* each. All this makes an overall total of 14,400 pieces of glass at 156,000 *akçe*. For the special window of Persian work (*acem işi*), 400 pieces of small glass per window—double the amount for the ordinary window—at 10 *akçe* each; and 1,400 pieces of medium glass at 11 *akçe* each, making a total of 19,400 *akçe*. A large quantity (1,000 *qintars* or 56,410 kg) of lead (*kurşun*) for 306,000 *akçe* was included in the shipment for replacement of the windows. One of the supplies listed for window replacement is three *qintars* or 169.2 kg of brass wire, rather surprising in that traditional Ottoman stained glass windows employed only a plaster armature (Document 7829 lists these materials and their cost). The mention of lead and brass supports suggests that, at the beginning of the 18th century, the Ottomans introduced European techniques of glass production for the restoration of the Dome's windows. This document is also the first record of any changes in the windows first placed there by Sulaiman in the 16th century.

The document sheds much light on the nature of 18th-century restoration techniques and their cost. European methods and materials are combined with traditional Ottoman ones in the Haram project. The scale and expense of the project indicate the importance of the Haram and Jerusalem to the Ottoman government. The restoration was a major organisational feat, with important administrators put in charge of the project and special craftsmen and materials sent from the capital and abroad to execute the project. If one compares the costs of this project to those of rebuilding such essential frontier fortresses as Niš and Vidin, it is clear that the Jerusalem project was considered as important as the security of the empire's borders (Rashid 1282/1865: 136–39).

An inventory of 1734, included with the above-mentioned document, indicates that tiles were found in storage under the Haram. There is no indication of when the tiles were placed there but they were no doubt extra tiles to be used in later restorations.

The question arises as to why it was at this particular moment that the government undertook such a grand project. There were several reasons. The restoration coincides with a general tightening of central government authority over the province of Damascus.¹⁶ The Ottomans

¹⁶Rashid 1282/1865: 161 notes that the *valilik* of Damascus was reorganised in AH 1132 in order to regain control. For more on the history of this period, see Barbir 1980.

sought increased contact with Europe at this time, sending the first official Ottoman embassies to Europe, who sent reports back to Istanbul concerning artistic taste and methods, and led to the introduction of European methods and materials in the Haram restoration. There was also an interest in major restoration projects in the capital, with sources mentioning that Haghia Sophia was restored at about the same time, as were a large number of other major monuments.¹⁷

The restoration also coincides with increased requests by the European powers for control over the Christian monuments of the city (Rashid 1282/1865, 5: 130-31). The historian Rashid, in his discussion of the events of the year 1131/1718, discusses the struggle between the French, the Austrians, and the Russians to control repairs to the Church of the Holy Sepulchre, which he, as well as many before him, refers to derogatorily as the *qumama*, 'the dung heap'.¹⁸ After having made vague promises to the Austrians in the Treaty of Passarowitz, the Ottomans forestalled both the Hapsburgs and the Russians by granting permission to the French, who were their allies. This permission was limited to repairs to the existing structure as stipulated in the Covenant of 'Umar and the *shari'a*. This meant that a proposed new closed dome in the Baroque manner was not permissible.¹⁹

In 1742, an important restoration was initiated in the name of Sultan Mahmud I. Maqizade Muhammad, the *mutaşarrif* of Gaza and Ramla, commissioned Maula Sayyid Muhammad Sa'id Efendi, *qadi-i Quds-i Sharif*, the *qadi* of Jerusalem, to repair both the Dome of the Rock and the Aqsa. A document in the Turkish National Archives provides a list of materials, their cost and quantity, and details the repairs and restoration that were needed.²⁰ The wooden ribbing of the outer dome needed to be replaced and the wood necessary for the project was shipped in from abroad, mostly from Anatolia and northern regions of the empire, notably Izmit and the Black Sea (Document 3609: 1). The metal plates that linked part of the rib-work were removed and re-used with the new wood shipped in for the project. The lead of the exterior dome was also repaired,

although apparently no lead was shipped in for that purpose. The document indicates that the underpart of the eaves (*saçak*) under the dome was covered with lead and that this lead was in need of renewal. The old lead covering the eaves was melted down and re-used for the same purpose. Moulds for the re-casting of the lead were also provided. Also repaired by the same method was the lead of the porches (*kapi saçaklar*). The document indicates that other materials were also re-used from the older work on the Dome; for example, nails were removed and re-used during the restoration.²¹

The marble of the Dome was removed; some of it was replaced with new panels and the remainder was put back in place, suggesting that the material that affixed the marble to the stone structure had decayed and needed replacement. The pavement of the interior was also renewed at this time and the interior was furnished with new carpets (*kaliça*) and kilims. The ceiling of the interior 'that was falling down' was renovated with Izmit pine, sent from Anatolia. There is no indication as to which ceiling, though the reference is clearly to the wooden ones of the arcades. Also restored was the gilding of the interior dome with some parts repaired and others replaced (Document 3609: 2).

Some of the tiles of the dome drum between the windows were replaced by some that were 'cast in moulds', and others of the old ones that they replaced were moved to other parts of the drum where they were needed. The restoration included all of the tiles of the drum except for the 'circle under the dome', which presumably means the tile mosaic inscription. Since no tiles or materials for tile production were shipped from abroad, one can assume that the tiles were locally produced in workshops in the area (Document 3609: 3).

Around the same time, the interior tiles made by the potters of Kütahya for the Armenian Cathedral of St James in Jerusalem were installed, as John Carswell has document in his study of the Kütahya industry (see Carswell 1972 1: 12-13). The Kütahya tiles are mostly figural, have Armenian inscriptions and are signed 'Abraham of Kütahya'. These are few in number; they are set in one wall of the cathedral and surrounded by other tiles. In the main room of the cathedral and elsewhere, large numbers of blue and white tiles with a lotus design fill the lower walls of the interior. The yellowish gritty clay body of these tiles differs substantially from the porcelain-like white clay of the area of Kütahya. Similar blue and white tiles with the same clay body appear on the Dome of the Rock and the Dome of the Chain. A comparison of the 18th-century blue and white tiles of the Armenian

¹⁷ Rashid 1282/1865, 5: 161. For Haghia Sophia see Eyice 1984-85, 3: 28.

¹⁸ A scatological pun on Kanisat al-Qiyama, the Arabic name of the Church of the Holy Sepulchre, a pun that, according to Peters 1985: 258-59, no Muslim writer from the Middle Ages on has been able to resist. Peters cites many of the early Arab sources who employed this term. There may also be a link with earlier Umayyad descriptions of the site of the Dome of the Rock—when 'Umar entered the Haram, it was noted that the rock had been heaped with dung by the Christians, who had desecrated the site which was holy to the Jews.

¹⁹ For religious legislation on this topic, see Claude Cahen, 'Dhimma' and G. Troupeau, 'Kanisa' in *EP* 2:228 and 4: 546.

²⁰ Basbakanlık Arsivi, BMAD 3609. My thanks to Dr Necat Göyünç for providing information concerning this document.

²¹ Document 3609: 1. Details for all lead projects for the Dome are detailed on this page.

Cathedral of St James with those of the Dome of the Rock and the Qubbat al-Silsila suggests that they were produced by the same tile workshop. The nature of the clay, glaze and decor of these tiles differs from the securely dated tiles produced in Kütahya, and thus suggests that they were produced elsewhere. Both the texture and the colour of the clay body resemble the clay found in the Hebron area, suggesting that these tiles were produced locally and decorated by local artisans in the 18th century. That other tiles at the Dome of the Rock are identical to those in the cathedral points to the existence of a tile atelier actively producing tiles for both the Christian and Muslim monuments of the city in the same period. There is no information concerning the tilemakers or their origins.

Another document in the *qadi sijillat* of Jerusalem dated 1167/1754 indicates that there was further restoration of the Dome of the Rock.²² In the last year of Mahmud I's reign, *al-hajj* As'ad Pasha, Governor of Damascus, ordered the *qadi* of Jerusalem to repair the Dome of the Rock and the Aqsa Mosque and appointed *al-hajj* Husain Beg ibn Marhum Muhammad Beg Makkizade of Jerusalem to supervise the project, with a certain Kemal giving advice (*Sijill* for the year 1742: 18, column 1).

There was a repair of the lead on the dome, including only four sheets of lead, indicating that this was a minor repair when compared to the 254 pieces of lead, weighing 42 *qintars* (25,000 lbs.) used for the dome of al-Aqsa Mosque. The interior and exterior marble of the Dome was replaced and repaired including an area of 205 *dhira'* (123m). On the interior, the area 'behind the false ceiling' was repaired with an area of 220 *dhira'* (132m). It is not clear which wooden ceiling of the arcades was in need of restoration (*Sijill* for the year 1742: 18, col. 2, and 19, col. 1).

Much time and expenditure was devoted to the restoration and replacement of the *qashani* or tiles of the Dome of the Rock. The *Ya Sin* inscription which circumscribes the top of the octagon, covering the original parapet of the building, was restored 'from the south to the west to the end of the north' façades. The extent of the work included 130 *dhira'* (c.78m), which suggests that there was an extensive restoration to this part of the inscription on the south-west, west and north-west side of the structure. Other tiles of the octagon were also restored at this time. Significantly, the first noted restoration of the tile mosaic inscription occurred at this time, with the extent of the work listed as 340 *dhira'* (204m; *Sijill* for 1742: 18, col. 2). There is no mention of what part of the inscription was included in the restoration, but it is known that there were two periods of restoration of this inscription, which

replaced the mosaic with ceramic tiles on the west and north-west sides of the building.²³ There are two different qualities of tiles, which indicates two different periods. The earlier tiles are of better quality and date to the 1754 restoration. The document indicates that without question there were new tiles produced to replace missing and damaged ones. In this way, there were tiles from slightly different periods in the 18th century scattered amongst the original 16th-century tiles.

In 1780 and 1781, Sultan 'Abd al-Hamid I (ruled 1774-89) rebuilt the west entrance of the Dome referred to as the *bait* (Bait al-Maqdis) and affixed a wooden ceiling to the bottom of roof supports of the inner arcade. An inscription placed above the exterior western door records this restoration of 1780, indicating that the door [portal] was restored, as were the tiles. It further states that the sultan redid the interior ceiling, encrusting it with Chinese porcelain plates; the inscription indicates that the supervisor was Haqqi Muhammad (van Berchem 1927: 343-46, no. 246). Thus, the Ottoman baroque western portal was sponsored by 'Abd al-Hamid I. The ceiling of the interior arcade was redone by 'Abd al-Hamid. The signatures, dated 1781, of artisans who worked on the restoration, Muhammad ibn Sufyan and Mahmud, appear on the cornice of the niches, flanked by colonettes, of two contiguous niches placed to the south of the south door. The wooden ceiling comprised coffers with porcelain plates set in the centre. Thus the niches were part of the 1781 ceiling restoration.²⁴ An additional inscription appears on a tile placed above the stairs that lead down to the grotto under the rock. The tile, which is also dated 1781, includes the name of the eunuch of the Istanbul harem, 'Abdi (van Berchem 1927: 348, no. 249).

Major restorations of the Haram monuments continued through the reigns of succeeding Ottoman sultans. Among the most important was that of 1817-18.²⁵ Under the order of Sultan Mahmud II, Sulaiman Pasha (whose appointment ran from 1804 to 1818), the *wali* or governor of Saida, undertook another major restoration of the Dome of the Rock in 1817-18. The work continued for 21 months (al-'Asali 1989: 220). Two documents dated 8 Shaban 1232/1815 and 1233/1816 and 1234/1817, and

²³ Van Berchem 1927: 333-35, no. 239, indicates that there were replacement tiles. Megaw 1946: 13, n. 46 also discusses two periods of restoration tiles indicated by two qualities and, in footnote 55, suggests that the better quality tiles date from the period of Ibrahim I (1642-30), and the later ones to 'Abd al-'Aziz in 1875. It is now clear that the better quality tiles date to the 1754 restoration.

²⁴ Van Berchem 1927: 347 no. 248 cites the inscriptions, indicating that they were replaced at a later date.

²⁵ For the history of the period, see Ma'oz 1968, Kushner 1986, Gerber 1985. For the city of Jerusalem in the 19th century, see Ben-Arieh 1984.

²² The *Guide Abrégé du Dome du Rocher et de Al-Haram al-Sharif* (Jerusalem Auqaf Council 1966: 68) mentions this document.

copied by the scribe Mustafa Ali Efendi, detail every item purchased for the restoration of the Dome and other monuments (Haram al-Sharif document 926). The master builder (*qalfa*) came from Istanbul to supervise the project, and a master architect Abu Salah Efendi is mentioned. Names of other architects include Hajji Bakir from Salt, 'Abd al-Rahim and Sa'id Khalil. Carpets and lapis lazuli came via Akka to Jerusalem. An inscription under the south porch and just to the east under the colonnade states that Mahmud ordered the restoration of the Dome's exterior marble (*rukham*) revetment and that the project was supervised by Sulaiman Pasha, the governor of Saida and Tripoli (van Berchem 1927: 348-49, no. 250). He also ordered the re-gilding of the interior of the dome and the repair of the outer lead covering (van Berchem 1927: 289-99, no. 225). An inscription from the period of 'Abd al-'Aziz indicates that Mahmud regilded the dome.

An inscription that was once on the exterior south side of the octagon under the colonnaded porch indicated that Mahmud had restored the marble (*rukham*; van Berchem 1927: 348-49, no. 250). According to the second part of the document written in 1233/1817, large quantities of marble were brought from Damascus. The document lists a large number of craftsmen, twelve in number, working with marble, including 'Ilyas Shanawi—the master and supervisor—Butros Lutfi, Yusuf ibn Abu Touma, Antonios Touma, and Nicola Danani. Two of them were masters (*wali al-ni'm*) and ten were craftsmen (*mu'allim*). From their names it is clear that most of these artisans were Christians. A new portico was also built over the south entrance.

At one time, there were tiles set into the octagon that indicated that the *qashani* or tiles were restored by Mahmud, but they had disappeared by 1894 (van Berchem 1927: 350-52, no. 251). According to the document, tiles were moved from the Dome to a storage area under the Haram,²⁶ suggesting that old tiles were removed from the exterior of the building, stored perhaps until the restoration could proceed after the production of new replacement tiles. Tiles were brought from Akka via Jaffa, suggesting perhaps that some tiles arrived from elsewhere by sea. The document lists materials such as wood beams for the construction of a workshop for tile production and materials such as clay blocks for kilns [ovens] for the firing of ceramic tiles. It further indicates that large quantities (several loads) of red, white and yellow clays were brought from Hebron and Solomon's Pools for the production of ceramics (Islamic Museum document 926: 2-3). Forms or moulds for tile-production are also listed, as well as other tools and equipment necessary for the production of tiles.

²⁶ Islamic Museum document no. 926: 1 includes information on the cost of hiring workers to move tiles into storage under the Haram.

The names of tilemakers also appear in the document. Four 'Masters of *qashani*' or tilemakers came from Ramla (Islamic Museum document 926: 1 includes a list of fees for animals to transport the masters). The tilemakers also signed and dated tiles during this period, examples of which are in the collection of the Islamic Museum in Jerusalem.²⁷ The clay used in these tiles is identical to the clay found in Hebron which is still in use today. These tiles all have a crackled clear glaze and are uniformly of low quality. Recently other tiles that share these same features were found stored under the Haram. Some of the latter were new and never used and were probably kept in storage for future use in repairs. On the drum of the dome there was once a tile with the signature of Yusuf Amin ibn Mustafa Agha, the director (*ma'mur*) of the restoration (van Berchem 1927: 352, no. 252). The name of the scribe of the document, Mustafa 'Ali Efendi, was on a number of tiles placed on the dome drum, suggesting that, as a calligrapher, he was one of the artisans who executed the calligraphic tiles (van Berchem 1927: 353-55, nos 253-61). The signatures of many tilemakers appear on tiles found mainly on the dome drum but also scattered on the lower octagon walls. Among them were 'Uthman ibn Muhammad, Muhammad ibn Yusuf, Hasan ibn Muhammad, Musa ibn Hasan, 'Uthman ibn Hasan, Ni'mat Allah al-Khuqandi, 'Umar ibn Husain, and Hajji Muhammad al-Qatri al-Shanji al-Dimashqi. The latter name appears on a dated tile and it has been suggested that this tilemaker was probably a Persian living in Damascus prior to his arrival in Jerusalem to work on this project.²⁸

This restoration comes not long after, when in 1810 the Russians constructed a new closed dome for the Church of the Holy Sepulchre. The Ottomans thus yielded to increased pressure from abroad to control Christian holy sites and to claim ownership of land. The Europeans continued to vie for power and control in the Holy Land; at this time the Russians were paramount. Shortly thereafter, in 1840, they constructed the Russian Compound which dominates the landscape looming over the north-west corner of the Old City. The restoration also reflected the sultan's continued interest in and respect for the monuments of early Islam as a symbol of Ottoman authority in Arab lands.

In 1853, Sultan 'Abd al-Majid began yet another major project at the Dome of the Rock headed by the Armenian architect Garabet (Karabet) Kalfa.²⁹ In 1855,

²⁷ Several signed and dated tiles are to be found in the large collection of tiles in storage. These tiles were removed from the Dome during the replacement of all the tiles in the restorations of the 1960s made by the late King Hussein of Jordan.

²⁸ Van Berchem 1927: 358, no. 270. At the time van Berchem was writing, the tile was in Paris.

²⁹ 'Kalfa' is not part of the architect's name but is his title as chief supervisor of the project.

Asad Efendi, an Ottoman architect, was apparently in charge of projects at the Haram.³⁰ The project, directed by another Armenian architect, Sarkis Efendi, was completed by 'Abd al-'Aziz in 1874-75.

The two Armenian architects, Garabet Kalfa and Sarkis Efendi, are probably from the Balian family of royal architects working for the sultan in Istanbul. The dates of these restorations, in 1853 and 1874-75, correspond to the time that these architects were actively engaged with royal commissions for the capital. It is also known that the Armenian Patriarchate building in Jerusalem was designed by the Balian family.³¹ Thus, the royal patrons of these projects considered them important enough to send the chief architects of the Empire to supervise them on site in Jerusalem.

The 1874-75 restoration included stripping the south and west sides of the Dome's exterior, the replacement of the tiles with new ones—which were produced in an Istanbul workshop and shipped to Jerusalem—and the replacement of the *Ya Sin* inscription along the parapet of the octagon.³² The *Ya Sin* Sura of the Qur'an is dated 1875-1876 and signed by the scribe Muhammad Shafiq. The signature appears in small letters and is contained within a medallion.³³ According to a dated inscription in the south section of the ceiling, in 1874 the decorative wooden ceiling of the interior arcade was also repaired. An inscription in the lower part of the dome interior indicates that the interior of the dome was regilded at this time and the lead of the exterior was also repaired (van Berchem 1927: 329-333, no. 238, and 347-48, no. 248). In addition, bare patches of mosaic decoration were painted (Richmond 1924: 86). There are further inscriptions from the period of 'Abd al-'Aziz in this part of the dome documenting the restorations of earlier rulers (van Berchem 1927: 329-333, no. 238 and 347-48, no. 248). Part of this project was to emphasise the importance of the Dome by adorning with stucco and painted decoration the arcades (*qanatir*) on the stairs of the Dome's slightly elevated platform, the Qubbat al-Mi'raj and the façade of the Aqsa Mosque.³⁴

³⁰ Bartolini 1870-71: 227. Bartolini visited the Haram with the architect on 29 November 1855. Asad Efendi wanted to consult him on certain projects undertaken on the Dome and on other buildings.

³¹ This information was obtained in a discussion with the current Armenian Patriarch of Jerusalem. As yet I have not pursued further research on this subject.

³² For tile production and subsequent tile restorations, see Yenişehirlioglu 1991 and de Vogüé 1865 for photographs. Wilson 1965 and Clermont-Ganneau 1899 discuss the condition of the monument prior to and during this restoration.

³³ Van Berchem 1927: 361, no. 272 read the name incorrectly as 'Fashiq'.

³⁴ A photograph dated 1871 indicates that this project, that is the addition of painted stucco to the arcades and façade of the mosque, dates from period of 'Abd al-'Aziz.

In 1876, 'Abd al-Hamid also bought carpets for the Dome. Successive Hamidian projects in 1897 include the repair of the dome and placing a new *hilal* (crescent) on top of the dome. New ribs were added to the dome and a new octagonal seat was made to support the increased weight of the new finial, which was made locally (Megaw 1946: 31). In 1898, three windows were introduced between the ribs at the base of the Dome, no doubt to enhance the illumination of the interior. There was also a hasty patching of the tiles, replacing old or missing ones with anything that was available (Megaw 1946: 18). In 1908, the band below the drum windows on the west side was reset with tiles from all periods of production (Megaw 1946: 18).

In the 19th century, all major building projects and restorations occurred as part of the Istanbul government's centralisation of military and administrative control over the provinces of the empire during the Tanzimat and the reign of 'Abd al-Hamid II. The government tried to centralise control in the provinces through institutional modernisation, Ottomanisation, and Islamisation. The initiation of the large-scale restoration by 'Abd al-Majid in 1853 reflects the reinstatement of the Ottomans in Jerusalem after a hiatus of Egyptian occupation from 1831-40, as well as rejoicing at the end of the Crimean War. The imposition of new institutions visibly altered the character of Jerusalem during this period and the politically motivated restorations of the Haram al-Sharif monuments can be seen as physical expressions of the Tanzimat and 'Abd al-Hamid's policy of Islamisation. Increased tourist and pilgrim access to the holy sites of Jerusalem and its region also prompted a renewed focus on the early Islamic monuments of the city.³⁵ In fact, the sprucing up of the monuments of the Haram al-Sharif and other projects in 1897-1898 are directly related to the visit of the German Kaiser Wilhelm in 1898. Many concessions were made for the visit of this German monarch, who had started, along with other European powers, to loan money and to fund projects in the Empire. Thus, Wilhelm's visit to Jerusalem is a reminder of the increased strength of European presence and the weakening of Ottoman financial and administrative control over the region.

In conclusion, the successive restoration projects of the Dome of the Rock from the 16th to the 20th centuries sponsored by the Ottomans are part of a continuum that began with Umayyad and later claims on Jerusalem. These restorations demonstrate the continuous Muslim maintenance of the site from 692 to 1917. The Dome of the Rock, in line with its early history, has thus been continuously appropriated as the symbol of sovereignty in Jerusalem, the spiritual capital of Bilad al-Sham.

³⁵ For restorations under 'Abd al-Hamid II, see Conrad Schick 1887 and 1896. See also Warren and Conder 1884.

Chapter 27

THE DECONSTRUCTION OF THE DOME OF THE ROCK¹

John Carswell

I first saw the Dome of the Rock in 1951, and I can vividly remember my first impression.² There was a greyish, ribbed dome rising above the walls of the Old City, and it was the dome which most impressed me. It had a kind of bloom on it, like a decaying plum, and the shape was slightly irregular. When I finally penetrated the labyrinth of the *sugs* and found the entrance to the Haram, I received another kind of impression. The octagonal walls below the grey dome were covered with a palimpsest of old tiles, shimmering and glinting in the sunlight, as if the building had been rolled in a basket of broken sherds. What fascinated me was the integrity of the whole structure, poised on the blank stone platform of the Haram, as if it had been there since the beginning of time.

Thinking back to that moment, I now realise that I was very lucky, for I saw the Dome of the Rock at a particularly important moment of its deconstruction, which had taken more than four hundred years to accomplish. The conventional attitude at that time was that the building was simply dilapidated, the result of neglect

and the passage of time. But there is more to it than that; all buildings—as indeed all of us—deconstruct from the moment of creation. But buildings, unlike us, never perish; they mutate, and even when they finally collapse achieve an afterlife as archaeological debris—whereas we rot away in the grave, or are cremated to dust. One could argue that bones survive, but they have little individuality; one femur is very much like another and can tell us nothing about the unique qualities of the human spirit. Here again, buildings are different, for they have a history which tells us much about the minds of those who created them. Even more, through the strength and weaknesses of structure, they can also illustrate how successive generations have reacted to the fact of their existence. Buildings are eternal, and considered in this context, the Dome of the Rock has much to tell.

Let us first consider the setting. It is facile to say that the location is the most significant factor, invested with the beliefs of Judaism, Christianity and Islam. But equally relevant is the fact that the building and Jerusalem itself are close to the site of the invention of architecture. For it was at Jericho, just a few miles to the east and below the rim of the earth's crust, that mankind first conceived the idea of piling one stone regularly upon another, to create uniform, free-standing structures. These are the round towers and city walls of ancient Jericho, some ten thousand years old.

Until the end of the last Ice Age, about twelve thousand years before the present, man inhabited terrestrial space by sleeping on the ground or seeking the comfort of caves. But then something radical occurred, for he discovered that along with the domestication of animals, he could build. Suddenly there was something finite which

¹ Deconstruction. 'You've heard fashiony-types talking about this season's new thing, "deconstruction", but don't know what they're on about, don't panic! It's basically a pretty grungy look that's all about putting on layers of mis-matched togs that look as "used and abused" as poss . . .' *Update* (a teen magazine, London, n. d.).

² This chapter is contributed to the present volume in the place of a more formal study of the tiles of the Dome of Rock by Professor John Carswell and Dr Julian Raby, *The Ottoman Tiles from the Dome of the Rock* (forthcoming). The colour plates in the present volume represent some of those in the extended study.

lasted longer than he did. The early city walls of Jericho, and the houses they enclosed, are the first expression of this invention on a grand, urban scale. And for eight thousand years, up to the late Bronze Age, the period of Joshua, the process of destruction and reconstruction took place continuously at Jericho. The legacy is a great mound over thirty metres high. At what stage religious belief became part of the equation we have no way of knowing. But it is certain that by the time Jerusalem was founded, structures associated with religious practice were a commonplace.

Jerusalem is built on a projecting limestone spur, overlooking the Rift Valley of the Jordan and the Dead Sea. Its geographical focus is towards the east, rather than the foothills of the Mediterranean. The rocky spur was levelled and a stone platform superimposed, on which the Temple of Solomon was built. This is very similar to the much later 16th-century Süleymaniyye complex in Istanbul, and the names Solomon/Sulaiman suggest that this may have been more than a mere coincidence. And it was on this very same platform that the Dome of the Rock was built. What did it signify? The general conclusion is that it had a symbiotic relationship with the Church of the Holy Sepulchre, and that in the early days of Islam it was intended to become a tangible marker to refute the all-embracing Christian Trinity, emphasising instead the new monotheistic faith. The dome itself, with its obvious cosmic significance, served as a symbol of infinity, as well as an umbrella for the traditional site of Muhammad's ascent. The two concentric galleries had a useful function as a covered *piste* for the circumambulating faithful. The spiritual element was further amplified by the decoration of the interior, which featured symmetrical bouquets and glittering diadems, an abstraction of the splendour and power of Islam. There was also a mysterious cave beneath the rock, a metaphor perhaps for the pre-architectural origins of mankind.

Since the 7th century, all these useful functions and symbolic qualities have never ceased to inspire. But the building itself, the shell which served to house and express these ideals, has changed. As a construct, the Dome of the Rock has assumed its own independent identity. On a mundane level, it is perhaps rather like the Ritz, which stands symbolically for more than a mere accumulation of bedrooms.

* * *

As far as we can tell from the literary evidence and early travellers' attempts to depict it, the Dome of the Rock remained essentially unchanged in structure and decoration until the 16th century. There were, of course, adaptations during the Crusader period, but these were limited to a screen around the rock and painted woodwork. However, the exterior of the building has always been

vulnerable to the ravages of the Jerusalem climate, scorching hot in summer and icy cold and wet in winter. The most obvious effect was the deterioration of the mosaics which lined the outer walls and parapet niches.

When Sultan Sulaiman Qanuni (the Lawgiver) came to rule in 1522, he automatically assumed the caliphate. He fulfilled his responsibilities by embarking on a programme of refurbishment of the Holy Places, included the three most holy shrines of Islam in Mecca, Medina and Jerusalem. Although his most conspicuous contribution to Jerusalem was the rebuilding of the city walls, he also devoted much attention to the Dome of the Rock. It was not enough for him simply to conserve it; instead he radically altered its appearance, turning it, as it were, inside out. Although inwardly it still focussed on the Rock, he determined that now it should proclaim itself loudly from the outside as well, as the older mosaics had done. Just as Mehmet the Conqueror built the Topkapi Sarai on a high hill above the Bosphorus to demonstrate his imperial power, Sulaiman seems to have had a similar intention for the Dome of the Rock. To be specific, the exterior was now clad for a good two-thirds of its height with glazed polychrome tiles. The exterior of most Ottoman buildings is marked by a certain sobriety; despite a few exceptions like the Yeşil Türbe at Bursa, the idea of sheathing the exterior of a building with tiles was most un-Ottoman. It was, however, common practice in Central Asia and Iran, and it was no accident that it should have been a group of Persian craftsmen whom Sulaiman ordered to work for him in Jerusalem.

The impact of Persian potters on the evolution of Syrian, Egyptian and Turkish tilework in the 15th century has long been acknowledged, and the frequency with which the name 'Tabrizi' occurs amongst the craftsmen links them definitively with Tabriz, in north-west Iran. Unfortunately, we know little about the genesis of the ceramic industry there. We do, however, know quite a lot about the expatriate Persian potters in Turkey, where they were responsible for the tiles in the Yeşil Cami and Yeşil Türbe in Bursa, and the Muradiyye Cami in Edirne. The mosque of Murad II, c.1437 AD, is of particular interest as it is here that one can see the switch from the traditional Persian *cuerda seca* technique to underglaze decoration, which was to be later exploited to such effect in the produces of the Iznik factories. After the capture of Constantinople in 1453, there appears to have been an initial hiatus, and when the ceramic industry got going again, first of all in Istanbul in the 1480s, and then at Iznik, it would appear that it was a new group of Persian potters who took the initiative. At the same time, Persian craftsmen continued to make tiles in the *cuerda seca* technique, and there is a whole sequence of imperial buildings decorated by them in the first half of the 16th century. One should also note that, whilst the Iznik potters were

contemporaneously producing a flood of underglaze-decorated vessels, the Iznik tile industry did not become fully active until the mid-16th century.

The key building which links the Persian *cuerda seca* tile-makers to the tiles decorating the exterior of the Dome of the Rock in Jerusalem is a little mosque in the small town of Bozüyük, east of Istanbul, on the road to Eskişehir. Here, in the Kasım Paşa Cami, which is dated 1528 AD, there is a series of tile panels of different design, including tiles with a pattern resembling a split butterfly, which closely resembles a similar tile design in Jerusalem. This group of potters worked in Turkey from 1520 until 1548, and it can be no coincidence that their last work there just predates the commencement of the tiling of the Dome of the Rock in Jerusalem.

But before the Dome of the Rock was tiled, a number of structural changes were made to the building. First, the windows of the outer octagon were remodelled, and the arch at the top became slightly pointed. And secondly, the Umayyad parapet niches separated by twin columns (of which more later) were walled up with limestone blocks to provide a plane surface for the tiles on the upper section of the octagon. Incidentally, what was the original purpose of this parapet wall? I suspect I may have discovered its function when I constructed a model of the Dome of the Rock some years ago. In fact, when you view the building from any direction whilst standing on the Haram platform, the parapet wall exactly masks the sloping roof of the octagon, and thus the drum and the dome above appear visually to rise up directly from the octagonal base.

The sequence of sheathing the building with tiles seems to have been within each zone, from the top to the bottom. The great tile mosaic inscription below the dome surmounts the tiling of the buttresses and panels of the drum, which are in *cuerda seca*. And on the eight faces of the octagon below, there is a transition from *cuerda seca* to true underglaze decoration, which reaches its zenith in the great *Ya Sin* inscription, removed at the end of the 19th century and now in storage. Julian Raby and I have been working on a study of the tiles, their evolution and design, for some years now, and the results are soon to be published. Here is it sufficient to say that we have found evidence for the production of the tiles in Jerusalem, actually close by in the Haram area. Finally, when their work was complete, the craftsmen moved on to Syria, where their initial work is to be found in the tiled *iwans* of the Bait Junblat in Aleppo, and then in a whole series of tiled buildings in Damascus, beginning with the Süleymaniyye Mosque.

One feature distinguishes the Jerusalem tiles from all others, and this is the fact that almost all the tiles were bored horizontally on their four sides, the tiles themselves being almost twice as thick as Iznik tiles. This was for the insertion of copper pins, which linked the tiles together,

and which were in turn hooked into the masonry behind. This unusual method of fastening the tiles to the building can only have been a practical response to the Jerusalem weather. Otherwise, moisture would have got behind the tiles and, when frozen in the winter time, they would eventually have been forced off the building. But this ingenious solution was not completely successful, and certainly by the early 18th century, the process of deconstruction was well under way. Tiles fell off, and were replaced by Syrian copies, easily detectable when compared with the originals. From now onwards, the exterior of the building became an outdoor museum of later Islamic tilework. A radical change came about at the end of the 19th century, when the tiles on the face of the parapet wall were in such bad repair that the whole *Ya Sin* inscription was taken down and replaced by a new copy. By the First World War, the building was in very bad shape, and one of the first moves under the British Mandate was to do something about it—and, indeed, about the generally dilapidated state of the Old City. Under the auspices of Sir Ronald Storrs, Governor of Jerusalem, and the High Commissioner for Palestine, Sir Herbert Samuel, the *Pro-Jerusalem Society* was formed. The Honorary Secretary was C R Ashbee, one of the most important members of the Arts and Crafts Movement, and it was probably due to him that so much was achieved in the few years before the society was disbanded, riven by political disputes.

K A C Creswell contributed an historical account of the Dome of the Rock to the *Proceedings of the Pro-Jerusalem Society*, published in 1920. Ernest Richmond was appointed to supervise repairs to the building, and Storrs invited an Armenian potter from Kütahya, David Ohanessian, to Jerusalem. He was instructed to build a kiln to make new tiles to replace the old. It is worth quoting Richmond's philosophy:

Tiles have decayed in the past, and tiles will decay in the future: some rapidly, some less so; some by natural and unavoidable causes, others by reason of neglect or lack of skill. In the past they have always been replaced in some form or other, though with varying success and uneven skill ...

If we admit ... that the Dome of the Rock is not merely a building of archaeological interest, but also a symbol of something very much alive, we must also allow that there is something to be said for maintaining the outward and visible sign of that vitality. All skin decays, but so long as there is life in the body which covers it, its tissues are continually renewed ... so long as the Dome of the Rock remains a live building ... so must its skin be continually renewed ... by marble

or mosaic, by tiles or by cement; for the walls have been too much hacked about, in order to provide a key by which to fix surface decoration, to make it tolerable that they should be entirely denuded ... within an appreciable number of years the choice will lie between cement as a covering to a considerable portion of the building, or new tiles.

Richmond's words were prophetic. The Ohanessian pottery never completely solved the problem of the Dome of the Rock, and the building continued to suffer further decay. By the end of the Second World War, it was decided that a thorough survey of the building and its decoration should be undertaken. This was executed by A S Megaw, and his report was deposited in the archives of the Palestine Archaeological Museum in Jerusalem. His recommendations were never acted upon, as in 1948 hostilities intervened, and the State of Israel was proclaimed. Jerusalem fell under Jordanian jurisdiction, and in the 1960s the Auqaf itself undertook responsibility for the restoration of the Dome of the Rock. This was carried out with pan-Islamic funding and under the control of a team of Egyptian and Palestinian architects.

I well remember visiting Jerusalem in 1966, to find to my astonishment that the greatest deconstruction of all had taken place. The entire tilework had been stripped from the façade and was lying in heaps around the Haram. Most interesting of all, the parapet niches had been uncovered, and where Sulaiman's blocking stones had fallen out, one could discern traces of the original Umayyad mosaic decoration. I had to leave the next day, but I encouraged the directors of both the British School of Archaeology in Jerusalem and the American School of Oriental Research to get up on the scaffolding and record them in detail. Neither did, nor as far as I know did the Egyptian architects. The parapet was then covered with six inches of reinforced concrete to provide a plane surface for the new tiles. One could argue that this was in its way an act of conservation, but to get at the evidence now one would need a pneumatic drill.

When I returned to Jerusalem some months later, the new tiles were in place, and the old tiles were still around the Haram. With the permission of the Auqaf, I made three representative collections of the different types, one to remain in Jerusalem, one for the British Museum, and a third for the museum of the American University of Beirut, where I then taught. As the final negotiations were being undertaken for their export, the 1967 so-called Six Day War broke out, the Israelis captured Jerusalem, and my three collections of tiles disappeared without trace.

As I was working in Beirut, Jerusalem was now out of bounds, but I did ask the head of the United Nations

Mission, Colonel Burns, if he could make some enquiries about the rest of the tiles. He reported back that he had been told that all the old tiles—some 60,000 of them—had been thrown away on the city dump. This was disappointing but not entirely surprising, as the Crusader painted woodwork which had been stripped out a couple of years previously during the restoration of the Dome of the Rock had been sold as lumber in the Old City, and you could buy chicken coops made from it. I wished I had.

As far as I was concerned at the time that was the end of the affair. The Dome of the Rock was completely restored, with a mix of some old but mostly new tiles. The reconstruction of the original design was quite close to the 16th-century scheme, with the opposite walls of the octagon repeating the same lay-out, so that each façade alternates with its neighbours. I came across the new tiles being manufactured in Kütahya, in Turkey, where they were skilfully copying the old designs. Although it is easy to detect the difference between the old and the new tiles close up, this does not show up so clearly at a distance. The major and certainly most striking addition to the building was the new anodised aluminium dome. Everyone hoped it would weather—which it did not—and more recently it has been replaced at the late King Hussein's own expense with a new ribbed dome properly gold-plated.

I said that as far as my own interest in the tiles was concerned, this was the end of the affair, but as events turned out, it was not. Much later I embarked on a survey and study of all the tiled monuments in Syria with Julian Raby, and during the course of our research it became very clear that what happened in Jerusalem in the mid-16th century as a result of Sulaiman's restoration of the Dome of the Rock was a crucial part of our general study of Syrian tiles. In the meanwhile, I had left the American University of Beirut, and by the late seventies was installed as Curator of the Museum of the Oriental Institute at The University of Chicago. One day, I received a call from the State Department asking me if I would entertain a young visitor from Jerusalem. When he arrived, I found he was the Palestinian Curator of the Aqsa Museum, on the edge of the Haram. Out of curiosity, I asked him if it was true that the Dome of the Rock tiles had all been thrown away. 'Oh no,' he said, 'I have them all locked up in a storeroom.' Having ascertained that we could see them, I rang up Julian Raby and agreed to meet him in Jerusalem as soon as we could get there. When we arrived we went to see Mr Adnan Husseini, the Engineer of the Auqaf, who was extremely friendly. But we came into collision with the keeper of the storeroom, who said we might study the tiles, but not photograph them without the written permission of the Auqaf. Adnan Husseini tried and tried to obtain this, and as the days ticked by I said to Julian that we would get permission on the day we left. In fact, we got it the day before. The weather was most inauspicious—cold, grey and

wet—and we had no special lighting. We took the tiles one by one onto the Haram and photographed them on the bare stone. Just in case, we both took duplicate sets and—incredibly—they all came out perfectly. Nor had we been idle whilst waiting for the *firman*, for we had used the time to measure and document each type in detail. The great discovery was the original *Ya Sin* inscription, which the elderly custodian had himself put into the correct sequence. We already had a copy of Megaw's report which he had generously given us in England, and in the Palestinian Archaeological Museum (now for political reasons euphemistically renamed the 'Rockefeller Museum') we were able to secure all the relevant photographs which accompanied the original report, and have them copied. Megaw's incisive and thorough report coupled with our own observations are the foundation of our present study.

★ ★ ★

I have recounted this personal story in detail for a purpose, for it now also becomes part of the history of the deconstruction of the Dome of the Rock. Nor was it the only building in the Old City which was transformed during the Ottoman period; one thinks of the Armenian Cathedral of St. James, radically redecorated in the early 18th century, again with tiles from Kütahya. To return to my original point—buildings have their own lives and can

mean many things to different people at different times. To conclude, I quote what the Grand Mufti said about the Dome of the Rock in 1920, in remarks addressed to the Muslim community worldwide:

Now, when the men of the occupying power, and particularly His Excellency Storrs, saw the ruined state in which stood the mosque ... it was an eyesore to him and he expressed his deep regret, and set about at once—may God watch over him—and applied for an able engineer ... very soon the British Government sent out from its capital London the most celebrated engineer, this is Major Richmond. No sooner arrived than he set to work at once, tucking up his shirt sleeves of activity, minutely examining and investigating and reporting on what ought to be done, he also showed in an estimate that it would necessitate 80,000 pounds—not much, God willing, for those charitable people who wish to lend God a pious loan, which is not much if the object be to preserve such sacred precincts to which humanity flocks from all parts of the world. His call is 'Lo! Our riches we entail to Thee!' For verily he erects the mosques of God who believes in God. Verily, also, God will not suffer good works to go unrewarded.

Chapter 28

THE OTTOMAN WINDOWS IN THE DOME OF THE ROCK AND THE AQSA MOSQUE

*Finbarr B Flood**

1. Introduction

The fragile art of the stucco and glass window (known in Arabic as *qamariyya* or *shamsiyya*) is one which has in general received short shrift from historians of Islamic art and architecture.¹ This is true even of those buildings about whose decoration much ink has been spilled, buildings in which the interior aesthetics, and indeed our ability to view

the decoration, is largely determined by the degree and quality of the illumination. The two structures to be considered here—the Qubbat al-Sakhra and the Masjid al-Aqsa—are good examples of the phenomenon. Despite the numerous studies which have dealt with the architecture and decoration of both monuments, their coloured glass windows have received little serious attention. While the reasons for this are probably several, the most obvious are the difficulties involved in dating window-grilles. In addition to their inherent conservatism of style, stucco grilles will be repaired, remade and replaced several times during the lifetime of a building.² Any study of the windows in the Aqsa and Dome of the Rock will invariably find itself hampered by these considerations. Nevertheless, this seems an appropriate place to try to assemble the available evidence in order to contribute not just to a more holistic understanding of the architectural history of these key monuments, but to the study of Ottoman architectural decoration in general.

Although it has occasionally been asserted that some of the window-grilles in the Dome of the Rock date from the Mamluk (Rosen-Ayalon 1975: 94) or even the Ayyubid period (Saladin 1907: 69), it should be stated at the outset that it is extremely unlikely that any of the window-grilles currently visible in the Dome of the Rock

* Acknowledgements

The research for this paper benefited greatly from a visit to Jerusalem in 1994, made possible by a travel grant from the Ottoman Jerusalem Project. During this visit I was also able to avail myself of the considerable resources in the Library of the British School of Archaeology in Jerusalem. I am grateful to Julian Raby for bringing the existence of A H S Megaw's unpublished report to my attention and to Ruba Kana'an for pointing me to Ibrahim al-Murat's account of the restoration undertaken by Mahmud II. I would like to thank Dr Ömür Bakirer for her generosity in supplying me with copies of her publications on Ottoman windows. In the study of archival photographic material both Teresa Fitzherbert of the Ashmolean Museum and Shimon Gibson of the Palestine Exploration Fund gave generously of their time. The accompanying photographs of the wooden ceilings in the Dome of the Rock are reproduced by courtesy of James Allan. My thanks are also due to Zahid Chaudhary for help with the drawings. This contribution to the history of Qubbat al-Sakhra and the Masjid al-Aqsa is dedicated to Louise Maguire and Anna McCord, my companions through an earlier winter in Jerusalem.

¹ The various articles published by H G Franz (1955, 1956, 1958) are an exception. More recently Ömür Bakirer has published a series of articles summarising the available information on the development of Turkish window-grilles (1985, 1990a, 1990b). See also Brosch 1990.

² In the discussion which follows I use the term 'repaired' where part of a grille has been replaced while still *in situ*. The term 'replaced' indicates where a grille has been removed and one of a later date substituted. Where the substituted grille reproduces the form of the grille which it replaces it is referred to as a 'copy'.

pre-date the Ottoman occupation. It seems more probable that most, if not all, of these stucco and glass windows are creations of the present century. The extent to which they replicate the designs of earlier windows will be considered below. The same is true of the window-grilles in the Aqsa mosque. The latter window-grilles will be dealt with only briefly, for less documentation is available regarding them and any earlier grilles were destroyed in the fire of 1386-87/1967.

Before commencing the discussion, it will be useful to summarise the evidence for the fenestration of both the Qubbat al-Sakhra and the Aqsa Mosque in the period immediately preceding the Ottoman conquest of Jerusalem. In the succeeding section an attempt will be made to determine the forms of the window-grilles installed during the restoration of both buildings in the reign of Sultan Sulaiman I (al-Qanuni). The evidence for changes to the window-grilles since the 10th/16th century is more fragmented, but will be presented in the relevant sections.

2. The Fenestration of the Monuments of the Haram in the Pre-Ottoman Period

The earliest indication that the windows of the Dome of the Rock were filled with coloured glass is given by Ibn al-Faqih (291/903), who mentions fifty-six windows 'glazed with glass of various hues' (Ibn al-Faqih 1885: 101; le Strange 1890: 120-21). The figure given corresponds to the sixteen windows in the drum of the dome and the five (including the lunettes above the doorways) pierced in each of the walls of the octagon. It is possible that some of these glass windows were contemporary with the construction of the monument, for almost all the major secular buildings of the Umayyad period have produced the remains of window-grilles composed of stucco and coloured glass.³ Richmond's investigations suggested that the original window-fillings were set back at an appreciable distance from both the internal and external faces of the window-openings (1924: 85-6; 1926: 39). One may assume that the windows were closed on the exterior with grilles of metal or marble, such as those which survive in the Great Mosque of Damascus (Creswell 1969: 202-4, pl. 59).

There is an unfortunate hiatus in the information pertaining to any subsequent changes to the windows of the Dome of the Rock before the Mamluk period. 6th/12th-century writers such as John of Würzburg do no more than mention the windows in passing (Tobler 1974:

125-6; de Sandoli 1980: 241). No information is given regarding the grilles which filled them, but there is no reason to suppose that any stucco and glass windows *in situ* would have proved unpalatable to Crusader tastes: elsewhere in the Levant stucco and glass window-grilles of traditional Islamic type were installed in Crusader castles and palaces.⁴

The information to be gleaned from the sources is more plentiful for the Mamluk period. Al-'Umari, writing before 755/1354, mentions the presence of glass lunette-grilles in the Qubbat al-Mi'raj (al-'Umari 1924: 149; Mayer 1931-2: 74). Of the windows in the Dome of the Rock—some of which may have been replaced during the restorations carried out in the reign of Sultan al-Nasir Muhammad in 718-9/1317-20 (Creswell 1969: 92 n. 4)—he states:

The drum wall is pierced with sixteen gilded glass (*zujaj mudhabat*) windows, covered externally with gratings ... each side of the octagon has seven windows, two blind lateral ones and five of glass, provided on the outer side with iron gratings (*al-shababik al-hadid*) (al-'Umari 1924: 140; Mayer 1932: 44-5).

In the mid-8th/14th century, Nicolo da Poggibonsi mentions that the Dome of the Rock has '*finestre bellissime*' (1945: 54). Subsequently Felix Fabri, observing the building from the adjacent Madrasa al-Ashrafiyya, mentions the presence of glass windows in passing (Clermont-Ganneau 1899: 191 n. 2; Creswell 1969: 79 n. 6). From this one may conclude that in the 8th/14th century the windows of the drum and octagon were filled with coloured glass, protected on the exterior by metal gratings.

One final point to be made in connection with the Dome of the Rock concerns the grilles which fill the lunettes above each of the four entrances to the Dome of the Rock. These consist of pierced marble grilles in the

⁴ For a mention of glass windows in Crusader dwellings see Rey 1883: 6). In the windows of a Crusader castle at Montfort and in a Crusader church at Atlit, pieces of coloured glass cut from circular panes of crown glass were set in lead cames (Lafond 1966: 237; Johns 1935: 133, fig. 8). The manufacture of crown glass was unknown in Europe at this date (Harden 1961: 41), but was common in the Levant from the Justinianic period (Meyer 1989). It has even been suggested that crown glass was introduced to Europe by returning Crusaders (Chambon 1963: 167). It had been common practice in the Levant from the Umayyad period onwards to cut pieces of coloured glass from such panes for use in stucco windows. The use of lead rather than stucco for the tracery of the windows at Atlit and Montfort is therefore anomalous. The windows thus appear to combine the techniques and materials of stained glass and *qamariyyat*.

³ Many of these finds are unpublished, but see Lafond 1966: 13-4; Bisheh 1990: 73, pl. LVI; Brosch 1990; Flood 1993: 17-23.

form of simple geometric patterns (Creswell 1969: 99). Several scholars have suggested that at least one of these grilles—an imbricated lattice above the western entrance—is Umayyad (Creswell 1969: 99 and pl. 4b; Sourdell-Thomine 1973: 143 and pl. 18). In view of the similarities between this grille and those surviving in the western *riwaq* of the Great Mosque of Damascus (Creswell 1969: 202–4 pl. 59 a–b), this would seem a reasonable assumption. There is however a problem, for Ibn al-Faqih mentions fifty-six windows filled with glass (Ibn al-Faqih 1885: 101). This figure would appear to include the sixteen windows of the drum, the five windows pierced in four walls of the building and the four windows and a lunette pierced in each of the walls in which entrances occur. Clermont-Ganneau (1899: 196) suggested that when Ibn al-Faqih visited the Sakhra the lunettes may have contained glass, although that is not the case with those presently in place. One must also consider the possibility that either Ibn al-Faqih was mistaken, or that none of the lunette grilles is original. If the latter is the case then one must at least consider the possibility that the lunette-grilles may have been replaced during one of the Ottoman restorations.

Perhaps the most remarkable testimony for the pre-Ottoman period is one which concerns the decoration not of the Dome of the Rock, but of the Aqsa Mosque. The description is given in the writings of Antonio da Crema who, along with two companions, was briefly permitted to see the interior of the mosque during a visit to Jerusalem in 891/1486. Amidst a long description, which is rich in detail but which has largely been ignored by architectural historians, da Crema notes two facts about the windows of the mosque. The first is that the lateral walls of the building were provided in their lower parts with large windows which were closed by means of bronze grilles in which the intersections of the vertical and horizontal bars were secured by metal ligatures (Nori 1981: 69). A second type of window, perhaps those along the *qibla* wall, were filled with coloured glass:

And at the end of this entrance one enters into a hall which is as long and as wide as the White Hall of your Lordship. The other side of it has windows which are much larger than the aforementioned, which come down almost as low as the floor of the room and which are furnished with shining glass (*lucido vetro*). Then above these is another order of small ones of which the window-glass is of various colours arranged individually (*singolarmente composite*) ... (after Nori 1981: 69).

No other descriptions of the Aqsa windows are known to me, but it is clear that at least some of the

windows in both the Dome of the Rock and the Aqsa mosque were filled with tracery containing polychrome glass in the period preceding the Ottoman conquest. Another building in the Haram, the Ashrafiyya Madrasa (847/1482) was also provided with windows of coloured glass, for they are mentioned in its *waqfiyya* and in several contemporary descriptions (van Berchem 1923: 369; Ibrahim 1961: 437).

3. The 10th/16th-century windows

(i) Introduction

In the renovations to the Dome of the Rock and al-Aqsa ordered by Sultan Sulaiman Qanuni (926–74/1520–66) following the Ottoman conquest of Jerusalem in 923–4/1517, the windows were among the first elements of the decoration to be replaced, presumably in order to protect the interior of the monument (van Berchem 1927: 329–32, no. 238; Meinecke 1988: 259). The continuous inscription which once ran from window to window gave a date of 935/1528–9 (van Berchem 1927: 331, n. 2). Since this date there have been numerous large- and small-scale restorations of both monuments which have entailed changes to their windows. The available information regarding such alterations will be summarised in sections 4 and 7. The frequency and scale of the recorded instances in which the window-grilles in both monuments have been replaced suggests that few, if any, of the windows now *in situ* date from the 10th/16th century. In addition to this, none of the windows which have been removed from the Qubbat al-Sakhra and the Masjid al-Aqsa and which are today preserved in the Haram Museum seem to pre-date the restorations of ‘Abd al-‘Aziz in 1291/1874 (Walls and Abu’l-Hajj 1980: no. 238).⁵ One is therefore left with the task of attempting to glean what information one can regarding the earlier windows from various sources.

Fortunately there are two excellent, if only partial, records of the windows installed by Sulaiman I in the octagon of the Dome of the Rock. The first—the *Temple de Jérusalem* of Count Melchior de Vogüé, published in 1281/1864—includes colour drawings of three windows and a partial record of the inscriptions which they bore. De

⁵ Of three grilles presently housed in the Haram Museum and examined in the course of this study, one (pl. 28.6), which follows the form of what appears to be a 13th/19th-century type, dates from 1342–6/1923–7 (see Appendix II, comments for window 19). Another bears the name of ‘Abd al-‘Aziz and the date 1291/1874 (pls. 28.9–11), while a third (pl. 28.7), which does appear to copy a 10th/16th-century form, seems likely to date from restorations of the 1340s/1920s, and to have been replaced subsequently.

Vogüé's account may be supplemented by that of Henri Sauvaire, whose more complete record of the inscriptions in the windows was compiled in 1311/1893 and checked again by Max van Berchem in 1333/1914 (van Berchem 1927: 329-30). Using the information contained in both these sources it is possible to suggest how the window-grilles installed by order of Sultan Sulaiman compared to both the types of contemporary grilles being produced in Istanbul and to those which fill the windows of the Dome of the Rock and the Aqsa Mosque today.

It should be stated at the outset that the window-grilles in the drum of the dome of the Qubbat al-Sakhra are of a different form from those of the octagon, both in their dimensions and in the lack of the epigraphic band which is included in all the stucco and glass window-grilles of the octagon. There is a noticeable dearth of evidence regarding the windows of the drum in the 10th/16th century and I will return to this issue in section 6.

(ii) The outer grilles

The system of fenestration employed in the windows of both the octagon and the dome was somewhat idiosyncratic. The original windows had been set in the centre of the embrasures (Richmond 1924: 86). In Mamluk buildings grilles of stucco and glass were usually set in the interior of window-openings, protected on the exterior by nets of brass or copper or by open grilles of wood or metal (Amin and Ibrahim 1990: 90-1). As we have just seen, during the Mamluk period the stucco and glass windows which filled the interior of the window-openings in the Dome of the Rock were protected on the exterior by metal grilles.

It was common practice in Ottoman buildings to protect fragile grilles of coloured glass with more robust exterior grilles of stucco or lead in which were set circular discs of clear, usually crown, glass (Arseven n.d: 183 fig. 453; Goodwin 1971: 237). According to Richmond, in the Ottoman windows of the Dome of the Rock an unusual combination of these methods was used. The inner window-grilles were of stucco and coloured glass. In the centre of each window-opening was a closed grille consisting of plain glass roundels of about 20cm in diameter set in stucco. There are indications that in some cases the middle grilles containing large panes of clear glass were of wood rather than stucco (Shafi'i 1970: 65). The date of any such wooden intermediary grilles is not clear, and they may have been introduced at some point after the 10th/16th century. Finally, the exterior of each window was filled with a grille consisting of pierced glazed tiles backed with wire netting (Richmond 1924: 78; Wilson 1881: 60). At certain times in the past the inner grilles of glass roundels set in stucco have been visible externally in

windows where the outer tile grilles were damaged (Schoberl 1835: 102).

Despite the introduction of the new system of fenestration, there is evidence that in some of the windows of both the octagon and the drum of the dome the metal gratings seen in the Mamluk period were not replaced, but continued to survive between the outer grilles of pierced tiles and the inner windows of coloured glass, possibly as late as the present century.⁶ This fact may explain a somewhat puzzling description of the external appearance of the windows by Elzear Horn, writing in the second quarter of the 12th/18th century:

In the four sides, where there are no doors, there are seven windows, and in the remaining four there are six windows, made of copper divided crosswise like a cage, and of encrusted glass, of which, however, some seem to be closed (Horn 1962: 202-3).

The error in the number of open windows in the sides of the octagon leaves open the possibility that this account is mistaken. It may be however that when Horn saw the monument the outer panels were missing, revealing the metal grilles and the glass windows beneath.

The major disadvantages of this unusually elaborate system are that it both hastened the demise of the coloured glass windows—permitting the build-up of rain-water, dampness and dirt between the two layers of stucco grilles—and severely curtailed the amount of light entering the building (Richmond 1924: 80). The latter disadvantage may have been mitigated to some extent by the amount of light entering through the doors,⁷ but at least by the time Evliya Çelebi visited Jerusalem, the entrances to the Dome of the Rock were covered with thick embroidered curtains, even when the doors were open (St Stephan 1942: 88). In terms of its effect on the light penetrating the interior, the triple-grille system acted to filter and subdue the light passing through windows, producing superimposed layers of pattern dimly visible behind the coloured glass of the interior grilles. The contrast between the subdued tones of the coloured light passing through the windows of the Dome of the Rock and the harsher hues of the coloured

⁶ The continued existence of such metal gratings is mentioned in the reports of Megaw 1952: 88 and Shafi'i 1970: 65. An unpublished photograph in the photographic archive of the Palestine Exploration Fund (P.1529-31), taken in 1291/1874, shows a metal grille appearing in a window in which parts of the outer tile panel are missing.

⁷ Nasir-i Khusrau informs us that, in the 5th/11th century, the main light entering the Aqsa came not from its windows, but from its doors (le Strange 1890: 107). It is reported that in the 10th/16th century the doors of the Sakhra were kept open day and night (Suriano 1949: 109).

glass windows in the Aqsa—which were not provided with exterior tile grilles—is noted by later observers (de Vogüé 1864: 103).

(iii) *The inner grilles of stucco and coloured glass*

The three drawings published by de Vogüé (pls. 1–3) show windows which are similar in their internal divisions. The windows measure about 3.25m by 1.09m (3.45m by 1.28m set in their wooden frames) and are divided into three distinct zones, each delineated by a thick border of stucco tracery about 2.5cm wide.⁸ The lower zone consists of a rectangular field measuring 30cm by 27cm. This is separated from the lunette of the grille by an epigraphic panel which measures 70cm by 37cm. An outer border 20cm wide, consisting of ovoid cartouches separated by medallions or rhomboids, surrounds the central fields. The central field is composed of a large rectangular panel separated from a round-headed lunette by a band of epigraphy. Details to be discussed shortly—such as border motifs and inscriptions—suggest that the grilles recorded by de Vogüé were indeed those set in place during the restorations of Sulaiman I. While the drawings are masterpieces of detailed architectural drawing, two points must be borne in mind in using them. Firstly—with the exception of thick outer borders—no attempt is made to distinguish the fine white lines of the inner stucco tracery from the glass which fills it. Secondly, the absence of a section through any of the windows means that, from the drawings alone, one cannot determine that the stucco tracery was executed to different depths, producing two different planes of tracery across the surface of the windows (Richmond 1924: 40).

The borders all consist of elongated cartouches separated by smaller geometric units. In the case of two of the published windows the cartouches are filled with a dense grid of floral elements similar to those which can be found in some of the window-grilles in place today. In the third window the cartouches are filled with a more complex arrangement of floral motifs. While the alternation of cartouches with medallions or rhomboids is undiagnostic, the border motif of the third window on the east side (pl. 28.2) is characteristically Ottoman. Here the cartouches are separated by a series of quadrilobed medallions which also appear in some of the modern windows (pl. 28.4). The same border motif appears in the tile ornament surrounding the exterior of the window-

openings (pl. 28.5). This suggests both that the design of the *qamariyya* is contemporary with the 10th/16th-century tile ornament, and that the fine stucco and glass grilles which filled the interior of the windows made reference to the more robust pierced tile grilles on the exterior.⁹ Further evidence to support a 10th/16th-century date for this design may be found in Istanbul and elsewhere, for similar quadrilobed medallions appear between larger cartouches as a border motif in stucco and glass windows in a series of buildings constructed by order of Sulaiman I or by members of his court.¹⁰

A 10th/16th-century date for the windows published by de Vogüé is confirmed by the inscriptions which they bear. In the original scheme, for which a reconstruction is proposed in Appendix 28.1, the epigraphic bands in the windows of the octagon formed a continuous inscription which started with the first window on the eastern side (window 1). The inscriptions in two of the windows published by de Vogüé are ahistorical. The first window on the eastern side (pl. 28.1) bore the *bismillah*, the third (pl. 28.2) an excerpt from Sura II:163. This is not the case with window 26, the last window on the south-western side (pl. 28.3), which, according to both de Vogüé and van Berchem, bore the inscription *Sulaiman ibn al-sultan Salim Khan ibn Bayazid*. If this window-grille was not an original work of the 10th/16th century it seems unlikely that it would bear the name and titles of Sulaiman; when many of the windows were removed during the restorations carried out in 1291/1874, the replacement windows bore the name of ‘Abd al-‘Aziz.

Quotations from three Qur’anic *suras* appeared in the windows. Sura II: 163–64 ran from window 2 to 3, while Aya 255 of the same *sura* was continued from window 4 to window 9. An extract from Sura IX: 18, rather than the complete *aya*, ran from window 15 to 18. The

⁹ Similar borders occur on the Ottoman tiled panels in the *qibla* wall of the Qubbat al-Silsila (Aslanapa 1989: fig. 2). Related polylobed medallions separating elongated cartouches may be found in the borders of some of the windows which appear in contemporary Ottoman miniatures (Bakirer 1990: fig. 91).

¹⁰ For example in the mosque of Shazadeh in Istanbul (950/1543), visible in an unpublished photograph in the Creswell Archive, no. 7124. A similar border motif is used in the stucco and glass windows flanking the *mihrab* in the Mosque of Sokollu Mehmet Pasha (979/1571). These windows are not original, but date from 1299/1881. According to contemporary sources, however, the 13th/19th-century windows ‘are in keeping with the original design’ and incorporate some fragments of the 10th/16th-century glass (see Kuban 1968: 36; Goodwin 1992: 272). The same border motif appears in the stucco and glass windows in the Tekkiye in Damascus (968–74/1560–6) (Creswell Archive no. 5602). These may be later copies, but they bear a sufficiently striking resemblance to some of the window-grilles in the Süleymaniyye Mosque in Istanbul (discussed in section 4 below) to suggest that even if this is so, they preserve the form of the 10th/16th-century windows.

⁸ The measurements which follow are based on an examination of a window now in the Haram Museum (pl. 28.7). The style of this window suggests that it reproduces one of the 10th/16th-century windows, but it may be a copy produced during one of the restoration campaigns of the present century.

longest extracts are from Sura XLVIII (*al-Fath* or 'Victory')—verses 1 to 5 appeared in continuous sections in windows 28 to 36. Van Berchem drew attention to the probability that the historical inscription in windows 10 to 13, with its mention of the victories of the Muslim armies, was intended as a reference to the campaign which Sulaiman began in 935/1529 (the date given in the windows) and ended at the walls of Vienna (1927: 332):

O God, aid and sustain the armies of the Muslims. Prolong the days of our Lord, the Sultan, Lord of the necks of nations, the Sultan Sulaiman, son of the Sultan Selim Khan, son of Bayazid.

One might add that the use of extensive quotations from the Sura of Victory should probably be interpreted in a similar vein. Similarly the presence of the Throne Verse—a verse which appeared frequently in funerary monuments—and of descriptions of Paradise (XLVIII: 5) may relate to the destiny of those who fell in the military campaigns by which such victories were won. They are also appropriate to the decoration of a monument which, whatever its original meaning, has often been interpreted as a depiction of the Garden of Delight (Rosen-Ayalon 1989: 46-73). There are however reasons for thinking that the epigraphic programme of the windows—including the choice and placing of the Qur'anic quotations—was influenced by the specific context in which it appears, revealing something of how the Dome of the Rock was perceived in the 10th/16th century.¹¹

Evliya Çelebi, visiting the Dome of the Rock in 1082/1672, gives the following description of the windows in the octagon and their inscriptions:

Windows in the first concentric wall overlook the Sanctuary. On their wonderful iridescent stained glass one reads either the words *la ilaha illallah* (There is no God but Allah) or the verse, 'God is the light of heavens (*sic*) and earth' (Sura XXIV: 35), or the names of the first four caliphs. It is a bewilderingly beautiful stained glass (St Stephan 1942: 89).

As may be seen from Appendix I, while the first part of the *shahada* did indeed appear in several windows, there is no evidence for the presence of either caliphal names or excerpts from the Light Verse. One must assume therefore that Evliya Çelebi's account is inaccurate on this

point. His perception may have been influenced by his familiarity with the coloured glass windows in the mosques of Istanbul, which did on occasion bear excerpts from the Light Verse (Necipoğlu 1985: 100; see section 4 below).

The letters of the inscriptions themselves were executed in colourless glass against a dark blue ground, which had the effect of rendering the inscriptions more legible than other aspects of the window tracery. Vegetal tracery filled with red glass appeared in the interstices between the letters of the inscription.

In two of the three window-types which are documented, the design of the tracery filling the large central field below the epigraphic band is continued in the lunette above (pls. 28.2-3, figs. 28.2-3). The two are linked conceptually, since the design is regular and repetitious, covering the whole internal field apart from where it is interrupted by the inscribed band. In the third case the pattern does not appear to be continuous, although a similar arabesque motif occurs in both the lower field and the lunette of the window. The tracery designs are all based on symmetrical arrangements of floral or vegetal ornaments, sometimes in combination with geometrical grids.

That the three windows for which published drawings exist are all of different form is indicative of a variety which would originally have almost certainly included several other window types. At least one of the 10th/16th-century windows recorded by de Vogüé (pl. 28.1) is no longer represented among the types now *in situ*. That the type of border motif associated with this form of grille—a series of cartouches with intermediate rhomboids—no longer appears among the windows of the Qubbat al-Sakhra suggests that the border motifs may have been specific to particular types of windows. The vanished type has been replaced by a type of grille (type 1, pl. 28.6) which may have been introduced in the 13th/19th century and which appears today in windows 1, 4, 10, 13, 19, 22, 28 and 31.¹²

Some clue as to how *qamariyyat* of different forms were arranged in the windows of the octagon is provided by the fact that windows 1 and 3, the first and third window-grilles in the eastern side, are of different types. This was also the case when de Vogüé recorded the grilles in these windows (Appendix II, windows 1 and 3). The reasons for believing the latter grilles to be 10th/16th-century creations, or accurate copies, are cited in Appendix II. One must either assume that all four window-grilles on this side were of differing types, or that the grilles were arranged symmetrically, with grilles of one type filling the two windows furthest from the entrance and two of another type in the windows nearest it. Since coloured glass

¹¹ This aspect of the inscriptions will be discussed in a forthcoming study of the meaning of the monument by Julian Raby.

¹² See note 42; Appendix II, comments on windows 19 and 28.

windows were usually arranged symmetrically in both Mamluk and Ottoman buildings, this seems the most likely possibility.¹³ Thus one may conclude that on the eastern and western sides of the octagon a pair of grilles of one of the types published by de Vogüé (pl. 28.2) was flanked in the outer windows on these sides by windows of the second type which he recorded (pl. 28.1). It may be that on the northern and southern sides the same arrangement was followed, but using two different types of windows.¹⁴

In those sides in which no entrance exists one can assume that, for reasons of symmetry, the grille filling the central window was of the same type as that which appeared in the two windows at either end of the side. With the exception of the south-western side of the octagon (windows 23-7), where the arrangement is disturbed, the arrangement of the 10th/16th-century windows thus appears to have been similar to that used for the coloured glass windows in place today, with the window-grilles in opposite sides identical apart from their inscriptions.¹⁵

Despite the similar arrangement, it is clear that the modern stucco and glass windows in the outer windows on the sides of the octagon aligned to the cardinal points (windows 1, 4, 10, 13, 19, 22, 28 and 31), and of which an example is on display in the Haram Museum (pl. 28.6), bear little relation to those of the 10th/16th century. These grilles, in which the interior space is subdivided into a series of panels, seem to have replaced the arabesque type of grille recorded by de Vogüé in window 1 (pl. 28.1).¹⁶ The inscriptions of the windows on the eastern side (windows 1 and 3) are, however, similar to those recorded by de Vogüé and Sauvaire. It thus appears that elements of the 10th/16th-century design survive in the modern window-grilles, but incorporated into grilles of quite different type.

Of the remaining four types in place today, the

type of grille in windows 2, 3, 20, 21, 23, 25 and 27 (type 2, pl. 28.2 and fig. 28.4) is recorded by de Vogüé and, as has been demonstrated, seems to follow the form of a 10th/16th-century type. A further type (type 5, fig. 28.5), based on a hexagonal grid and now to be seen in windows 11-12, 24, 26, and 29-30, is similar, but not identical, to another 10th/16th-century type recorded by de Vogüé (pl. 28.3).¹⁷ A third type (type 3, fig. 28.4), now in windows 5, 7, 9, 14, 16, 18, 32, 34 and 36, may also reproduce another form of this date, for in more than three windows there is no evidence for the form of the grille having been altered substantially (Appendix 28.2, comments for windows 5, 7, 9, 32 and 34). The lack of small interstitial medallions between the larger cartouches of the border may indicate that the grilles now in place are modern copies of the 10th/16th-century windows in which the form of the original border has not been preserved. The final type of window-grille (type 4), now in windows 6, 8, 15, 17, 33 and 35, may also preserve the form of one of the grilles installed by Sultan Sulaiman, for its central motif—a medallion with terminal trefoils—appears in one of the windows of the dome (pl. 28.18, fig. 28.7) which, there are reasons for thinking, dates from this period (Appendix 28.3, comments for window 6). Similar windows appear in Persian miniatures from the late 9th/15th century onwards (fig. 28.6), and in Ottoman miniatures of the 10th/16th and 11th/17th centuries.¹⁸

From this survey, and from the evidence assembled in Appendix 28.2, one must conclude that, apart from one intrusive later type, the stucco and glass windows in the octagon today preserve the general forms of the 10th/16th-century windows. In many cases however the borders and inscriptions which appeared on the earlier windows have been altered. The modern arrangement conforms to the spirit, if not the letter, of the arrangement introduced at the time of Sultan Sulaiman.

If the forms and arrangement of the grilles indicate a certain fidelity to 10th/16th-century prototypes, this is not so with the glass used in the windows. Just as some of the earlier inscriptions have been copied but without reference to the grille type in which they appeared in the 10th/16th-century arrangement, so too the treatment of

¹³ Numerous examples may be found in the Burji Mamluk buildings of Cairo, for example, in the *madrasas* of Sultan Barquq (786-8/1384-6) and Inal al-Yusufi (795/1392). In Istanbul, symmetrical arrangements of coloured glass windows are found in the Süleymaniyye (965-6/1557-8) and in the Mosque of Sokollu Mehmet Pasha (979/1571).

¹⁴ The outer grilles on both these sides today copy late forms (see Appendix 28.2, comments for window 19). Before the major restorations of this century a window-grille of the type now in windows 6, 8, 15, 17, 33 and 35—a type likely to reproduce the form of a 10th/16th-century grille, but for which there is no evidence of use in the windows of the eastern or western sides—appeared on the north side of the octagon, in window 30 (see Appendix 28.2, comments for window 30).

¹⁵ This is confirmed by the fact that there is no evidence for the grille now in window 20 ever having been substantially altered (Appendix 28.2). Apart from its inscription, the form of the grille is identical to that recorded by de Vogüé 1864: 96, pl. XXV in the window opposite (window 3). The same type appears in window 3 today.

¹⁶ For a discussion of this type see note 42 and Appendix 28.2, comments on windows 19 and 28.

¹⁷ Similar hexagonal grids appear in the windows depicted in 10th/16th-century Ottoman paintings (Bakirer 1990a: fig. 95).

¹⁸ The window in the accompanying drawing (fig. 28.6) appears in an illustrated version of the *Khamseh* of Nizami produced in Herat in 900/1494 (Stchoukine 1954: pl. LXXI). For similar window grilles in Ottoman paintings see Anon (n.d.: pls. XLII, XLIV, LII, LXXXI). Although the precise nature of the relationships between the windows depicted in Ottoman miniatures and their Persian counterparts, and the relation of both to window grilles in actual buildings, remains to be determined, it seems clear that a relationship exists (Rogers 1983: 230 n. 38; Bakirer 1985: 151). See also the discussion in Section 6.

the inscriptions in the earlier windows has not been preserved with strict accuracy. The use of colourless glass for the letters of the inscriptions is respected, but these are set against a blue ground in place of the original red. Indeed one suspects that little of the 10th/16th-century colour scheme is preserved in the coloured glass windows now in place. The predominant tones of the glass in the modern windows of the Dome of the Rock are blue and yellow. The painting executed by Harvey in 1327/1909 shows a wide range of colours—including colourless, red, yellow, green, turquoise, royal blue and purple—among the glass filling the windows (Creswell 1969 frontispiece). To judge from the painting, however, the predominant tone of the glass in the 10th/16th-century windows of the Dome of the Rock was not blue and yellow, but red, with blue and purple being the main subsidiary colours. This hypothesis finds some support in the reports of 10th/19th-century visitors to Jerusalem, who mention the purple hue of the windows in the Dome of the Rock (Conder 1879: 317). If the colours of the glass in the windows of the Süleymaniyye in Istanbul can be trusted,¹⁹ then red and blue were also the predominant colours of the glass used at this period in the windows of religious buildings in Istanbul.²⁰ If this is accepted, then it follows that the colours of the light which penetrates the interior of the Dome of the Rock today bear little resemblance to the colours which filled the interior after the restorations of Sultan Sulaiman.

In addition to information regarding the form of the coloured glass window-grilles installed by Sulaiman the Magnificent, some details of the techniques used in their manufacture are available. Clermont-Ganneau, in an account dating from 1291/1874, mentions handling a fragment of one of the windows. It seems likely that this was from one of the windows installed by Sultan Sulaiman, some of which were replaced at this time. He describes the method of manufacture as follows:

Every one knows that these windows consist of a simple slab of plaster, rather thick, cut

into holes in various pretty patterns; at the end of these holes are fixed little pieces of transparent coloured glass, combined with exquisite taste (Clermont-Ganneau 1899: 218-9; Richmond 1924: 40).

This is clearly visible from the reverse of one of the windows removed from the Dome of the Rock and now in the Haram Museum (pl. 28.7). The stucco windows were strengthened by the use of rods of cane or iron and were mounted in thick wooden frames set into the window-openings (Richmond 1924: 79; 1926: 40).²¹

Most of the windows in the Haram Museum seem to date from the 1340s/1920s and were probably removed during the restorations of 1378-84/1958-64. It is probable however that some of the 10th/16th-century glass was reused in the later windows.²² The modern copies of window-types of the latter date preserved in the Haram Museum contain glass which does not appear to be modern.²³ This glass is cut from circular panes of window-glass of the type known as crown glass. The practice of cutting small pieces of coloured glass for use in *qamariyyat* from such circular plates was pioneered in Umayyad Syria and had continued subsequently in various parts of the Muslim world.²⁴ Despite the tendency for later visitors to describe the glass used in the windows of both the Dome of the Rock and the Aqsa as 'painted', de Vogüé rightly emphasises the point that the effect of the windows is not achieved by the use of painted glass—as in medieval European cathedrals for example—but by the juxtaposition within the lines of a pattern formed by stucco tracery of pieces of coloured glass, '*de la vitrerie pure et simple*' (1864: 96).

Replacing the windows in both the Dome of the Rock and the Aqsa must have required vast quantities of good quality glass. A single window-grille of the simple type pierced with large circular apertures which were used between the outer tiles and the inner *qamariyyat* could have used as many as fifty-five circular panes of clear glass, the diameter of each being about 20cm.²⁵ With fifty-two windows in the Dome of the Rock alone provided with such grilles, almost 3,000 panes may have been required. Additional clear glass would have been required for the protective grilles of the Aqsa, even without taking into account the coloured glass needed for the windows in both

¹⁹ The windows have evidently been either repaired or replaced with copies, for Arseven publishes a photograph of a fragment from one: (n.d: fig. 456). Goodwin (1971: 237) concludes that the window-grilles of the Süleymaniyye 'follow the original design but have been restored.' Bakirer (1985: 150) suggests that the windows are either original 'or else remade according to their original designs.'

²⁰ The construction notebooks of the mosque mention the purchase of white, red, yellow, deep blue, ruby and purple glass, much of which would have been used in the windows (Barkan 1972-9, vol. 1: 17; vol. 2: 175-6; Rogers 1982: 292). Red, purplish-red and turquoise were the predominant colours of the glass used in the windows of the Yeni Cami in Istanbul (finished 1074/1663) (Anon 1975: 69, colour plate on page 167). It is not known whether these are original; Bakirer (1985: 150) concludes that either they are, or that they copy the original windows.

²¹ For the use of metal rods in the manufacture of Turkish windows, see Lecompte (1902: 79).

²² See note 50.

²³ It is clearly distinct from that used in the window bearing the name of 'Abd al-'Aziz (pl. 28.11), which is flat glass with a high gloss, cut into large pieces.

²⁴ See notes 3 and 4.

²⁵ Based on Arseven (n.d: fig. 453, 3). The diameter of the panes is given by Richmond (1924: 78).

buildings. Although the glass industry at nearby Hebron could conceivably have provided at least some of the glass for both Mamluk and Ottoman windows,²⁶ it seems likely that much was imported from Istanbul. Since substantial quantities of both coloured and clear window-glass were imported to Mamluk Egypt and Ottoman Turkey—usually from Venice²⁷—it also seems probable that some of the glass used in the windows of the Dome of the Rock was imported. A *firman* dated 984/1576, however, which lists materials assembled during the reign of Sultan Sulaiman for repairs to the buildings of the Haram, makes no mention of glass (Heyd 1960: 101).

The fact that the pieces of coloured glass were attached to the rear of the stucco tracery rather than being sandwiched between two thick layers of tracery makes it clear that, technically at least, these windows were produced under the influence of local traditions. In Egypt and Syria the technique of attaching pieces of coloured glass to the rear of one layer of stucco tracery appears to have replaced the earlier technique of ‘sandwiching’ the glass between two layers of stucco tracery in the mid-8th/14th century (Herz Bey 1896: 3–4; Flood 1993: 146–8).²⁸ The latter technique continued in use in Ottoman Turkey; the windows of the Süleymaniye in Istanbul were produced in this way (Arseven n.d.: 182–3, figs. 455–6). This technique was later transmitted to the Yemen, where it continues to be used in the manufacture of stucco and glass windows (Bonnenfant 1977: 256–8). That a technique pioneered in Mamluk *qamariyyat* should be used in the manufacture of the windows of the Dome of the Rock in preference to a technique in use in the Ottoman capital suggests that these windows were manufactured by craftsmen of local origin.

By the time of the Ottoman conquest, coloured glass windows had been an integral part of the decorative repertoire of Mamluk architecture for almost two hundred and fifty years. The coloured glass windows of the

Ashrafiyya Madrasa (887/1482) in the Jerusalem Haram are mentioned by both Felix Fabri and Mujir al-Din (van Berchem 1923: 369, n. 2 and n. 5), and are described in its *waqfiyya* (Ibrahim 1961: 437). This was an imperial foundation which reflected the influence of Cairene architectural models, and for which materials were brought from Syria (Burgoyne 1987: 601). Van Berchem (1927: 333) suggests that the presence of coloured glass windows in the Ashrafiyya is evidence that the craft of *qamariyyat* manufacture was flourishing at this period. As an imperial *madrasa* the Ashrafiyya is, however, a special case and cannot be taken as the norm. There is no evidence for the existence of a local Jerusalemite tradition of coloured glass windows in the late 9th/15th century, and during the following century the lack of skilled craftsmen in Jerusalem is bemoaned in several documents (Heyd 1960: 156 n. 2). This is in contrast to Cairo, where coloured glass windows continued to be produced in the Ottoman period, the glass used in their manufacture being known as *zujaj qala’uni*, after the sultan during whose reign it was believed that such windows were introduced (Hanna 1984: 41). Although little is known of the *qamariyyat* industry in Damascus after the 8th/14th century, craftsmen were brought from Damascus to Jerusalem to work on various building projects in the 970s/1560s (Heyd 1960: 156, n. 2). It seems likely therefore that the 10th/16th-century windows in the Dome of the Rock and the Aqsa Mosque were the work of either Egyptian or Syrian craftsmen.

In spite of the use of local techniques in their production, one aspect of the windows is redolent of the stucco and glass windows of Ottoman Turkey: the fact that the pieces of glass used in the windows

are inserted obliquely, and not vertically, so as to overhang and meet the eye of the visitor at right angles ... (Clermont-Ganneau 1874: 138; 1899: 219; de Vogüé 1864: 96).²⁹

The resulting effect is to counteract the distortion caused by viewing the windows at an angle and to render the details of the design more legible. This also seems to have been facilitated by the use of tracery in two different planes, the main lines of the composition projecting further from the surface of the plaster panel than those of the subsidiary ornament filling the border cartouches (Richmond 1926: 40).

Although some still remained in the 13th/19th century (de Vogüé 1864: 103), any 10th/16th-century windows in the Aqsa have long since disappeared. Like those in the Dome of the Rock, the windows appear to have

²⁶ The flourishing state of the Hebron glass ateliers is noted by 8th/14th-century Western travellers (Bellorini and Hoade 1948: 68). There is some suggestion that the glass used in the *qamariyyat* which Qa’itbai sent to the Mosque of the Prophet in Medina may have come from Hebron (see Newhall 1988: 241).

²⁷ For the Mamluk period, we have evidence that ‘Frankish’ glass (*al-zujaj al-afranjī*) was used in the windows of the Ashrafiyya Madrasa (see van Berchem 1922: 369, n. 5; Ibrahim 1961: 427). Al-‘Umari mentions ‘Cypriot’ glass (*al-zujaj al-qibristī*) in the windows of a palace in the Cairo citadel, possibly the Qasr al-Ablaq (see Casanova 1897: 643). For Ottoman imports of Venetian window-glass, see Goodwin (1971: 347); Petricioli (1973: 91, fig. 22); Bakirer (1985: 148); and Rogers (1983: 245, 250).

²⁸ Any finds of window fragments manufactured according to the new technique from contexts which might pre-date the Bahri Mamluk period are either unstratified or described with so little precision that no conclusions can be drawn.

²⁹ For the same phenomenon in Turkish windows see Arseven (n.d.: fig. 457; 1939: fig. 404). The angle of downward slope in the tracery of the grilles in the Haram Museum is about 30°.

borne a continuous inscription in which the names of Sultan Sulaiman were given (van Berchem 1927: 439, no. 294). Sauvaire recorded the date of 996/1587 in this inscription. The date cannot be accurate, since Sulaiman died in 974/1566: it may have been a misreading for 936/1529-30, one year later than the date formerly visible in the windows of the Dome of the Rock (Meinecke 1988: 260-1). Nothing is known about the style of the Aqsa windows, but there are suggestions that they were of inferior quality to those in the Dome of the Rock. De Vogüé (1864: 103) suggests that this impression may be due to the absence of the exterior tile grilles which one finds in the Sakhra, so that the light entering the Aqsa had a harsher quality. The form of the outer grilles now in the windows of the mosque suggests that slabs of stucco filled with circular discs of crown glass—similar to the intermediate grilles in the windows of the Dome of the Rock—were installed at this time.

4. The Jerusalem windows in the context of imperial Ottoman architectural decoration

The coloured glass windows in the Aqsa and the Dome of the Rock have occasionally been described as ‘carpets’ of light (Schick 1887: 20). Although used as a poetic simile, this description may be more apt than those who coined it imagined. It is a notable aspect of Mamluk *qamariyyat* that many of the designs employed in their tracery are not exclusive to them, but reflect certain aesthetic trends which make themselves felt in the decoration of contemporary metalwork and textiles (Flood 1993: 148-52). The same seems to be true of Ottoman glass windows. As noted previously, the border motifs in some of the 10th/16th-century windows in the Dome of the Rock reproduced those on the tiles surrounding the exterior of the windows (pls. 28.4-28.5).

A further manifestation of this phenomenon is the fact that the colours and patterns of Burji Mamluk *qamariyyat* show marked parallels with those found in late Mamluk and early Ottoman carpets. Like the original 10th/16th-century windows in the Dome of the Rock, these were predominantly blues, red and purples. This may be part of the same shared aesthetic, or of a generalised ‘textile mentality’ (Golombek 1988), but there are indications of a more specific utilitarian dimension to the relationship between textile or carpet designs and certain types of architectural decoration. A good example of this is Semra

Ögel’s suggestion that the painted ornament on the interior of Ottoman domes reproduces the embroidered decoration of tents (Ögel 1973-6: 221-2). The ornament of the walls of such tents frequently suggest openings, and textiles were often hung on solid wall surfaces to similar effect (Denny 1990: 97-8). The textiles which hung in front of doors and window-openings were sometimes decorated with single-arch motifs which recall the form of the doors and windows which they covered.³⁰ A similar impulse is at work in the use on the leather covers of books of single sun designs (*shamsas*) which anticipate the illuminated *shamsa* of the frontispiece. It is not surprising therefore that the stucco tracery of Mamluk and Ottoman windows often appears to reproduce forms familiar from carpets or book covers (Bakirer 1985: 150-1). At both the Timurid and the Ottoman courts the use of cartoons which originated in imperial scriptoria for decorative enterprises executed in different media and on different scales is well documented (Raby and Tanindi 1993: 17, 22-3, 54-9). Such a scenario would go a long way towards explaining the overlapping styles of Ottoman window-grilles, tilework, frescoes, tent decoration, book-covers and carpets.

The large rectangular fields of at least two of the 10th/16th-century window-types in the Dome of the Rock (pl. 28.18, figs. 28.3 and 28.7) recall the design of contemporary carpets or book-covers. No precise parallels can be cited, but the concept of a rectangular field in which a central medallion is framed by four partially visible medallions is similar (Raby and Tanindi 1993: figs. 18-9, 62-3). Analogous motifs appear in the painted decoration of 10th/16th-century mosques in Istanbul (Otto-Dorn 1950: 52 fig. 8). Even if they were executed locally, one suspects—since the windows were installed at the behest of the sultan himself—that their designs may have originated in an imperial scriptorium. The transfer of designs from paper to ceramics, and subsequently to wall-painting and carpets, is a marked characteristic of the imperially-sponsored art of Istanbul in the 10th/16th century (Denny 1979: 9). The same phenomenon is apparent in the stucco and glass windows of the same period. For example, the four corner panels of the window above the *mihrab* in the Süleymaniyye Mosque in Istanbul, on which a flowering prunus appears (pl. 28.8 and fig. 28.8), reproduces a design which is found on tile panels appearing in a series of buildings with imperial associations in the capital.³¹

In the light of the available information one may

³⁰ See for example that depicted in a miniature in the 10th/16th-century *Hadiqat al-Su'ada* in the Türk-ve Islam Museum, Istanbul (Milstein 1990: 83, pl. VI).

³¹ The earliest appears to be a tile panel on the façade of the Sünnet Odası in Topkapi palace which was originally placed on one of a number of structures constructed by order of Sultan Sulaiman in 934-6/1527-8 (Atasoy and Raby 1989: 102). Tile panels with similar decoration appear in the following locations: the Tomb of Hürrem Sultan (967/1559), the Baths of Selim II, a *minbar* in the Mosque of Rüstem Pasha (969/1561) (see Denny 1977: figs. 136, 219-20, 251).

conclude that the designs of the 10th/16th-century coloured glass windows in the Dome of the Rock may have been determined in the Ottoman capital. Whether this is so or not, the technical considerations just cited indicate that they were not produced by craftsmen from Istanbul. The absence of skilled artisans such as carpenters and stone-cutters in Jerusalem at this period is recorded in several contemporary documents (Heyd 1960: 156 n. 2), which renders it likely that the craftsmen who produced the windows were brought from Egypt or Syria.

Not only the techniques used in the manufacture of the windows, but also the treatment of the inscriptions which they bear find their closest parallels in the *qamariyyat* which filled the windows of Mamluk mosques, *madrasas*, *khanqahs*, tombs and palaces. In Cairene tombs and *madrasas* of the 8th/14th century there are several instances of an inscription—usually a Qur’anic quotation—continuing from *qamariyya* to *qamariyya*.³² This is in contrast to the fenestration of Ottoman mosques, where one often finds the use of windows containing coloured glass restricted to the *qibla* wall, with a single elaborate epigraphic window-grille being reserved for the window above the *mihrab*.³³ It may be that this distinction merely reflects the predominance of different architectural forms and their associated systems of fenestration in different areas of the Islamic world. Nonetheless, taken in conjunction with the technical features mentioned previously, the treatment of the inscriptions which appeared on the windows installed by order of Sultan Sulaiman is one more pointer to the hybrid nature of the Jerusalem *qamariyyat*.

Not only were large quantities of glass imported to fill the windows of the new mosques erected in Istanbul,³⁴ but these very windows are sometimes mentioned in *waqf* documents along with the other ‘culturally significant architectonic elements of the mosque’s interior’ (Necipoğlu 1985: 99). As the case of the 10th/16th-century windows in the Dome of the Rock shows, the cultural significance of such windows might be enhanced by the inscriptions which they bore. The appearance of the names and titles of Sultan Sulaiman Qanuni in the windows of a building on the third holiest site in the Muslim world should be seen in the context of the latter’s building activities in Jerusalem as a whole, and within the Haram al-Sharif in particular

(Meinecke 1988). The inclusion of the sultan’s name in the inscriptions of the windows, with their blend of universal Qur’anic affirmations and specific historical aspirations, establishes an immediate connection between the holy places and the newly triumphant Ottoman dynasty. The replacement of the exterior mosaics with a covering of glazed tiles may be seen as part of a similar attempt to stamp an Ottoman identity on the Dome of the Rock (Necipoğlu 1990: 154). There were well-established precedents for such endeavours for, more often than not, the numerous campaigns of repair and restoration undertaken by the Mamluk sultans in the Haram al-Sharif were not merely the product of utilitarian sensibilities but of a desire to establish visual links between the Umayyad monuments and their own dynastic architecture (Flood 1997: 72).

While Sulaiman’s bequest of coloured glass windows to the Dome of the Rock and the Aqsa was an inherent part of the overall restoration of the Jerusalem monuments, it also follows a precedent set by earlier custodians of the holy places. In section 6 it will be argued that at least some of the coloured glass windows in the Dome of the Rock were replaced as part of the work undertaken in 718-19/1318-19 by order of the Mamluk Sultan al-Nasir Muhammad. In the following century, a series of coloured glass windows—a novelty in the Hijaz—were set in place along the *qibla* wall of the Mosque of the Prophet at Medina by order of Sultan Qa’itbai (Samhudi 1891: 170; Newhall 1987: 241). The installation of coloured glass windows as part of a major programme of restoration in the Haram is indicative both of the important role which such elements played in the repertoire of Ottoman architectural decoration in general, and of their ability to act as bearers of religious and political meaning in specific circumstances.

The functional association between the window and light rendered it a natural vehicle for iconographic allusions to the theme of divine light. This association appears to have been particularly exploited in Ottoman architecture. In the *waqfiyya* of the Süleymaniyye Mosque (965-6/1557-8) in Istanbul, the Light Verse (Sura XXIV:35) is invoked, ‘to show that the mosque is illuminated by divine light’ (Kürkçüoğlu 1962: 22; Necipoğlu 1985: 100). To the same end the use of coloured glass is restricted to the windows of the *qibla*, while the Light Verse itself appears in the most elaborate window, directly above the *mihrab*. The same verse appears in a series of domes erected in the city in the 10th/16th and 11th/17th centuries (Von Hammer 1834: 76; Goodwin 1971: 235; Ögel 1973-6: 225-6). Contemporary descriptions of the coloured windows compare their colours to the ever-changing colours of the wings of the Prophet or the Archangel Gabriel (Sözen 1989: 90; Pasha 1983: 216). Since Evliya Çelebi’s is the earliest description of the 10th/16th-century Jerusalem windows available, it is worth

³² In the windows of the mausoleum adjoining the Madrasa of Aslam al-Silahdar (746/1345) and in the prayer-hall of the Barquqiyya (786/1384-6).

³³ As in the Süleymaniyye (Necipoğlu 1985: 100; see also Kuban 1968: 27; von Hammer 1834: 71). This is also the case in the Jami’ al-Taurizi in Damascus, which was restored in the late 9th/15th century.

³⁴ See note 27. Imports of window-glass for the mosques of Istanbul are also mentioned by Evliya Çelebi (see von Hammer 1834: 113).

comparing his description of the Süleymaniyye windows to that which he gives of the windows in the Dome of the Rock and Aqsa Mosque. Of the Süleymaniyye he says:

Sinan opened windows on every side to give light to the mosque. Those over the Mihrab and Minber are filled with coloured glass, the brilliance of whose colours within, and the splendour of the light reflected from them at noon, dazzle the eyes of the beholders, and fill them with astonishment. Each window is adorned with some hundreds of thousands of small pieces of glass, which represent either flowers, or the letters forming the excellent names (i.e. the Divine attributes); they are, therefore, celebrated by travellers all over the world (von Hammer 1834: 75).

In this same traveller's account of the windows installed in the Dome of the Rock and Aqsa by Sultan Sulaiman, there are implicit connections with those of the Süleymaniyye. Although Evliya Çelebi omits to mention that the Light Verse appears in the Süleymaniyye windows, he asserts that it is present in the windows of the Dome of the Rock—an assertion for which there is no corroborating evidence.³⁵ It seems unlikely that Evliya Çelebi took the time to decipher the inscriptions in the windows and more probable that, the connection between natural and divine illumination being well-established, he assumed that the Light Verse would appear in the windows of the Dome of the Rock, even as it did in the windows of the Süleymaniyye. In fact, although no details are given of the coloured glass grilles in the sixteen windows of the dome, we are told that it is 'full of divine lights' (St Stephan 1942: 90). We are also told that, on seeing the Rock, it was customary for pilgrims to offer a prayer which began, 'O God, let there be light in my heart ...' (St Stephan 1942: 86).

Using language reminiscent of his somewhat clichéd description of the Süleymaniyye windows, Evliya Çelebi gives an idea of how the windows in the Dome of the Rock appeared in the early 11th/17th century:

The master builder lavishly adorned [the piers] with richly gilt ornamentations, as well as variegated paintings so that, when the sun rays fall through the stained window glass on these piers, a stranger, not accustomed to the sight, would be bewildered (St Stephan 1942: 89).

The clearest suggestion that there is a direct connection between the windows of the Süleymaniyye and those installed by Sulaiman in the buildings of the Haram comes in the description of al-Aqsa. We are given the following description of the dome in front of the *qibla* and the *mihrab*:

It is a rotunda of 'light above light' (Sura XXIV: 35). Round it the verse is inscribed: 'Allah is the Light of Heaven and Earth' (Sura XXIV: 35). It was restored by Sulaiman Khan ... Sulaiman Khan selected from personal acquaintance the gifted master, the glass-mosaicist, the Drunkard 'Abdullah (Serkhosh 'Abdo), who has performed marvels in this prayer-niche of the Noble Mosque, by using twelve kinds of different fine and iridescent colours, so much so that the reflected rays, falling on the ground, lighten the entire mosque and fill the whole large congregation with light and meditation, inspiring them to reverent and submissive prayers. Besides the glass panes of twelve colours already mentioned there are one hundred and five glass panes in all, crystals, rock-crystals, and violet-coloured glass included (St Stephan 1942: 82-3).

Further on in the same passage the Light Verse is invoked in a description of the artificial illumination of the mosque. Apart from the explicit connection made between the Light Verse and the coloured light radiated through the windows and reflected from the mosaics of the dome, Evliya Çelebi ascribes the vitreous ornament of the Aqsa to Abdullah the Drunkard. The coloured glass windows of the Süleymaniyye are attributed to Ibrahim the Drunkard (Mayer 1954: 265; Goodwin 1971: 235-7).³⁶ While it is possible that the same skilled imbibor was responsible for the windows in both Istanbul and Jerusalem (Meinecke 1988: 261), given the fact that the buildings stand at a remove of almost thirty years—not to mention the unhealthy lifestyle of the individual—this seems unlikely. Instead it may be that Evliya Çelebi is attempting, or reporting an attempt, to acknowledge a connection between the celebrated glass ornament in two buildings which stand at the centre of the metropolitan and provincial architectural programmes undertaken by Sulaiman.

³⁵ As mentioned in Section 3 (iii). It is noteworthy that two of the inscriptions attributed to the Jerusalem windows—the Light Verse and the names of the first four caliphs—do appear in the epigraphic ornament of the Süleymaniyye (Goodwin 1971: 235).

³⁶ Since the name of this individual does not appear among the lists of craftsmen recorded as having worked on the mosque, Rogers (1983: 243) suggests that either he was permanently absent with a hangover, or that he may have been a mythical figure.

Some indication that the transcendental significance attributed to natural light in this description and those cited previously was not an idiosyncratic one is found in the Dome of the Rock itself. In addition to the lunettes and windows filled with coloured glass mentioned previously, a single low rectangular window closed with a metal grille and wooden shutters was pierced in two faces of the octagon, on its south-eastern and south-western sides. The openings were created at the same time, for each once bore an inscription which gave the date of 1006/1597-8 (van Berchem 1927: 340-2 nos. 243-4). The inscription accompanying the south-eastern window states that the work was undertaken as a result of a revelation in which the benefactor was told to open a window in the Qubbat al-Sakhra so that the morning sun might penetrate the building and give it the appearance of Paradise (*jannat alma'wa*).³⁷ Although it stands at a remove of sixty years from the installation of the coloured glass windows, read in conjunction with the evidence from Istanbul the inscription suggests the Ottoman approach to fenestration in the Dome of the Rock was not motivated solely by utilitarian or aesthetic considerations.

5. Changes to the windows in the octagon of the Dome of the Rock since the 10th/16th century

At least eight campaigns of restoration to the Dome of the Rock have been carried out since the time of Sulaiman Qanuni.³⁸ Many of these were extended to the Aqsa mosque also. The campaigns known to have involved alterations to the windows of one or both buildings are those of 1133-5/1720-1, 1233/1817-8, 1291-3/1873-5, 1342-6/1923-7 and 1378-84/1958-64. For convenience, a summary of those changes to the window-grilles of the Sakhra which can be documented is provided in Appendices II and III. Several windows in the octagon were replaced during the restorations of 1291/1874, while

more were replaced in the period between 1291/1874 and 1342/1923, some on the occasion of the Kaiser's visit in 1316/1898. It is clear however that the majority of the changes occurred during the two major restorations of the present century. Between 1342/1923 and 1346/1926 for example twenty windows were removed and replaced (Anon 1928: 13). A single window (e.g. window 19) may have had its *qamariyya* replaced on as many as three occasions in the past hundred years. In some cases the modern coloured glass window bears no relation to that previously in place. In others, copies of one type of 10th/16th-century window-grille occur in windows where another type would originally have appeared.

On the basis of the information summarised in Appendix II and discussed in Section 3 (iii) above, the following conclusions may be offered. Of the five different window-types now *in situ*, one appears to copy a design of the 13th/19th century.³⁹ The remaining four types preserve the form of the *qamariyyat* introduced during the restorations undertaken by Sulaiman the Magnificent, but in most cases the inscriptions have been altered. In addition, the colour of the glass in the present *qamariyyat* bears little relation to that used in the 10th/16th-century windows. At some time during the present century a type of 10th/16th-century window-grille (pl. 28.1) has been lost, and another (pl. 28.3) altered.⁴⁰

Because the windows have undergone so many changes, little can be said of any 11th/17th- or 12th/18th-century *qamariyyat* which may have been introduced in the period between the restoration of the monument by Sultan Sulaiman and the major campaigns of restoration undertaken in the present century.

An exception to this is the period of Sultan 'Abd al-'Aziz (1277-93/1861-76). The design of a fragmentary window-grille now in the Haram Museum which bears the names and titles of 'Abd al-'Aziz (pls. 28.9-11 and fig. 28.9) seems to have been based on a 10th/16th-century type, but did not copy it exactly.⁴¹ A second window in the Haram Museum which may also date from this period (pl. 28.7) is more faithful to the 10th/16th-century original. It appears that at least one new type—based on a pastiche of elements derived for the most part from 10th/16th-century window-grilles—was introduced at some point in the 12th/18th or

³⁷ Van Berchem 1927: 341 no. 243. The story of an architectural project undertaken as the result of a dream or vision is suspiciously reminiscent of the manner in which Sulaiman's programme of restoration in the Haram is said by Evliya Çelebi to have been inspired (St Stephan 1942: 87).

³⁸ Ibrahim I 1052/1642-3 (Walls and Abu'l-Hajj 1980: no. 245); Ahmad III 1133-5/1720-1 (Göyünç 1982: 328; St Laurent and Reidlmayer 1993: 77-9); Mahmud I 1155/1742 (Göyünç 1982: 329, n.8); 'Abd al-Hamid I 1194-5/1780-1 (Walls and Abu'l-Hajj, 1980: no. 246); Mahmud II 1233/1817-8 (Le Strange 1890: 135; Walls and Abu'l-Hajj 1980: nos 250-9); 'Abd al-'Aziz 1291-3/1873-5 (van Berchem 1927: 329-30; Creswell 1969: 91); 1342-6/1923-7 (Anon 1928); 1378-84/1958-64 (Walls and Abu'l-Hajj 1980: no. 238).

³⁹ See note 42.

⁴⁰ I am assuming that the tracery in the form of a hexagonal grid (now in windows 11-12, 24, 26 and 29-30) is based on the form depicted above (pl. 28.3).

⁴¹ The presence of the name of this sultan and the form in which it appears indicates that the grille could only have been removed from window 12, for van Berchem (1927: 329) recorded such an inscription in this position. Curiously, van Berchem makes no mention of the date, perhaps because it was barely legible when the grille was in place.

13th/19th century and copied subsequently (pl. 28.6).⁴²

While the window-grille with the name of 'Abd al-'Aziz is clearly intended to blend with the earlier *qamariyyat* in the Sakhra—and should not therefore be taken as typical of late Ottoman coloured glass windows—they do betray certain technical peculiarities. The glass which was used in their manufacture is quite different from that which Richmond describes in the earlier *qamariyyat* (1924: 79). In place of the small pieces of streaked and bubbled glass used earlier, large pieces of flat translucent glass with a high surface gloss were used in the window of 'Abd al-'Aziz (pl. 28.11). The fact that so many of the window-grilles installed during the restorations of 'Abd al-'Aziz were subsequently replaced is a testimony to the poor quality of the plaster of which their tracery was composed, a fact noted by Richmond (1924: 79).

The final detail which may be used to distinguish window-grilles of this period from earlier *qamariyyat* is the treatment of the inscriptions which they contain. Not only was the content of the inscriptions altered when the window-grilles were remade—with the name and titles of 'Abd al-'Aziz being frequently interpolated (Appendix 28.2, windows 12, 16 and 24)—but the manner in which the inscriptions were executed was also different. The letters of the inscriptions were executed in relief against a flat panel which was perforated with random drillings, a feature entirely absent from the 10th/16th-century windows. In the earlier windows, the letters of the inscription were filled with colourless glass set against a deep blue ground. In the dated window, however, the letters of the inscription were filled with yellow glass set against a green ground. Although such a use of colours is unattested for the 10th/16th-century windows in the Dome of the Rock, it is found in the windows of some 10th/16th- and 11th/17th-century mosques in Istanbul.⁴³

Major changes to the windows of the octagon were undertaken during the large-scale restoration campaigns of 1342-6/1923-7 and 1378-84/1958-64. Of the thirty-six

grilles in the windows of the octagon, twenty were replaced in the first period of restoration (Anon 1928: 13). All the grilles on the north, north-western and west walls were either repaired or replaced at this time (Megaw 1952: 55). The extent of the changes in the later restoration is not known, but at least two of the window-grilles in the octagon were subsequently removed and replaced with copies of those removed (Shafi'i 1970 65).⁴⁴ In view of these extensive changes, it seems probable that, even where they preserve the forms of earlier window-grilles, most, if not all, of the *qamariyyat* now in place are creations of the present century.

6. The windows in the dome

The difficulties which one encounters in trying to map the changes to the window-grilles in the octagon during the period of Ottoman suzerainty are redoubled when one comes to consider the windows in the dome itself. Owing to the difficulties of gaining access, it appears that these window-grilles were altered or replaced less frequently than those in the octagonal outer walls. This is witnessed by the fact that when the interior lighting was judged inadequate for the Kaiser's visit in 1316/1898—due at least in part to the poor state of the window-grilles in the drum of the dome and the accumulation of dirt on the glass which filled them—rather than undertaking the arduous task of cleaning or replacing the grilles, a solution was found in the simple expedient of piercing openings in the base of the dome itself (Richmond 1924: 81).

Common to all types of window-grilles in the drum of the dome, except one, is the division into an arched lunette and a rectangular field. The intervening epigraphic panel which one finds in the window-grilles of the octagon is absent. An assessment of individual grilles is complicated by several factors. Firstly, it is clear that until the major renovations which took place this century, it had been common practice to replace part of these window-grilles—possibly while they were still *in situ*—rather than replace them *in toto*. This was no doubt a consequence of their inaccessible location, and led to windows being filled with grilles which were composed of sections which dated from different periods (as noted by Megaw 1952: 56). Before the restorations which took place this century, it was often the case that the style and date of the lunette differed considerably from that of the tracery in the central field of the window associated with it (pls. 28.16-8). The resulting problems with the endeavour to deconstruct and date the

⁴² Although grilles of this type were manufactured and installed in the 1340s/1920s (they appear in some published photographs of the restoration, see Anon 1928), there is good reason to believe that these were merely copying an earlier type, for similar grilles appear in the earlier painting of Harvey (Creswell 1969: frontispiece). It was therefore at some point before the beginning of the present century that the type was introduced. Its similarity to the window above the *mihrab* in the Süleymaniyye (pl. 28.8, fig. 28.8) suggests that it may have been modelled on a generic 10th/16th-century type at the time of a later restoration. Today it replaces one of the 10th/16th-century types which has vanished altogether from the repertoire represented among the grilles in the Dome of the Rock (see comments for windows 19 and 28, Appendix II).

⁴³ For example, in the Mosque of Sokollu Mehmet Pasha and in the Yeni Cami. It may however be significant that the windows of the former mosque were replaced in the 13th/19th century (see Kuban 1968: 36).

⁴⁴ These were in the south-eastern and south-western sides, but the exact locations are not given. At least one of those replaced seems to have been a modern grille, installed in the 1340s/1920s: see comments for window 19 in Appendix 28.2.

various parts of such grilles is magnified by the fact that the Ottoman windows have all been replaced and one is obliged to work from photographic evidence.

A more serious difficulty is the divergence between textual evidence or archival records—where they exist—and the evidence of the windows themselves. The implications of the latter problem will become clear shortly. The accumulated evidence for the changes to the windows in the drum of the dome has been summarised in Appendix III. While this is not intended to be an exhaustive survey, it does provide some chronological *termini* for the discussion which follows.

When Richmond studied the building in 1338-9/1919, he concluded that some of the Mamluk window-grilles—or at least parts of them—still survived (1924: 78; Creswell 1969: 79 n. 6). The same conclusion was reached by Megaw when he surveyed the monument in 1367/1947 and again in 1372/1952 (1952: 56). These grilles were presumably from the extensive restorations to the building carried out by order of al-Nasir Muhammad in 718-9/1318-9 (Creswell 1969: 79 n. 6), but one cannot be certain that what appeared to be Mamluk grilles were not in fact later copies of 8th/14th-century windows. Some of the modern window-grilles set in place during the renovations of this century were clearly inspired by the design of the 'Mamluk' windows. Common to all but one of these types is the division into a lunette filled with a symmetrical vegetal motif and a rectangular field below. This is filled variously with a repetition of the axially-arranged vegetal motif (windows 9 and 10; pl. 28.12) or with a *shamsa* in the form of a twelve-pointed starburst (windows 1, 2, 13 and 14; pl. 28.20). There are at least two variants in the borders of the latter type. The third type is again filled with vegetal tracery and has a wide outer border, but lacks the differentiated lunette (pl. 28.13).

The modern window-grilles in which axial vegetal motifs predominate are clearly related to one of the windows published by Richmond (pls. 28.12-3). Some support for the suggestion that the window-grilles seen by Richmond dated from the 8th/14th century is found in the wooden ceilings of the outer ambulatory. At least part of these are thought to date from the restorations carried out by al-Nasir Muhammad (Creswell 1969: 91). Panels decorated with axial vegetation occur in the interstices between the larger rectangular panels of which the ceiling is composed (pl. 28.14). The similarities between the design of the small ceiling panels and some of the windows formerly in the dome suggest that both were set in place at the same date. Prominent among the designs used for the large square panels of the ceiling in the outer ambulatory are ten- and twelve-pointed starbursts (pls. 28.15-6) similar to the motif which appears in the lunette of a grille published by Richmond (pl. 28.12), and now appear in windows 1, 2, 13 and 14 (pls. 28.18-20). Before the

restorations of 1378-84/1958-64, Megaw counted nine windows with arabesque grilles or lunettes in the drum and concluded:

In the ceiling of the outer ambulatory is seen the same combination of rectilinear motifs with arabesques akin to those in the dome. Consequently it seems permissible to connect all those 9 window panels with a single scheme of re-decoration despite differences of form and detail, and to assign them to the repairs carried out under an Nasir Muhammad (1952: 56).⁴⁵

Window-grilles in which axial vegetal motifs appear are found in some of the Bahri Mamluk monuments of Cairo.⁴⁶ The type seems to disappear before the mid-8th/14th century for, among the surviving monuments, it is not found after this date.⁴⁷ Although vegetal or 'arabesque' motifs appear in the 10th/16th-century windows of the octagon (pl. 28.1), these are manufactured according to a technique different to that which Richmond observed in the arabesque windows of the dome. This then would lend further support to a date in the early 8th/14th century for the appearance of the type in the windows of the Dome of the Rock.

On the basis of the resemblance between the windows of the drum and the wooden panels in the ceiling of the ambulatory, one might suggest that a third type of grille—in which geometric rather than vegetal tracery predominated—was also set in place in the 8th/14th century. Richmond mentions that the six window-grilles in the drum of the dome, which he attributes to the pre-Ottoman period, consist of both vegetal designs and geometric patterns (1924: 78). Although he gives no details of the latter, it seems probable that the modern grilles in which a single twelve-pointed *shamsa* appears in the central field preserve these patterns (pls. 28.18-19).⁴⁸ *Qamariyyat* in which a central rectangular field is filled with such *shamsas* are still to be found in the contemporary Mamluk monuments of Cairo,⁴⁹ and the same type appears in photographs taken before the restorations of the 1340s/1920s (pl. 28.20).

⁴⁵ Richmond (1924: 78) assigns only six of the grilles to this date.

⁴⁶ For example in the mausoleum of Sultan Qala'un (683-4/1284-5).

⁴⁷ The last surviving examples are in the Maridani Mosque (741/1340) and in the mausoleum of Aslam al-Silahdar (746/1345). It is conceivable that the disappearance of the type is related to the introduction of a new and faster technique of manufacturing *qamariyyat*, which produced grilles in which geometric tracery predominated.

⁴⁸ These are to be seen in windows 1, 2, 13 and 14.

⁴⁹ For example in the Madrasa of Inal al-Yusufi (795/1392).

No technical details are available for the windows currently *in situ* in the dome, but the windows seen by Richmond were filled with red, blue, green, yellow and white glass. The following details are given:

The panes are large compared with those of the sixteenth-century windows, and the lines of plaster that take the place of the lead in our windows are narrow, barely more than one centimeter wide. The glass is set at a distance of from six to seven centimeters from the outer surface of the plaster. On the inside the glass is held in place by a fillet of plaster, beveled on each edge, and about one centimeter wide and one centimeter thick, covering the joints between the panes (1924: 79).

Richmond also notes that the glass used in the windows just described is 'streaked and filled with bubbles', but this is not on its own a reliable chronological indicator, for glass from earlier windows may be used in later replacements.⁵⁰ Despite this, the significance of this description cannot be overstated, for comparison with the description of the 10th/16th-century windows in the octagon given above clearly indicates that these were produced in a different manner. While the Ottoman window-grilles have small pieces of glass roughly attached to the exterior of the tracery, those formerly in the drum consisted of pieces of glass held between two layers of stucco. The change from the latter technique to the former cannot be dated with certainty, but it is thought that the simpler technique was in use in Egypt from the middle of the 8th/14th-century onwards (Herz Bey 1892: 3-4; Flood 1993: 146-8). The use of the earlier 'sandwich' technique would therefore support a date early in the 8th/14th century. It has already been noted that Ottoman Turkey was one of the few regions of the Muslim world to retain the 'sandwich' technique for the manufacture of stucco and glass windows, but that the Haram windows which date from the Ottoman occupation are made according to the contemporary local tradition, that is, with pieces of glass attached to the exterior of the grille using a thin application of stucco. The windows in the drum described by Richmond are exceptions to this.

One final piece of evidence which one might use to support the suggestion that some of the grilles seen by Richmond and Megaw had not been replaced since the Mamluk period is the presence of 'cross-bars of wrought iron' in the intervals between the stucco and glass grilles of

some of the windows and the Ottoman pierced tile panels which filled their exteriors (Megaw 1952: 88).⁵¹ The precise windows in which such grilles could be seen before the restoration of 1378-84/1958-64 were never recorded but, although they occasionally survived into the Ottoman period and beyond, metal grids were not part of the system of fenestration introduced to the windows of the octagon by Sulaiman Qanuni. Instead, it is in the Mamluk period that one finds ample evidence for the use of such metal grilles in the windows of both the Dome of the Rock and the Aqsa (see Section 2). In the case of some of the drum windows it may be therefore that the only change introduced in the 10th/16th century was the provision of an outer pierced tile panel.

Thus far the stylistic and technical evidence seems to concur in validating Richmond's attribution of some of the window-grilles which he saw in the drum to the renovations carried out at the behest of Nasir al-Din Muhammad in 718-9/1318-9. A major problem presents itself, however, in the form of an unpublished register (*defter*) which records the repairs to the monument carried out at the behest of Ahmad III in 1134-6/1721-2. This unpublished document apparently suggests that all of the coloured glass windows in the drum of the dome were replaced at this time:

Plain and colored glass is listed according to the number of panels needed for each window. Two kinds of window are specified: twelve ordinary windows using little glass, and fancier windows for the *qibla* wall using a large number of small pieces of the 'Persian' type, with more color (St Laurent and Riedlmayer 1993: 79).⁵²

The mention of 'Persian' windows is particularly interesting,⁵³ in view of the fact that the term commonly used for coloured glass windows in Ottoman Turkey, *rezvenî-menkus* ['decorated windows'] (Essad 1926: 266), was itself a combination of Persian and Arabic terms (Arseven n.d: 182). While such nomenclature suggests a hybrid ancestry for Ottoman coloured glass windows, the dearth of surviving material evidence renders any evaluation of the connections between Persian and Ottoman stucco and glass windows hazardous. A mutual relationship in technical and stylistic matters does, however, seem likely.⁵⁴

Although these are not mentioned, it is hard to

⁵¹ See also note 6.

⁵² A summary of the document (*Basbakanlik Arsivi, Maliyeden Müdevver Defterler* no. 7829) is given by Göyünç 1982: 328-9.

⁵³ Although from the published references to the *defter* it is unclear as to whether the epithet 'Persian' is being applied to the windows or to the glass.

⁵⁴ See note 18.

⁵⁰ This is the case with the *qamariyyat* produced today in the Haram workshop. Owing to the high cost of the material, broken glass was apparently used in Turkish windows of the Ottoman period (see Rogers 1983: 250-1).

believe that the windows of the octagon were unaffected by this phase of restoration. The fact that 16,200 pieces of coloured and plain glass were ordered from Istanbul for the purpose gives some idea of the extent of the undertaking (Göyünç 1982: 328). The evidence for exports of window-glass to Istanbul in the 10th/16th and 11th/17th centuries has been given above. Since window-glass was among the most common exports to Istanbul during the late 11th/17th century (Mantran 1962: 617), it may be that some of the glass for the windows was imported from further afield than Istanbul.

In the light of the evidence which indicates that some of the windows still extant in the drum earlier this century preserved the forms of Mamluk and 10th/16th-century windows, the suggestion that all were replaced in the reign of Ahmad III raises a number of questions. One may rule out the possibility that some of the coloured glass in the grilles may have been changed without the entire grille being replaced, for many of the grilles seen by Richmond and Megaw had their glass sandwiched between two layers of stucco. There would therefore be no way to remove the glass without destroying the stucco tracery in which it was held.⁵⁵

A further possibility is that, although all the windows were replaced, the forms of the earlier windows were copied. This copying would have had to extend to the technical aspects of the windows, for as previously noted the windows formerly in the drum were produced using two different methods. The use of two different techniques in a single phase of restoration seems highly unlikely.

Another apparent anomaly is the purchase of brass wire for use in replacing the windows. It has been suggested that this reflects the influence of European stained glass in the manufacture of the 12th/18th-century windows (St Laurent and Riedlmayer 1993: 79). It seems more likely, however, that the wire was used to strengthen the border of the grilles, or for the provision of a mesh to cover the reverse of the grilles. The use of copper and brass wire for the latter purpose was common in Mamluk Cairo (Amin and Ibrahim 1990: 90-1), and Megaw mentions the presence of thin wire netting behind the windows of the drum (1952: 88). The use of metal rods for strengthening the outer borders of the stucco grilles and the wooden frames in which they were set has been mentioned above. One must conclude that none of the evidence produced so far supports the suggestion that any grille introduced at this period reflected the influence of European stained glass.

The architectural evidence suggests that either the document in question is in error, or that it is only partly correct, and that the changes to the windows of the drum were not as extensive as it suggests.

When he studied the monument, Megaw suggested that six of the window-grilles in the dome (those in windows 3-5, 7-8 and 15) and part of another (in window 11) dated from the 8th/14th century. To these I would add the grilles which filled windows 6 and 16. In view of the evidence just cited it seems highly unlikely that all the window-grilles in the drum were replaced during the reign of Ahmad III—even if some were altered at this time, fewer than half can have been affected.

It is clear from the evidence summarised in Appendix 28.3 that there are only four windows (5, 6, 9 and 10) in which the grilles now in place may preserve the forms of the stucco and glass set in place in the 10th/16th century or earlier. It is striking that the types of grilles in these windows are exactly those published by Richmond (pls. 28.12-3). It may be therefore that these are the only window-grilles in the drum which have preserved the form of the earlier stucco and glass windows, if not the original grilles themselves. On the basis of these survivals, and the evidence summarised in Appendix 28.3, there are only two possible alternative scenarios for the arrangement of the windows. One possibility is that a pair of the type without lunette published by Richmond (pl. 28.13) appeared at the centre of each side of the drum, flanked by the type with lunette (pl. 28.12). An alternative arrangement would have pairs of one type alternating with pairs of the other. Neither solution is entirely satisfactory,⁵⁶ and if, as argued above, these types preserve the form of 8th/14th-century windows, it is not at all clear how the windows installed by Sultan Sulaiman fitted into this scheme.

Although evidence for alterations to the windows of the drum in subsequent campaigns of restoration is lacking, it seems likely that both parts of the grilles and entire grilles were subsequently replaced. There are four types of window-grilles which have now vanished but which may be seen in photographs and paintings of the Sakhra which predate 1342/1923. The style of these was crude compared to that of the window-grilles for which a Mamluk date, or a date early in the Ottoman occupation, has been proposed. The tracery in the lunette of the grille formerly in window 1 (visible in pl. 28.17) consisted of an axial vegetal motif similar to that of the windows published by Richmond (pls. 28.12-3). The rectangular field of the same window was filled with tracery which, to judge by its crudity and lack of resemblance to the lunette, clearly belonged to a later date (fig. 28.10). It appears to copy the

⁵⁵ Megaw (1952: 88) comments: 'However the drum window panels of the type attributed to the repairs under al-Malik an-Nasir Muhammad have their glass inserted from the inside and so, in their present form, access to the outside face would not enable missing glass to be replaced.'

⁵⁶ The problems with both arrangements are discussed by Megaw (1952: 56-7).

type formerly in window 12, now in window 13 (pl. 28.18, fig. 28.7), for which a 10th/16th-century date has been proposed. Of all the grilles known to have filled the windows of the drum, it is the only example known to have borne an inscription.⁵⁷ It seems likely that this dated from the restoration ordered by Mahmud II in 1233/1817-8. As will be seen below, extensive changes were made to the windows of the Aqsa at this date. The erection of scaffolding around the exterior of the dome to enable the regilding of the dome would also have facilitated access to the windows.⁵⁸ A grille of less complex form which filled the adjacent window (window 2), and has now vanished, may also have dated from this period. This consisted of a network of hexagonal tracery (visible in pl. 28.17).

Of the two remaining windows (7 and 11) in which grilles of types now no longer present once appeared, that in window 11 (pl. 28.19) was the least complex of all four vanished types. While the lunette of the window was filled with the arabesque tracery for which a date in the 10th/16th century or earlier has been proposed, the lower part of the tracery consisted of a plaster panel pierced with a crude geometric pattern based on touching circles (Megaw 1952: 56). The crudeness of style and flat two-dimensional plane in which the tracery was executed distinguishes it from the grilles just discussed. For this reason one might propose a date in the second half of the 12th/19th century.⁵⁹

As regards the form of the grilles installed during the restoration of the monument ordered by Sulaiman Qanuni, it has already been suggested that the grille now in window 12 preserves the form of one of the 10th/16th-century grilles (pl. 28.18, fig. 28.7). It is possible that a grille which once appeared in window 7 was of this date. The grille was more complex than any of the three just discussed, consisting of tracery based on a pattern of eight-pointed stars (visible in pl. 28.20). The main lines of the tracery were raised above the background, a characteristic of the 10th/16th-century windows in the octagon.

A further problem with the windows of the dome is to determine which, if any, were replaced during the restoration carried out by Sultan Sulaiman. Since all the windows of the octagon were replaced during this major restoration, it seems reasonable to suppose that all the windows of the drum were also provided with new grilles.

Despite this, the evidence for the survival of 8th/14th-century windows just cited suggests that only some of the grilles in the windows of the drum were replaced at this stage. It might be thought that what have been described as 8th/14th-century window types are in fact those installed by Sultan Sulaiman. However, the fact that the technique used in their manufacture differs considerably from that used in the 10th/16th-century windows of the octagon argues against this. For this reason, and for the stylistic reasons adduced above, I have differed from Megaw in dating the forms of the grilles published by Richmond to the period of al-Nasir Muhammad rather than that of Sulaiman.⁶⁰ As has been shown above, the survival of metal grids in some of the window-openings may also indicate that not all the Mamluk grilles were replaced in the 10th/16th century.

The height of the dome and the accumulation of dirt on the exterior of the windows renders any assessment of the colours of the glass in the windows of the drum difficult.⁶¹ The colours of the glass in the modern windows cannot be taken as a guide to those of the Ottoman windows. A noteworthy feature of the painting by Harvey (1327/1909) (Creswell 1969: frontispiece) is that the grille formerly in window 13 (pl. 28.18, fig. 28.7), which the one now in window 12 copies, is distinguished by its colour scheme from the other windows in the drum. The predominance of blue and red glass in the grille is in harmony with the colours of the 10th/16th-century windows shown in the octagon (see section 3). This may be taken as further support for the suggestion that this represents an original 10th/16th-century type.

It is clear that the windows in the drum of the dome are more problematic than those of the octagon. The problems result from discrepancies between the documentary and material evidence and are exacerbated by the tendency of craftsmen involved in the various Ottoman restorations to copy the forms of earlier window-grilles when they replaced them with new ones. The process of replacing the windows has continued in the present century. When Megaw submitted his report in 1374/1952 he could identify nine of the window-grilles in the dome as preserving 8th/14th-century forms. It seems

⁵⁷ This could not be deciphered from the available photograph.

⁵⁸ The presence of the scaffolding is mentioned by Richardson (1822: 304).

⁵⁹ The cupola was restored in 1291/1874 (van Berchem 1927: 330), which might have provided an opportunity for replacing some of the grilles. The fact that at the time of the Kaiser's visit twenty-four years later the lack of light from the dome windows led to openings being pierced in the dome itself (Richmond 1924: 81) suggests that any alterations undertaken at this time cannot have been extensive.

⁶⁰ Megaw (1952: 56) concludes that the grilles which he saw in windows 6, 9, 10 and 13 'undoubtedly derive from Sulaiman's repairs, though some may in their present form be later reproductions of panels first installed during these repairs.' Three of these grilles were of the types published by Richmond (pls. 28.12-3). The fourth was similar to that now to be seen in window 12 (fig. 28.7) and does seem to be the only type among the windows of the drum which can be ascribed to the work of Sulaiman's craftsmen.

⁶¹ When the monument was visited in January 1415/1994, the dome was being regilded and the windows were obscured by exterior scaffolding.

that most of the grilles in the dome which he saw have been replaced subsequently. Where copies of earlier grilles have been produced these have not usually been re-installed in the correct position. Of the eight different types of grille now in place, only three (those in windows 1, 2, 5, 6, 9, 10, 13 and 14) are likely to preserve the forms of the grilles installed by al-Nasir Muhammad, while only one (that in window 15, fig. 28.7) may be tentatively attributed to Sulaiman's restoration. The remainder seem to copy the forms of window-grilles installed during the restorations of the 12th/18th and 13th/19th century.

The complexities of this accretional approach to fenestration become clear when one considers Megaw's recommendations for the restoration and replacement of the drum windows, made in 1374/1952. These include replacing the 'Mamluk'-type windows with copies, identical in all respects except their method of manufacture. Thus, the glass should no longer be held between two layers of tracery, but attached to the reverse of the grilles, as is the case in the 10th/16th-century windows of the octagon (1952: 88). Megaw also recommends that another feature of the Ottoman windows, the use of downward-sloping tracery, should be replicated in the modern copies. Many of the modern window-grilles produced subsequently for the windows of the drum were thus a mixture of Mamluk forms and Ottoman techniques.⁶² As such, they perpetuate a tradition of hybridisation which has characterised the approach to the stucco and glass windows taken by restorers over almost five centuries.

The constant replacement of the window-grilles in the Dome of the Rock has both practical and political dimensions. In view of the dearth of evidence for the fenestration of the building between the Umayyad and Mamluk periods, whether the replacement of such grilles was of necessity from the time of the building's completion or is a more recent phenomenon is not clear. What is clear is that from the 8th/14th century onwards the window-grilles were removed, replaced and repaired with surprising frequency. The political implications of this process have been considered in Section 4 and elsewhere (Flood 1997: 72) but there can be little doubt that at least some of these restorations were motivated by concerns for the fabric of the building. The complex system of fenestration introduced in the 10th/16th century seems to have accelerated the rate of decay of the coloured glass windows (see Section 3[ii]), contributing to the frequent need to replace them. The rate at which the window-grilles were

replaced in later centuries suggests that there may have been a subsequent decline in the quality of the window-grilles—for example, the grille filling window 19 in the octagon has been replaced three times since 1311/1893 (see Appendix II).

7. Changes to the windows of the Aqsa since the 10th/16th century

Unfortunately far less literary and visual material is available on the windows of the Aqsa than on those of the Qubbat al-Sakhra. The dearth of information about the windows installed in the reign of Sulaiman I has been noted in the preceding section. This hiatus may be because the windows of the mosque have been subject to more vicissitudes than those of the Sakhra. During the renovations of the 1360s/1940s, for example, it appears that all the window-grilles were removed,⁶³ while any of those which survived appear to have been destroyed in the conflagration of 1386-7/1967.

It is not clear whether the repairs to the Dome of the Rock in 1133-5/1721-2 also involved changes to the fenestration of the Aqsa. The first evidence for such changes comes with the restoration undertaken by Mahmud II in 1233-4/1817-8. In addition to the installation of new windows in the Dome of the Rock, the windows in the dome of the Aqsa were altered. A lithograph published in 1279/1862—and which therefore pre-dates the renovations of 'Abd al-'Aziz—shows a remarkable arrangement in the windows of the dome (Paris 1978: pl. 47). This arrangement may be seen in photographs of the dome taken before the restorations of 1342-6/1923-7 (pl. 28.21).⁶⁴ The large windows are blocked from their base to approximately one-third of their height. The lower part of each window is filled with a landscape scene executed in a European idiom. The grilles filling the upper parts of the windows are of at least two types: those in which the lunette is not distinguished, and those in which the lunette is separated from the rectangular field below. In the latter type, the rectangular field is further subdivided into two vertical arched panels. It appears that the two types alternated in the windows around the dome.

The date at which this idiosyncratic system of fenestration was introduced can be determined from travellers' accounts. 'Ali Bey al-'Abbassi, who visited the building between 1218/1803 and 1222/1807, makes no mention of the landscape scenes, stating only that the cupola has

⁶² No information is available on the changes made to the windows during the restoration of 1378-84/1958-64. At some later date two windows in the south-eastern and south-western sides of the octagon were replaced with copies of the types removed (Shafi'i 1970 65). Which two windows these were is not specified.

⁶³ This is clear from the published photographs of the restoration (see Hamilton 1949).

⁶⁴ Also in an unpublished photograph of the dome's interior (Creswell Archive no. 1476).

... two rows of windows, and is ornamented with arabesque paintings and gilding of exquisite beauty ('Ali Bey al-'Abbassi 1816: 217).

Wilson, who saw the mosque before 1299/1881, is less complimentary, telling us that

Some wretched paintings by an Italian artist were introduced when the mosque was repaired at the commencement of the present century (Wilson 1881: 66).
